pandiastolic /-dī′əstol′ik/ [Gk, *pan* + *dia,* through, *stellein,* to set], pertaining to the complete diastole. Also called **holodiastolic.**

panencephalitis /pan′ənsef′əlī′tis/ [Gk, *pan* + *enkephale,* brain, *itis*], inflammation of the entire brain characterized by an insidious onset, a progressive course with deterioration of motor and mental functions, and evidence of a viral cause. One example is **subacute sclerosing panencephalitis,** an uncommon childhood disease thought to be caused by a "slow" latent measles virus after recovery from a previous infection. Most of the patients are younger than 11 years of age, and many more boys than girls are affected. The disease results in ataxia, myoclonus, atrophy, cortical blindness, and mental deterioration. Antiviral drugs, immunosuppressants, and interferon inducers are sometimes administered, but the disease is usually unremitting and fatal.

panendoscope /-en′dəskōp′/ [Gk, *pan* + *endon,* within, *skopein,* to look], a cystoscope that allows a wide view of the interior of the bladder and urethra with a special lens system.

panesthesia /-esthē′zhə/ [Gk, *pan* + *aisthesis,* feeling], the total of all sensations experienced by an individual at one time. Compare **cenesthesia.**

pang, a sudden severe but temporary pain.

pangenesis /-jen′əsis/ [Gk, *pan* + *genesis,* origin], an idea that each cell and particle of a parent reproduces itself in progeny.

panhidrosis, perspiration over the entire body.

panhypopituitarism /panhī′pōpito͞o′itəriz′əm/ [Gk, *pan* + *hypo,* under, *pituita,* phlegm], generalized insufficiency of pituitary hormones, resulting from damage to or deficiency of the gland. **Prepubertal panhypopituitarism,** a rare disorder usually associated with a suprasellar cyst or craniopharyngioma, is characterized by dwarfism with normal body proportions, subnormal sexual development, and insufficient thyroid and adrenal function. Diabetes insipidus is frequently present, bitemporal hemianopia or complete blindness may occur, and skin is often yellow and wrinkled, but mentality is usually unimpaired. X-ray films show delayed fusion of the epiphyses, suprasellar calcification, and, frequently, destruction of the sella turcica. The condition is treated with cortisone, thyroid and sex hormone replacement, and human growth hormone. Postpubertal panhypopituitarism may be caused by postpartum pituitary necrosis (Sheehan's syndrome) resulting from thrombosis of pituitary circulation during or after delivery or other trauma to the pituitary. Characteristic signs of the disorder are failure to lactate, amenorrhea (in females), weakness, cold intolerance, lethargy, and loss of libido and of axillary and pubic hair. There may be bradycardia or hypotension, and progression of the disorder leads to premature wrinkling of the skin and atrophy of the thyroid and adrenal glands. Treatment consists of the administration of the hormones of the target organs. Panhypopituitarism may also be caused by pituitary apoplexy, hemorrhage, or head trauma. Also called **hypophyseal cachexia, pituitary cachexia, Simmonds' disease.**

panhysterectomy /pan′histərek′təmē/ [Gk, *pan* + *hystera,* uterus, *ektomē,* excision], complete surgical removal of the uterus and cervix. See also **hysterectomy.**

panic /pan′ik/, an intense, sudden, and overwhelming fear or feeling of anxiety that produces terror and immediate physiological changes that result in paralyzed immobility or senseless, hysteric behavior.

panic attack [Gk, *panikos,* of the god Pan; Fr, *attaquer*], an episode of acute anxiety that occurs unpredictably, with feelings of intense apprehension or terror accompanied by dyspnea, dizziness, sweating, trembling, and chest pain or palpitations. The attack may last several minutes and may occur again in certain situations. Compare **anxiety attack.**

panic disorder. See **anxiety attack.**

panitumumab, a miscellaneous antineoplastic.

■ INDICATIONS: This drug is used to treat metastatic colon cancer expressing epidermal growth factor receptor.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include fatigue, ocular toxicity, peripheral edema, anorexia, mouth ulceration, abdominal pain, constipation, thrombophlebitis, pruritus, skin fissure, hypocalcemia, hypomagnesemia, antibody formation, dyspnea, pneumonitis, and wheezing. Life-threatening side effects include exfoliative dermatitis, bronchospasm, cough, hypoxia, and pulmonary fibrosis. Common side effects include nausea, diarrhea, vomiting, and rash.

panivorous /paniv′ərəs/ [L, *panis,* bread, *vorare,* to devour], pertaining to the practice of subsisting exclusively on bread. **—***panivore, n.*

panlobular emphysema. See **panacinar emphysema.**

panmyelosis /panmī′əlō′sis/, a pathological condition characterized by a proliferation of bone marrow cells of all types. This term is not in common usage.

Panner's disease, a rare form of osteochondrosis in which abnormal bony growth occurs in the capitulum of the humerus.

panniculitis /pənik′yəlī′tis/ [L, *panniculus,* piece of cloth; Gk, *itis,* inflammation], a chronic inflammation of subcutaneous fat in which the skin becomes hardened, particularly over the abdomen and thorax. Small subcutaneous masses of hard tissue are found in the affected areas. Some forms of the inflammation may be marked by the appearance of painless subcutaneous nodules on the lower extremities.

panniculus /pənik′yələs/ *pl.* *panniculi* [L, small garment], a membranous layer; the many sheets of fascia covering various structures in the body.

pannus /pan′əs/ [L, *cloth*], an abnormal condition of the cornea, which becomes vascularized and infiltrated with granular tissue just beneath the surface. Pannus may develop in the inflammatory stage of trachoma or after a detached retina, glaucoma, iridocyclitis, or other degenerative eye disorder.

panography /pənog′rəfē/, a method of tomography that visualizes curved surfaces of the body at any depth. In dentistry it is accomplished by simultaneous radiography or dental imaging of the maxillary and mandibular dental arches and associated structures along two axes of rotation. A panoramic image is recorded on an intensifying screen that rotates with the radiation source around the patient's head. The image is converted to digital form to be viewed on a computer screen. See also **panoramic radiograph.**

panophobia. See **panphobia.**

panophthalmitis /pan′ofthalmī′tis/ [Gk, *pan* + *ophthalmos,* eye, *itis*], an inflammation of the entire eye, usually caused by virulent pyogenic organisms, such as strains of meningococci, pneumococci, streptococci, anthrax bacilli, and clostridia. Initial symptoms are pain, fever, headache, drowsiness, edema, and swelling. As the infection progresses, the iris appears muddy and gray, the aqueous humor becomes turbid, and precipitates form on the posterior surface of the cornea. Treatment consists of intensive systemic and local antibiotic therapy. Evisceration of the globe or excision of the eye may be required, but excision is contraindicated if surrounding tissues are infected.

panoptic /panop′tik/ [Gk, *pan,* all, *opsis,* vision], pertaining to the enhanced visual effect produced by stains applied to microscopic specimens.

panoramic radiograph /pan′ôram′ik/ [Gk, *pan* + *horama,* view; L, *radiare,* to emit rays; Gk, *graphein,* to record], an x-ray image of a curved body surface, such as the upper and lower jaws, on a single film. Also called **pantomograph, panoramic radiography.**

panotitis /pan′ōtī′tis/, a general inflammation of the ear, including the middle ear.

PanOxyl, a trademark for a keratolytic **(benzoyl peroxide).**

panphobia /-fō′bē·ə/ [Gk, *pan* + *phobos,* fear], an anxiety disorder characterized by an irrational fear of everything. Also called **panophobia, pantophobia. —***panphobic, adj.*

panplegia /panplē′jē·ə/, paralysis of all four extremities.

pansclerosis /pan′sklirō′sis/, a general hardening of a tissue or body part.

pansystolic /-sistol′ik/, pertaining to the entire systole. Also called **holosystolic.**

pansystolic murmur. See **systolic murmur.**

pant-. See **panto-.**

pantanencephaly /pantan′ensef′əlē/, a congenital absence of all or nearly all brain tissue.

panthenol /pan′thənôl/, **1.** an alcohol converted in the body to pantothenic acid, a vitamin in the B complex. Also called **pantothenyl alcohol**. **2.** a viscous liquid derived from pantothenic acid, a member of the vitamin B_{12} group.

panting [Fr, *panteler,* to gasp], a ventilatory pattern characterized by rapid, shallow breathing commonly used during labor. Panting usually moves gas back and forth in the anatomical dead space at a high flow rate, which evaporates water and removes heat but produces little or no alveolar ventilation. It does not usually cause carbon dioxide levels to be affected. Compare **hyperventilation.**

panto-, pant-, prefix meaning "all, the whole": *pantophobia, pantoscopic, pantosomatous.*

pantograph /pan′təgraf′/, **1.** a jointed device for copying a plane figure to any desired scale. **2.** a device that incorporates a pair of face bows fixed to the jaws, used for inscribing centrically related points and arcs leading to the points on segments relatable to the three craniofacial planes.

pantomograph /pantom′əgraf/. See **panoramic radiograph.**

pantomography /-mog′rəfē/ [Gk, *pan* + *graphein,* to record], panoramic radiography or dental imaging for obtaining simultaneous radiographs or images of the maxillary and mandibular dental arches and related structures.

pantophobia. See **panphobia.**

pantoprazole /panto′prah-zōl/, a gastric acid pump inhibitor with properties similar to those of omeprazole. It is administered orally and intravenously as the sodium salt in the treatment of erosive esophagitis associated with gastroesophageal reflux disease and intravenously as the sodium salt in the treatment of hypersecretion associated with Zollinger-Ellison syndrome or other neoplastic conditions.

pantoscopic /pan′təskop′ik/, pertaining to bifocal eyeglasses designed for both reading and distance viewing. The bottom half is for close vision, and the top half is for far vision.

pantothenic acid /pan′təthen′ik/, a member of the vitamin B complex. It is widely distributed in plant and animal tissues, almost entirely in the form of coenzyme A (CoA). This coenzyme has many metabolic roles in the cell, and a lack of pantothenic acid can lead to depressed metabolism of both carbohydrates and fats. No definite deficiency syndrome has been recognized in humans, perhaps due to its wide occurrence in almost all foods.

pantothenyl alcohol. See **panthenol.**

pantropic virus, a virus that affects or has an affinity for many different kinds of tissue or organs.

panzootic, occurring among animals over a wide geographic area.

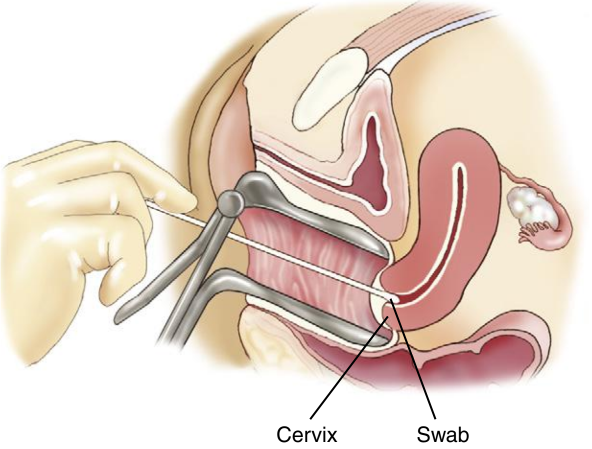
PaO_2, symbol for **partial pressure of oxygen in arterial blood.**

PAO_2, symbol for *partial pressure of alveolar oxygen.*

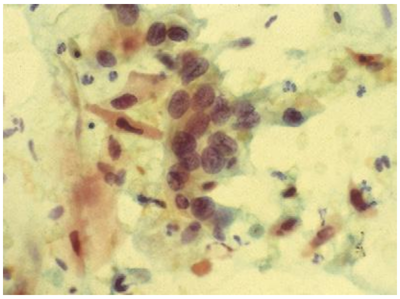
pap, **1.** any soft, soggy food. **2.** porridge or gruel.

papain /pəpā′ēn/, an proteolytic enzyme from the fruit of *Carica papaya,* a tropical melon tree. It is prescribed for enzymatic debridement of wounds and promotion of healing.

Papanicolaou (Pap) test /pap′ənik′əlou′/ [George N. Papanicolaou, Greek physician in U.S. practice, 1883–1962], a simple smear method of examining stained exfoliative cells. It is used most commonly to detect cancers of the cervix, but it may be used for tissue specimens from any organ. A smear, the Papanicolaou's (Pap) smear, is usually obtained during a routine pelvic examination annually beginning at 18 years of age. The technique permits early diagnosis of cancer and has contributed to a lower death rate from cervical cancer. The findings are usually reported descriptively. Also called *(informal)* **Pap smear, Pap test.**



Obtaining a cervical Pap smear *(Leonard, 2009)*



Positive Pap smear indicative of cervical cancer
(Skarin, 2010/Courtesy Dr. Edmund Cibas, Department of Pathology, Brigham and Women's Hospital, Boston, Massachusetts)

papaverine hydrochloride /papav′ərēn/, a smooth muscle relaxant and vasodilator.

■ INDICATIONS: It is prescribed in the treatment of cardiovascular or visceral spasms.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use, and it must be used with caution in patients with glaucoma. It must be administered slowly because it can cause apnea and arrhythmias. Larger dosages can cause AV block.

■ ADVERSE EFFECTS: The most serious adverse effects include jaundice, tachycardia, arrhythmias, drowsiness, headache, weakness, nausea, and vomiting.

papaya /pəpī′ə/, the fruit of the tropical *Carica papaya* (pawpaw) tree and the source of the proteolytic enzyme papain used in blood group serological evaluation. Papain is also used to prevent adhesions. A common nonmedicinal use is as a meat tenderizer.

paper, a material produced in sheets, usually from wood pulp or other cellulose products. It can be adapted for many purposes, such as litmus paper for testing acidity, filter paper, and articulating carbon paper used to record points of contact between teeth of the upper and lower jaws.

paper chromatography [Gk, *papyros,* papyrus], the separation of a mixture into its components by filtering it through a strip of special paper.

paper-doll fetus. See **fetus papyraceus.**

paper point, in root canal therapy, a cone of variable width and taper, usually made of paper or a paper product, used to dry or maintain a liquid disinfectant in the canal. Also called **absorbent point.**

Paper point *(Gutmann and Lovdahl, 2011)*

paper radioimmunosorbent test (PRIST), a technique for determining total immunoglobulin E levels in patients with type I hypersensitivity reactions.

papill-, prefix meaning "resembling a nipple": *papillate, papilledema, papilloma.*

papilla /pəpil′ə/ *pl.* **papillae** [L, nipple], **1.** a small nipple-shaped projection, such as the conoid papillae of the tongue and the papillae of the dermis that extend from collagen fibers, the capillary blood vessels, and sometimes the nerves of the dermis. **2.** the **optic papilla**, a round white disc in the fundus oculi, which corresponds to the entrance of the optic nerve. Also called **urethral papilla**.

papilla duodeni major. See **hepatopancreatic ampulla.**

papillae. See **papilla.**

papilla mammae, papilla mammaria. See **nipple.**

papilla of Vater. See **hepatopancreatic ampulla.**

papillary /pap′əle′rē/ [L, *papilla,* nipple], pertaining to a papilla.

papillary adenocarcinoma, a malignant neoplasm characterized by small papillae of vascular connective tissue covered by neoplastic epithelium that projects into follicles, glands, or cysts. The tumor is most common in the ovaries and thyroid gland. Also called *polyploid adenocarcinoma.*

papillary adenocystoma lymphomatosum, an unusual tumor, consisting of epithelial and lymphoid tissues, that develops in the area of the parotid and submaxillary glands. Also called **adenolymphoma, Warthin's tumor.** See also **adenocyst.**

papillary adenoma, a benign epithelial tumor in which the membrane lining the glandular tissue forms papillary processes that project into the alveoli or grow out of a cavity's surface.

papillary carcinoma, a malignant neoplasm characterized by fingerlike projections.

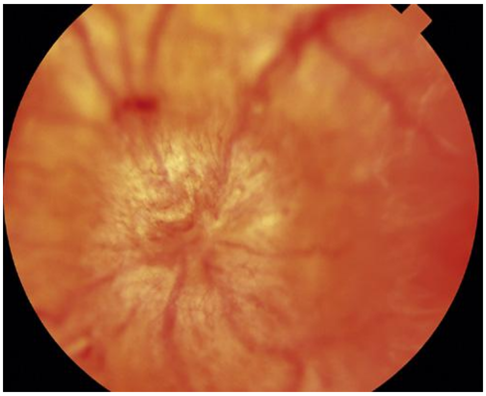
papillary duct, any one of the thousands of straight collecting renal tubules that descend through the medulla of the kidney and join with others to form the common ducts opening into the renal papillae. Compare **loop of Henle.** See also **kidney.**

papillary muscle, any one of the rounded or conical muscular projections attached to the chordae tendineae in the ventricles of the heart. The papillary muscles vary in number. The two main muscles are the anterior papillary muscle and the posterior papillary muscle. The papillary muscles are associated with the atrioventricular valves that they help open and close. Compare **chordae tendineae, trabecula carnea.**

papillary tumor. See **papilloma.**

papillate /pap′ilit/, marked by papillae or nipplelike prominences.

papilledema /pap′ilədē′mə/ *pl. papilledemas, papilledemata* [L, *papilla* + Gk, *oidema,* swelling], swelling of the optic disc, visible on ophthalmoscopic examination of the fundus of the eye, caused by increase in intracranial pressure. The meningeal sheaths that surround the optic nerves from the optic disc are continuous with the meninges of the brain; therefore increased intracranial pressure is transmitted forward from the brain to the optic disc in the eye to cause swelling. Also spelled *papilloedema*.



Papilledema
(Roy, Fraunfelder, and Fraunfelder, 2008)

papilliform /pəpil′ifôrm/, shaped like a nipple.

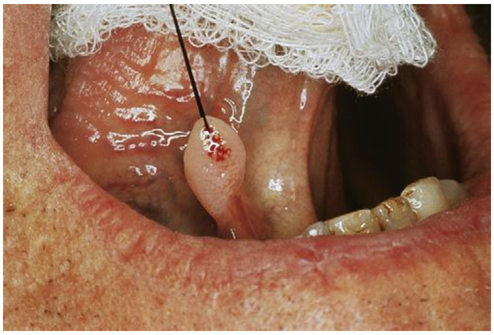
papillitis /pap′ilī′tis/ [L, *papilla* + Gk, *itis,* inflammation], **1.** inflammation of a papilla, such as the lacrimal papilla. **2.** inflammation of the optic disc.

papilloadenocystoma /pap′ilō·ad′ənō′sistō′mə/, a benign epithelial tumor in which the lining develops in numerous small folds.

papillocarcinoma [L, *papilla,* nipple; Gk, *oma,* tumor, *karkinos,* crab, *oma,* tumor], a malignant tumor in which there are papillary outgrowths.

papilloma /pap′ilō′mə/ [L, *papilla* + Gk, *oma,* tumor], a benign epithelial neoplasm characterized by a branching or lobular tumor. Also called **papillary tumor.**

papilloma papovavirus. See **papovavirus.**



Papilloma *(Regezi, Sciubba, and Jordan, 2008)*

papillomatosis /pap′ilōmətō′sis/ [L, *papilla* + Gk, *oma,* tumor, *osis,* condition], an abnormal condition characterized by widespread development of nipplelike growths.

papillomatosis coronae penis. See **hirsutoid papilloma of the penis.**

papillomavirus /pap′ilō′məvī′rəs/ [L, *papilla* + Gk, *oma,* tumor; L, *virus,* poison], the virus that causes warts in humans.

Papillon-Lefèvre syndrome /pä′pēyôN′ lə·fev′rə/ [M.M. Papillon, French dermatologist, 20th century; Paul Lefèvre, French dermatologist, 20th century], an autosomal-recessive disorder occurring between the first and fifth years of life, characterized by palmoplantar keratoderma resembling psoriasis, which may also involve the elbows, knees, tibias, external malleoli, and other areas; ectopic calcifications of the skull; and periodontitis and premature shedding of both the primary and secondary teeth.

papilloretinitis /pap′ilōret′inī′tis/ [L, *papilla* + *rete,* net; Gk, *itis,* inflammation], an inflammatory occlusion of a retinal vein.

papillotomy /pap′ilot′əmē/, a surgical incision in the papilla of the duodenum.

papovavirus /pap′əvəvī′rəs/ [(abbreviation) *pa*pilloma *po*lyoma *va*cuolating *virus*], one of a group of small deoxyribonucleic acid (DNA) viruses, some of which may be potentially cancer-producing. The human wart is caused by a kind of papovavirus, but it very rarely undergoes malignant transformation. Kinds of papovaviruses are **papilloma papovavirus, polyoma papovavirus,** and **SV40 papovavirus.**

pappataci fever. See **phlebotomus fever.**

Pappenheimer bodies [A.M. Pappenheimer, U.S. pathologist, 1878–1955], red blood cell inclusions composed of ferric iron. On Prussian blue iron stain preparations, they appear as multiple dark blood irregular granules at the periphery of the cell. On Wright stain blood films they appear as pale blue clusters. Also called **siderotic granules.**

pappus /pap′əs/ [Gk, *pappos,* down], the first growth of beard, characterized by downy hairs.

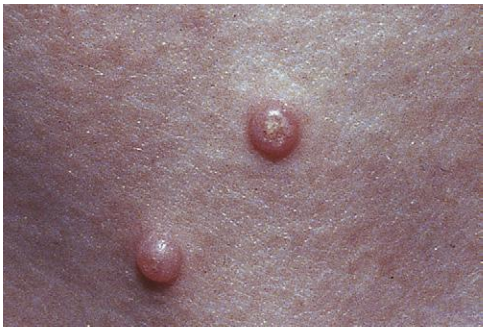
Pap smear, Pap test. See **Papanicolaou test.**

papula /pap′yələ/ [L, *papula,* pimple], a small superficial elevation of the skin.

papular /pap′yələr/, pertaining to or resembling a papule.

papular acrodermatitis of childhood. See **Gianotti-Crosti syndrome.**

papular scaling disease [L, *papula,* pimple; AS, *scealu*], any of a group of skin disorders characterized by discrete, raised, dry, scaling lesions. Some kinds of papular scaling diseases are **lichen planus, pityriasis rosea,** and **psoriasis.** Also called **papulosquamous disease.**



Papules *(du Vivier, 2002)*

papular urticaria [L, *papula,* pimple + *urtica,* nettle], a persistent cutaneous eruption representing a hypersensitivity reaction to insect bites (e.g., mites, fleas, bedbugs, gnats, mosquitoes, animal lice), seen primarily in atopic children and characterized by crops of small urticarial papules and wheals and transitional forms of these lesions, which may become secondarily infected or lichenified as a result of rubbing and scratching. Also called **lichen urticatus, strophulus.**

papulation /pap′yəlā′shən/ [L, *papula,* pimple, *atus,* process], the development of papules.

papule /pap′yo͞ol/ [L, *papula,* pimple], a small, solid, raised skin lesion less than 1 cm in diameter, such as that found in lichen planus and nonpustular acne. Compare **macule. —papular,** *adj.*

papulo-, prefix meaning "papules or pimples": *papular, papuliferous.*

papuloerythematous /pap′yəlō·er′ithem′ətəs/, pertaining to an eruption of papules on an erythematous surface.

papulopustular /pap′yəlōpus′tyələr/, pertaining to a skin eruption of both pustules and papules.

papulosis /pap′yəlō′sis/, a widespread occurrence of papules over the body.

papulosquamous /pap′yəlōskwā′məs/ [L, *papula,* pimple + *squama,* scale], pertaining to a skin eruption that is both papular and scaly.

papulosquamous disease. See **papular scaling disease.**

papulovesicular /pap′yəlō′vesik′yələr/, pertaining to a skin rash characterized by both papules and vesicles.

papyraceous /pap′irā′shəs/ [Gk, *papyros,* paper], having a paperlike quality. Also spelled *papyraceus.*

papyraceous fetus. See **fetus papyraceus.**

Paquelin's cautery /pak′əlinz/ [Claude A. Paquelin, French physician, 1836–1905; Gk, *kauterion,* branding iron], a cauterizing device consisting of a platinum loop through which a heated hydrocarbon is passed.

Paquin technique, a type of ureteroneocystostomy in which the ureter is excised from its attachment to the bladder and reattached in a more posteromedial position.

par, a pair, specifically a pair of cranial nerves, such as the par nonum, or ninth pair.

PAR, abbreviation for **pulmonary arteriolar resistance.**

par-, **1.** prefix meaning "aside, beyond, apart from, against": *parabacteria, parotid, parumbilical.* **2.** See **para.**

para /par′ə/ [L, *parere,* to bear], a woman who has produced an infant, regardless of whether the child was alive or stillborn. The term is used with numerals to indicate the number of pregnancies carried to more than 20 weeks' gestation, such as para 2, indicating two pregnancies. See also **nullipara, parity.**

para-, par-, prefix meaning "similar, beside, beyond, supplementary to, disordered": *parabiosis, paramedical, paranoia, paraplegia.*

-para, -parous, suffix meaning "to bear or give birth": *ovovipara, pipipara, primipara.*

paraactinomycosis /per′ə·ak′tinō′mīkō′sis/, a chronic pulmonary infection similar to actinomycosis. The infection is caused by bacteria of the genus ***Nocardia.*** Also called **mandras foot, pseudoactinomycosis.**

***para*-aminobenzenesulfonic acid.** See **sulfanilic acid.**

paraaminobenzoic acid ($H_2NC_6H_4COOH$) (PABA) /per′ə·amē′nōbenzō′ik/, a substance, often associated with the vitamin B complex, found in cereals, eggs, milk, and meat, and present in detectable amounts in blood, urine, spinal fluid, and sweat. It is widely used as a sunscreen that forms a partial chemical conjugation with constituents of the horny layer and resists removal by water and sweat. PABA is a sulfonamide antagonist and may be an effective agent for the treatment of scleroderma, dermatomyositis, and pemphigus. Also called **paraaminobenzoic acid.**

paraaminohippuric acid (PAHA, PHA) /per′ə·amē′nōhipo͝or′ik/, the *p*-aminobenzamide derivative of glycerin. Its sodium salt is used for measuring effective renal plasma flow and determining kidney function.

paraaminosalicylic acid (PAS, PASA) /per′ə·amē′nōsal′isil′ik/, a bacteriostatic agent. Also called **aminosalicylic acid.**

■ INDICATIONS: It is prescribed for the treatment of pulmonary and extrapulmonary tuberculosis and has unlabeled indications for Crohn's disease.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It may interact with other drugs such as digoxin.

■ ADVERSE EFFECTS: Among the most serious effects are nausea, vomiting, diarrhea, and abdominal pain. Fever, skin eruptions and other kinds of hypersensitivity reactions, goiter, hypokalemia, and acidosis may occur.

***para*-ammosulfonic acid.** See **sulfanilic acid.**

paraballism /per′əbôl′izəm/ [Gk, *ballismos,* jumping about], involuntary jerking movements of the legs.

parabiosis /-bī·ō′sis/, the fusion of two eggs or embryos, resulting in conjoined twins.

parabolic /-bol′ik/, (in ultrasonics) pertaining to flow conditions in blood vessels. Under parabolic flow, blood cells in the middle of the vessels move the fastest, with a gradual decrease in flow velocity for points farther away from the center.

paracanthoma /-kənthō′mə/, a tumor that develops from the abnormal overgrowth of the prickle cell layer of the skin.

paracellular transport, transport of molecules around cells and through tight junctions in an epithelial cell layer.

paracelsian method /-sel′sē·ən/ [Philippus Aureolus Paracelsus, Swiss alchemist and physician, 1493–1541], the use of chemical agents, such as sulfur, iron, lead, and arsenic, in the treatment of disease.

paracenesthesia /-sen′esthē′zhə/, any abnormality in the general sense of well-being.

paracentesis /per′əsentē′sis/ [Gk, *para* + *kentesis,* puncturing], a procedure in which fluid is withdrawn from a body cavity. An incision is made in the skin, and a hollow trocar, cannula, or catheter is passed through the incision into the cavity to allow outflow of fluid into a collecting device. Paracentesis is most commonly performed to remove excessive accumulations of ascitic fluid from the abdomen. Strict asepsis is followed. The patient needs to empty the bladder before this procedure to decrease the risk of bladder trauma. The patient is assessed for any adverse reaction.

paracentesis thoracis [Gk, *para* + *kentesis,* puncturing, *thorax,* chest], the aspiration of fluid or air or both through a needle inserted into the pleural cavity.

paracentesis tympani. See **myringotomy.**

paracentral /-sen′trəl/ [Gk, *para* + *kentron*], close to a center or a central part.

paracervical /-sur′vikəl/ [Gk, *para* + L, *cervix,* neck], pertaining to the area adjacent to the cervix.

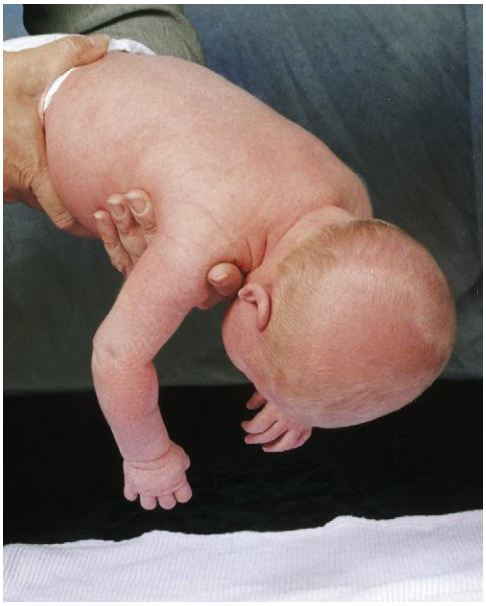
paracervical block, a form of regional anesthesia in which a local anesthetic is injected into each side of the uterine cervix to block nerves innervating the uterine cervix. Paracervical block is not the anesthesia of choice for labor and delivery, given the high incidence of fetal bradycardia and its efficacy in only the first stage of labor, but it is an option during abortion and other gynecological procedures.

paracervix /-sur′viks/, the connective tissue of the pelvic floor, extending from the uterine cervix.

paracetamol. See **acetaminophen.**

paracholera /-kol′ərə/, an infectious disease with symptoms similar to those of cholera but not caused by the true infectious agent, ***Vibrio cholerae.***

parachute reflex /per′əsho͞ot/, a variation of the **Moro reflex** whereby an infant is tested for motor nerve development by suspending him or her in the prone position and then dropping him or her a short distance onto a soft surface. If the motor nerve development is normal, the infant at 4 to 6 months will extend the arms, hands, and fingers on both sides of the body in a protective movement. Also called **startle reflex.**



Parachute reflex *(Hockenberry and Wilson, 2011/Courtesy Paul Vincent Kuntz, Texas Children's Hospital, Houston, Texas)*

paracinesia. See **parakinesia.**

paracme /perak′mē/, **1.** the phase of a fever or disease marked by a subsidence of symptoms. **2.** the point of involution, beyond the prime of life. Also called *paracmasis.*

paracoccidioidomycosis /per′əkoksid′ē·oi′dōmīkō′sis/ [Gk, *para* + *kokkos,* berry, *eidos,* form, *mykes,* fungus, *osis,* condition], a chronic, occasionally fatal fungal infection caused by *Paracoccidioides brasiliensis.* It is characterized by ulcers of the oral cavity, larynx, and nose. Other effects include large, draining lymph nodes; cough; dyspnea; weight loss; and skin, genital, and intestinal lesions. The disease occurs in Mexico and Central and South America and is acquired by inhalation of spores of the fungus. Diagnosis is by microscopic examination of a smear prepared from a lesion. This infection is sensitive to the use of sulfonamides, amphotericin B, and the azole antifungals. Azoles are preferred over sulfonamides and amphotericin B because they are less toxic, more effective, and require a shorter duration of treatment. Azoles are available in an oral form. Also called **paracoccidioidal granuloma, South American blastomycosis.** Compare **North American blastomycosis.**

paracolic gutters, depressions formed between the lateral margins of the ascending and descending colon and the posterolateral abdominal wall through which material can pass from one region of the peritoneal cavity to another.

paracolitis /-kōlī′tis/, an inflammation of the outer peritoneal coat of the colon.

paracolpium /-kol′pē·əm/, the connective and other tissues around the vagina.

paracortex /-kôr′teks/, the thymus-dependent area of a lymph node between the subscapular cortex and the medullary cord.

paracrine /per′əkrēn/, an endocrine function in which effects of a hormone are localized to adjacent or nearby cells.

paracusis /per′əko͞o′sis/, a disorder involving the sense of hearing, including distortions of pitch.

paracystitis /-sistī′tis/, an inflammation of the connective tissues around the urinary bladder.

paradenitis /-dēnī′tis/, an inflammation of tissues around a gland.

paradentium. See **periodontium** (def. 1).

paradichlorobenzene poisoning. See **naphthalene poisoning.**

paradidymal /-did′iməl/ [Gk, *para,* beside, *didymos,* twin], **1.** pertaining to the paradidymis. **2.** beside the testis.

paradidymis /per′ədid′imis/ *pl. paradidymides* [Gk, *para* + *epi,* above, *didymos,* twin], a rudimentary structure in the male, situated on the spermatic cord of the epididymis, that consists of vestigial remains of the caudal part of the embryonic mesonephric tubules. A similar vestigial structure, the paroophoron, is found in the female. Also called **organ of Giraldés, parepididymis.** See also **appendix epididymidis.**

paradigm /per′ədīm, -dim/, a pattern that may serve as a model or example.

paradipsia /-dip′sē·ə/, an abnormal desire for fluids unrelated to body needs.

paradoxic /-dok′sik/ [Gk, *paradoxos,* strange], pertaining to a person, situation, statement, or act that may appear to have inconsistent or contradictory qualities or that may be true but appears to be absurd or unbelievable. Also **paradoxical** /-dok′sikəl/.

paradoxic aciduria, a metabolic alkalosis condition that may involve an exchange of sodium and hydrogen ions for potassium. It may occur with prolonged nasogastric suctioning or repeated vomiting.

paradoxical. See **paradoxic.**

paradoxic breathing [Gk, *paradoxos* + AS, *braeth*], a condition in which a part of the lung deflates during inspiration and inflates during expiration. The condition usually is associated with a chest trauma, such as an open chest wound or rib cage damage as in flail chest. In such cases the condition is sometimes called internal paradoxic breathing. External paradoxic breathing may be observed during deep general anesthesia.

paradoxic bronchospasm, a constriction of the airways after treatment with a sympathomimetic bronchodilator.

paradoxic incontinence. See **retention with overflow.**

paradoxic intention, a logotherapeutic technique that encourages a patient to do what he or she fears and if possible to exaggerate it to the point of humor. The technique is used in the treatment of phobias.

paradoxic pulse. See **pulsus paradoxus.**

paradoxic pupillary reflex, the response of a pupil to light that is the reverse of a normal reflex, as when the pupil contracts in a darkened room. It can be a sign of severe congenital visual deficit.

paradoxic thrombosis syndrome. See **Heparin-induced thrombocytopenia with thrombosis (HIT).**

paraffin /per′əfin/ [L, *parum,* little + *affinis,* related], any of a group of hydrocarbons or hydrocarbon mixtures of the paraffin series as indicated by the formula, $C_nH_{(2n+2)}$. Examples include methane gas, kerosene, and paraffin wax. Also called **alkane.**

paraffin bath [L, *parum,* little, *affinis,* related], the application of heat to a specific area of the body through the use of paraffin. The part is quickly immersed in heated liquid wax and then withdrawn so that the wax solidifies to form an insulating layer. The procedure is repeated until the layer is 5 to 10 mm thick, and then the entire area is wrapped in an insulating material, such as a loose-fitting plastic bag or paper towels. The technique is effective for heating traumatized or inflamed areas, especially the hands, feet, and wrists, and is used primarily for patients with arthritis and rheumatism or any joint condition. Also called **wax bath.**

paraffin method, (in surgical pathology) a method used in preparing a selected portion of tissue for pathological examination. The tissue is fixed, dehydrated, and infiltrated by and embedded in paraffin, forming a block that is cut with a microtome into slices 8 µm thick. This method, which is more commonly used than the frozen section method, is slower and therefore not used during surgery.

paraffinoma /per′əfinō′mə/, a tumor caused by the prosthetic or therapeutic injection of paraffin beneath the skin.

paraffin section [L, *parum,* little + *affinis,* related, *sectio*], a histological section cut from tissue that has been embedded in paraffin wax.

Paraflex, a trademark for a skeletal muscle relaxant **(chlorzoxazone).**

parafollicular C cell /-folik′yələr/, a calcitonin-secreting cell located between follicles.

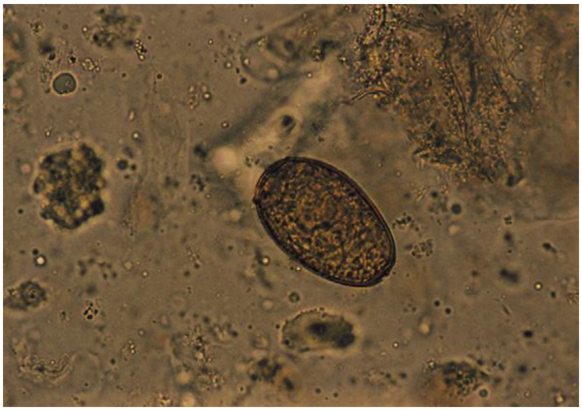
Parafon Forte, a trademark for a skeletal muscle relaxant used for the relief of painful musculoskeletal conditions **(chlorzoxazone).**

paraganglioma /-gang′glē·ō′mə/, a tumor derived from the chromoreceptor tissue of a paraganglion.

paraganglion /-gang′glē·on/ *pl.* *paraganglia* [Gk, *para* + *ganglion,* knot], any one of the small groups of chromaffin cells associated with the ganglia of the sympathetic nerve trunk and situated outside the adrenal medulla, most often near the sympathetic ganglia along the aorta and its branches. The paraganglia are also connected with the ganglia of the celiac, renal, suprarenal, aortic, and hypogastric plexuses. The paraganglia secrete the hormones epinephrine and norepinephrine. Also called **chromaffin body.** See also **chromaffin cell.**

parageusia /-jo͞o′sē·ə/, a disorder involving the sense of taste.

paragonimiasis /per′əgon′imī′əsis/ [Gk, *para* + *gonimos,* generative, *iasis,* condition], chronic infection by the lung fluke *Paragonimus westermani,* occurring most commonly in Asia. It is characterized by hemoptysis, bronchitis, and occasionally abdominal masses; pain and diarrhea; ocular pathological conditions; cerebral involvement with paralysis; or seizures. The disease is acquired by ingesting cysts in infected freshwater crabs or crayfish, the intermediate hosts. Praziquantel given orally is the usual treatment. Adequate cooking of shellfish prevents the disease.



***Paragonimus westermani* egg**
(Mahon, Lehman, and Manuselis, 2011)

parahemophilia. See **Owren's disease.**

parahippocampal gyrus, a convolution on the inferior surface of each cerebral hemisphere, lying between the hippocampal and collateral sulci.

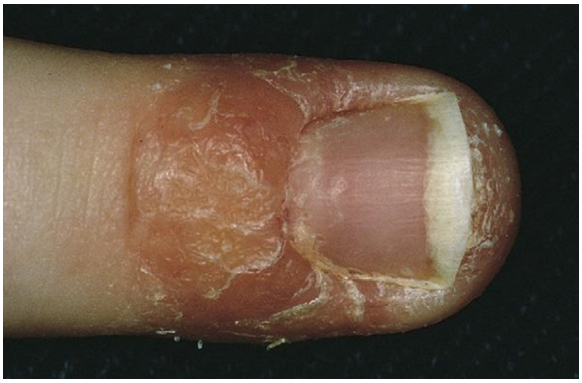
parahormone /-hôr′mōn/, a substance produced through normal metabolism that may exert an influence on a remote organ even though it is not a true hormone. Carbon dioxide is a parahormone because of its effects on respiration.

parahypnosis /-hipnō′sis/ [Gk, *para* + *hypnos,* sleep], a form of disordered sleep that is observed in hypnosis and narcosis.

parainfectious /par′ah-in-fek′shus/, pertaining to manifestations of infectious disease that are caused by the immune response to the infectious agent.

parainfluenza virus /per′ə·in′flo͞o·en′zə/ [Gk, *para* + It, *influenza,* influence], a myxovirus with four serotypes, causing respiratory infections in infants, young children, and, less commonly, adults. Type 1 and 2 parainfluenza viruses may cause laryngotracheobronchitis or croup; type 3 is a cause of croup, tracheobronchitis, bronchiolitis, and bronchopneumonia in children; and types 1, 3, and 4 are associated with pharyngitis and the common cold. Compare **influenza, rhinovirus.**

parakeratosis /-ker′ətō′sis/, an abnormal formation of horn cells of the epidermis caused by the persistence of nuclei, incomplete formation of keratin, and moistness and swelling of the horn cells. It is observed as scaling in many conditions such as psoriasis.



Parakeratosis pustulosa
(Hordinsky, Sawaya, and Scher, 2000)

parakinesia /-kinē′zhə/ [Gk, *para* + *kinesis,* movement], an abnormality of movement resulting from a nerve disorder in a muscle, such as an irregularity of one of the ocular muscles. Also called **paracinesia** /-sinē′zhə/.

parakinesis. See **telekinesis.**

paraldehyde /peral′dəhīd/, a clear, colorless, strong-smelling liquid obtained by the polymerization of acetaldehyde with a small amount of sulfuric acid. It is used as a solvent and may be administered orally, intravenously, intramuscularly, or rectally to induce hypnotic states or sedation.

paralinguistic cues, nonverbal elements, such as intonation, body posture, gestures, and facial expression, that modify the meaning of verbal communication.

parallax /per′əlaks/ [Gk, *parallelos,* side-by-side], the apparent displacement of an object at different distances from the eyes when viewed by both eyes together. It is the basis of stereoscopic vision and depth perception.

parallel grid /per′əlel/ [Gk, *parallelos,* side-by-side; ME, *gredire*], in radiography, an x-ray grid that has lead strips oriented parallel to each other.

parallelogram condenser /per′əlel′əgram′/ [Gk, *parallelos* + *gramma,* record; L, *condensare,* to make thick], an instrument with an end shaped like a rectangle or parallelogram, used for compacting amalgams in restoring teeth.

parallel play [Gk, *parallelos* + AS, *plegan,* to play], a form of play among a group of children, primarily toddlers, in which each engages in an independent activity that is similar to but not influenced by or shared with the others. Compare **cooperative play.** See also **associative play, solitary play.**

parallel processing, the use of multiple processors for the simultaneous execution of steps of a computer program that would normally run sequentially, done in order to shorten the time necessary to run the program.

parallel talk, a form of speech used during children's play therapy in which the clinician verbalizes activities of the child without requiring answers to questions. The parallel talk may take a form such as, "I'm making a cake. You are making a cake, too." The clinician repeats utterances of the child correctly and may parallel the child's actions.

parallergic /per′alur′jik/, having a nonspecific sensitivity to allergens as a result of a prior sensitization with a specific allergen.

Paralympics /per′əlim′piks/ [*paraplegic* + *Olympics*], an international competitive wheelchair sports event, usually held in association with the official quadrennial Olympic Games. Also called **ParaOlympics.**

paralysis /pəral′isis/ *pl.* *paralyses* [Gk, *paralyein,* to be palsied], the loss of muscle function, sensation, or both. It may be caused by a variety of problems, such as trauma, disease, and poisoning. Paralyses may be classified according to the cause, muscle tone, distribution, or body part affected. See also **flaccid paralysis, spastic paralysis. —paralytic,** *adj.*

paralysis agitans. See **Parkinson's disease.**

paralytic /per′əlit′ik/ [Gk, *paralyein,* to be palsied], pertaining to the characteristics of paralysis.

paralytic dementia. See **paresis,** def. 2.

paralytic ileus [Gk, *paralyein,* to be paralyzed, *eilein,* to twist], a decrease in or absence of intestinal peristalsis. It may occur after abdominal surgery or peritoneal injury or be associated with severe pyelonephritis; ureteral stone; fractured ribs; myocardial infarction; extensive intestinal ulceration; heavy metal poisoning; porphyria; retroperitoneal hematomas, especially those associated with fractured vertebrae; or any severe metabolic disease. The most common overall cause of intestinal obstruction, paralytic ileus is mediated by a hormonal component of the sympathoadrenal system. Also called **adynamic ileus.**

■ OBSERVATIONS: Paralytic ileus is characterized by abdominal tenderness and distension, absence of bowel sounds, lack of flatus, and nausea and vomiting. There may be fever, decreased urinary output, electrolyte imbalance, dehydration, and respiratory distress. Loss of fluids and electrolytes may be extreme, and, unless they are replaced, the condition may lead to hemoconcentration, hypovolemia, renal insufficiency, shock, and death.

■ INTERVENTIONS: Typically, computed tomography of the abdomen and pelvis is performed with PO and IV contrast to rule out anatomical obstruction. The patient is kept in bed in a low Fowler's position, and nothing is given by mouth. A nasogastric tube may be inserted into the stomach and connected to intermittent suction and the patient is positioned to facilitate the advancement of the tube, which is checked at intervals, usually every 30 to 60 minutes. The character of GI drainage is monitored at intervals, usually every 2 to 4 hours, and any increase or decrease in the amount or changes in the color or consistency is reported. Bowel sounds, blood pressure, pulse, and respirations are checked every 2 to 4 hours, or as indicated in a particular circumstance, and rectal temperature usually every 4 hours. Abdominal girth is measured at least every 2 hours, and any increase is reported. Parenteral fluids with electrolytes and medication to promote peristalsis are administered as ordered; intake and output are measured, and, if less than about 30 mL of urine is excreted per hour, the physician is informed. The patient is helped to turn and deep breathe every 2 to 4 hours and is given oral hygiene every 1 to 2 hours. Active or passive range-of-motion exercises are performed every 4 hours. Walking is helpful as gravity is a useful force. When intestinal output increases and bowel sounds return, the intestinal tube may be clamped and small amounts of warm tea may be given. If pain, distension, or cramps do not recur, the intestinal tube may be removed, but a rectal tube or an enema may be ordered to relieve distension.

■ NURSING CONSIDERATIONS: The concerns of the health care providers include monitoring and reporting the signs of paralytic ileus and its potential complications, ensuring that the patient is as comfortable as possible, explaining the purpose of the intestinal tube, and walking with the patient, encouraging ambulation. The patient is instructed to try to avoid mouth breathing because swallowed air can increase distension. Before surgery, patients need reassurance that the sutures are strong and the distended abdomen will not burst.

paralytic incontinence [Gk, *paralyein,* to be palsied; L, *incontinentia,* inability to retain], urinary or fecal incontinence resulting from loss or impaired motor nerve control of the sphincter muscles.

paralytic mydriasis [Gk, *paralyein,* to be palsied, *mydriasis,* pupil enlargement], an area of depressed vision that is on the periphery of the field.

paralytic poliomyelitis [Gk, *paralyein,* to be palsied, *polios,* gray, *myelos,* marrow, *itis,* inflammation], a flaccid paralysis of the limbs resulting from damaged lower motor neurons. Progressive bulbar paralysis with respiratory and vasomotor failure may result when the brainstem nuclei are involved.

paralytic shellfish poisoning. See **shellfish poisoning.**

paralytic stroke [Gk, *paralyein,* to be palsied; AS, *strac*], a sudden attack of paralysis caused by disease or injury to the brain or spinal cord.

paralyze /per′əlīz/ [Gk, *paralyein,* to be palsied], **1.** to produce or enter into a state of paralysis. **2.** to cause loss of muscle power.

paramagnetic /pār′amagnet′ik/, being attracted by a magnet and assuming a position parallel to that of a magnetic force, but not becoming permanently magnetized.

paramagnetic substance, a substance with positive magnetic susceptibility resulting from the presence of unpaired atomic electrons (e.g., gadolinium chelates). These substances enhance magnetic relaxation and are often used as contrast agents in magnetic resonance imaging.

paramedic (medic) /-med′ik/ [Gk, *para* + L, *medicina,* art of healing], a person who acts as an assistant to a physician or in place of a physician until the physician is available. *—paramedical, adj.*

paramedical personnel, health care workers other than physicians, dentists, podiatrists, and nurses who have special training in the performance of supportive health care tasks. Examples are the **emergency medical technician, audiologist,** and **radiological technologist.** Also called **allied health personnel.**

paramesonephric duct /per′əmēz′ōnef′rik/ [Gk, *para* + *mesos,* middle, *nephros,* kidney], one of a pair of embryonic ducts that develops into the uterus and the uterine tubes. Also called **müllerian duct.**

parameter /pəram′ətər/ [Gk, *para* + *metron,* measure], **1.** a value or constant used to describe or measure a set of data representing a physiological function or system, as in the use of acid-base relationships of the blood as parameters for evaluating the function of a patient's respiratory system. **2.** a statistical value of a population group. **3.** *(informal)* limit or boundary.

parametria. See **parametrium.**

parametric imaging /-met′rik/ [Gk, *para* + *metron,* measure; L, *imago,* image], **1.** a diagnostic procedure in which an image of an administered radioactive tracer is derived mathematically, such as by dividing one image by another. **2.** in positron emission tomography, a procedure in which a physiological parameter such as blood flow is mapped according to anatomical position.

parametric statistics, statistics that assume that a population has a symmetric, such as a gaussian or normal, distribution.

parametritis /per′əmetrī′tis/ [Gk, *para* + *metra,* womb, *itis*], an inflammatory condition of the tissue of the structures around the uterus. See also **pelvic inflammatory disease.**

parametrium /per′əmē′trē·əm/ *pl.* **parametria** [Gk, *para* + *metra,* womb], the lateral extension of the uterine subserous connective tissue into the broad ligament. Compare **endometrium, myometrium.**

paramitome. See **hyaloplasm.**

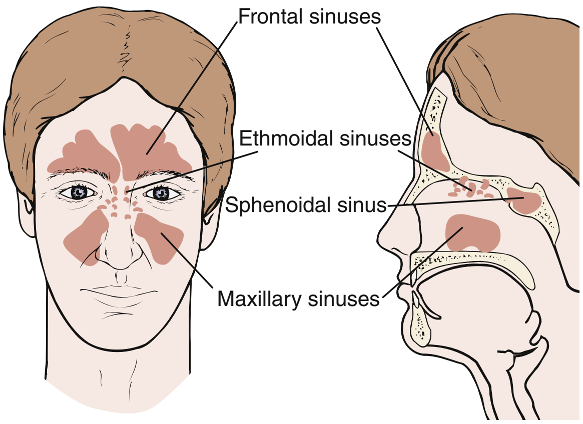
paramnesia /per′amnē′zhə/ [Gk, *para* + *amnesia,* forgetfulness], **1.** a perversion of memory in which one believes that one remembers events and circumstances that never actually occurred. Compare **déjà vu. 2.** a condition in which words are remembered and used without comprehension of their meaning.

paramyloidosis /peram′iloidō′sis/, **1.** an accumulation of amyloid-like protein in the tissues. **2.** any of several hereditary forms of amyloidosis characterized by sensory changes and muscle atrophy caused by amyloid deposits in somatic and visceral nerves.

paramyxovirus /-mik′sōvī′rəs/ [Gk, *para* + *myxa,* mucus; L, *virus,* poison], a member of a family of viruses that includes the organisms that cause parainfluenza, mumps, and some respiratory infections.

paranasal /-nā′zəl/ [Gk, *para* + L, *nasus,* nose], pertaining to an area near or alongside the nose, such as the paranasal sinuses.

paranasal sinus, any one of the air cavities in various bones around the nose, such as the frontal sinus in the frontal bone lying deep to the medial part of the superciliary ridge and the maxillary sinus within the maxilla between the orbit, the nasal cavity, and the upper teeth. See also **accessory nasal sinuses.** Compare **confluence of the sinuses, occipital sinus.**



Paranasal sinuses *(Lewis et al, 2011)*

paraneoplastic cerebellar degeneration, the most common paraneoplastic syndrome affecting the brain, occurring most commonly with ovarian and breast carcinoma and Hodgkin's disease, characterized pathologically by severe loss of Purkinje's cells and clinically by insidious and progressive truncal and appendicular ataxia, dysarthria, nystagmus, and, occasionally, dementia. In some women with gynecological or breast carcinoma, it is associated with an autoantibody (anti-Yo).

paraneoplastic syndromes /-nē′əplas′tik/ [Gk, *para* + *neos,* new, *plassein,* to mold, *syn,* together, *dromos,* course], the indirect effects of a tumor that occur distant to the tumor or metastatic site. They may result from the production of active proteins, polypeptides, or inactive hormones by the tumor.

paranephric fat. See **pararenal fat.**

paranesthesia /peran′esthē′zhə/, anesthesia affecting the lower half of the body.

parangi. See **yaws.**

paranoia /per′ənoi′ə/ [Gk, *para* + *nous,* mind], (in psychiatry) a condition characterized by an elaborate, overly suspicious system of thinking. It often includes delusions of persecution and grandeur usually centered on one major theme, such as a financial matter, a job situation, an unfaithful spouse, or another problem, such as being followed or monitored by the CIA, FBI, or outer space aliens; being the victim of computer tampering; or being poisoned. Also spelled *paranoea* /per′ənē′ə/. Compare **paranoid schizophrenia. —paranoiac,** *n.*

paranoia querulans. See **querulous paranoia.**

paranoid /per′ənoid/ [Gk, *para* + *nous,* mind, *eidos,* form], **1.** *adj,* pertaining to or resembling paranoia. **2.** *n,* a person afflicted with a paranoid disorder. **3.** *(informal)* a person, or pertaining to a person, who is overly suspicious or exhibits persecutory trends or attitudes.

paranoid disorder, a mental disorder characterized by an impaired sense of reality and persistent delusions. Kinds of paranoid disorders include **paranoia,** and **shared paranoid disorder.**

paranoid ideation, an exaggerated, sometimes grandiose, belief or suspicion, usually not of a delusional nature, that one is being harassed, persecuted, or treated unfairly.

paranoid personality, a personality characterized by paranoia.

paranoid personality disorder, a psychiatric disorder characterized by extreme suspiciousness and distrust of others to the degree that one blames them for one's mistakes and failures and goes to abnormal lengths to validate prejudices, attitudes, or biases.

paranoid reaction, a psychopathological condition that may be associated with delirium or dementia and characterized by the gradual formation of delusions, usually of a persecutory nature and often accompanied by related hallucinations. Other manifestations of senile degeneration, such as memory loss and confusion, may not accompany the reaction.

paranoid schizophrenia, a form of schizophrenia characterized by persistent preoccupation with illogical, absurd, and changeable delusions, usually of a persecutory, grandiose, or jealous nature, accompanied by related hallucinations. The symptoms include extreme anxiety, exaggerated suspiciousness, aggressiveness, anger, argumentativeness, and hostility, which may lead to violence. Formerly called **heboid paranoia.** Compare **paranoia.** See also **schizophrenia.**

paranoid state, a transitory abnormal mental condition characterized by illogical thought processes and generalized suspicion and distrust, with a tendency toward persecutory ideas or delusions.

paranormal /-nôr′məl/ [Gk, *para* + L, *normalis,* rule], pertaining to phenomena that cannot be explained by normal scientific investigation.

paranuclear body. See **centrosome.**

ParaOlympics. See **Paralympics.**

paraoperative, pertaining to the accessories essential to operative surgery, such as sterilization and the care of instruments and gloves.

paraparesis /-pərē′sis/ [Gk, *para* + *paresis,* paralysis], a partial paralysis, usually affecting only the lower extremities.

parapedesis /-pedē′sis/, any secretion or excretion through an abnormal passageway.

paraperitoneal /-per′itənē′əl/, near or beside the peritoneum.

paraperitoneal nephrectomy [Gk, *para* + *peri* + *tenein,* to stretch, *nephros,* kidney, *ektome,* excision], the surgical removal of a kidney through an extraperitoneal incision.

parapertussis /per′əpərtus′is/ [Gk, *para* + L, *per,* very, *tussis,* cough], an acute bacterial respiratory infection caused by *Bordetella parapertussis,* having symptoms closely resembling those of pertussis. It is usually milder than pertussis, although it can be fatal. It is possible to be infected with both *B. parapertussis* and *B. pertussis* at the same time. A parapertussis vaccine is available and may be given in combination with pertussis vaccine.

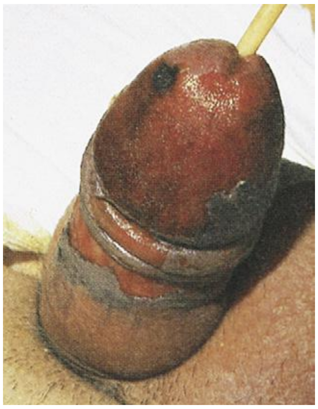
parapharyngeal abscess /per′əfərin′jē·əl/ [Gk, *para* + *pharynx,* throat; L, *abscedere,* to go away], a suppurative infection of tissues adjacent to the pharynx, usually a complication of acute pharyngitis or tonsillitis. Infection may spread to the jugular vein, where it may cause thrombophlebitis and septic emboli. Systemic antibiotics and surgical drainage may be required. Also called **parapharyngeal space abscess.** Compare **peritonsillar abscess, retropharyngeal abscess.** See also **tonsillitis.**

paraphasia /-fā′zhə/ [Gk, *para* + *phrasein,* to utter], **1.** a condition in which a person hears and comprehends words but is unable to speak correctly. Incoherent words are substituted for intended words, thereby creating sentences that are unintelligible. **2.** speech that is incoherent, unintelligible, and apparently incomprehensible but may be meaningful when carefully interpreted by a psychotherapist. Also called **jargon aphasia, word salad.**

paraphia /pə·rā′fē·ə/ [Gk, *para,* apart from or against + *haphē,* touch], a disorder of the sense of touch. Also called **dysaphia.**

paraphilia /per′əfil′yə/ [Gk, *para* + *philein,* to love], sexual perversion or deviation. A condition in which the sexual instinct is expressed in ways that are socially prohibited or unacceptable or are biologically undesirable, such as the use of a nonhuman object for sexual arousal, sexual activity with another person that involves real or simulated suffering or humiliation, or sexual relations with a nonconsenting partner. Kinds of paraphilia include **exhibitionism, pedophilia, transvestism, voyeurism,** and **zoophilia.** **—***paraphiliac, adj., n.*

paraphimosis /per′əfīmō′sis/ [Gk, *para* + *phimoein,* to muzzle], a condition characterized by an inability to replace the foreskin in its normal position after it has been retracted behind the glans penis. Caused by a narrow or inflamed foreskin, the condition may lead to gangrene. Circumcision may be required. Compare **phimosis.**



Paraphimosis *(Seidel et al, 2011/Courtesy Patrick C. Walsh, MD, The Johns Hopkins University School of Medicine, Baltimore, Maryland)*

paraphrenia /-frē′nē·ə/, a psychiatric condition that is primary to an affective illness or organic mental disorder. Gross disturbances of affect, volition, and function, which are characteristic of schizophrenia, are not prominent, but paranoid delusions and hallucinations are always present.

paraplasm /per′əplaz′əm/ [Gk, *para* + *plassein,* to mold], any abnormal growth or malformation. Compare **hyaloplasm.** **—***paraplasmic, adj.*

paraplastic /-plas′tik/ [Gk, *para* + *plassein,* to mold], **1.** misshapen or malformed. **2.** showing abnormal formative power; of the nature of a paraplasm.

paraplectic. See **paraplegic.**

paraplegia /per′əplē′jē·ə/ [Gk, *para* + *plege,* stroke], paralysis characterized by motor or sensory loss in the lower limbs and trunk. Approximately 11,000 spinal cord injuries reported each year in the United States involve paraplegia. Such injuries commonly result from automobile and motorcycle accidents, sporting accidents, falls, and gunshot wounds. Paraplegia less commonly results from nontraumatic lesions, such as scoliosis, spina bifida, or neoplasms. Compare **hemiplegia, tetraplegia.** **—paraplegic,** *adj., n.*

■ OBSERVATIONS: The signs and symptoms of paraplegia may develop immediately from trauma and include the loss of sensation, motion, and reflexes below the level of the lesion. Depending on the level of the lesion and whether damage to the spinal cord is complete or incomplete, the patient may lose bladder and bowel control, and sexual dysfunctions may develop. An incomplete spinal cord injury does not usually inhibit circumanal sensation, voluntary toe flexion, or sphincter control. A complete spinal cord injury destroys sensation and voluntary muscle control and usually causes the permanent loss of muscle function distal to the injury.

■ INTERVENTIONS: The treatment of paraplegia seeks to restore proper spine alignment, stabilize the injured spinal area, decompress any involved neurological structures, and rehabilitate the patient as quickly as possible. At the accident scene when spinal cord injury is suspected, the patient must not be moved until strapped and stabilized on a board. Such stabilization helps to prevent permanent damage to any injured spinal structures. Drugs such as baclofen may be administered to relieve any muscle spasms associated with dysfunction of the upper motor neurons.

■ NURSING CONSIDERATIONS: When the paraplegic patient progresses from bed rest to use of a wheelchair, the nurse is alert to any signs of orthostatic hypotension. Special binders and antiembolism hose are used to help the patient adjust to the transition from bed to wheelchair. Prevention of pressure sores is an important priority. Other treatment may include a high-bulk diet and the administration of suppositories to prevent constipation.

paraplegic /-plē′jik/ [Gk, *para* + *plege,* stroke], pertaining to a person affected by paraplegia or a condition resembling paraplegia. Also called **paraplectic.**

parapneumonic empyema, thoracic empyema occurring as a complication of pneumonia.

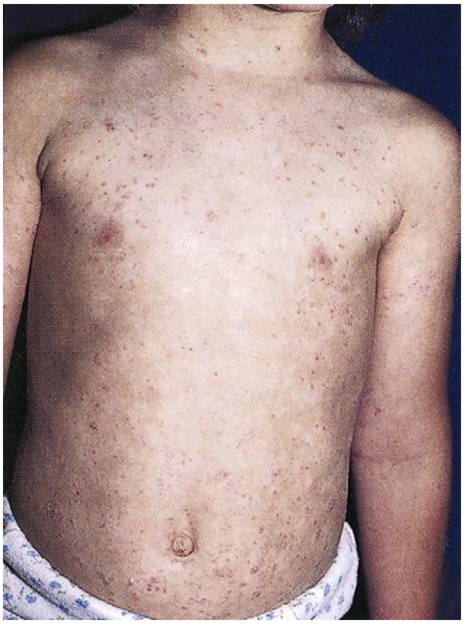
parapraxia /-prak′sē·ə/ [Gk, *para* + *praxis,* doing], **1.** the abnormal performance of purposive actions, such as performance of one movement occurring in place of another intended movement. **2.** forgetfulness with a tendency to misplace things.

paraproctitis /-proktī′tis/, an inflammation affecting the tissues around the rectum and anus.

paraprostatitis /-pros′tətī′tis/, an inflammation of the tissues around the prostate gland.

paraprotein /-prō′tēn/, any of the incomplete monoclonal immunoglobulins that occur in plasma cell disorders.

parapsoriasis /per′əsərī′əsis/ [Gk, *para* + *psorian,* to itch], a group of chronic skin diseases resembling psoriasis, characterized by maculopapular, erythematous scaly eruptions without systemic symptoms. Parapsoriasis is resistant to all treatment.



Parapsoriasis

(Weston, Lane, and Morelli, 2007)

parapsoriasis varioliformis acuta. See **Mucha-Habermann disease.**

parapsychology /-sīkol′əjē/ [Gk, *para* + *psyche,* mind, *logos,* science], a branch of psychology concerned with the study of alleged psychic phenomena, such as clairvoyance, extrasensory perception, and telepathy.

paraquat poisoning /per′əkwot′/ [Gk, *para* + L, *quaterni,* four each, *potio,* drink], a toxic condition caused by the ingestion of paraquat dichloride, a highly poisonous herbicide. Characteristically, progressive pulmonary fibrosis and damage to the esophagus, kidneys, and liver develop several days after ingestion. After fibrosis begins, death is inevitable, usually within 3 weeks. The mechanism of action of the poison is unknown. Most often poisoning results from accidental occupational exposure. There is considerable concern that the inhalation of the smoke of marijuana treated with the herbicide may cause intoxication, but no clinical syndrome resulting from such exposure has been documented.

pararectal fossa, either of two cavities formed by folds of the peritoneum, one on either side of the rectum, varying in size according to distension of the rectum. In males this is continuous with the rectovesical pouch, and in females it is continuous with the rectouterine pouch.

parareflexia /-riflex′sē·ə/, any abnormal condition of the reflexes.

pararenal fat, a layer of fat that accumulates posteriorly and posterolaterally to each kidney. It is the final layer of fat and fascias associated with the kidney. Also called **paranephric fat.** See also **perirenal fat.**

pararhotacism. See **rhotacism.**

parasacral /-sā′krəl/ [Gk, *para* + *sacrum*], pertaining to the area around the sacrum.

parasalpingitis /-sal′pinjī′tis/, an inflammation of the tissues around the fallopian tubes.

paraseptal emphysema. See **distal acinar emphysema.**

parasite /per′əsīt/ [Gk, *parasitos,* guest], **1.** an organism living in or on and obtaining nourishment from another organism. A **facultative parasite** may live on a host but is capable of living independently. An **obligate parasite** is one that depends entirely on its host for survival. **2.** See **parasitic fetus. —parasitic,** *adj.*

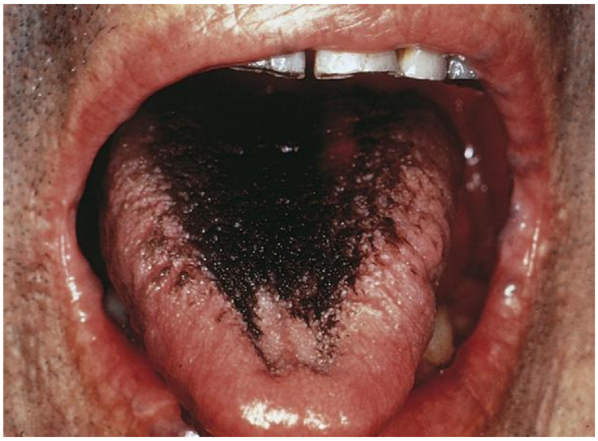
parasitemia /per′əsītē′mē·ə/ [Gk, *parasitos* + *haima,* blood], the presence of parasites in the blood. Compare **bacteremia, fungemia, viremia.**

parasitic fetus /-sit′ik/ [Gk, *parasitos* + L, *icus,* like, *fetus,* pregnant], the smaller, usually malformed member of conjoined, unequal, or asymmetric twins that is attached to and dependent on the more normal fetus for growth and development. Compare **autosite.**

parasitic fibroma, a pedunculated uterine fibroid deriving part of its blood supply from the omentum.

parasitic glossitis, a mycosis of the tongue, characterized by a black or brown furry patch on the posterior dorsal surface. The patch is composed of hypertrophied filiform papillae that measure about 1 cm in length and are easily broken. This condition may occur as the result of poor oral hygiene, the use of broad-spectrum antibiotics, or radiation treatment of the neck and head. The condition, caused by *Cryptococcus linguae-pilosasae* in symbiosis with *Nocardia lingualis,* produces no discomfort and may be treated with a simple mouthwash. The patch may disappear spontaneously and later reappear. Also called **black hairy tongue, glossitis parasitica, glossophytia.**

parasitic hemoptysis [Gk, *parasitos,* guest, *haima,* blood + *ptyein,* to spit], the spitting of bright red blood caused by a parasitic infection. The condition usually involves the lung fluke *(Paragonimus)* or tapeworms *(Echinococcus)*.



Parasitic glossitis *(Callen et al, 1993)*

parasitism /per′əsitiz′əm/ [Gk, *parasitos,* guest], the relationship between two different organism types whereby one organism (the parasite) receives benefits from the other organism (the host) by inducing damage to it.

parasternal line. See **costoclavicular line.**

parasympathetic /-sim′pəthet′ik/ [Gk, *para* + *sympathein,* to feel with], pertaining to the craniosacral division of the autonomic nervous system, consisting of the oculomotor, facial, glossopharyngeal, vagus, and pelvic nerves. The actions of the parasympathetic division are mediated by the release of acetylcholine and primarily involve the protection, conservation, and restoration of body resources. Preganglionic parasympathetic fibers, which emerge from the hypothalamus, other brain areas, and sacral segments of the spinal cord, form synapses in ganglia located near or in the walls of the organs to be innervated. Reactions to parasympathetic stimulation are highly localized and tend to counteract the adrenergic effects of sympathetic nerves. Parasympathetic fibers slow the heart; stimulate peristalsis; promote the secretion of lacrimal, salivary, and digestive glands; induce bile and insulin release; dilate peripheral and visceral blood vessels; constrict the pupils, esophagus, and bronchioles; and relax sphincters during micturition and defecation. Postganglionic parasympathetic fibers extend to the uterus, vagina, oviducts, and ovaries in females and to the prostate, seminal vesicles, and external genitalia in males, innervating blood vessels of pelvic organs in both sexes; stimulation of these nerves causes vasodilation in the clitoris and labia minora and erection of the penis.

parasympathetic ganglion [Gk, *para* + *sympathein,* to feel with, *ganglion,* knot], a cluster of nerve cell bodies of the parasympathetic division of the autonomic nervous system. The nerves are functionally antagonistic to those of the sympathetic division.

parasympathetic nervous system. See **autonomic nervous system.**

parasympatholytic. See **anticholinergic.**

parasympathomimetic /per′əsim′pəthō′mimet′ik/ [Gk, *para* + *sympathein,* to feel with, *mimesis,* imitation], **1.** *adj,* pertaining to a substance producing effects similar to those caused by stimulation of a parasympathetic nerve. **2.** *n,* an agent whose effects mimic those resulting from stimulation of parasympathetic nerves, especially those produced by acetylcholine. Also called **cholinergic.**

parasympathomimetic drug. See **cholinergic.**

parasynovitis /-sinəvī′tis/, an inflammation of the tissues around a joint.

parasystole [Gk, *para* + *systole,* contraction], an independent ectopic rhythm whose pacemaker cannot be discharged by impulses of the dominant (usually the sinus) rhythm because an area of depressed conduction surrounds the parasystolic focus. In the classic parasystole, the interectopic intervals are exact multiples of a common denominator reflecting the protected status of the parasystolic focus; however, the ectopic focus is usually influenced by the phasic events around its protection zone (modulated parasystole). Thus the sinus rhythm may modulate the parasystolic rhythm so that criteria for absolute, undisturbed regularity are not fulfilled. Fusion beats are common because of the simultaneous discharge of the ventricles by both the sinus and the parasystolic impulses.

parataxic distortion /per′ətak′sik/ [Gk, *para* + *taxis,* arrangement], **1.** a defense mechanism in which current interpersonal relationships are perceived and judged according to a mode of reference established by an earlier experience. **2.** Harry S. Sullivan's term for inaccuracies in judgment and perception. See also **transference.**

parataxic mode, a term introduced by H.S. Sullivan to identify a childhood perception of the physical and social environment as being illogical, disjointed, and inconsistent. The parataxic mode may persist into adulthood in some individuals.

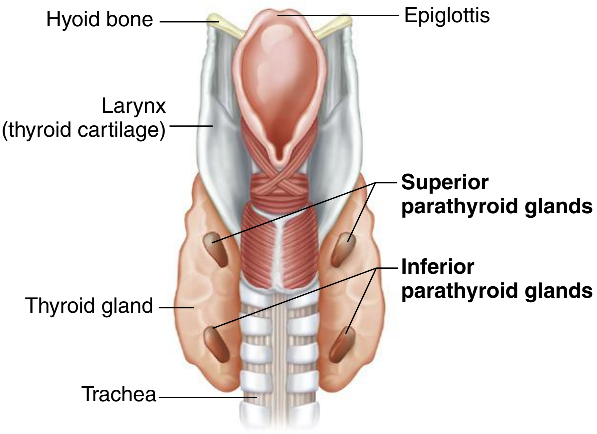
parathion poisoning /per′əthī′on/ [Gk, *para* + *thio,* phosphate, *on* + L, *potio,* drink], a toxic condition caused by the ingestion, inhalation, or absorption through the skin of the highly toxic organophosphorus insecticide parathion. Symptoms include nausea, vomiting, abdominal cramps, confusion, headache, lack of muscular control, convulsions, and dyspnea.

parathyroid-, parathyro-, prefix meaning "parathyroid glands": *parathyroidectomy.*

parathyroidectomy /-thī′roidek′təmē/ [Gk, *para* + *thyreos,* shield, *eidos,* form, *ektomē,* excision], the surgical removal of the parathyroid gland.

parathyroid gland /-thī′roid/ [Gk, *para* + *thyreos,* shield, *eidos,* form; L, *glans,* acorn], any one of several small structures, usually four, attached to the dorsal surfaces of the lateral lobes of the thyroid gland. The parathyroid glands secrete parathyroid hormone, which helps maintain the blood calcium concentration and ensures normal neuromuscular irritability, blood clotting, and cell membrane permeability. Each parathyroid gland is an oval brownish red disk measuring about 6 by 4 mm. The parathyroids are divided, according to their location, into the superior parathyroids and the inferior parathyroids. The superior parathyroids, usually two, are commonly situated, one on each side, on the caudal border of the cricoid cartilage beside the junction of the pharynx and the esophagus. The inferior parathyroids, also usually two, may be situated on the caudal edge of the lateral lobes of the thyroid gland or adjacent to one of the inferior thyroid veins. These glands are composed of intercommunicating columns of cells bound by connective tissue with a rich supply of capillaries. Parathyroid hypofunction usually causes tetany, which can be treated by the administration of calcium salts or parathyroid extracts.

parathyroid hormone (PTH), a hormone secreted by the parathyroid glands that acts to maintain a constant concentration of calcium in the extracellular fluid. The hormone regulates absorption of calcium from the GI tract; mobilization of calcium from the bones; deposition of calcium in the bones; and excretion of calcium in the breast milk, feces, sweat, and urine. Surgical removal of the parathyroid glands, as may



Hyoid bone
Epiglottis
Larynx (thyroid cartilage)
Superior parathyroid glands
Inferior parathyroid glands
Thyroid gland
Trachea

Parathyroid glands *(Patton and Thibodeau, 2010)*

inadvertently occur in thyroidectomy, results in hypocalcemia, leading to anorexia, tetany, seizures, and death if not corrected. Normal parathyroid laboratory findings are less than 2000 pg/mL. See also **hypoparathyroidism.**

parathyroid hormone (PTH) test, a blood test that is useful in establishing a diagnosis of hyperparathyroidism and distinguishing nonparathyroid from parathyroid causes of hypercalcemia. PTH is secreted by the parathyroid gland in response to hypocalcemia.

parathyroid scan, a nuclear scan used to determine the number of parathyroid glands involved in hyperparathyroidism. Enlargement of all four glands indicates parathyroid hyperplasia. Enlargement of only one indicates adenoma or cancer.

parathyroid tetany [Gk, *para* + *thyreos,* shield, *tetanos,* convulsive tension], a form of tetany (hypocalcemia) that is caused by a deficiency of parathyroid secretion.

parathyrotropic /-thī′rōtrop′ik/, stimulating the growth or rate of activity of the parathyroid glands.

paratonia. See **gegenhalten.**

paratrichosis /-trikō′sis/, an abnormality in the distribution, growth, and quantity of scalp hair.

paratriptic /-trip′tik/, pertaining to an agent that causes chafing.

paratrooper fracture /-tro͞o′pər/ [Fr, *parasol* + *troupe,* company; L, *fractura,* break], a break in the distal tibia and its malleolus, commonly occurring when an individual jumps from an elevated platform and lands feet first on the ground, subjecting the ankles to extreme force. The fracture may be bilateral.

paratyphlitis /-tiflī′tis/ [Gk, *para* + *typhlos* blind, *itis,* inflammation], an inflammation of the tissues around the cecum and vermiform appendix. Also called **perityphlitis.**

paratyphoid fever /-tī′foid/ [Gk, *para* + *typhos,* stupor, *eidos,* form; L, *febris,* fever], a bacterial infection, caused by any ***Salmonella*** species other than *S. typhi,* characterized by symptoms resembling typhoid fever, although somewhat milder. See also **rose spots, *Salmonella,* salmonellosis, typhoid fever.**

paraurethral duct /per′əyo͝orē′thrəl/ [Gk, *para* + *ourethra,* urethra; L, *ducere,* to lead], one of a pair of ducts that drain the bulbourethral glands into the vestibule of the vagina. Also called **Skene's duct.**

paravaccinia virus /-vaksin′ē·ə/, a member of a subgroup of poxviruses that can infect humans through direct contact with infected livestock. It is related to the smallpox virus and is the cause of pseudocowpox, which produces **milker's nodules.**

paravaginitis /-vaj′inī′tis/, an inflammation of the tissues around the vagina.

paravertebral /-vur′təbrəl/ [Gk, *para* + L, *vertebra,* joint], pertaining to the area alongside the spinal column or near a vertebra.

paravertebral block [Gk, *para* + L, *vertebra* + OFr, *bloc*], **1.** the blocking of transmission of somatic impulses by the spinal nerves by injection of a local analgesic solution near the point of their emergence. **2.** the blocking of the paravertebral sympathetic chain of nerves anterolateral to the vertebral bodies.

paravertebral sympathetic trunk, the trunk formed by ascending and descending postganglionic fibers, together with all the ganglia, that extends the entire length of the vertebral column on each side and enables the visceral motor fibers of the sympathetic part of the autonomic division of the peripheral nervous system to be distributed to peripheral regions innervated by all spinal nerves.

paravesical fossa, the fossa formed by the peritoneum on each side of the urinary bladder, into which the obturator canal opens. In females it is the lateral part of the vesicouterine pouch.

paravesical spaces, a pair of subdivisions of the extraperitoneal space found lateral to the prevesical space.

paraxial /perak′sē·əl/, pertaining to an organ or other structure located near the axis of the body.

parchment skin /pärch′mənt/ [Fr, *parchemin* + AS, *scinn*], thin, wrinkled, or stretched skin that is exceptionally fragile.

paregoric /per′əgôr′ik/, a camphorated tincture of opium.

■ INDICATIONS: It is prescribed in the treatment of diarrhea and as an analgesic.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to any opium derivative prohibits its use. It should not be used when diarrhea is caused by a toxic substance.

■ ADVERSE EFFECTS: Drowsiness and dizziness are common. When used as directed, nausea and constipation may occur. Other adverse effects include respiratory depression, hypotension and miosis, and, with continued use, psychological dependence.

parencephalitis /per′ensef′əlī′tis/, an inflammation of the cerebellum.

parencephalocele /per′ensef′əlōsēl′/, a protrusion of the cerebellum through a hole in the cranium.

parenchyma /pəreng′kimə/ [Gk, *para* + *enchyma,* infusion], the functional tissue or cells of an organ or gland, as distinguished from supporting or connective tissue.

parenchymal. See **parenchymatous.**

parenchymal cell /pəreng′kiməl/, any cell that is a functional element of an organ, such as a hepatocyte.

parenchyma of prostate, glandular substance consisting of small compound tubulosaccular or tubuloalveolar glands that makes up the bulk of the prostate. It is surrounded by muscular substance and permeated by muscular strands.

parenchymatous /per′əngkim′ətəs/ [Gk, *para* + *enchyma,* infusion], pertaining to or resembling the functional tissues of an organ or gland. Also **parenchymal.**

parenchymatous myositis. See **myositis.**

parenchymatous nephritis. See **nephritis.**

parenchymatous neuritis [Gk, *para* + *enchyma,* infusion; L, *osus,* like], any inflammation affecting the substance, axons, or myelin of the nerve. Also called **axial neuritis, central neuritis.** See also **neuritis.**

parenchymatous salpingitis, an inflammation and thickening of the fallopian tubes. Also called **pachysalpingitis.**

parent [L, *parens*], a mother or father; one who bears offspring. —*parental, adj.*

parental generation (P_1) /pəren′təl/, the initial cross between two varieties in a genetic sequence. The parents of any individual belonging to a first filial generation.

parental grief, the behavioral reactions that characterize the grieving process and result in the resolution of grief at the loss of a child from expected or unexpected death. All people who survive the loss of a loved one normally experience symptoms of both somatic and psychological distress, such as feelings of guilt and hostility accompanied by changes in usual patterns of conduct. When the death of a child with a terminal illness is expected, there is time for anticipatory grieving, so that parents can evaluate their relationship with the child, set priorities for the duration of time involved, and prepare for the actual death of the child. In such cases, parental grieving begins with the discovery of the diagnosis of a life-threatening condition. Parents' adjustment to the diagnosis involves a complete cycle of reactions that extends over an indefinite period, depending on the severity and nature of the disease. The immediate reactions are shock and disbelief, followed by acute grief at the anticipation of losing the child. Periods of depression, anger, hope, fear, and anxiety alternate during induction therapy, remission, and maintenance of the disease as parents learn to accept and cope with the situation. Heightened anticipatory grieving recurs during episodes of relapse, and the parents experience increased fear, depression, and final acceptance of death during the terminal stages of the illness. Although families can prepare themselves for the expected loss, at the time of death there is a period of acute grief, during which parents need to express their deep sorrow and anger. An extended phase of mourning follows, with the eventual resolution of grief and reintegration into society. In sudden, unexpected death, parents are denied the advantages of anticipatory grief and, because of the lack of time to prepare, usually have extreme feelings of guilt and remorse. The nurse can especially help such parents to assess their feelings so that they can work through them and progress through the resolution of grief and the mourning process, which in unexpected death take a much longer time. The function of the nurse during all phases of parental grief is primarily supportive, and the degree of intervention depends on the family's strengths and weaknesses in coping with the crisis. Nurses can act directly, or they can help find other potential sources of support for the parents, such as extended family members, other parents who have lost children, or specific community services or agencies. A large part of the nursing support involves helping families explore new ways of coping, not only to meet the present crisis but to grow and change. Always an important nursing consideration is the education of the parents about all aspects of the child's illness, especially in terminal conditions. See also **death, grief reaction.**

parental leave. See **family care leave.**

parent-child relationship. See **maternal-infant bonding.**

parent education, thoughtful conveyance of information enabling the parent to provide high-quality childrearing.

parent education: adolescent, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting parents to understand and help their adolescent children. See also **Nursing Interventions Classification.**

parent education: child-rearing family, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting parents to understand and promote the physical, psychological, and social growth and development of their toddler, preschool, or school-aged child/children. See also **Nursing Interventions Classification.**

parent education: infant, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on nurturing and physical care needed during the first year of life. See also **Nursing Interventions Classification.**

parent ego state, (in transactional analysis) an ego state that incorporates the feelings and behavior learned from parents or other authority figures; a part of the self that offers advice like that of one's own parents, containing messages that emphasize what one "ought to" or "should not" do.

parenteral /pəren′tərəl/ [Gk, *para* + *enteron*, bowel], pertaining to treatment other than through the digestive system. —**parenterally,** *adv.*

parenteral absorption, the taking up of substances within the body by structures other than the digestive tract.

parenteral dosage, pertaining to a medication administered by a route that bypasses the GI tract, such as a drug given by injection.

parenteral hyperalimentation. See **total parenteral nutrition.**

parenterally. See **parenteral.**

parenteral nutrition, the administration of nutrients by a route other than the alimentary canal, such as subcutaneously, intravenously, intramuscularly, or intradermally. The nutrients, or parenteral fluids, usually consist of physiological saline solution with glucose, amino acids, electrolytes, vitamins, and medications. They may not be nutritionally complete but maintain fluid and electrolyte balance during the immediate postoperative period and in other conditions, such as shock, coma, malnutrition, and chronic renal and hepatic failures. See also **total parenteral nutrition.**

Common indications for parenteral nutrition

- Chronic severe diarrhea and vomiting
- Complicated surgery or trauma
- Gastrointestinal obstruction
- Gastrointestinal tract anomalies and fistulae
- Intractable diarrhea
- Severe anorexia nervosa
- Severe malabsorption
- Short bowel syndrome

From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St Louis, 2011, Mosby.

parent figure [L, *parens* + *figura*, form], **1.** a parent or a substitute parent or guardian who cares for a child, providing the physical, social, and emotional requirements necessary for normal growth and development. **2.** a person who symbolically represents an ideal parent, having those attributes that one conceptualizes as necessary for forming the perfect parent-child relationship.

parent image, a conscious and unconscious concept that a child forms concerning the roles and characteristics of the personality of the mother and father. See also **imago, primordial image.**

parent-infant attachment, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as parent and infant behaviors that demonstrate an enduring affectionate bond. See also **Nursing Outcomes Classification.**

parenting: adolescent physical safety, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as parental actions to prevent physical injury in an adolescent from 12 years through 17 years of age. See also **Nursing Outcomes Classification.**

parenting: early/middle childhood physical safety, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as parental actions to avoid physical injury of a child from 3 years through 11 years of age. See also **Nursing Outcomes Classification.**

parenting: infant/toddler physical safety, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as parental actions to avoid physical injury of a child from birth through 2 years of age. See also **Nursing Outcomes Classification.**

parenting performance, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as parental actions to provide a child a nurturing and constructive physical, emotional, and social environment. See also **Nursing Outcomes Classification.**

parenting promotion, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing parenting information, support, and coordination of comprehensive services to high-risk families. See also **Nursing Interventions Classification.**

parenting: psychosocial safety, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as parental actions to protect a child from social contacts that might cause harm or injury. See also **Nursing Outcomes Classification.**

Parents Anonymous, a self-help group for parents who have abused their children or who feel that they are prone to maltreat them. The organization offers support and guidance, provides a forum for discussing mutual problems, and furnishes a distressed parent with a positive mechanism for coping with anger by talking to another member rather than by releasing his or her emotions on the child. See also **child abuse.**

Parents Without Partners, a self-help group for single parents, including those who are separated, divorced, or widowed.

parepididymis. See **paradidymis.**

paresis /pərē′sis, per′isis/ [Gk, *paralyein,* to be palsied], **1.** also called **dementia paralytica, general paresis, paralytic dementia.** motor weakness or partial paralysis related in some cases to local neuritis. **2.** a late manifestation of neurosyphilis, characterized by generalized paralysis, tremulous incoordination, transient seizures, Argyll Robertson pupils, and progressive dementia caused by degeneration of cortical neurons. Paresis resulting from untreated syphilis usually develops in the third to fifth decade but may occur at an early age in patients with congenital syphilis. **—paretic,** *adj.*

-paresis, suffix meaning "incomplete or partial paralysis": *hemiparesis.*

paresthesia /per′esthē′zhə/ [Gk, *para* + *erethizein,* to excite], any subjective sensation, experienced as numbness, tingling, or a "pins and needles" feeling. Paresthesias often fluctuate according to such influences as posture, activity, rest, edema, congestion, or underlying disease. When experienced in the extremities, it is sometimes identified as acroparesthesia. Also spelled *paraesthesia.* See also **acanthesia**.

paresthetic pain. See **paresthesia.**

paretic /peret′ik/ [Gk, *paresis,* paralysis], pertaining to or resembling partial paralysis.

paretic dementia. See **general paresis.**

pareunia. See **coitus.**

paricalcitol, a vitamin D analog.

■ INDICATION: It is used to treat hypoparathyroidism.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug and hypercalcemia prohibit its use.

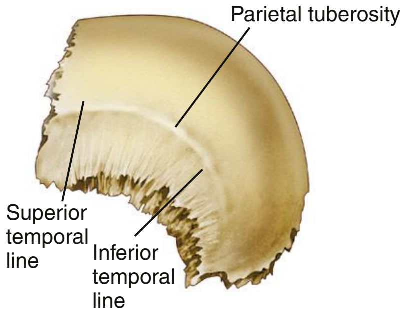
■ ADVERSE EFFECTS: Sepsis is a life-threatening effect. Other adverse effects include nausea, vomiting, anorexia, dry mouth, lightheadedness, palpitations, pneumonia, edema, chills, fever, and flu.

paries /per′i·ēz/, *pl.* **parietes,** the wall of a hollow organ or cavity in the body.

parietal /pərī′ətəl/ [L, *paries,* wall], **1.** pertaining to the outer wall of a cavity or organ. **2.** pertaining to the parietal bone of the skull or the parietal lobe of the cerebrum.

parietal abdominal fascia, the fascia lining the wall of the abdominal cavity.

parietal bone, one of a pair of bones forming the sides of the cranium. Each parietal bone has two surfaces, four borders, and four angles and articulates with five bones: the opposite parietal, occipital, frontal, temporal, and sphenoid.



Parietal bone

parietal cells [L, *paries,* wall, *cella,* storeroom], the cells on the periphery of the gastric glands of the stomach. They are located on the basement membrane beneath the chief cells and secrete hydrochloric acid.

parietal endopelvic fascia. See **parietal pelvic fascia.**

parietal hernia. See **Richter's hernia.**

parietal layer of glomerular capsule, the layer of the glomerular capsule opposite the visceral layer, with the urinary space in between. It is composed of simple squamous epithelium.

parietal lobe, a portion of each cerebral hemisphere that occupies the parts of the lateral and medial surfaces that are covered by the parietal bone. On the lateral surface of the hemisphere the parietal lobe is separated from the frontal lobe by the central sulcus and from the temporal lobe by an imaginary line that extends from the posterior ramus of the lateral sulcus toward the occipital pole. It is concerned with language mechanisms and general sensory functions. Compare **central lobe, frontal lobe, occipital lobe, temporal lobe.**

parietal lymph node, any one of the small oval glands that filter the lymph coursing through the lymphatic vessels in the walls of the thorax or through the lymphatic vessels associated with the larger blood vessels of the abdomen and the pelvis. The parietal lymph nodes of the thorax include the sternal nodes, intercostal nodes, and diaphragmatic nodes. The parietal lymph nodes of the abdomen and pelvis include the common iliac nodes, epigastric nodes, external iliac nodes, iliac circumflex nodes, internal iliac nodes, lumbar nodes, and sacral nodes. See also **lymph, lymphatic system, lymph node.**

parietal pain, a sharp sensation of distress in the parietal pleura, aggravated by respiration and thoracic movements and caused by pneumonia; empyema; pneumothorax; asbestosis; tuberculosis; neoplasm; or the accumulation of fluid resulting from heart, liver, or kidney disease. Pain arising from the parietal pleura lining the chest wall is perceived over the involved area, but that arising from the central part of the diaphragm is referred to the posterior shoulder area;

pain from the costal portions of the diaphragm is referred to the adjacent thoracic wall.

parietal pelvic fascia, the layer of fascia surrounding the abdominal cavity, composed of transversalis fascia, the fascia covering muscle associated with the upper regions of the pelvic bones, and similar fascia covering the muscles of the pelvic cavity. Also called **parietal endopelvic fascia.**

parietal pericardium [L, *paries,* wall; Gk, *peri* + *kardia,* heart], an outer layer of the serous pericardium that is not in direct contact with the heart muscle.

parietal peritoneum, the portion of the largest serous membrane in the body that lines the abdominal wall. Compare **visceral peritoneum.** See also **peritoneal cavity.**

parietal pleura, the outer layer of the pleura, lining the walls of the thoracic cavity.

parietes. See **paries.**

parietomastoid suture, the suture at which the mastoid part of the temporal bone articulates superiorly with the parietal bone.

parietooccipital /pərī′ətō·oksip′itəl/ [L, *paries* + *occiput,* back of the head], pertaining to the parietal and occipital bones or cerebral lobes.

parietooccipital sulcus, a groove on each cerebral hemisphere marking the division of the parietal and occipital lobes of the cerebrum. Also called **occipitoparietal fissure.**

parietotemporal /-tem′pərəl/ [L, *paries,* wall, *tempus,* temple], pertaining to the temporal and parietal bones of the cranium. Also called **temporoparietal.**

parietovisceral /-vis′ərəl/, pertaining to the abdominal wall and abdominal organs.

-parin, suffix for heparin derivatives.

Parinaud's oculoglandular syndrome /per′ənōz/ [Henri Parinaud, French ophthalmologist, 1844–1905], a term often used to refer to conjunctivitis that is usually unilateral, follicular, and followed by enlargement of the preauricular lymph nodes and tenderness. The syndrome is caused by a wide range of tularemia, cat-scratch fever, and lymphogranuloma venereum. Also called *Parinaud's ophthalmoplegia.*

paring board. See **spikeboard.**

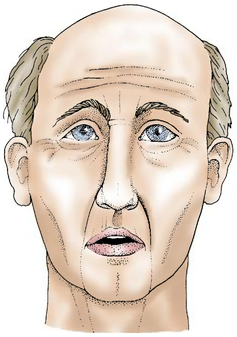
pari passu /per′ē pas′o͞o/ [L, *par,* equal, *passus,* step], at the same time or in equal proportions.

paritonsillar abscess. See **parapharyngeal abscess.**

parity /per′itē/ [L, *parere,* to give birth], **1.** (in obstetrics) the classification of a woman by the number of live-born children and stillbirths she has delivered at more than 20 weeks of gestation. Commonly parity is noted with the total number of pregnancies and represented by the letter *P* or the word *para.* A para 4 (P4) gravida 5 (G5) has had four deliveries after 20 weeks and one abortion or miscarriage before 20 weeks. Currently a more complete system is in use: the total number of term infants (T) is followed by the number of premature infants (P), the number of abortions or miscarriages before 20 weeks' gestation (A), and the number of children living at present (L). This system may be abbreviated as *TPAL.* **2.** (in epidemiology) the classification of a woman by the number of live-born children she has delivered. **3.** (in computer processing) the condition of a set of items, either even or odd in number, used as a means for checking errors, such as in the transmission of information between various elements of the same computer.

parkinsonian. See **Parkinson's disease.**

parkinsonian facies [James Parkinson, English physician, 1755–1824; L, *facies,* face], a masklike and immobile facial expression, usually occurring with Parkinson's disease. Infrequent blinking also occurs. Also called **masked facies.**

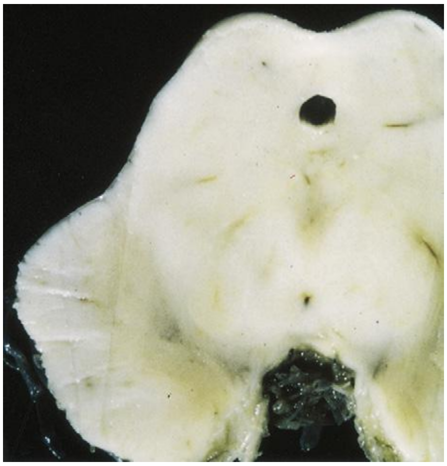


Parkinsonian facies *(Ignatavicius and Workman, 2010)*

parkinsonian tremor [James Parkinson; L, *tremor,* shaking], a mild resting tremor with slow, regular oscillations of three to six per second, exacerbated by fatigue, cold, or emotion. The tremors usually, but not always, cease during voluntary movement of the affected part and during sleep. Also called **pill-rolling tremor.**

parkinsonism /pär′kənsəniz′əm/ [James Parkinson], a neurological disorder characterized by tremor, muscle rigidity, hypokinesia, a slow shuffling gait, and difficulty in chewing, swallowing, and speaking and caused by various lesions in the extrapyramidal motor system. Signs and symptoms of parkinsonism resemble those of idiopathic Parkinson's disease and may develop during or after acute encephalitis and in syphilis, malaria, poliomyelitis, and carbon monoxide poisoning. Parkinsonism may occur in patients treated with antipsychotic drugs. Also called **shaking palsy.** See also **Parkinson's disease.**

Parkinson's disease [James Parkinson], a slowly progressive degenerative neurological disorder characterized by resting tremor, pill rolling of the fingers, a masklike facies, shuffling gait, forward flexion of the trunk, loss of postural reflexes, and muscle rigidity and weakness. It is usually an idiopathic disease of people over 60 years of age; it may occur in younger people, however, especially after acute encephalitis or carbon monoxide or metallic poisoning, particularly by reserpine or phenothiazine drugs. Typical pathological changes are destruction of neurons in basal ganglia; loss of pigmented cells in the substantia nigra; and depletion of dopamine in the caudate nucleus, putamen, and pallidum, structures in the neostriatum that normally contain high levels of the neurotransmitter dopamine. Signs and symptoms of Parkinson's disease, which include resting tremor, bradykinesias, drooling, increased appetite, intolerance to heat, oily skin, emotional instability, and defective judgment, are increased by fatigue, excitement, and frustration. Palliative and symptomatic treatment of the disease focuses on correcting the imbalance between depleted dopamine and abundant acetylcholine in the striatum because dopamine normally appears to inhibit excitatory cholinergic activity in this brain area. Levodopa, a dopamine precursor that crosses the blood-brain barrier, may be used, but many patients experience side effects, such as nausea, vomiting, insomnia, orthostatic hypotension, and mental confusion. Carbidopa-levodopa, which contains an inhibitor of the enzyme dopa decarboxylase, limits peripheral metabolism of levodopa and thus causes fewer side effects. Anticholinergic drugs, such as benztropine mesylate, biperiden, procyclidine, and trihexyphenidyl, may be used as therapeutic agents but often cause ataxia, blurred vision, constipation, dryness of the mouth, mental disturbances, slurred speech, and urinary urgency or retention. Amantadine hydrochloride, an antiviral



Parkinson's disease: depigmented substantia nigra

(Kumar et al, 2010)

drug with antiparkinsonian activity, promotes the accumulation of dopamine in extracellular or synaptic sites, but the therapeutic effectiveness may not last more than 3 months in some patients; side effects, such as mental confusion, visual disturbances, and seizures, occur infrequently. Also called **paralysis agitans.** **—parkinsonian,** *adj.*

Parkinson's mask [James Parkinson; Fr, *masque*], an expressionless face with eyebrows raised and smoothing but immobility of facial muscles.

Parlodel, a trademark for a dopamine receptor agonist (bromocriptine).

Parnate, a trademark for an antidepressant **(tranylcypromine sulfate).**

parole /pərōl′/, (in psychiatry) a system of supervision of a patient who has been physically released from a hospital setting but is still listed as an inpatient and may be returned to the hospital without further court action. Also called **leave.**

paromomycin sulfate /per′əmōmī′sin/, an oral antiamebic aminoglycoside antibiotic.

■ INDICATIONS: It is prescribed in the treatment of intestinal amebiasis, tapeworms, and *Cryptosporidium*, and is used preoperatively to suppress intestinal flora.

■ CONTRAINDICATIONS: Intestinal inflammation, intestinal obstruction, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious effects are GI distress and diarrhea. Less common adverse effects include headache, vertigo, and pruritus.

paromphalocele /perom′fəlōsēl′/, a hernia or tumor near the umbilicus.

paronychia /per′ənik′ē·ə/ [Gk, *para* + *onyx,* nail], an infection of the fold of skin at the margin of a nail. Treatment includes hot compresses or soaks, antibiotics, and possibly surgical incision and drainage. Compare **onychia.**

paroophoritis /per′ō·of′ərī′tis/ [Gk, *para* + *oon,* egg, *pherein,* to bear, *itis*], **1.** inflammation of the paroophoron. **2.** inflammation of the tissues surrounding the ovary.

paroophoron /per′ō·of′əron/ [Gk, *para* + *oon,* egg, *pherein,* to bear], a small vestigial remnant of the mesonephros, consisting of a few rudimentary tubules lying in the broad ligament between the epoophoron and the uterus. It is most evident in very young girls. A similar vestigial structure, the aberrant ductule, is found in the male. Also called **parovarium.** Compare **epoophoron.**

parosmia /pəroz′mē·ə/ [Gk, *para* + *osme,* smell], any dysfunction or perversion concerning the sense of smell. See also **anosmia, cacosmia.**

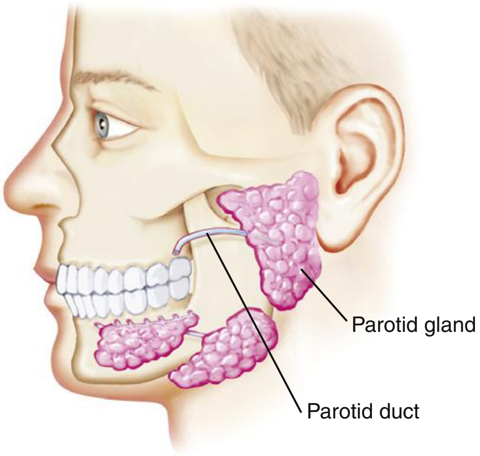
parosteitis /per′ostē·ī′tis/, an inflammation of the tissues adjacent to or associated with a bone.

parosteosis /per′ostē·ō′sis/, the development of bone in an abnormal location, such as in the area of the periosteum or in the skin.

parotid /pərot′id/ [Gk, *para* + *ous,* ear], near the ear.

parotid abscess, a collection of pus in a parotid salivary gland.

parotid duct [Gk, *para* + *ous,* ear; L, *ducere,* to lead], a tubular canal, about 7 cm long, that extends from the anterior part of the parotid gland near the ear to the mouth. It crosses the masseter after leaving the parotid gland, pierces the buccinator, runs for a short distance obliquely forward between the buccinator and the mucous membrane of the mouth, and opens on the oral surface of the cheek through a small opening opposite the second upper molar tooth. Also called **Stensen's duct.** See also **parotid gland, salivary gland.**



Parotid duct and parotid gland

parotidectomy /pərot′idek′təmē/ [Gk, *para* + *ous* + *ektomē,* excision], the surgical removal of the parotid gland.

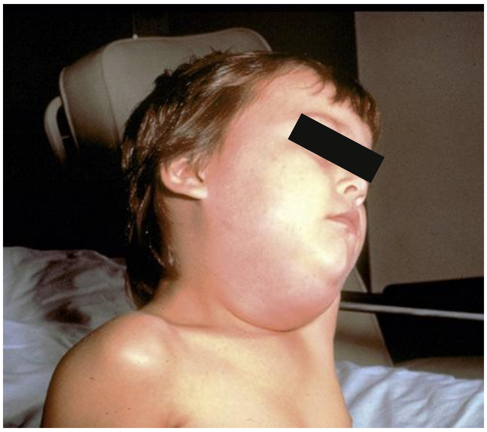
parotid gland [Gk, *para* + *ous,* ear; L, *glans,* acorn], one of the largest pairs of salivary glands that lies at the side of the face just below and in front of the external ear. The main part of the gland is superficial, somewhat flattened, and quadrilateral. It is enclosed in a capsule continuous with the deep cervical fascia. The parotid duct starts at the anterior part of the gland and opens on the inside of the cheek opposite the second upper molar. Compare **sublingual gland, submandibular gland.** See also **salivary gland.**

parotitis /per′ətī′tis/ [Gk, *para* + *ous,* ear, *itis,* inflammation], inflammation or infection of one or both parotid salivary glands. See also **mumps.**

parous /per′əs/, having borne one or more viable offspring.

-parous, suffix meaning "pertaining to the quantity of offspring produced simultaneously or to the method of gestation": *quadriparous, uniparous, viviparous.*

parovarian /per′ōver′ē·ən/ [Gk, *para* + L, *ovum,* egg], pertaining to residual tissues in the area near the fallopian tubes and the ovary.



Parotitis *(Courtesy Centers for Disease Control and Prevention, Atlanta, Georgia)*

parovarium. See **epoophoron.**

paroxetine, a selective serotonin reuptake inhibitor.

■ INDICATIONS: It is prescribed in the treatment of mental depression, obsessive-compulsive disorder, panic disorders, and anxiety disorders, including social anxiety and general anxiety. Unlabeled uses include treatment of impulse control disorders, premenstrual syndrome, and vasomotor symptoms of menopause.

■ CONTRAINDICATIONS: It should not be given to patients taking monoamine oxidase inhibitors. Caution is advised in administering the drug to patients with a history of drug abuse, mania, seizures, suicidal tendencies, or kidney or liver disease.

■ ADVERSE EFFECTS: The side effects most often reported include decreased libido and ejaculatory disturbances, nausea, diarrhea, vomiting, constipation, abdominal pain, flatulence, changes in appetite, and muscle weakness. Paroxetine may also cause SIADH and/or hyponatremia and lead to or exacerbate coagulation disturbances because of impairment of platelet aggregation.

paroxysm /per′əksiz′əm/ [Gk, *paroxynein,* to stimulate], **1.** a marked, usually episodic increase in symptoms. **2.** a convulsion, fit, seizure, or spasm. —*paroxysmal, adj.*

paroxysmal atrial tachycardia. See **paroxysmal supraventricular tachycardia.**

paroxysmal AV nodal reentry tachycardia [Gk, *paroxysmos,* irritation; L, *nodus,* knot; Gk, *tachys,* fast, *kardia,* heart], a type of paroxysmal supraventricular tachycardia usually initiated by a premature atrial complex and sustained by an atrioventricular nodal reentry mechanism. A vagal maneuver is usually successful in restoring sinus rhythm. If it is not, adenosine or verapamil, procainamide, and cardioversion are tried, in succession.

paroxysmal cold hemoglobinuria (PCH), a rare autoimmune hemolytic anemia disorder marked by hemolysis minutes or hours after exposure to cold. Characterized by the presence of a biphasic hemolysin, called the Donath-Landsteiner antibody, which hemolyzes red cells after exposure to cool temperatures and then warming back to 37°C. Systemic symptoms include the passage of dark urine, severe pain in the back and legs, headache, vomiting, diarrhea, and moderate reticulocytosis. Temporary hepatosplenomegaly and mild hyperbilirubinemia may follow the onset of an attack.

paroxysmal cough [Gk, *paroxysmos,* irritation; AS, *cohhetan,* cough], a severe attack of coughing, as may accompany whooping cough, bronchiectasis, or a lung injury.

paroxysmal hemoglobinuria, the sudden passage of hemoglobin in urine, occurring after local or general exposure to low temperatures, as in paroxysmal cold hemoglobinuria.

paroxysmal junctional tachycardia. See **paroxysmal supraventricular tachycardia.**

paroxysmal labyrinthine vertigo. See **Ménière's disease.**

paroxysmal nocturnal dyspnea (PND). a disorder characterized by sudden attacks of respiratory distress that awaken the person, usually after several hours of sleep in a reclining position. This occurs because of increased fluid central circulation with reclining position. It is most commonly caused by pulmonary edema resulting from congestive heart failure. The attacks are often accompanied by coughing, a feeling of suffocation, cold sweat, and tachycardia with a gallop rhythm. Sleeping with the head propped up on pillows may prevent PND, but treatment of the underlying cause is required to prevent fluid from accumulating in the lungs. Also called **nocturnal paroxysmal dyspnea.** See also **dyspnea.**

paroxysmal nocturnal hemoglobinuria (PNH), an acquired hemolytic anemia caused by a clonal stem cell mutation that results in an absence of glycosylphosphatidylinositol-anchored proteins, including decay-accelerating factor (DAF) and CD55. Red cells lacking DAF and CD55 have an increased susceptibility to complement activation and lysis, resulting in intravascular hemolysis and hemoglobinuria, especially during sleep.

paroxysmal supraventricular tachycardia, an ectopic heart rhythm with a rate of 170 to 250 beats/min. It begins abruptly with a premature atrial or ventricular beat and is supported by an atrioventricular (AV) nodal reentry mechanism or by an AV reentry mechanism involving an accessory pathway. Formerly called **paroxysmal atrial tachycardia, paroxysmal junctional tachycardia.**

paroxysmal ventricular tachycardia [Gk, *paroxysmos,* irritation; L, *ventriculus,* little belly; Gk, *tachys* + *kardia*], a rapid heartbeat of sudden onset and termination caused by a quick succession of discharges from an ectopic site in a ventricle.

parrot fever. See **psittacosis.**

parry fracture. See **Monteggia's fracture.**

pars /pärs/ *pl. partis* [L, part], a part, such as the pars abdominalis esophagi. See also **part.**

Parse, Rosemarie Rizzo, a nursing theorist who, in her *Man-Living-Health: A Theory of Nursing* (1981), synthesized Martha E. Rogers' principles and concepts (Science of Unitary Human Beings) and the work of existential phenomenologists. Parse's view of nursing is based on humanism as opposed to positivism. Her theory addresses the unity of humans' lived experience, the lived experience of health. She used the term *man* to express male and female. Man chooses from options and bears responsibility for choices. Parse deduces three principles of Man-Living-Health, each interrelated with three concepts: (1) meaning (ultimate meaning and the meaningful moments of life) with the concepts of imaging, valuing, and languaging; (2) rhythmicity (rhythmic patterns of living) with the concepts of revealing-concealing, enabling-limiting, and connecting-separating; and (3) cotranscendence (reaching out beyond self) with the concepts of powering, originating, and transforming. Parse proposes that nursing is a human science and rejects the traditional view of nursing as an emerging natural science. See also **Rogers, Martha E.**

pars fetalis. See **fetal placenta.**

pars flaccida, the thin and slack part of the tympanic membrane superior to the anterior and posterior malleolar folds. See also **pars tensa.**

pars interarticularis, a region of the vertebra between the superior and inferior facet joints that is susceptible to trauma.

Parsonage-Turner syndrome. See **neuralgic amyotrophy.**

pars planitis /pärz plā·nī′tis/, **1.** a granulomatous uveitis of the ciliary disk (pars plana of the ciliary body). **2.** intermediate uveitis.

pars tensa, the thick and taut part of the tympanic membrane. See also **pars flaccida.**

part [L, *pars*], a part of a larger area, such as the condylar part of the occipital bone. See also **pars.**

part-, prefix meaning "related to childbirth": *parturient, parturifacient, parturiometer.*

part. aeq., abbreviation for the Latin phrase *partes aequales,* meaning "in equal parts."

parthenogenesis /pär′thənōjen′əsis/ [Gk, *parthenos,* virgin, *genesis,* origin], a type of nonsexual reproduction in which an organism develops from an unfertilized ovum, as in many simpler animals. The development of the unfertilized ovum may be artificially induced through mechanical or chemical stimulation. Also called **unicellular reproduction.** *—parthenogenetic, parthenogenic, adj.*

partial anodontia, partial absence of the teeth. It is a relatively common congenital condition characterized by absence of one or more teeth because of absence of their anlage (or primordium), which is seldom associated with other anomalies. Also called **hypodontia.**

partial breech extraction. See **assisted breech.**

partial cleavage /pär′shəl/, mitotic division of only part of a fertilized ovum, usually the activated cytoplasmic part surrounding the nucleus. Compare **total cleavage.** See also **meroblastic.**

partial crown, a restoration that replaces some but not all surfaces of a tooth. Also called a *three-quarter crown.*

partial denture [L, *pars,* part, *dens,* tooth], a dental prosthesis, either fixed or removable, used to replace one or more missing teeth. Kinds of partial dentures include **articulated partial denture, bridgework, extension partial denture, fixed cantilever, fixed partial denture, removable partial denture, sectional denture,** and **unilateral denture.**

Removable partial denture *(Christensen, 2002)*

partial dislocation [L, *pars* + *dis* + *locare,* to place], the partial, abnormal separation of the articular surfaces of a joint. Also called **incomplete dislocation, subluxation.**

partial hospitalization program, an organizational entity that provides therapeutic services to patients who use only day or night hospital services or adult day health services rather than regular inpatient hospitalization services.

partial involution. See **uterine subinvolution.**

partial liquid ventilation, ventilatory support in which the lungs are filled to the level of the functional residual capacity with a liquid perfluorocarbon. Mechanical ventilation is then superimposed, and oxygen and carbon dioxide are transferred through the liquid.

partially acid-fast /pär′shəlē/, capable of retaining the stain carbolfuchsin during mild acid decolorization. This ability is found in bacteria of the genus ***Nocardia*** because of the presence of unusual long-chain fatty acids in their cell walls.

partially edentulous arch, a dental arch in which one or more but not all natural teeth are missing.

partial placenta previa, placenta previa in which the placenta is implanted in the lower uterine segment and partially covers the internal os of the uterine cervix. As the cervix dilates in labor, the part of the placenta that lies over the cervix is separated, causing bleeding from the villous spaces of the uterine wall. Depending on the degree of separation, the bleeding may be scant or severe, resulting in hemorrhage that is life-threatening to the mother and the baby. Treatment may require cesarean section if the pressure of the presenting part of the baby is not sufficient to tamponade the bleeding site, stopping the hemorrhage. Diagnosis of partial placenta previa may be made before bleeding occurs by ultrasonic visualization or digital palpation in the course of prenatal examination. See also **marginal placenta previa, placenta previa.**

partial pressure, the pressure exerted by any one gas in a mixture of gases or in a liquid, with the pressure directly related to the concentration of that gas to the total pressure of the mixture. The concentration of oxygen in the atmosphere represents approximately 21% of the total atmospheric pressure, calculated at 760 mm Hg under standard conditions. Therefore, the partial pressure of atmospheric oxygen is about 160 mm Hg (760 mm Hg × 0.21).

partial pressure of carbon dioxide in arterial blood ($PaCO_2$), the portion of total blood gas pressure exerted by carbon dioxide. It decreases during heavy exercise, during rapid breathing, or in association with severe diarrhea, uncontrolled diabetes, or diseases of the liver or kidneys. It increases with chest injuries or respiratory disorders. The reference interval is 35-45 mm Hg in arterial blood and 40-45 mm Hg in venous blood.

partial pressure of oxygen in arterial blood (PaO_2), the portion of total blood gas pressure exerted by oxygen. It is lower than normal in patients with asthma, obstructive lung disease, or certain blood diseases and in healthy individuals during vigorous exercise. The normal PaO_2 in arterial blood is 95-100 mm Hg.

partial response, the condition in which the maximum decrease in treated tumor volume is at least 50% but less than 100%.

partial root amputation. See **apicoectomy.**

partial shadowing, (in ultrasonics) a manifestation of decreased echo signal amplitudes returning from regions lying beyond an object in which the attenuation is higher than the average attenuation in adjacent overlying regions.

partial thromboplastin time (PTT), a test for detecting coagulation defects of the intrinsic system by adding activated partial thromboplastin to a sample of test plasma and to a control sample of normal plasma. The time required for the formation of a clot in test plasma is compared with that in the normal plasma. A delayed clotting time suggests an abnormality in one or more factors of the intrinsic system. If indicated, specific factor abnormalities can be identified by exposing the test plasma to a series of plasma samples with known factor deficiencies and observing for coagulation, which occurs only if the test plasma provides the missing clotting factors. PTT is one of the basic tests used to measure specific factor activity and to detect hemophilias. It can be used to monitor liver function and to monitor the activity of the anticoagulant heparin. The normal activated PTT in plasma is 25 to 45 seconds after the addition to the plasma sample of partial thromboplastin reagent and ionized calcium. Also called **activated partial thromboplastin time.** Compare **prothrombin time.** See also **hemostasis.**

partial volume artifact, an artifact caused by a mixture of tissues with different attenuation coefficients within any given voxel.

partial zona dissection (PZD), an older micromanipulation technique used in male factor infertility. A cut is made into the zona pellucida and spermatozoa are inserted.

participant, **1.** a subject in a research project. **2.** See **enrollee.**

participation in health care decisions, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal involvement in selecting and evaluating health care options to achieve a desired outcome. See also **Nursing Outcomes Classification.**

particle /pär′tikəl/ [L, *particula,* small part], **1.** any fundamental unit of matter. **2.** a minute fragment or speck.

particulate /pärtik′yəlit/, pertaining to a minute discrete particle or fragment of a substance or material.

-partite, suffix meaning "having the (specified) number of parts": *bipartite, tripartite, quadripartite.*

parts per million (PPM, ppm), the ratio of the amount of one substance to the amount of another, expressed as a unit of solute dissolved in one million units of solution. It denotes the number of units of one substance relative to one million units of another substance. It may be further expressed in terms of mass-to-mass, volume-to-volume, or another relationship of units of measure.

parturient /pärt(y)o͞o′rē·ənt/ [L, *parturire,* to desire to bring forth], pertaining to the act of childbirth.

parturition /pär′t(y)o͞orish′ən/ [L, *parturire,* to desire to bring forth], the process of giving birth.

part. vic, abbreviation for the Latin term *partes vicibus,* meaning "divided doses."

parulis. See **gumboil.**

paruresis, the inhibition of urination as a result of psychological or other reasons.

paruria /pəro͞or′ē·ə/, any defect of the urination process.

parvovirus B19 /pär′vōvī′rəs/, a small single-stranded deoxyribonucleic acid virus of the Parvoviridae family that infects humans, causing erythema infectiosum, aplastic crisis in hemolytic anemia, and other disorders. Another strain of the Parvoviridae, canine P2, causes acute enteritis and myocarditis in dogs.

parvovirus B19 antibody test, a blood test used to detect the presence of antibodies to the B19 parvovirus, a known human pathogen. The B19 virus is associated most commonly with erythema infectiosum (also called fifth disease), but also with joint inflammation, purpura, hydrops fetalis, and aplastic anemia.

parvule /pär′vyo͞ol/, a very small pill. Also called **pilule.**

PAS, PASA, abbreviation for **paraaminosalicylic acid.**

PASCAL /poskul′, paskal′/ [Blaise Pascal, French scientist, 1623–1662], a higher level computer compiler language, used to teach programming.

Pascal's principle /poskuls′, paskals′/ [Blaise Pascal], (in physics) a law stating that a confined liquid transmits pressure applied to it from an external source equally in all directions. Pascal's principle provides the basis for all hydraulic devices.

PASG, abbreviation for **pneumatic antishock garment.** See **military antishock trousers.**

pass. See **conditional discharge.**

passage /pas′ij/, **1.** an opening, channel, route, or gap. **2.** the movement of something from one place to another, as in evacuation of the bowels.

pass facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as arranging a leave for a patient from a health care facility. See also **Nursing Interventions Classification.**

passiflora /pas′iflôr′ə/, the passion flower, *Passiflora incarnata,* a climbing herb. It has flowers and fruiting tops that are the source of medications used as antispasmodics and sedatives and for the treatment of burns, dysmenorrhea, hemorrhoids, and insomnia.

passion flower, an herbal product derived from a perennial climbing vine that is native to tropical and subtropical areas of the Americas, also found in the southeastern United States.

■ USES: It is used orally for the treatment of insomnia and restlessness and gastrointestinal disturbances associated with nervousness. It is used topically for the treatment of hemorrhoids, burns, and inflammation. Other traditional uses include treatment of menopause, pain, palpitations, arrhythmias, and hypertension. It may be effective in relieving nervousness; there are insufficient reliable data regarding its effectiveness for other indications.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity.

passive [L *passivus*], pertaining to behavior that subordinates the individual's own interests to the demands of others.

passive-aggressive personality [L, *passivus* + *aggressus,* combative, *persona,* character], a personality characterized by a chronically negativistic disposition with passive resistance and aggression manifested by forceful actions or attitudes expressed in an indirect, nonviolent manner, such as pouting, obstructionism, procrastination, inefficiency, stubbornness, and forgetfulness. Compare **aggressive personality, passive-dependent personality.** See also **passive-aggressive personality disorder.**

passive-aggressive personality disorder, a *DSM-IV* psychiatric disorder characterized by the indirect expression of resistance to occupational or social demands. It results in persistent pervasive ineffectiveness, lack of self-confidence, poor interpersonal relationships, and pessimism that can lead in severe cases to major depression, alcoholism, or drug dependence. The behavior often reflects an unexpressed hostility or resentment stemming from a frustrating interpersonal or institutional relationship on which an individual is overly dependent. Treatment may consist of behavior therapy or any of the various psychotherapeutic procedures, depending on the individual and the severity of the condition.

passive algolagnia. See **masochism.**

passive anaphylaxis. See **antiserum anaphylaxis.**

passive carrier [L, *passivus* + OFr, *carier*], **1.** a healthy person whose body carries the causal organisms of an infectious disease although the person has not contracted the disease and remains symptomless. **2.** a person who carries a gene associated with a hereditary trait although the trait is not expressed in the person. Also called **symptomless carrier.**

passive clot, a clot that forms in an aneurysm when circulation is interrupted.

passive congestion [L, *passivus* + *congerere,* to heap together], an excessive amount of blood accumulation in an organ as a result of increased venous pressure.

passive-dependent personality [L, *passivus* + Fr, *dependre,* to depend; L, *persona,* character], a personality characterized by helplessness, indecisiveness, and a tendency to cling to and seek support from others. Compare **passive-aggressive personality.**

passive euthanasia, the ending of life by the deliberate withholding of drugs or other life-sustaining treatment.

passive exercise, repetitive movement of a part of the body as a result of an externally applied force or a voluntary effort to move another part of the body. Passive exercise can be used to prevent contractures and maintain joint mobility but does not promote muscle maintenance. Compare **active exercise.** See also **aerobic exercise, anaerobic exercise.**

passive expiration [L, *passivus* + *expirare,* to breathe out], normal exhalation that occurs without direct muscular effort, as during normal tidal breathing. Air is expelled from the lungs as a result of the recoil effect of elastic tissues in the chest, lungs, and diaphragm.

passive immunity, a form of acquired immunity resulting from antibodies that are transmitted naturally through the placenta to a fetus, through the colostrum to an infant, or artificially by injection of antiserum for treatment or prophylaxis. Passive immunity is not permanent and does not last as long as active immunity. Compare **active immunity.** See also **immune response, natural immunity.**

passive incontinence [L, *passivus* + *incontinentia*], urine overflow that may occur when the bladder (musculus detrusor vesicae) is paralyzed and greatly distended. See also **incontinence.**

passive lingual arch, an orthodontic appliance that may help maintain tooth space and dental arch length when bilateral primary molars are prematurely lost.

passive lung collapse [L, *passivus* + AS, *lungen* + L, *collabi*], a condition of dyspnea, cough, and hemoptysis with pigmented cells caused by an obstructed blood flow from the lungs to the heart.

passive motion [L, *passivus* + *motio*], involuntary motion caused by an external force rather than by voluntary muscular effort. See also **passive exercise.**

passive movement, the moving of parts of the body by an outside force without voluntary action or resistance by the individual. Also called **passive exercise.** Compare **active movement.**

passive play, play in which a person does not participate actively. For younger children such activity may include watching and listening to others, observing other children or animals, listening to stories, or looking at pictures. Older children are passively entertained by games and toys that require concentration and intellectual skill, such as chess, reading, listening to music, or watching television. Compare **active play.**

passive range of motion (PROM), the moving of a joint through its range of motion without exertion by the subject, usually done by an examiner who moves the person's body part manually.

passive recoil, the return of elastic tissue to its normal length and position when applied tension on the tissue is released.

passive sensitization [L, *passivus* + *sentire,* to feel], a temporary form of sensitization induced by injecting serum from a sensitized individual. See also **passive immunity.**

passive smoking, the inhalation by nonsmokers of the smoke from other people's cigarettes, pipes, or cigars. The amount of such smoke inhaled by a nonsmoker is small compared with that inhaled by tobacco users. However, passive smoking can aggravate respiratory illnesses and contribute to serious diseases, including cancer. Infants, fetuses, and individuals with chronic heart and lung diseases or allergies to tobacco can be adversely affected by passive smoking. See also **secondhand smoke.**

passive stretching, stretching that involves only noncontractile elements, such as ligaments, fascia, bursae, dura mater, and nerve roots. Examples include manipulation of a muscle, such as during therapeutic massage or during isometric exercises in which there is no range of motion of the body part involved.

passive symptom [L, *passivus* + Gk, *symptoma,* that which happens], a symptom that attracts little or no attention. Also called **static symptom.**

passive transfer, the conferring of immunity to a nonimmune host by injection of antibodies or lymphocytes from an immune or sensitized donor.

passive transfer test. See **Prausnitz-Küstner test.**

passive transport, the movement of small molecules across the membrane of a cell by diffusion. Passive transport occurs when the chemicals outside a cell become concentrated and start moving into the cell, changing the intracellular equilibrium. Passive transport is essential to various processes of metabolism, such as the intake of digestive products by the cells lining the intestines. Compare **active transport, osmosis.**

passive tremor. See **resting tremor.**

passivity /pəsiv′itē/ [L, *passivus*], a maladaptive mental state of submission, dependence, or inactivity.

Passy-Muir valve, a one-way speaking valve for use with tracheostomy tubes. Its normal position at rest is closed, so that it is open only during inhalation and closes during exhalation, allowing air to pass through the vocal folds for phonation.

paste /pāst/, a topical semisolid formulation containing a pharmacologically active ingredient in a fatty base, a viscous or mucilaginous base, or a mixture of starch and petrolatum. Typically it is used externally only.

Pasteur effect /pasto͞or′, pästœr′/ [Louis Pasteur, French chemist, 1822–1895], the inhibiting effect of oxygen on carbohydrate fermentation by living cells.

Pasteurella /pas′tərel′ə/ [Louis Pasteur], a genus of gram-negative bacilli or coccobacilli, including species pathogenic to humans and domestic animals. *Pasteurella* infections may be transmitted to humans by animal bites or scratches. The plague bacillus, *Pasteurella pestis,* is now called *Yersinia pestis; P. tularensis,* which causes tularemia, has been reclassified as *Francisella tularensis.*

Pasteurella pestis. See ***Yersinia pestis.***

pasteurellosis /pas′tərelō′sis/ [Louis Pasteur], a local wound infection, caused by the gram-negative bacillus *Pasteurella multicide,* which may be acquired through the bite or scratch of an infected animal, usually a cat.

pasteurization /pas′tərīzā′shən/ [Louis Pasteur; Gk, *izein,* to cause], the process of applying heat, usually to milk or cheese, for a specified period for the purpose of killing or retarding the development of pathogenic bacteria. *—pasteurize, v.*

pasteurized milk /pas′tərīzd/ [Louis Pasteur; Gk, *izein,* to cause; AS, *moluc,* milk], milk that has been treated by heat to destroy pathogenic bacteria. By law, pasteurization requires a temperature of 145° F to 150° F for not less than 30 minutes, followed by a temperature of 161° F for 15 seconds, followed by immediate cooling. Pasteurized milk is sometimes produced by using the high-temperature short-time method in which the milk is heated to 270° F for 1 second.

Pasteur, Louis [French chemist, 1822–1895], promoter of the germ theory of infection and developer of the pasteurization process to kill pathogenic organisms in milk. Pasteur also developed several vaccines and pioneered the development of stereochemistry by separating mirror image isomers.

Pasteur treatment [Louis Pasteur], a method of preventing rabies by daily injections of attenuated cultures of rabies virus cultured in the central nervous system tissues of rabbits.

The treatment, developed by Pasteur, is no longer used. See also **human diploid cell rabies vaccine.**

past health [ME, *passen,* to pass; AS, *hoelth,* sound body], (in a health history) an overall summary of the person's general health to date, including past injuries, allergies, surgical procedures, immunizations, hospitalizations, and obstetric and psychiatric history. The past health information is obtained from the person or the person's family at the initial interview and becomes part of the permanent record. See also **health history.**

Pastia's lines /pas′te·əz/ [Chessec Pastia, 20th century Romanian physician], lines of hyperpigmentation seen in the body folds in scarlet fever.

pastille /pastēl′, pas′til/, **1.** a gelatin-based sweetened and molded medication impregnated with a therapeutic substance intended to be sucked. See also **troche. 2.** a chemically treated paper disk that undergoes color changes when exposed to radiation. **3.** a small mass containing aromatic substances and benzoic acid that is burned for fumigation. Also spelled *pastil*.

pastoral counseling department /pas′tərəl/ [L, *pastor,* shepherd], the hospital chaplaincy service.

past pointing [OFr, *passer* + L, *punctus,* pricked], the inability to place a finger on another part of the body accurately, indicating a lack of coordination in voluntary movements.

Patau's syndrome. See **trisomy 13.**

patch [ME, *pacche*], a small spot of surface tissue that differs from the surrounding area in color or texture or both and is not elevated above it.

patch test, a skin test for identifying allergens, especially those causing contact dermatitis. The suspected substance (food, pollen, animal fur) is applied to an adhesive patch that is placed on the patient's skin. Another patch, with nothing on it, serves as a control. After a certain period (usually 24 to 48 hours) both patches are removed. If the skin under the suspect patch is red and swollen and the skin under the control area is not, the test result is said to be positive, and the person is probably allergic to that substance. Compare **radioallergosorbent test.**

Removing patch tests *(Marks and Miller, 2006)*

patek. See **yaws.**

patella /pətel′ə/ [L, small dish], a flat, large sesamoid bone at the front of the knee joint, having a pointed apex that attaches to the patellar ligament. The convex anterior surface of the bone is perforated for the passage of nutrient vessels and covered by an expansion from the tendon of the quadriceps femoris. Also called **kneecap.**

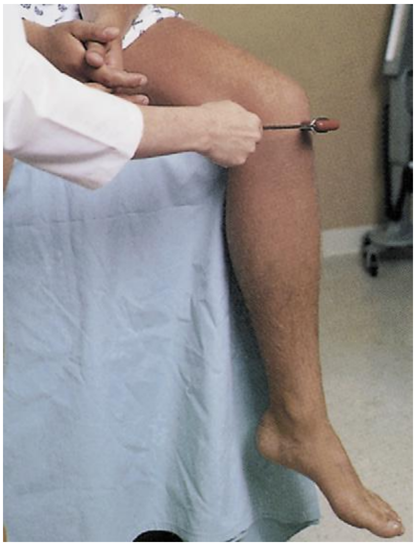
patellar /pətel′ər/ [L, *patella,* small dish], pertaining to the patella.

patellar-bearing supracondylar/suprapatellar (PTBSC/SP) socket, a type of patellar-tendon below-the-knee bearing prosthesis with a socket that extends in front, medially, and laterally to accommodate both the patella and the femoral condyles. The higher socket increases knee stability, and a suspension strap is not required.

patellar bursa [L, *patella,* small dish; Gk, *byrsa,* wineskin], any of the fluid-filled connective tissue sacs around the knee cap. Kinds of patellar bursae include **prepatellar,** and **suprapatellar.**

patellar ligament [L, *patella* + *ligare,* to bind], the central part of the common tendon of the quadriceps femoris. The ligament is a strong flat ligamentous band, about 8 cm long, attached proximally to the apex and the adjoining margins of the patella and distally to the tuberosity of the tibia. Its superficial fibers are continuous over the front of the patella with those of the tendon of the quadriceps femoris.

patellar reflex, a deep tendon reflex, elicited by a sharp tap on the tendon just distal to the patella, normally characterized by contraction of the quadriceps muscle and extension of the leg at the knee. The reflex is hyperactive in disease of the pyramidal tract above the level of the second lumbar vertebra. Also called **knee jerk reflex, quadriceps reflex.** See also **deep tendon reflex.**



Elicitation of the patellar reflex
(Elkin, Perry, and Potter, 2007)

patellar-tendon bearing (PTB) prosthesis, an ankle-foot orthosis that provides prolonged stretch to the posterior leg musculature and may create extension force at the knee joint.

patellar-tendon bearing supracondylar (PTB/SC) socket, a lower-leg prosthesis with supracondylar (above a condyle) and suprapatellar (above the patella) suspension.

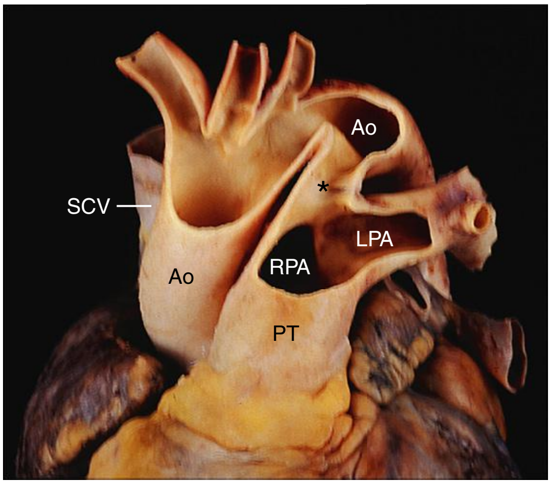
patellectomy /pat′əlek′təmē/ [L, *patella,* small dish; Gk, *ektomē,* excision], the surgical removal of the patella.

patellofemoral chondrosis, the softening or loss of smooth cartilage covering the back of the kneecap.

patency /pā′tənsē/ [L, *patens,* open], a state of being open or exposed.

patent /pā′tənt/ [L, *patens,* open], open and unblocked, such as a patent airway or a patent anus.

patent ductus arteriosus (PDA), an abnormal opening between the pulmonary artery and the aorta caused by failure of the fetal ductus arteriosus to close after birth. It is seen primarily in premature infants. The defect allows blood from the aorta to flow into the pulmonary artery and recirculate through the lungs, where it is reoxygenated and returned to the left atrium and left ventricle, placing an increased workload on the left side of the heart and causing increased pulmonary vascular congestion and resistance. Clinical manifestations include cardiomegaly, especially of the left atrium and left ventricle; dilated ascending aorta; bounding pulses resulting from increased systolic pressure; tachycardia; and a typical machinery-like murmur that is heard during all of systole and most of diastole. Characteristic auscultatory and radiological findings are sufficient to confirm diagnosis so that cardiac catheterization is not necessary. Correction is delayed until the child is old enough to tolerate surgery and until spontaneous closure, which sometimes occurs. Untreated complications include congestive heart failure, pulmonary vascular disease, calcification of the ductal site, and infective endocarditis. See also **congenital cardiac anomaly.**



Patent ductus arteriosus *(Damjanov and Linder, 2000)*

patent medicine [L, *patens,* open, *medicina*], a drug available to the general public without a prescription. The ingredients and contraindications are usually listed on the label or wrapper. Also called **OTC drug, proprietary drug.**

patent urachus, a congenital anomaly in which the urachus remains patent from the bladder to the umbilicus, with a channel that may be small or large and leakage of urine at the umbilicus.

paternal /pətur′nəl/ [L, *pater,* father], pertaining to fatherhood, characteristic of a father, or related through a father.

paternal engrossment. See **bonding.**

paternity test /pətur′nitē/ [L, *pater* + *testum,* crucible], a test based on genetic blood groups and used mainly to exclude the possibility that a particular man could be the father of a specific child. For example, a man with group AB blood could not be the father of a child with group O blood.

Paterson-Kelly syndrome. See **Plummer-Vinson syndrome.**

Paterson-Parker dosage system [James R.K. Paterson, English radiologist; H.M. Parker, twentieth-century American-English physicist], a radiotherapy system that uses sources of specific relative loadings arranged according to defined rules, which lead to a homogenous dose in the implanted region.

path [AS, *paeth*], a route or course along which something moves, such as a circuit of the nervous system that is followed by sensory or motor nerve impulses. See also **pathway.**

path-. See **patho-.**

path., **1.** abbreviation for **pathological. 2.** abbreviation for **pathology.**

-path, -pathic, -pathy, suffix meaning "disease or suffering": *cardiopath, naturopathic, osteopathy.*

pathetic /pəthet′ik/, pertaining to something that engenders emotions of sympathy, pity, and sadness.

-pathetic, -pathetical /pəthet′ik/, suffix meaning "emotions": *antipathetic, apopathetic, sympathetic.*

pathfinder, a thin, flexible cylindric instrument containing a series of filiform guides, used to locate strictures.

-pathic. See **-path.**

patho-, path-, prefix meaning "disease": *pathocrinia, pathoformic, pathography.*

pathodontia. See **dental pathology.**

pathogen /path′əjən/ [Gk, *pathos,* disease, *genein,* to produce], any microorganism capable of producing disease. **—pathogenic,** *adj.*

pathogenesis /-jen′əsis/ [Gk, *pathos* + *genesis,* origin], the source or cause of an illness or abnormal condition.

pathogenic /-jen′ik/ [Gk, *pathos,* disease, *genein,* to produce], capable of causing or producing a disease. Also called *pathogenetic.*

pathogenicity /-jənis′itē/, the ability of a pathogenic agent to produce a disease.

pathogenic occlusion, an abnormal closure of the teeth, capable of producing pathological changes in the teeth, supporting tissues, and related structures.

pathogenic theory of medicine. See **germ theory.**

pathognomonic /pəthog′nəmon′ik/ [Gk, *pathos* + *gnomon,* index], (of a sign or symptom) specific to a disease or condition, such as Koplik's spots on the buccal and lingual mucosa, which are indicative of measles.

pathognomonic symptom. See **symptom.**

pathological (path.) /-loj′ik/ [Gk, *pathos* + *logos,* science], pertaining to a condition that is caused by or involves a disease process.

pathological absorption, the assimilation of excremental liquids or bacterial substances within the bloodstream.

pathological amenorrhea [Gk, *pathos,* disease, *logos,* science, *a* + *men,* month, *rhoia,* to flow], a stoppage or absence of menstrual discharge from the uterus as a result of a disease.

pathological anatomy, (in applied anatomy) the study of the structure and morphological characteristics of the tissues and cells of the body as related to disease.

pathological diagnosis, a diagnosis arrived at by an examination of the substance and function of the tissues of the body, especially of the abnormal developmental changes in the tissues by histological techniques of tissue examination.

pathological fracture. See **neoplastic fracture.**

pathological histology [Gk, *pathos,* disease, *logos,* science, *histos,* tissue, *logos,* science], the study of the effects of disease on the structure, composition, and function of tissues.

pathological microorganisms [Gk, *pathos,* disease, *logos,* science, *mikros,* small, *organon,* instrument, *ismos,* condition], any microscopic life form, from a virus to a nematode, that has the potential to cause disease.

pathological mitosis, any cell division that is atypical, asymmetric, or multipolar and results in an unequal number of chromosomes in the nuclei of the daughter cells. It is indicative of malignancy, as occurs in cancer and the genetic anomalies.

pathological myopia, a type of severe, progressive nearsightedness characterized by changes in the fundus of the eye, posterior staphyloma, and deficient corrected acuity. Refractive error is greater than −8.00 diopters, and axial length is greater than 32.5 mm. Pathological myopia increases the risk of retinal detachment by affecting the curvature of the crystalline lens.

pathological physiology, **1.** the study of the physical and chemical processes involved in the functioning of diseased tissues. **2.** the study of the modification of the normal functioning processes of an organism caused by disease. Also called **morbid physiology.** See also **pathophysiology.**

pathological reflex [Gk, *pathos,* disease, *logos,* science; L, *reflectere,* to bend back], any abnormal reflex that is caused by a lesion in or an organic disease of the nervous system.

pathological retraction ring, a ridge that may form around the uterus at the junction of the upper and lower uterine segments during the prolonged second stage of an obstructed labor. The lower segment is abnormally distended and thin, and the upper segment is abnormally thick. The ring, which may be seen and felt abdominally, is a warning of impending uterine rupture. Also called **Bandl's ring.** Compare **constriction ring, physiological retraction ring.**

pathological sleep [Gk, *pathos,* disease, *logos,* science; AS, *slaep*], excessive sleep associated with a neurological disorder such as encephalitis lethargica, or sleeping sickness.

pathological triad, the combination of three respiratory disease conditions: bronchospasm, retained secretions, and mucosal edema. This triad is typically found in chronic bronchitis and asthma. It is treated with bronchodilators, hydration, mucolytics, and decongestants.

pathologist /pəthol′əjist/, a physician specializing in the study of disease. A pathologist usually specializes in autopsy or in clinical or surgical pathology.

pathologists' assistant, an allied health professional who, under the direct supervision of a licensed pathologist, participates in autopsies and in the examination, dissection, and processing of tissue specimens. Baccalaureate and master's degree programs are available.

pathology (path.) /pəthol′əjē/ [Gk, *pathos,* disease, *logos,* science], the study of the characteristics, causes, and effects of disease, as observed in the structure and function of the body. **Cellular pathology** is the study of cellular changes in disease. **Clinical pathology** is the study of disease by the use of laboratory tests and methods. **—pathological,** *adj.*

pathomimicry. See **Munchausen's syndrome.**

pathophysiology /-fiz′ē·ol′əjē/ [Gk, *pathos,* disease, *physis,* nature, *logos,* science], the study of the biological and physical manifestations of disease as they correlate with the underlying abnormalities and physiological disturbances. Pathophysiology does not deal directly with the treatment of disease. Rather, it explains the processes within the body that result in the signs and symptoms of a disease. **—***pathophysiological, adj.*

pathosis, a disease condition.

pathway [AS, *paeth* + *weg*], **1.** a network of neurons that provides a transmission route for nerve impulses from any part of the body to the spinal cord and the cerebral cortex or from the central nervous system to the muscles and organs. **2.** a chain of chemical reactions that produces various compounds in critical sequence, such as the Embden-Meyerhof pathway.

-pathy. See **-path.**

patient (pt.) /pā′shənt/ [L, *pati,* to suffer], **1.** a recipient of a health care service. **2.** a health care recipient who is ill or hospitalized. **3.** a client in a health care service.

patient advocate. See **ombudsman.**

patient assignment, a specialty capitation method in which patients choose a provider in each specialty represented. Capitation payments are then distributed accordingly to the providers selected.

patient care committee, a hospital staff organization, composed of medical, nursing, and other health professionals, with responsibility for monitoring all patient care practices to ensure that predetermined standards are met.

patient care technician, a health technician working under the supervision of a registered nurse, physician, or other health professional to provide basic patient care. Duties may include taking vital signs, obtaining blood and urine samples, performing basic diagnostic tests, and assisting the patient as needed.

patient compensation fund, a fund usually established by state law, commonly financed by a surcharge on malpractice premiums, and used to pay malpractice claims.

patient contracting, a nursing intervention from the Nursing Interventions Classification (NIC) defined as negotiating an agreement with an individual that reinforces a specific behavior change. See also **Nursing Interventions Classification.**

patient-controlled analgesia (PCA), a drug-delivery system that dispenses a preset intravascular dose of a narcotic analgesic when the patient pushes a switch on an electric cord. The device consists of a computerized pump with a chamber containing the drug. The patient administers a dose of narcotic intravenously when the need for pain relief arises. A lockout interval automatically inactivates the system if a patient tries to increase the amount of narcotic within a preset period.

Patient-controlled analgesia infusion pump
(Elkin, Perry, and Potter, 2011)

patient-controlled analgesia (PCA) assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating patient control of analgesic administration and regulation. See also **Nursing Interventions Classification.**

patient day (P.D.), a unit in a system of accounting used by health care facilities and health care planners. Each day represents a unit of time during which the services of the institution or facility are used by a patient; thus 50 patients in a hospital for 1 day would represent 50 patient days.

patient dumping, the premature discharge of Medicare or indigent patients from hospitals for economic reasons. A 1986 U.S. federal rule requires hospitals to advise Medicare patients on admission for treatment of their right to challenge what they consider as premature discharge after treatment. The regulation was adopted after initiation of a Medicare policy of paying hospitals according to a particular illness, regardless of the length of hospitalization, as an incentive for hospitals to reduce the period of inpatient care.

patient interview, a systematic interview of a patient, the purpose of which is to obtain information that can be used to develop an individualized plan for care. Also called **client interview.**

patient mix, **1.** the distribution of demographic variables in a patient population, often represented by the percentage of a given race, age, sex, or ethnic derivation. **2.** the distribution of indications for admission in a patient population, such as surgical, maternity, or trauma.

patient plan of care, a document developed after the patient assessment that identifies the nursing diagnoses to be addressed in the hospital or clinic. The plan of care includes the objectives, nursing interventions, and time frame for accomplishment and evaluation. It should be formulated with input from the patient and the patient's family.

Patient Protection and Affordable Care Act, a federal statute signed in 2010 designed to improve health care access in the United States through insurance reform.

patient record, a collection of documents that provides an account of each episode in which a patient visited or sought treatment and received care or a referral for care from a health care facility. The record is confidential and is usually held by the facility, and the information in it is released only to the patient or with the patient's written permission. It contains the initial assessment of the patient's health status, the health history, laboratory and radiological reports of tests performed, notes by nurses, physicians, and other health care professionals regarding the daily condition of the patient, and notes by consultants, as well as order sheets, medication sheets, admission records, discharge summaries, and other pertinent data. A problem-oriented medical record also contains a master problem list. The patient record is often a collection of papers held in a folder, but it may be computerized. Also called **chart.** See also **medical record.**

patient representative. See **ombudsman.**

patient representative services, hospital services provided by designated staff members relating to the investigation and mediation of patients' complaints and the promotion and protection of patients' rights. See also **ombudsman.**

patient rights protection, a nursing intervention from the Nursing Interventions Classification (NIC) defined as protection of health care rights of a patient, especially a minor, incapacitated, or incompetent patient unable to make decisions. See also **Nursing Interventions Classification.**

Patient's Bill of Rights, a list of the patient's rights promulgated by the American Hospital Association. It offers some guidance and protection to patients by stating the responsibilities that a hospital and its staff have toward them and their families during hospitalization, but it is not a legally binding document.

Patient Self-Determination Act, an act mandating that individuals enrolled in health care facilities are informed on admission in writing of their rights to formulate advance directives and to consent to or refuse treatment.

Patient Zero, an individual identified by the Centers for Disease Control and Prevention (CDC) as the person who introduced the human immunodeficiency virus in the United States. According to CDC records, Patient Zero, an airline steward, infected nearly 50 other persons before he died of acquired immunodeficiency syndrome in 1984.

Patrick test, a test for pain or dysfunction in the hip and sacroiliac joints in which overpressure is applied at the knee during flexion, abduction, and external rotation of the hip. While applying pressure on the knee, the examiner also applies counterpressure at the opposite anterior superior iliac spine. Also called **fabere sign, figure-four test.**

patrilineal /pat′rilin′ē·əl/ [L, *pater,* father, *linea,* line], pertaining to a line of descent through the male members of the family.

patten /pat′ən/, a metal support worn on a shoe to prevent weight-bearing on the opposite leg.

patterning /pat′ərning/ [ME, *patron*], a method of treatment or act of establishing a system or pattern of stimuli that will evoke a new set of responses. The process is commonly used to retrain people who have suffered a brain injury that disrupts normal sensory-motor activities.

patulous /pat′yələs/ [L, *patulus,* open], pertaining to something that is open or spread apart.

paucibacillary /paw′səbas′əlā-re/, containing just a few bacilli. See also **leprosy.**

pau d'arco, an herbal product harvested from an evergreen flowering tree native to Florida, the West Indies, Mexico, and Central/South America.

■ USES: It is used for cancer, inflammation, and infection. It is possibly unsafe when used orally in typical dosages; there are insufficient data regarding its efficacy for any indications.

■ CONTRAINDICATIONS: For those ignoring the general concerns related to personal safety, it should not be used during pregnancy and lactation, in children less than 18 years of age, or in those with hemophilia, von Willebrand's disease, thrombocytopenia, or known hypersensitivity.

Paul-Bunnell test [John R. Paul, American physician, 1893–1971; Walls W. Bunnell, American physician, 1902–1966], an old term for a blood test for heterophil antibodies, used for confirming a diagnosis of infectious mononucleosis. See also **heterophil antibody test.**

paruesis /pôrē′sis/, the inhibition of urination for psychological or other reasons.

Pautrier microabscess /pôtrēyā′/ [Lucien M.A. Pautrier, French dermatologist, 1876–1959; Gk, *mikros,* small; L, *abscedere,* to go away], an accumulation of intensely staining mononuclear cells in the epidermis characterizing malignant lymphoma of the skin, especially mycosis fungoides. See also **mycosis fungoides.**

Pauwels' fracture /pou′əlz/ [Friedrich Pauwels, twentieth-century German surgeon; L, *fractura,* break], a break in the proximal femoral neck with varying degrees of angulation.

Pavabid, a trademark for a smooth muscle relaxant **(papaverine hydrochloride).**

pavement epithelium. See **squamous epithelium.**

Pavlik harness, a device used to correct hip dislocations in infants with developmental dysplasia of the hip, consisting of a set of straps that hold the hips in flexion and abduction.

Pavlov, Ivan Petrovich /pav′lôv, pä′vlôf/, (1849–1936), a Russian physiologist who discovered a pattern of conditioned stimulus-reflex learning, the manner in which the physiological mechanism of digestion is controlled by the nervous system, and a theory of the causes and treatment of human neuroses.

pavor /pā′vôr/ [L, quaking], a reaction to a frightening stimulus, characterized by excessive terror.

pavor diurnus /dī·ur′nəs/, a sleep disorder occurring in children during daytime sleep in which they cry out in alarm and awaken in fear and panic. See also **sleep terror disorder.**

pavor nocturnus /noktur′nəs/, a sleep disorder occurring in children during nighttime sleep in which they cry out in alarm and awaken in fear and panic. See also **nightmare, sleep terror disorder.**

Pavulon, a trademark for a neuromuscular blocking agent **(pancuronium bromide).**

PAWP, abbreviation for **pulmonary artery wedge pressure.** See **pulmonary wedge pressure.**

Paxil, a trademark for a selective serotonin reuptake inhibitor (**paroxetine**).

Payr's clamp /pī′ərz/ [Erwin Payr, German surgeon, 1871–1946; AS, *clam,* fastener], a heavy clamp used in GI surgery.

Pb, symbol for the element **lead.**

PBL, abbreviation for *peripheral blood lymphocytes*.

PC, **1.** abbreviation for **professional corporation.** **2.** abbreviation for **personal computer.** **3.** abbreviation for the Latin *post cibum,* 'after meals.'

p.c., abbreviation for the Latin *post cibum,* "after meals."

PCB, abbreviation for **polychlorinated biphenyls.**

pcc, abbreviation for *precipitated calcium carbonate*.

PCC, abbreviation for **prothrombin complex concentrate.**

PCCM, abbreviation for **primary care case management.**

PCH, abbreviation for **paroxysmal cold hemoglobinuria.**

PCI, abbreviation for **percutaneous coronary intervention.**

PCIS, abbreviation for *Patient Care Information System,* an online computer system that contains full medical care data on all the residents or the patients in a facility.

PCLN, abbreviation for **psychiatric consultation liaison nurse.**

PCOS, abbreviation for **polycystic ovary syndrome.**

P.C.P., abbreviation for **primary care physician,** used by house staff or others to distinguish a patient's primary physician from university faculty, attending specialist physicians, or house staff. Also called **L.M.D., P.M.D.**

PCP, **1.** abbreviation for **phencyclidine hydrochloride.** **2.** abbreviation for ***Pneumocystis* pneumonia.** **3.** abbreviation for **primary care physician.**

PCR, **1.** abbreviation for **polymerase chain reaction.** **2.** abbreviation for **protein catabolic rate.**

PCT, abbreviation for **porphyria cutanea tarda.**

PCWP, abbreviation for **pulmonary capillary wedge pressure.** See **pulmonary wedge pressure.**

PD, abbreviation for **peritoneal dialysis.**

Pd, symbol for the element **palladium.**

p.d., abbreviation for the Latin *per diem,* "by the day."

P.D., PD, **1.** abbreviation for **patient day.** **2.** abbreviation for *Doctor of Pharmacy*. **3.** abbreviation for *prism diopter.* **4.** abbreviation for *pupil diameter.* **5.** abbreviation for *pupillary distance*. **6.** abbreviation for **pulse duration.**

PDA, **1.** abbreviation for **patent ductus arteriosus.** **2.** abbreviation for **personal digital assistant.**

PDL, abbreviation for **periodontal ligament.**

***PDR*,** abbreviation for ***Physicians' Desk Reference*.**

PE, abbreviation for **pulmonary embolism.**

PEA, abbreviation for **pulseless electrical activity.**

Peaceful End of Life Theory. See **Ruland, Cornelia M.** or **Moore, Shirley M.**

peak [ME, *pec*], the amount of medication in the blood that represents the highest level during a drug administration cycle.

peak acid output (PAO), on the pentagastrin test, after administration of pentagastrin, the sum of the two highest 15-minute outputs of gastric acid multiplied by 2, expressed as mmol/hr.

peak and trough specimens, serum samples collected to determine the level of an antibiotic or other pharmaceutic agent in the blood. Peak specimens, which represent the highest level, are generally collected ½ hour after the dose is given intravenously or 1 hour after it is given intramuscularly. Trough specimens, representing the lowest level, are generally collected approximately ½ hour before the next dose. See also **peak method of dosing.**

peak compressional pressure, (in ultrasonics) the temporal maximum positive pressure in a medium during the passage of a pulsed sound wave. It is expressed in pascals or megapascals.

peak concentration, the maximum amount of a substance or force, such as the highest concentration of a drug measured after it is administered.

peak expiratory flow, the greatest rate of airflow that can be achieved during forced expiration, beginning with the lungs fully inflated. Also called *peak expiratory flow rate*.

peak flow meter, an instrument for measuring the flow of air in the early part of forced expiration.

Peak flow meter *(Courtesy of Microlife USA, Inc.)*

peak height velocity, a point in pubescence in which the tempo of growth is the greatest.

peak level, the highest concentration, usually in the blood, that a substance reaches during the period under consideration, after which it declines, such as the highest blood glucose level attained during a glucose tolerance test.

peak method of dosing, the administration of a drug dosage so that a specified maximum level is reached to produce a desired effect, such as lowering the blood pressure.

peak mucus sign, a lubricative, cloudy-to-clear, white cervical mucus that occurs during periods of high estrogen levels, particularly at the time of ovulation. See also **spinnbarkeit.**

peak refractional pressure, (in ultrasonics) the temporal maximum negative pressure in a medium occurring during the passage of a pulsed ultrasound wave. It is expressed in pascals or megapascals.

Pean clamp, a curved or straight hemostatic clamp with serrations along the entire length of the jaw.

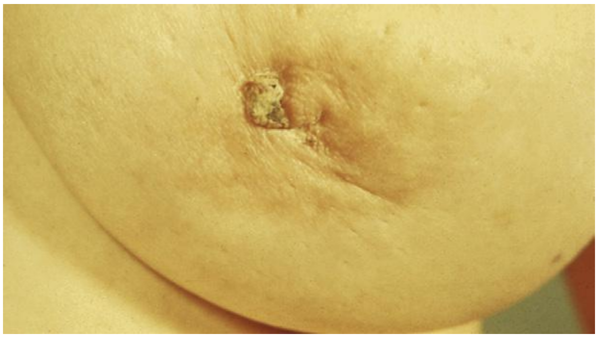
pearly penile papules. See **hirsutoid papilloma of the penis.**

pearly tumor. See **cholesteatoma.**

pear-shaped bladder, a urinary bladder with widening of the inferior section, seen in conditions such as pelvic lipomatosis, perivesical hematoma or urinoma, and lymphoma or lymphocyst.

Pearson's product movement correlation [Karl Pearson, English mathematician, 1857–1936], (in statistics) a statistical test of the relationship between two variables measured in interval or ratio scales. Correlations computed fall between +1.00 and −1.00. The closer to 1 (positive or negative), the higher the correlation.

peau d'orange /pō′dôräNzh′/ [Fr, skin of orange], a dimpling of the skin that gives it the appearance of the skin of an orange. It is common in advanced breast cancer.



Peau d'orange *(Skarin, 2010)*

pecilo-. See **poikilo-.**

Pecquet's cistern. See **chyle cistern.**

pecten /pek′tən/, **1.** a ridge extending laterally from the pubic tubercle to which the pectineal part of the inguinal ligament is attached. **2.** a vascular pleated membrane that extends from the optic disc to the vitreous humor in some animals.

pectenitis /pek′tənī′tis/, an inflammation of the anal canal, causing interference with the anal sphincter muscle.

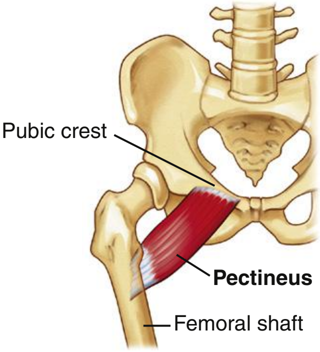
pecten pubis. See **pectineal line.**

pectin /pek′tin/ [Gk, *pektos,* congealed], a gelatinous carbohydrate substance found in fruits and succulent vegetables and used as the setting agent for jams and jellies and as an emulsifier and stabilizer in many foods. It also adds to the diet bulk necessary for proper GI functioning. See also **dietary fiber.**

pectinate muscles, the ridges that cover the walls of the atrium proper and the right auricle. Also called **musculi pectinati.**

pectineal ligament, the fibers that extend from the lacunar ligament along the pectineal line of the pelvic brim. Also called **Cooper's ligament.**

pectineal line, a ridge on the superior ramus of the pubic bone. Also called **pecten pubis.**



Pectineus muscle

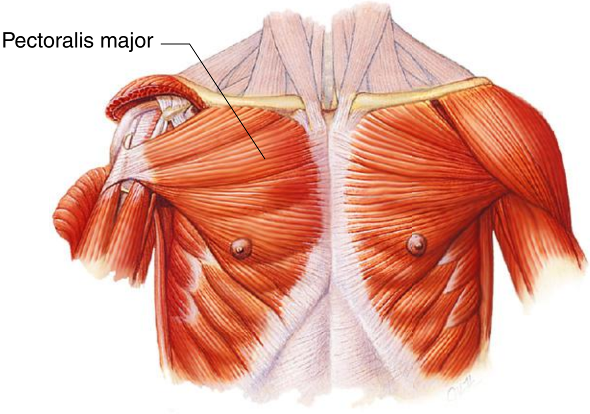
pectineus /pektin′ē·əs/ [L, *pecten,* comb], the most anterior of the five medial femoral muscles. It functions to flex and adduct the thigh and to rotate it medially. Compare **adductor brevis, adductor longus, adductor magnus, gracilis.**

pector-, prefix meaning "breast": *pectoralgia, pectoriloquy, pectorophony.*

pectoral /pek′tərəl/ [L, *pectus,* breast], pertaining to the thorax or chest.

pectoralgia /pek′tôral′jə/, a pain in the thorax.

pectoralis major /pek′tərā′lis, pek′tərəlis′/ [L, *pectus,* breast], a large muscle of the upper chest wall that acts on the joint of the shoulder. Thick and fan-shaped, it arises from the clavicle, the sternum, the cartilages of the second to the sixth ribs, and the aponeurosis of the obliquus externus abdominis. It serves to flex, adduct, and medially rotate the arm in the shoulder joint.



Pectoralis major *(Patton and Thibodeau, 2010)*

pectoralis minor, a thin triangular muscle of the upper chest wall beneath the pectoralis major. The base arises from the third, fourth, and fifth ribs on their upper outer surfaces. It inserts as a flat tendon into the coracoid process of the scapula. It functions to rotate the scapula, to draw it down and forward, and to raise the third, the fourth, and fifth ribs in forced inspiration. Compare **pectoralis major, subclavius.**

pectoriloquy /pek′təril′əkwē/, a phenomenon in which voice sounds, including whispers, are transmitted clearly through the pulmonary structures and are clearly audible through a stethoscope. It is often a sign of lung consolidation.

pectus carinatum. See **pigeon breast.**

pectus excavatum. See **funnel chest.**

ped-. See **pedia-.**

pedagogy /ped′əgōj′ē/ [Gk, *pais,* child, *agogos,* leader], the art and science of teaching children, based on a belief that the purpose of education is the transmittal of knowledge.

pedal /ped′əl/ [L, *pes,* foot], pertaining to the foot.

-pedal. See **-pedic.**

-pede. See **-ped.**

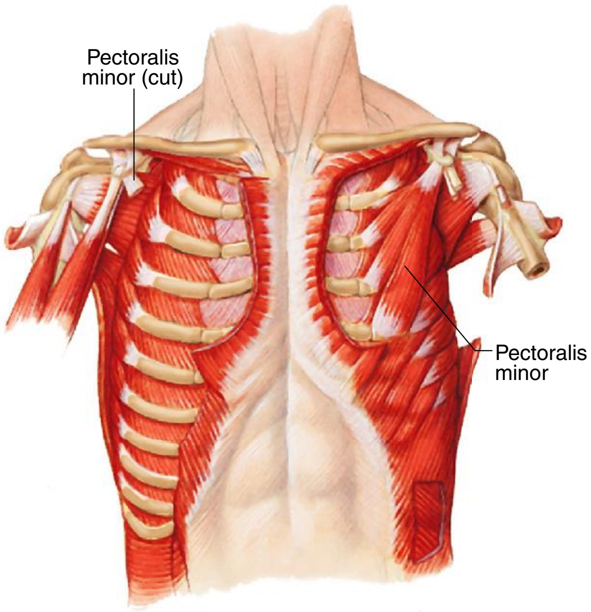
pederosis. See **pedophilia.**

pedes. See **pes.**

-pedia, -paedia, suffix meaning "to educate or a compendium of knowledge": *pharmacopedia, logopedia.*

Pediaflor, a trademark for a dental preparation (sodium fluoride) used in prophylaxis against dental caries in children.

Pedialyte, a trademark for a balanced solution containing various electrolytes.



Pectoralis minor *(Patton and Thibodeau, 2010)*

pedia-, ped-, pedo-, prefix meaning "child": *pediatric, pediatrician, pediatrics, pedodontics, pedophilia*.

pediatric /pē′dē·at′rik/ [Gk, *pais,* child, *iatreia,* treatment], pertaining to preventive and primary health care and treatment of children and the study of childhood diseases.

pediatric advanced life support (PALS), a system of critical care procedures and facilities, such as the intensive care nursery, for the basic and advanced treatment of seriously ill or injured infants and children. It includes the neonatal resuscitation program as recommended by the American Academy of Pediatrics and the American Heart Association.

pediatric anesthesia [Gk, *pais,* child, *iatreia,* treatment], a subspecialty of anesthesiology dealing with the anesthesia of neonates, infants, special needs patients, and children up to 12 years of age.

pediatric dentistry, the branch of dentistry devoted to the diagnosis and treatment of dental problems affecting children. Also called **pedodontics.**

pediatric dosage, the determination of the correct amount, frequency, and total number of doses of a medication to be administered to a child or infant. Such variables as the age, weight, body surface area, and ability of the child to absorb, metabolize, and excrete the medication must be considered, as well as the expected action of the drug, possible side effects, and potential toxicity. Various formulas have been devised to calculate pediatric dosage from a standard adult dose, although the most reliable method is to use one of the formulas to calculate the proportional amount of body surface area to body weight. See also **Clark's rule.**

pediatric hospitalization, the confinement of a child or infant in a hospital for diagnostic testing or therapeutic treatment. Regardless of age or the degree of illness or injury, hospitalization constitutes a major crisis in the life of a child, and the emotional trauma may elicit various behavioral reactions that the nurse must recognize and be prepared to cope with to facilitate recovery. The dominant factors influencing stress, which vary according to the child's developmental age, his or her previous experience with illness, and the seriousness of the condition, include separation from the parents and familiar environment, disruption of routine patterns of daily life, loss of independence, and worry about bodily injury or painful experiences. The nurse can minimize stress by preparing the child and family through prehospital counseling; by encouraging active parental participation in the child's care through rooming-in facilities or frequent visits; by maintaining as normal a daily routine as possible, especially with eating, sleeping, hygiene, and play activities; by explaining all hospital procedures and the immediate and long-term prognosis in terms that the child can easily understand; and by providing support and guidance for parents and siblings. Child life specialists can also be extremely helpful in teaching coping strategies to children and families during a hospitalization. The nurse also may use the hospital experience to foster an improved parent-child relationship and to teach other members of the family about proper health care. Emergency admission greatly increases the emotional trauma of hospitalization, making the nurse's role in counteracting negative reactions even more significant.

pediatrician /pē′dē·ətrish′ən/ [Gk, *pais,* child, *iatreia,* treatment], a physician who specializes in the development and care of infants and children and in the treatment of their diseases. Also spelled **paediatrician.** Also called **pediatrist** /pē′dē·at′rist/.

pediatric nurse practitioner (PNP), a nurse practitioner who, by advanced study and clinical practice, such as in a master's degree program or certificate program in pediatric nursing, has gained advanced knowledge in the nursing care of infants and children. See also **pediatric nursing.**

pediatric nursing, the branch of nursing concerned with the care of infants and children. Pediatric nursing requires knowledge of normal psychomotor, psychosocial, and cognitive growth and development, as well as of the health problems and needs of people in this age group. Preventive care and anticipatory guidance are integral to the practice of pediatric nursing. See also **pediatric nurse practitioner.**

pediatric nutrition, the maintenance of a proper well-balanced diet consisting of the essential nutrients and the adequate caloric intake necessary to promote growth and sustain the physiological requirements at the various stages of a child's development. Nutritional needs vary considerably with age, level of activity, and environmental conditions, and they are directly related to the rate of growth. In the prenatal period growth totally depends on adequate maternal nutrition. During infancy the need for calories, especially in the form of protein, is greater than at any postnatal period because of the rapid increase in both height and weight. From toddlerhood through the preschool and middle childhood years, growth is uneven and occurs in spurts, with a resulting fluctuation in appetite and calorie consumption. In general, the average child expends 55% of energy on metabolic maintenance, 25% on activity, 12% on growth, and 8% on excretion. The accelerated growth phase during adolescence has greater nutritional requirements, although food habits are often influenced by emotional factors, peer pressure, and fad diets. Inadequate nutrition, especially during critical periods of growth, results in retarded development or illness, such as anemia from deficiency of iron or scurvy from deficiency of vitamin C. The role of the nurse is to educate and give nutritional guidance for good eating habits. A special problem is overfeeding in the early childhood years, which may lead to obesity or hypervitaminosis.

See also **recommended dietary allowances** and specific vitamins.

pediatrics /pē′dē·at′triks/, a branch of medicine concerned with the development and care of infants and children. Its specialties are the particular diseases of children and their treatment and prevention. Also spelled **paediatrics.** Also called *(informal)* **peds.—pediatric,** *adj.*

pediatric surgery, the special preparation and care of the child undergoing surgical procedures for injuries, deformities, or disease. In addition to the usual fears and emotional trauma of illness and hospitalization, the child is especially concerned about being anesthetized. Younger children worry more about what will happen to them and how they will feel after awakening from anesthesia, whereas older children fear the operation itself and possible death, the loss of control while under anesthesia, and any change in body image or mutilation of parts. The role of the nurse is to prepare the child psychologically and physically for the particular surgical procedure and any postoperative reactions; to offer support to the parents and involve them as much as possible in the care, both before and after surgery; and to explain immediate and long-term prognoses. See also **pediatric hospitalization.**

pediatrist. See **pediatrician.**

-pedic, -pedal, suffix meaning “feet”: *arthrosteopedic, talipedic, velocipedic, orthopedic.*

pedicle [L, *pediculus,* little foot], a narrow stalk, stem, or tube of tissue attached to a tumor, skin flap, bone, or organ.

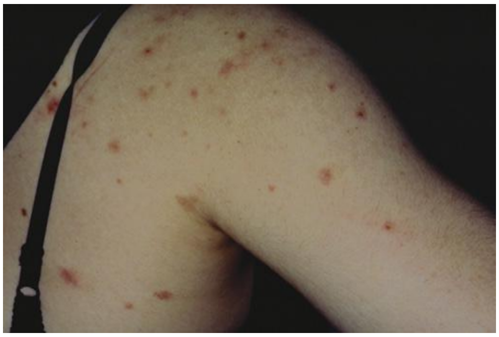
pedicle clamp /ped′ikəl/ [L, *pediculus,* little foot; ME, *clam,* fastener], a locking surgical forceps used for compressing blood vessels or pedicles of tumors during surgery. Also called **clamp forceps.**

pedicle flap operation, a surgical procedure for grafting gingival tissue from a donor site to the site of an isolated defect, usually a tooth surface denuded of attached gingiva.

pedicle of vertebral arch, one of the paired parts of the vertebral arch that connect a lamina to the vertebral body.

pediculicide /pədik′yo͞olisīd′/ [L, *pediculus,* little foot, *caedere,* to kill], any of a group of drugs that kill lice.

pediculosis /pədik′y͝oolō′sis/ [L, *pediculus* + *osis,* condition], an infestation with blood-sucking lice. *Pediculosis capitis* is infestation of the scalp with lice. *Pediculosis corporis* is infestation of the skin of the body with lice. *Pediculosis palpebrarum* is infestation of the eyelids and eyelashes with lice. **Pthirus pubis** (formerly called *pediculosis pubis*) is infestation of the pubic hair region with lice. An over-the-counter treatment is pyrethrin or permethrin containing topical agents. Malathion and lindane are other treatments, although misuse can result in neurotoxicity. See also **crab louse, lice.**



Pediculosis corporis *(Lemmi and Lemmi, 2000)*

pediculous /pədik′yələs/ [L, *pediculus*], infested with sucking lice.

Pediculus humanus capitis, a species of head lice.

Pediculosis capitis *(Callen et al, 2000/Courtesy Dr. Robert Zax)*

Pediculus humanus corporis, a species of body lice.

pedicure /ped′ikyo͞or/, care of the feet, especially trimming of the toenails.

pedigree /ped′əgrē/ [Fr, *pied de grue,* crane’s foot pattern], **1.** line of descent; lineage; ancestry. **2.** a chart that shows the genetic makeup of a person’s ancestors, used in the mendelian analysis of an inherited characteristic or disease in a particular family. It typically uses squares to represent males and circles to represent females. The figures may be unshaded, shaded, or partially shaded to designate normal individuals, those affected by the disease or trait, and those who are carriers. The generations are numbered with roman numerals at the left, with the most recent at the bottom, and members within each generation are designated by arabic numerals from left to right according to age, with the oldest at the left. The inquiry begins with the siblings of the affected person and proceeds to the parents and grandparents and any of their immediate relatives. See also **Punnett square.**

pedo-. See **pedia-.**

pedodontics. See **pediatric dentistry.**

pedogenesis /pē′dōjen′əsis/ [Gk, *pais,* child, *genesis,* origin], the production of offspring by young or larval forms of animals, often by parthenogenesis, as in certain amphibians. Also spelled **paedogenesis.** —*pedogenetic, adj.*

pedophilia /ped′əfil′ē·ə/ [Gk, *pais,* child, *philein,* to love], **1.** an abnormal interest in children. **2.** (in psychiatry) a psychosexual disorder in which the fantasy or act of engaging in sexual activity with prepubertal children is the preferred or exclusive means of achieving sexual excitement and gratification. It may be heterosexual or homosexual. Also spelled **paedophilia.** Also called **pederosis.** See also **paraphilia.** —*pedophilic, adj.*

-ped, -pede, suffix meaning “foot or feet”: *biped, taliped.*

peds. See **pediatrics.**

peduncle /pədung′kəl/ [L, *pes,* foot], a stemlike connecting part, such as the pineal peduncle or a peduncle graft. **—peduncular, pedunculate,** *adj.*

pedunculated /pədung′kyəlā′tid/ [L, *pes,* foot], pertaining to a structure with a stalk or peduncle.

pedunculotomy /pədung′kyəlot′əmē/, a surgical incision in a cerebral peduncle.

pedunculus /pədung′kyələs/ [L, *pes,* foot], a stalk, stem, or stalklike anatomical structure.

peeling, the loss of all or part of the epidermis, as may occur after a sunburn or exposure to a chemical.

PEEP, abbreviation for **positive end-expiratory pressure.**

peeping testis, an undescended testis in the peritoneal cavity that moves slightly across the internal inguinal ring.

Peeping Tom. See **voyeur.**

peer [L, *par,* equal], a person deemed an equal for the purpose at hand. A peer is usually a colleague or associate of roughly the same age or level of mental endowment.

peer review^1, an appraisal by professional coworkers of equal status of the way an individual health professional conducts practice, education, or research. The appraisal uses accepted standards as measures against which performance is weighed. See also **Professional Standards Review Organization.**

peer review^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as systematic evaluation of a peer's performance compared with professional standards of practice. See also **Nursing Interventions Classification.**

Peganone, a trademark for an anticonvulsant **(ethotoin).**

pegaptanib, a miscellaneous ophthalmic agent that binds to vascular endothelial growth factor, thereby inhibiting angiogenesis.

■ INDICATIONS: This drug is used in the treatment of neovascular age-related macular degeneration. It may be used alone or with photodynamic therapy.

■ CONTRAINDICATIONS: Ocular or periocular infections and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include retinal detachment and traumatic cataract. Common side effects include anterior chamber inflammation, blurred vision, conjunctival hemorrhage, corneal edema, cataract, eye discharge, eye pain, increased intraocular pressure, punctuate keratitis, reduced visual acuity, vitreous floaters, vitreous opacities, blepharitis, conjunctivitis, and photophobia.

pegaspargase, a modified version of the enzyme L-asparaginase used in cancer chemotherapy.

■ INDICATIONS: It is prescribed in the treatment of acute lymphoblastic leukemia, during a blast crisis of chronic lymphocytic leukemia, and during salvage therapy in non-Hodgkin's lymphoma. It may also be effective in those who are hypersensitive to other forms of the enzyme.

■ CONTRAINDICATIONS: It should not be given to patients with pancreatitis or those who have had significant hemorrhagic events associated with prior use of the enzyme or have experienced serious allergic reactions to the product.

■ ADVERSE EFFECTS: The side effects most often reported include chills, fever, nausea and vomiting, edema, pain, chemical hepatotoxicities, and coagulopathies.

pegfilgrastim /peg-fil-gras′tim/, a long-acting colony-stimulating factor produced by recombinant technology and used as an adjunct in patients with bone marrow suppression caused by antineoplastic therapy.

peginterferon alfa-2a, a covalent conjugate of recombinant interferon alfa-2a and polyethylene glycol, used in the treatment of chronic infection by hepatitis C virus. It is administered subcutaneously.

peginterferon alfa-2b, a covalent conjugate of recombinant interferon alfa-2b and polyethylene glycol, used in the treatment of chronic infection by hepatitis C virus. It is administered subcutaneously.

pegvisomant, a rarely used miscellaneous agent.

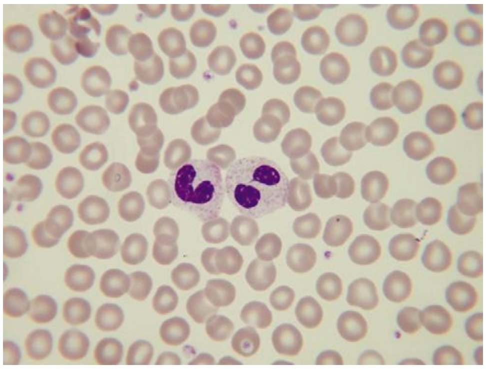
■ INDICATIONS: This drug is used to treat acromegaly in those patients who have an inadequate response to other treatment.

■ CONTRAINDICATIONS: Latex allergy and known hypersensitivity to this drug prohibit its use.

PEL, abbreviation for **permissible exposure limit.**

Pel-Ebstein fever /pel′ eb′stēn/ [Pieter K. Pel, Dutch physician, 1852–1919; Wilhelm Ebstein, German physician, 1836–1912], a fever recurring in cycles of several days or weeks, characteristic of Hodgkin's disease or other malignant lymphomas. Also called **Murchison fever.**

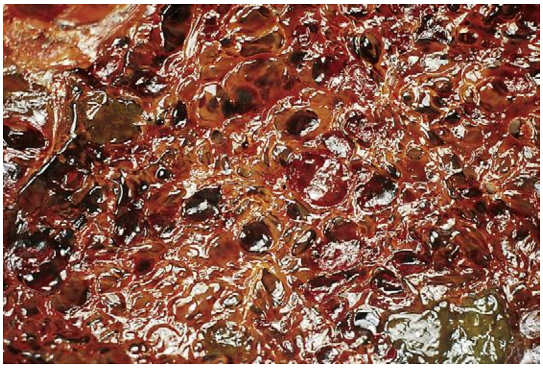
Pelger-Huët anomaly /pel′gər hyo͞o′ət/ [Karel Pelger, Dutch physician, 1885–1931; G.J. Huët, Dutch physician, 1879–1970; Gk, *anomalia,* irregular], an inherited disorder characterized by granulocytes with unusually coarse nuclear material and dumbbell-shaped or peanut-shaped nuclei. Normal nuclear segmentation does not occur, but there are no clinical consequences.



Pelger-Huët anomaly *(Goldman et al, 2012)*

pelidnoma /pel′idnō′mə/, a circumscribed elevated dark patch on the skin. Also called *pelioma*.

peliosis hepatitis /pel′ē·ō′sis/, the presence of blood-filled cavities in the liver. The cavities may become lined by endothelium and may be found in patients who are infected with human immunodeficiency virus or who use oral contraceptives or anabolic steroids.

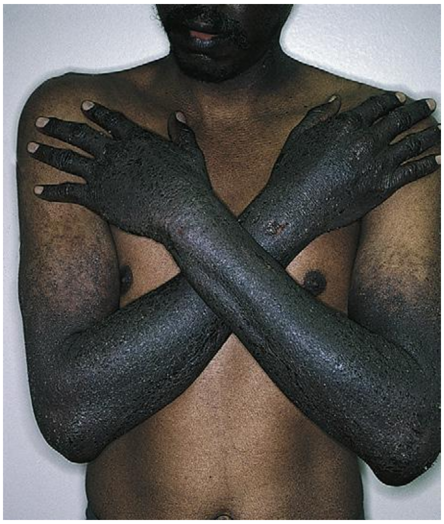


Peliosis hepatitis *(Fletcher, 2000)*

Pelizaeus-Merzbacher disease /pā′lētsā′o͞os·merts′bä·kər/ [Friedrich Pelizaeus, German physician, 1850–1917; Ludwig Merzbacher, German physician, 1875–1942], an X-linked leukoencephalopathy occurring in early life and running a slowly progressive course into adolescence or adulthood. It is marked by nystagmus, ataxia, tremor, choreoathetoid movements, parkinsonian facies, dysarthria, and mental deterioration. Pathologically, there is diffuse demyelination in the white substance of the brain that may involve the brainstem, cerebellum, and spinal cord. There is no cure. Treatment is symptomatic and supportive. Also called **familial centrolobar sclerosis, Merzbacher-Pelizaeus disease, Pelizaeus-Merzbacher sclerosis.**

pell-, prefix meaning “skin”: *pellagra, pellicle, pellicular.*

pellagra /pəlā′grə, pəlag′rə/ [It, *pelle,* skin, *agra,* rough], a disease resulting from a deficiency of niacin or tryptophan or a metabolic defect that interferes with the conversion of the precursor tryptophan to niacin. It once was commonly seen in individuals whose diet consisted primarily of corn, which is low in tryptophan. It is characterized by scaly dermatitis, especially of the skin exposed to the sun; glossitis; inflammation of the mucous membranes; diarrhea; and mental disturbances, including depression, confusion, disorientation, hallucination, and delirium. Treatment and prophylaxis consist of administration of niacin and tryptophan, usually in conjunction with other vitamins, particularly thiamine and riboflavin, and a well-balanced diet containing foods rich in these nutrients, such as liver, eggs, milk, and meat. Kinds of pellagra are **pellagra sine pellagra** and **typhoid pellagra.** Compare **kwashiorkor. —pellagrous,** *adj.*



Dermatitis caused by pellagra *(Callen et al, 2000)*

pellagra sine pellagra /sī′nē, sē′nə/, a form of pellagra in which the characteristic dermatitis is not present. See **pellagra.**

pellagrous. See **pellagra.**

Pellegrini’s disease /pel′əgrē′nēz/ [Augusto Pellegrini, Italian surgeon, b. 1877], ossification of the upper part of the medial collateral ligament, sometimes accompanied by bony growth at the internal condyle of the femur. The condition usually follows a leg injury. Also called *Pelligrini-Stieda disease.*

pellet /pel′it/, a pilule or very small pill.

pellicle /pel′ikəl/, **1.** a thin film or skin. **2.** a scum or crust on a solution.

pelo-, prefix meaning “mud”: *pelohemia, pelology, pelotherapy.*

pelotherapy /pē′lōther′əpē/, the treatment of certain conditions with baths or packs of mud, peat, or earth on part or all of the body surface.

pelves. See **pelvis.**

pelvi-, prefix meaning “pelvis”: *pelvimetry, pelvicophalometry.*

pelvic abscess [L, *pelvis,* basin, *abscedere,* to go away], a pus-producing lesion in the pelvic peritoneum, usually originating in the rectouterine pouch.

pelvic axis, an imaginary curved line that passes through the centers of the various anteroposterior diameters of the pelvis.

pelvic bones [L, *pelvis,* basin; AS, *ban*], a combination of the ilium, ischium, and pubis. Compare **innominate bone.**

pelvic brim, the curved top of the bones of the hip extending from the anterosuperior iliac crest in front on one side around and past the sacrum to the crest on the other side. Below the brim is the pelvis.

pelvic cellulitis, bacterial infection of the parametrium, occurring after childbirth or spontaneous or therapeutic abortion. It represents an extension of infection via the blood vessels and lymphatics from a primary wound infection in the external genitalia, perineum, vagina, cervix, or uterus. It is characterized by fever, uterine subinvolution, chills and sweats, abdominal pain that spreads laterally, and, if untreated, the formation of a large abscess and signs of peritonitis. It occurs most commonly between the third and the ninth days after delivery or abortion. Treatment includes an antibiotic, bed rest, IV fluids, and drainage of any abscess that forms. Oxytocics may be given to augment involution.

pelvic classification, **1.** a process in which the anatomical and spatial relationships of the bones of the pelvis are evaluated, usually to assess the adequacy of the pelvic structures for vaginal delivery. Caldwell-Moloy’s system of classification is the one most commonly used. **2.** one of the types in a classification system of the pelvis. See also **Caldwell-Moloy pelvic classification.**

pelvic congestion syndrome, an abnormal gynecological condition characterized by chronic low back pain, dysuria, dysmenorrhea, vague lower abdominal pain, vaginal discharge, and dyspareunia. The cause of the symptoms is not understood; formerly it was thought that the vascular bed of the area was distended with blood, but this has not been demonstrated. Women between 25 and 45 years of age are most often affected.

pelvic diameter [L, *pelvis,* basin; Gk, *diametros,* measuring across], **1.** at the rim of the pelvis, a line from the lumbosacral angle to the symphysis pubis. **2.** at the pelvic outlet, a line from the tip of the coccyx to the lower border of the symphysis pubis.

pelvic diaphragm, the inferior aspect of the body wall, stretched like a hammock across the pelvic cavity and comprising the levator ani and the coccygeus muscles. It holds the abdominal contents, supports the pelvic viscera, and is pierced by the anal canal, the urethra, and the vagina. It is reinforced by fasciae and muscles associated with these structures and with the perineum.

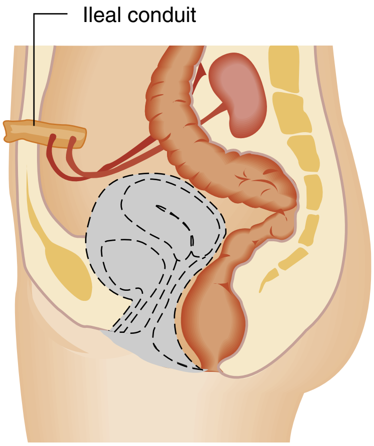
pelvic examination, a diagnostic procedure in which the external and internal genitalia are physically examined by inspection, palpation, percussion, and auscultation. It should be performed regularly throughout a woman’s life. See also **female reproductive system assessment.**

■ METHOD: The woman empties her bladder, disrobes, and puts on an examining gown. Breast examination is often carried out before the pelvic examination. The woman is made as comfortable as possible in the dorsal lithotomy position, her feet in stirrups and her buttocks at the very edge of the foot of the examining table, and is then draped. Particular attention is paid to the suprapubic area to detect any masses extending from the pelvis above the symphysis and to the groin to detect inguinal lymphadenopathy or hernia. If a mass is felt, percussion may be performed to delineate it. If pregnancy is suspected, palpation and percussion of the uterus and auscultation of fetal heart tones are attempted. The examiner then moves to the stool at the foot of the table between the patient’s legs. The labia majora are spread apart to permit inspection of the clitoris, the urethral meatus, the labia minora, and the vaginal vestibule. Any swelling, discoloration, lesion, scar, cyst, discharge, or bleeding is noted. Skene's and Bartholin's glands and ducts are palpated and milked, and any secretions expressed are evaluated and a specimen is spread on culture medium. The urethra is assessed for color and shape. The tone of the perineal and paravaginal musculature is assessed. Cystocele, rectocele, or varying degrees of uterine descensus may be observed as the woman is asked to bear down. The speculum is warmed, lubricated with warm water, and introduced gradually. The examiner is careful to direct the speculum along the axis of the vagina, which is at an angle of approximately 45 degrees to the axis of the table if the woman is lying flat. The speculum may need to be moved lightly from side to side to slip it over the vaginal rugae. The woman is advised that she may feel a stretching sensation. The speculum is gently opened and its position is adjusted to hold the vaginal folds out of the way to reveal the cervix. The color and condition of the vaginal epithelium are observed, and the position, size, and quality of the superficial epithelium are evaluated. Specimens for bacteriological study are obtained before the Papanicolaou (Pap) test. For the Pap test, scrapings of the endocervix and the cervix and a sample of the vaginal secretions may be secured on a Pap stick and an applicator and lightly spread on labeled glass slides. The slides are immediately sprayed or dipped into a fixative. Another method is a liquid-based Pap test, in which the endocervical and cervical secretions are sampled with a collection device and then deposited into a solution. The slide is made at the laboratory. This liquid may also be tested for human papillomavirus, which is known to be a causative factor for cervical cancer. The speculum is then closed, rotated slightly, removed from the vagina, and, if not disposable, rinsed or placed directly into a germicidal solution. In the bimanual part of the examination, two gloved fingers are well lubricated and inserted slowly and gently into the vagina. The examiner uses the opposite hand to apply pressure to the lower abdomen in several positions and directions to move the uterus, tubes, and ovaries into positions in which they may be felt. The size, shape, position, mobility, and consistency of the organs and tissues are evaluated, and any tenderness or discomfort is noted. Rectal or rectovaginal examination is then performed. Before the insertion of a finger in the anus, lateral pressure is applied to the sphincter, and the woman is urged to bear down lightly to relax the muscle and minimize discomfort.

■ INTERVENTIONS: Minor thoughtlessness or inadvertent movement may cause tension and make the examination more difficult for the woman and for the examiner. Instruments, culture materials, a light, drapes, and a gown are all made ready beforehand. The table, instruments, and drapes are clean and warm. Materials from previous examinations are not in evidence. The woman is forewarned of what to expect at each step of the examination. Gentleness and quietness are exercised at all times. On completion of the examination the woman is helped to slide well back on the table before sitting up. Syncope after pelvic examination is uncommon but not rare; there is risk of injury should the patient faint and fall from the examining table. The woman is observed briefly after sitting up before being left alone. She is then given tissues, a sanitary napkin or tampon, and a private area in which to dress.

■ OUTCOME CRITERIA: Pelvic examination may demonstrate many pelvic abnormalities and diseases. Cytological and bacteriological specimens are conveniently obtained. A pelvic examination cannot be satisfactorily performed without the cooperation of the woman being examined. Inadequate relaxation, obesity, extensive scarring, pelvic tenderness, and heavy vaginal discharge also may preclude an adequate examination.

pelvic exenteration /eksen′tərā′shən/, the surgical removal of all reproductive organs and their lymph nodes and en bloc removal of the rectum, distal sigmoid colon, urinary bladder, distal ureters, internal iliac vessels, entire pelvic floor with accompanying pelvic peritoneum, levator muscles, and perineum. Pelvic exenteration is the preferred treatment for recurrent or persistent carcinoma of the cervix after radiation therapy.



Anterior pelvic exenteration *(Black and Hawks, 2009)*

pelvic floor, the soft tissues enclosing the pelvic outlet.

pelvic floor electrical stimulation (PFES), functional electrical stimulation of the muscles of the pelvic floor, delivered through a vaginal or rectal probe, used in the treatment of stress incontinence.

pelvic girdle [L, *pelvis,* basin; AS, *gyrdel*], a bony ring formed by the hip bones, the sacrum, and the coccyx.

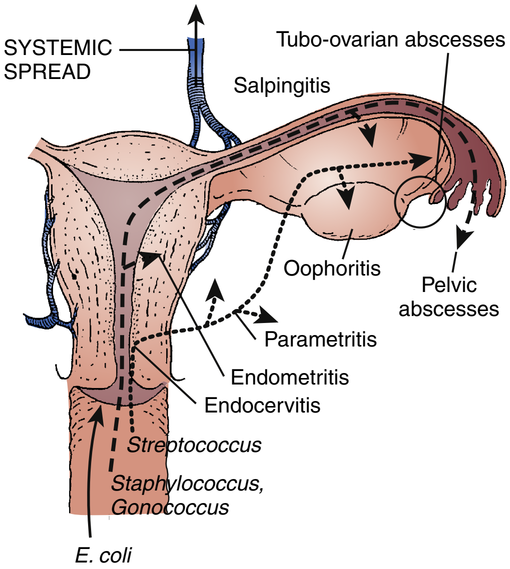
pelvic hematoma, an accumulation of blood in the soft tissues of the pelvis, as may occur during childbirth.

pelvic inferior aperture. See **pelvic outlet.**

pelvic inflammatory disease (PID), any inflammatory condition of the female pelvic organs, especially one caused by bacterial infection. Characteristics of the condition include fever; foul-smelling vaginal discharge; pain in the lower abdomen; abnormal uterine bleeding; pain with coitus; and tenderness or pain in the uterus, affected ovary, or fallopian tube on bimanual pelvic examination. If an abscess has already developed, a soft, tender fluid-filled mass may be palpated. Bed rest and antibiotics are usually prescribed, but surgical drainage of an abscess may be required. Severe, fulminating PID may necessitate hysterectomy to prevent fatal septicemia. If the cause is infection by gonococci or chlamydiae, the woman's sexual partners are also treated with antibiotics. Severe PID is usually very painful. The woman may be prostrate and require narcotic analgesia. Recurrent or severe PID often results in scarring of the fallopian tubes, obstruction, and infertility.

■ OBSERVATIONS: PID may be either acute or chronic. Acute onset typically occurs after onset of menses. Symptoms typically include progressive lower abdominal pain with guarding and rebound tenderness, fever, copious purulent cervical discharge, nausea and vomiting, malaise, urinary urgency and frequency, vaginal itching, and maceration. Chronic PID is manifested as chronic pain, menstrual irregularities, and recurrence and exacerbation of acute symptoms. Diagnosis is made through a clinical exam that reveals typical

Pelvic inflammatory disease *(Kumar et al, 2007)*



Routes of spread of pelvic inflammatory disease
(Black and Hawks, 2005)

symptomatology coupled with elevated WBCs and erythrocyte sedimentation rate plus a positive culture of secretions. On pelvic examination, moving of the cervix causes severe pain and rebound tenderness that is present in the abdomen. Transvaginal ultrasound may show thickened fluid-filled fallopian tubes or adnexal mass. MRI and laparoscopy may be used to detect pelvic abnormalities. Common complications include general peritonitis, sterility, and ectopic pregnancy.

■ INTERVENTIONS: Acute treatment is aimed at control and alleviation of infection with combinations of antiinfective drugs. Laparoscopy may be used to drain antibiotic-resistant abscesses, salpingolysis to remove adhesions, salpingostomy to reopen blocked fallopian tubes, and salpingo-oophorectomy for ruptured fallopian tubes or ectopic pregnancy. In vitro fertilization may be used in women with PID-induced sterility who wish to have children.

■ NURSING CONSIDERATIONS: Nursing plays a key role in prevention, early recognition, and prompt treatment. Education is aimed at reducing factors that place women at increased risk, such as unprotected sex, multiple sex partners, exposure to urethritis, or STDs, and frequent vaginal douching; recognizing conditions that make one more susceptible to PID, such as IUD insertion, recent abortion, or pelvic surgery, and improper use of antibiotics; and seeking treatment for any signs of vaginal infection, such as any evidence of abnormal vaginal odor or discharge. Acute care is supportive and aimed at adequate rest in a semi-Fowler's position and adequate hydration. IUDs require removal during treatment. Instruction is given about the proper use of antibiotics. Education stresses sexual abstinence and avoidance of tampons and douching during treatment. Sexual partners need to be tracked and treated if PID was associated with an STD.

pelvic inlet, (in obstetrics) the inlet to the true pelvis, bounded by the sacral promontory, the horizontal rami of the pubic bones, and the top of the symphysis pubis. Because the infant must pass through the inlet to enter the true pelvis and to be born vaginally, the anteroposterior, transverse, and oblique dimensions of the inlet are important measurements to be made in assessing the pelvis in pregnancy. There are three anteroposterior diameters: the true conjugate, the obstetric conjugate, and the diagonal conjugate. The true conjugate can be measured only on radiographic films because it extends from the sacral promontory to the top of the symphysis pubis. Its normal measurement is 11 cm or more. The obstetric conjugate is the shortest of the three. It extends from the sacral promontory to the thickest part of the pubic bone and measures 10 cm or more. The diagonal conjugate is the most easily and commonly assessed because it extends from the lower border of the symphysis pubis to the sacral promontory. It normally measures 11.5 cm or more. The inlet is said to be contracted when any of these diameters is smaller than normal. The anteroposterior diameters are shorter than normal in the small gynecoid and platypelloid pelvis. The transverse diameter of the inlet is bounded by the inferior border of the walls of the iliac bones and is measured at the widest point. It is normally close to 13.5 cm but may be less in the small gynecoid pelvis and anthropoid pelvis. The oblique diameters of the pelvis extend from the juncture of the sacrum and ilium to the eminence on the ilium on the opposite side of the pelvis. Each oblique diameter measures nearly 13 cm. This dimension is smaller than normal in the small gynecoid and platypelloid pelves. See also **android pelvis, anthropoid pelvis, gynecoid pelvis, platypelloid pelvis.**

pelvic kidney. See **ptotic kidney.**

pelvic lipomatosis, deposition of fat around the pelvic cavity, a disorder of unknown cause. As it progresses the fat may compress the pelvic organs, causing urinary tract, kidney, or other symptoms.

pelvic minilaparotomy /min′ēlap′ərot′əmē/, a surgical operation in which the lower abdomen is entered through a small suprapubic incision. It is performed most often for tubal sterilization but also for diagnosis and treatment of ectopic pregnancy, ovarian cyst, endometriosis, and infertility. It may be performed as an alternative to laparoscopy, often on an outpatient basis. The patient is placed in the supine position, and the abdomen is prepared with antiseptic solution and covered with sterile drapes. An incision a few centimeters long is made, usually transversely, in the suprapubic fold of skin in the midline and is then carried down through the fat and fascia, between the rectus abdominis muscles, and into the peritoneal cavity. Bleeding is ligated, and a small self-retaining retractor is placed in the incision. A laparoscope may be used for visualization. The sterilization or other procedure is performed. After hemostasis is ensured, each tube is replaced in its anatomical position, and the incision is closed in layers. Because incisional pain in the postoperative period may mask the pain of intraperitoneal bleeding, vital signs are monitored frequently. Tachycardia and hypotension not alleviated by analgesia may be signs of hemorrhage or injury to the bowel. Before discharge, outpatients are carefully instructed in postoperative danger signs and proper care of the incision at home. Arrangements are made for follow-up examination. Often minilaparotomy may be performed faster and less expensively than laparoscopy. Though small, the minilaparotomy incision is considerably larger than is the usual laparoscopy incision. It is therefore less pleasing cosmetically, as well as more painful in the postoperative period. Compare **laparoscopy.**

pelvic muscle exercise, a nursing intervention from the Nursing Interventions Classification (NIC) defined as strengthening and training the levator ani and urogenital muscles through voluntary, repetitive contraction to decrease stress, urge, or mixed types of urinary incontinence. See also **Nursing Interventions Classification.**

pelvic outlet, the space surrounded by the bones of the lower part of the true pelvis. In men the shape of the pelvic outlet is narrower than that in women, but this is of no clinical significance. In women the shape and size of the pelvis vary and are of importance in childbirth. The shapes are classified by the length of the diameters as compared with each other and by the thickness of the bones. The diameters of the outlet are the anteroposterior, from the symphysis pubis to the coccyx, and the intertuberous, laterally from one to the other ischial tuberosity. See also **pelvic classification.**

pelvic pain, pain in the pelvis, as occurs in appendicitis, oophoritis, and endometritis. The character and onset of pelvic pain and any factors that alleviate or aggravate it are significant in making a diagnosis.

pelvic part of ductus deferens, the distal part of the ductus deferens, where it is within the pelvic cavity and terminates at the ampulla ductus deferentis.

pelvic pole, the end of the axis at which the breech of the fetus is located.

pelvic presentation [L, *pelvis,* basin, *praesentare,* to show], a breech presentation.

pelvic rotation, one of the five major kinematic determinants of gait, involving the alternate rotation of the pelvis to the right and the left of the body's central axis. The usual pelvic rotation occurring at each hip joint in most healthy individuals is approximately 4 degrees to each side of the central axis. Pelvic rotation occurs during the stance phase of gait and involves a medial to lateral circular motion. During normal locomotion or walking, considered a progressive sinusoidal movement, pelvic rotation serves to minimize the vertical displacement of the body's center of gravity. Analysis of pelvic rotation is often a factor in diagnosis of various orthopedic diseases, deformities, and abnormal bone conditions and in the correction of pathological gaits. Compare **knee-ankle interaction, knee-hip flexion, lateral pelvic displacement, pelvic tilt.**

pelvic rotunda [L, *pelvis,* basin, *rotundus,* wheel], a part of the ear appearing as a funnel-shaped depression of the tympanum above the fenestra cochlea.

pelvic tilt, one of the five major kinematic determinants of gait that lowers the pelvis on the side of the swinging lower limb during the walking cycle. Through the action of the hip joint the pelvis tilts laterally downward, adducting the lower limb in the stance phase of gait and abducting the opposite extremity in the swing phase of gait. The knee joint of the non-weight-bearing limb flexes during its swing phase to allow the pelvic tilt. Pelvic tilt helps minimize the vertical displacement of the body's center of gravity, thus conserving energy during walking. It is often a factor in the diagnosis and treatment of various orthopedic diseases, deformities, and abnormal conditions and in the analysis and correction of pathological gaits. Compare **knee-ankle interaction, knee-hip flexion, lateral pelvic displacement, pelvic rotation.**

pelvic ultrasonography, an ultrasound examination of a woman performed to identify paracervical, endometrial, or ovarian pathology or the risk of fetal abnormalities.

pelvic varicocele. See **ovarian varicocele.**

pelvifemoral /pel′vēfem′ərəl/ [L, *pelvis,* basin, *femur,* thigh], pertaining to the structures of the hip joint, especially the muscles and the area around the bony pelvis and the head of the femur that make up the pelvic girdle.

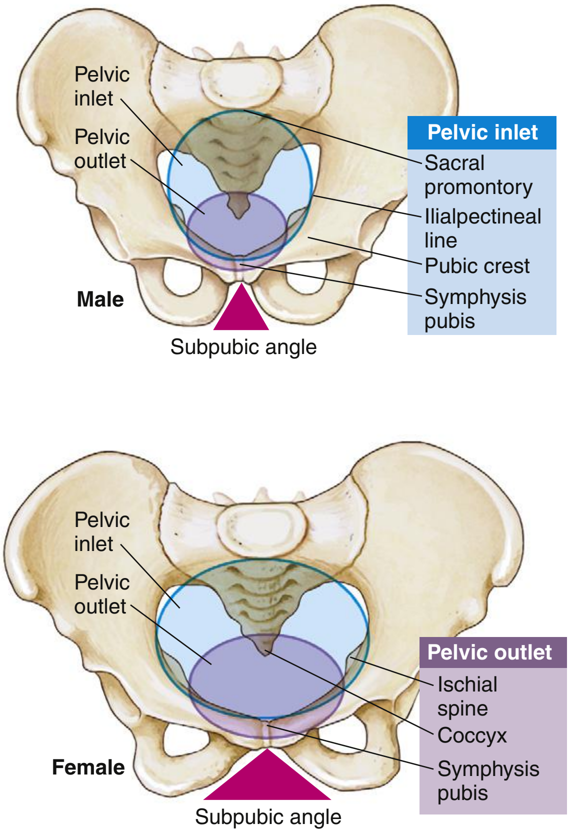
pelvifemoral muscular dystrophy. See **Leyden-Möbius muscular dystrophy.**

pelvimeter /pelvim′ətər/ [L, *pelvis,* basin; Gk, *metron,* measure], a device for measuring the diameter and capacity of the pelvis.

pelvimetry /pelvim′ətrē/, the act or process of determining the dimensions of the bony birth canal. Kinds of pelvimetry are **clinical pelvimetry** and **x-ray pelvimetry.**

pelviotomy. See **pubiotomy.**

pelvis /pel′viz/ *pl.* **pelves** [L, basin], the lower part of the trunk of the body, composed of four bones, the two innominate bones laterally and ventrally and the sacrum and coccyx posteriorly. It is divided into the greater, or false, pelvis and the lesser, or true, pelvis by an oblique plane passing through the sacrum and the pubic symphysis. The greater pelvis is the expanded part of the cavity situated cranially and ventrally to the pelvic brim. The lesser pelvis is situated distally to the pelvic brim, and its bony walls are more complete than those of the greater pelvis. The inlet and outlet of the pelvis have three important diameters: anteroposterior, oblique, and transverse. The pelvis of a woman is usually less massive but wider and more circular than that of a man. Also called **true pelvis.** —pelvic, *adj.*



Comparison of male and female bony pelvis
(Patton and Thibodeau, 2010)

pelvisacral /pel′visā′krəl/, pertaining to the pelvis and sacrum.

pelvospondylitis ossificans /pel′vōspon′dilī′tis/, inflammation of the pelvic part of the spine with deposits of bony material between the sacral vertebrae.

PEM, abbreviation for **protein-energy malnutrition.**

pemetrexed, an antineoplastic-antimetabolite.

■ INDICATIONS: This drug is used in combination with cisplatin in the treatment of malignant pleural mesothelioma and as a single agent in the treatment of non–small cell lung cancer.

■ CONTRAINDICATIONS: Pregnancy, an absolute neutrophil count less than 1500 cells/mm^3, a creatinine clearance count of less than 45 mL/min, thrombocytopenia (less than 100,000/mm^3), anemia, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include creatinine elevation. Life-threatening effects include thrombosis and embolism, renal failure, neutropenia, leukopenia, thrombocytopenia, myelosuppression, anemia, and infection with or without neutropenia. Common side effects include fatigue, fever, mood alteration, neuropathy, chest pain, nausea, vomiting, anorexia, diarrhea, ulcerative stomatitis, constipation, dysphagia, dehydration, rash, desquamation, and dyspnea.

pemirolast /pĕ-mir′o-last′/, a mast cell stabilizer that inhibits type I hypersensitivity reactions, administered topically to the conjunctiva as the potassium salt to prevent pruritus associated with allergic conjunctivitis.

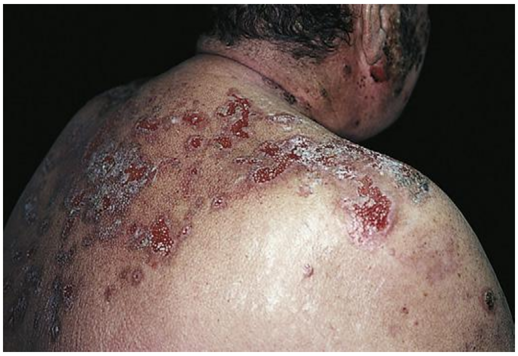
pemphigoid /pem′figoid/ [Gk, *pemphix*, bubble, *eidos*, form], a bullous disease resembling pemphigus, distinguished by thicker-walled bullae arising from erythematous macules or urticarial bases. Oral lesions are uncommon. It may rarely be associated with an internal malignancy. Spontaneous remission occasionally occurs after several years. Treatment usually includes oral corticosteroids. Compare **pemphigus.**

pemphigus /pem′figəs, pemfī′gəs/ [Gk, *pemphix*, bubble], an uncommon, severe disease of the skin and mucous membranes, characterized by thin-walled bullae arising from apparently normal skin or mucous membrane. The bullae rupture readily, leaving raw patches. The person loses weight, becomes weak, and is subject to major infections. Treatment with corticosteroids and other immunosuppressive medications has changed the prognosis of this disease from almost certain fatality to a controllable problem compatible with a nearly normal life. The cause is unknown. Compare **pemphigoid.**

pemphigus chronicus. See **pemphigus vulgaris.**

pemphigus erythematosus. See **erythematous pemphigus.**

pemphigus vulgaris [Gk, *pemphix*, bubble; L, *vulgus*, common], a chronic, progressive autoimmune disease that is often fatal, characterized by the formation of bullae on otherwise normal oral mucosal membrane. Also called **pemphigus chronicus.**



Pemphigus vulgaris *(Callen et al, 2000)*

penbutolol /pen-bu′tah-lol/, a beta-adrenergic blocking agent with intrinsic sympathomimetic activity. It is used as an antihypertensive in the form of the sulfate salt.

penciclovir /pen-si′klo-vir/, a compound that inhibits viral DNA synthesis in herpesviruses 1 and 2, used in the treatment of recurrent herpes labialis. It is applied topically.

Pender, Nola J. [b. 1941], a nursing theorist who first presented her Health Promotion Model for nursing in her book *Health Promotion in Nursing Practice* (1982). She developed the idea that promoting optimal health supersedes preventing disease. Pender's theory identifies cognitive-perceptual factors in the individual, such as importance of health, perceived benefits of health-promoting behaviors, and perceived barriers to health-promoting behaviors. These factors are modified by demographic and biological characteristics and interpersonal influences, as well as situational and behavioral factors. They help predict participation in health-promoting behavior. The individual's definition of health for himself or herself has more importance than a general statement about health. A major assumption in Pender's theory is that health, as a positive high-level state, is assumed to be a goal toward which an individual strives.

pendular nystagmus [L, *pendulus*, hanging down; Gk, *nystagmos*, nodding], an undulating involuntary movement of the eyeball.

pendulous /pen′dələs/, hanging loose or lacking proper support.

pendulous abdomen [L, *pendulus*, hanging down, *abdomen*], an abnormal condition in which the anterior abdominal wall becomes relaxed and allows the abdomen to hang down over the pubic region.

-penem, suffix for certain antibiotics, including analogs of penicillanic acid.

penetrance /pen′ətrəns/ [L, *penetrare*, to penetrate], the regularity with which an allele is expressed in a person who carries it. If an allele always produces its effect on the phenotype, it is fully penetrant. Achondroplasia is caused by a fully penetrant allele; if the allele is present, achondroplasia results. If an allele produces its effect less frequently than 100% of the time, it is not fully penetrant. Retinoblastoma develops in 90% of the children carrying the allele for the disease; in 10% of children the allele is nonpenetrant. —*penetrant, adj.*

penetrate /pen′ətrāt/ [L, *penetrare*], **1.** *v*, to enter or pierce a barrier. **2.** *adj*, pertaining to the degree to which x-rays pass through matter.

penetrating wound /pen′ətrā′ting/ [L, *penetrare* + AS, *wund*], a wound that breaks the skin and enters into a body area, organ, or cavity.

penetration /pen′ətrā′shən/, **1.** a piercing or entering. **2.** intellectual discernment. **3.** a stage in establishment of a viral infection in which the viral genetic material enters the host cell through fusion, phagocytosis, or injection.

penetrometer. See **stepwedge.**

-penia, suffix meaning a "(specified) deficiency": *glycopenia, lipopenia, thyropenia.*

penicillamine /pen′isil′əmēn/, a chelating agent.

■ INDICATIONS: It is prescribed for the treatment of Wilson's disease and cystinuria and can be prescribed to bind with and remove heavy metals from the blood when there is poisoning resulting from metals such as copper, lead, mercury, arsenic, and gold (succimer is preferred for lead and mercury toxicity). It is also prescribed as a palliative in the treatment of systemic sclerosis (scleroderma) and rheumatoid arthritis when other medications have failed.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or penicillamine-related aplastic anemia prohibits its use. It is not given to patients who are pregnant or who have kidney dysfunction.

■ ADVERSE EFFECTS: Among the more serious adverse effects are fever, rashes, and blood dyscrasias. Severe bone marrow depression and immune disorders have been associated with long-term use of this drug. D-penicillamine is less toxic than the L form, and much of the reported toxicity is caused by the use of the L or DL form.

penicillic acid /pen′isil′ik/, an antibiotic compound isolated from various species of the fungus ***Penicillium.***

penicillin /pen′isil′in/ [L, *penicillus,* paintbrush], any one of a group of antibiotics derived from cultures of species of the fungus ***Penicillium*** or produced semisynthetically. Various penicillins administered orally or parenterally for the treatment of bacterial infections exert their antimicrobial action by inhibiting the biosynthesis of cell-wall mucopeptides during active multiplication of the organisms. Penicillin G is a widely-used therapeutic agent for meningococcal, pneumococcal and streptococcal infections; syphilis; and other diseases. It is rapidly absorbed when injected intramuscularly or subcutaneously, but it is inactivated by gastric acid and hydrolyzed by penicillinase produced by most strains of *Staphylococcus aureus*. Penicillin V is also active against gram-positive cocci, with the exception of penicillinase-producing staphylococci, and, because it is resistant to gastric acid, it is effective when administered orally. Penicillins resistant to the action of the enzyme penicillinase (beta-lactamase) are cloxacillin, dicloxacillin, methicillin, nafcillin, and oxacillin. Ampicillin and amoxicillin are broad-spectrum aminopenicillins active against gram-negative organisms, including *Escherichia coli, Haemophilus influenzae, Neisseria gonorrhoeae, Salmonella, Shigella,* and *Proteus mirabilis*. Extended-spectrum penicillins include carbenicillin, piperacillin, and ticarcillin. These drugs are effective against the same bacteria killed by the aminopenicillins and are also effective against a number of additional bacteria, including species of *Pseudomonas, Enterobacter, Klebsiella, Proteus,* and *Bacteroides*. Hypersensitivity reactions are common in patients receiving penicillin and may appear in the absence of prior exposure to the drug, presumably because of unrecognized exposure to a food or other substance containing traces of the antibiotic. The most common hypersensitivity reactions are rash, fever, and bronchospasm, followed in frequency by vasculitis, serum sickness, and exfoliative dermatitis. In some patients severe erythema multiforme accompanied by headache, fever, arthralgia, and conjunctivitis (Stevens-Johnson syndrome) develop. The most frequent cause of anaphylactic shock is an injection of penicillin.

penicillinase /pen′əsil′ənās/, an enzyme elaborated by certain bacteria, including many strains of staphylococci, that inactivates penicillin and thereby promotes resistance to the antibiotic. A purified preparation of penicillinase, derived from cultures of saprophytic spore-forming ***Bacillus cereus,*** is used in the treatment of adverse reactions to penicillin. Also called **beta-lactamase.**

penicillinase-producing *Neisseria gonorrhoeae* (PPNG), those strains of *Neisseria gonorrhoeae* that are resistant to the effects of penicillin because of the production of penicillinase (beta-lactamase).

penicillinase-producing staphylococci, strains of staphylococcal organisms that elaborate the penicillin-inactivating enzyme penicillinase (beta-lactamase) and thereby resist the bactericidal action of the antibiotic.

penicillinase-resistant antibiotic, an antimicrobial agent that is not rendered inactive by penicillinase, an enzyme produced by certain bacteria, especially by strains of staphylococci. The semisynthetic penicillins cloxacillin sodium, dicloxacillin sodium, methicillin sodium, nafcillin sodium, and oxacillin sodium resist the action of penicillinase and are used in treating infections caused by staphylococci that elaborate the enzyme.

penicillin G benzathine, a long-acting depot form of penicillin.

■ INDICATIONS: It is used primarily for the treatment of syphilitic infection outside the central nervous system. It is given by deep intramuscular injection to achieve steady concentrations in the plasma and to slow systemic absorption from the repository in the muscle. Absorption occurs in a period that ranges from 12 hours to several days. It may be administered as prophylaxis against susceptible strains of bacteria, primarily gram-positive bacteria.

■ CONTRAINDICATIONS: Hypersensitivity to this drug or to other penicillins prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse effect is anaphylaxis. The most common side effects are diarrhea, maculopapular rash, urticarial rash, fever, bronchospasm, vasculitis, serum sickness, and exfoliative dermatitis.

penicillin G potassium, a narrow-spectrum antibiotic for parenteral use.

■ INDICATIONS: It is prescribed in the treatment of many gram-positive bacterial infections (generally excluding *Staphylococcus*), some gram-negative infections (e.g., *Neisseria*), syphilis, and some anaerobes.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to any penicillin prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are allergic reactions that vary from minor skin rashes to anaphylaxis. Nausea and diarrhea occur frequently.

penicillin V, a narrow spectrum bacterial antibiotic for oral administration. Also called *penicillin phenoxymethyl*.

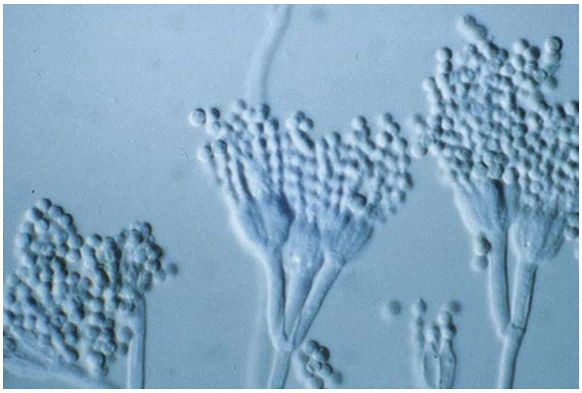
■ INDICATIONS: It is prescribed for prophylaxis against rheumatic fever and in the treatment of ear, nose, throat, skin, and urinary tract infections caused by susceptible bacterial strains (primarily gram-positive bacteria).

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to any penicillin prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are anaphylaxis and urticaria.

penicilliosis /pen′isil′ē·ō′sis/ [L, *penicillus,* paintbrush; Gk, *osis,* condition], pulmonary infection caused by fungi of the genus ***Penicillium.***

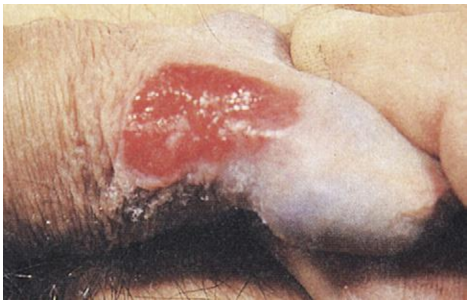
Penicillium /pen′isil′ē·əm/ [L, *penicillus,* paintbrush], a genus of imperfect fungi, some species of which have been tentatively linked to disease in humans, most notably in immunocompromised patients. Many species are commonly found in the human environment. Penicillin G is obtained from *Penicillium chrysogenum* and *P. notatum*.



***Penicillium* species** *(Mahon, Lehman, and Manuselis, 2011)*

penile /pē′nīl/ [L, penis], pertaining to the penis.

penile cancer /pē′nīl/ [L, *penis,* penis, *cancer,* crab], a rare malignancy of the penis generally occurring in uncircumcised men and associated with genital herpesvirus infection and poor hygiene. It is often mistaken for a venereal wart. Smegma may be a causative factor, but the specific substance and mechanism are unknown. Leukoplakia or the flat-topped papules of balanitis xerotica obliterans may be premalignant lesions, and the velvety red painful papules of Queyrat's erythroplasia are penile squamous cell carcinoma in situ. Cancer of the penis usually presents as a local mass or a bleeding ulcer and metastasizes early in its course. Surgical treatment involves partial or total amputation of the penis and excision of inguinal nodes and adjacent tissue when necessary. Radiotherapy is often used preoperatively and postoperatively. Methotrexate or bleomycin also may be administered, especially in metastatic disease. Postoperative nursing intervention includes observation and assessment for depression caused by body image change.



Penile cancer *(Seidel et al, 2011/Courtesy Patrick C. Walsh, MD, The Johns Hopkins University School of Medicine, Baltimore, Maryland)*

penile curvature, abnormal curving of the penis to one side when erect. Also called **clubbed penis.**

penile prosthesis [L, *penis* + Gk, *prosthesis,* addition], a device that can be surgically implanted in the penis to treat erectile dysfunction. Some such devices have mechanisms that control production of an erection. Penile prostheses can be semirigid (maintaining a continuous state of erection) or inflatable plastic cavernosal cylinders attached to a pump that forces fluid from a reservoir into the cylinders, producing an erection.

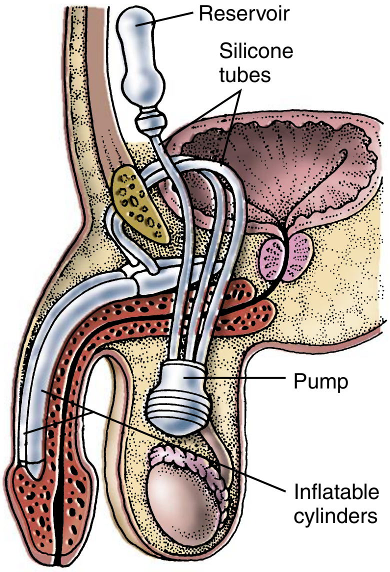
penile reflex. See **bulbocavernosus reflex.**

penis /pē′nis/ [L, male sex organ], the external reproductive organ of a man, homologous with the clitoris of a woman. It is attached with ligaments to the front and sides of the pubic arch and is composed of three cylindrical masses of cavernous tissue covered with skin. The corpora cavernosa penis surrounds a median mass called the corpus spongiosum penis, which contains the greater part of the urethra. The subcutaneous fascia of the penis is directly continuous with that of the scrotum, which contains the testes.

penis envy, literally, female envy of the male penis, but generally a female wish for male attributes, position, and advantages. It is believed by some psychologists to be a significant factor in female personality development. Compare **castration anxiety.**

-pennate, suffix meaning "having feathers": *bipennate, pennate, unipennate.*

penniform /pen′ifôrm/ [L, *penna,* feather, *forma,* form], pertaining to the shape of a feather, especially the patterns of muscular fasciculi that correlate with the range of motion and the power of muscles. Penniform fasciculi converge on one side of certain tendons. Muscles with more fasciculi have greater power but less range of motion than muscles with fewer fasciculi. Compare **bipenniform, multipenniform.**



Inflatable penile prosthesis
(Ignatavicius, Workman, and Mishler, 2002)

penoscrotal fusion, a developmental anomaly in which the penis is fused to the scrotum.

penoscrotal transposition, a developmental anomaly in which the two halves of the scrotum are found lateral to the shaft of the penis or sometimes higher, often accompanied by hypospadias.

Penrose drain [Charles B. Penrose, American surgeon, 1862–1925; AS, *draehen,* teardrop], a thin rubber tube used as a surgical drain device.

pent-, penta-, prefix meaning "five": *pentaploid, pentose, pentoside.*

pentachlorophenol poisoning /pen′təklôr′ōfē′nol/, a toxic effect of skin absorption of sodium pentachlorophenate, an antimildew agent sometimes used in laundering. The condition has affected newborns with occasionally fatal symptoms of fever and profuse sweating, caused by skin contact with pentachlorophenate residue on diapers and nursery linens.

pentad /pen′tad/, **1.** a pentavalent chemical element. **2.** a relationship among five things.

pentadactyl /pen′tədak′til/ [Gk, *pente,* five, *daktylos,* fingers or toes], having five fingers per hand and five toes per foot.

pentagastrin test, (for gastric function) a test comparing basal acid output with a peak acid output. After the patient fasts overnight, a basal acid output and its pH are obtained for secretion of stomach acid. Then pentagastrin is administered into the stomach through a nasogastric tube and maximal acid output and peak acid output values are obtained. Also called **pentagastrin stimulation test.**

pentalogy of Cantrell /pen·tal′ə·jē kan·trel/ [Gk, *pente,* five + *logos,* word; James R. Cantrell, American physician, 20th century], a cleft in the inferior part of the sternum associated with midline abdominal defects such as omphalocele and defective pericardium and diaphragm with communication between the pericardial and peritoneal cavities and with cardiac anomalies such as ventricular septal defect or, less often, atrial septal defect, tetralogy of Fallot, or left ventricular diverticulum.

Pentam 300, a trademark for an antiprotozoal agent **(pentamidine isethionate).**

pentamidine isethionate, a parenteral antiprotozoal drug.
■ INDICATIONS: It is prescribed in the treatment and prevention of pneumonia caused by ***Pneumocystis jiroveci,*** particularly in patients who have human immunodeficiency syndrome. It can also be used to treat trypanosomiasis and visceral leishmaniasis.
■ CONTRAINDICATIONS: To reduce the risk of toxicity, the following tests must be carried out before, during, and after therapy: blood urea nitrogen, serum creatinine, blood glucose, complete blood and platelet counts, liver function, serum calcium, and electrocardiogram.
■ ADVERSE EFFECTS: Among adverse reactions to the injectable form of pentamidine are hypotension, hypoglycemia, leukopenia, thrombocytopenia, cardiac arrhythmias, acute renal failure, hypocalcemia, Stevens-Johnson syndrome, elevated serum creatinine level, elevated liver function results, pain or induration at the injection site, nausea, anorexia, fever, and rash. Some of these side effects are reduced by an aerosol formulation of pentamidine, but the aerosol causes other adverse effects, including fatigue, dizziness, and dyspnea.

pentaploid. See **polyploid.**

Pentatrichomonas hominis /pen′tətrik′əmō′nəs/, a species of parasitic protozoan flagellate, formerly part of the genus ***Trichomonas,*** that lives symbiotically in the colon of humans. Formerly called *Trichomonas hominis*.

pentavalent /pəntav′ələnt/ [Gk, *pente,* five; L, *valere,* to have worth], **1.** *n,* a chemical radical or element that has a valency of 5. **2.** *adj,* pertaining to a body formed by the association of five chromosomes held together by chiasmata at the first division of meiosis.

pentazocine hydrochloride /pentā′zəsēn/, an agonist/antagonist opioid analgesic that stimulates kappa opioid receptors and blocks the mu opioid receptors. Also called *pentazocine lactate*.
■ INDICATION: It is prescribed for the relief of moderate to severe pain.
■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is administered with caution to patients with head injury, seizures, acute myocardial infarction, or kidney or liver dysfunction and to those undergoing biliary surgery. Pentazocine can cause withdrawal symptoms in patients with a history of opioid drug abuse and dependency.
■ ADVERSE EFFECTS: Nausea and dizziness commonly occur. Other minor problems include constipation, malaise, headache, restlessness, urinary tract spasms, blurred vision, miosis, and drowsiness. High doses may cause respiratory or circulatory depression and coma.

pentobarbital /pen′təbär′bitol/, a sedative and hypnotic.
■ INDICATIONS: It is prescribed as a preoperative sedative, to induce coma during treatment of increased intracranial pressure, and to abort status epilepticus unresponsive to other medications.
■ CONTRAINDICATIONS: Porphyria or known hypersensitivity to this drug or to other barbiturates prohibits its use. It is used with caution in patients with impaired respiratory or liver function or a history of dependence on sedative or hypnotic drugs.
■ ADVERSE EFFECTS: Among the more serious adverse reactions are respiratory or circulatory depression, paradoxical excitement, jaundice, or various hypersensitivity reactions. Nausea and hangover-like symptoms may occur.

pentosan /pen′to-san′/, a carbohydrate derivative used as an antiinflammatory, in the form of **pentosan polysulfate sodium,** in the treatment of interstitial cystitis. It is administered orally.

pentosan polysulfate sodium, a polysulfate derivative of a xylose-containing, glucuronate-substituted pentosan, with an average molecular weight between 4000 and 6000 Da, and having fibrinolytic and anticoagulant actions. It is used as an antiinflammatory in the treatment of interstitial cystitis; it is administered orally.

pentose /pen′tōs/ [Gk, *pente,* five; L, *osus,* having], a monosaccharide made of carbohydrate molecules, each containing five carbon atoms. It is produced by the body and is elevated after the ingestion of certain fruits, such as plums and cherries, and in certain rare diseases.

Pentothal Sodium, a trademark for a barbiturate drug **(thiopental sodium).**

pentoxifylline /pentok′sēfil′ēn/, a drug that lowers blood viscosity by making red blood cells even more flexible.
■ INDICATIONS: It is prescribed for the treatment of intermittent claudication associated with chronic occlusive arterial limb disease but should not be used as a replacement for other types of medications used for peripheral vascular disease because its efficacy is marginal. There are several unlabeled uses for the drug for which decreased blood viscosity could be advantageous, including cerebrovascular disease and diabetic neuropathy.
■ CONTRAINDICATIONS: It should not be administered to patients who are allergic to xanthines or who have had recent episodes of bleeding, especially in the brain or retina, and should be used with caution if renal impairment is present.
■ ADVERSE EFFECTS: Among the most serious adverse effects are nausea, dyspepsia, dizziness, angina, arrhythmia, and hypotension.

Pen-Vee K, a trademark for an antibiotic (penicillin V potassium).

Pepcid, a trademark for an H_2 receptor antagonist used as antiulcer medication **(famotidine).**

Peplau, Hildegard E. [1909–1999,], a pioneer in nursing theory development and a proponent in the 1950s of the concept that nursing is an interpersonal process. Borrowing heavily from the knowledge base of psychology, Peplau proposed hypotheses based on the premise of the interpersonal process. From the early work evolved a nursing goal to foster the assumption that humans value, strive for, and have a right to independence. In a 1952 work, Peplau wrote that the nurse-patient relationship occurs in phases during which the nurse functions as a resource person, a counselor, and a surrogate. The four phases of the process are orientation, identification, exploitation, and resolution. The nurse assists in orientation when a patient with a need seeks help. Identification assures the patient that the nurse can understand his or her situation. Exploitation begins when the patient uses the services available. Resolution is marked as old needs are met and newer ones emerge.

peplos /pep′los/, a lipoprotein coat that may surround a virion.

peppermint, the dried leaves and flowering tops of an herb, *Mentha piperita*. A source of a volatile oil, it is used as a carminative and antiemetic.

peppermint oil, a volatile oil from fresh aboveground parts of the flowering plant of peppermint *(Mentha piperita),* used as a flavoring agent for drugs and as a gastric stimulant and carminative.

pepper spray, an aerosolized form of oleoresins from capsicum, highly irritant to the skin and mucous membranes. It is used similarly to tear gas.

Pepper's syndrome [William Pepper, American physician, 1874–1947], a neuroblastoma of the adrenal glands that usually metastasizes to the liver.

pep pills slang. amphetamines, diet pills, or any other stimulant.

peps-, pept-, prefix meaning "digestion": *pepsin, pepsiniferous, pepsitensin*.

-pepsia, -pepsy, -peptic, suffix meaning "a state of the digestion": *anapepsia, colodyspepsia, oligopepsia, dyspeptic*.

pepsin /pep′sin/ [Gk, *pepsis,* digestion], an enzyme secreted in the stomach that catalyzes the hydrolysis of protein. Preparations of pepsin obtained from pork and beef stomachs are sometimes used as digestive aids. See also **enzyme, hydrolysis.**

pepsinogen /pəpsin′əjən/ [Gk, *pepsis* + *genein,* to produce], a zymogenic substance secreted by pyloric and gastric chief cells. It is converted to the enzyme pepsin in an acidic environment, as in the presence of hydrochloric acid produced in the stomach.

pepsinuria /pep′sino͝or′ē·ə/ [Gk, *pepsis,* digestion + *ouron,* urine], the presence of pepsin in urine.

-pepsy. See **-pepsia.**

PEP syndrome. See **POEMS syndrome.**

pept-. See **peps-.**

peptic /pep′tik/ [Gk, *peptein,* to digest], pertaining to digestion or to the enzymes and secretions essential to digestion.

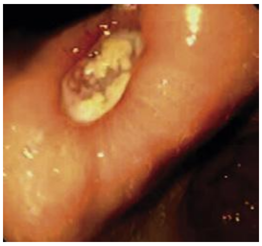
-peptic. See **-pepsia.**

peptic ulcer, a sharply circumscribed loss of the mucous membrane of the stomach, duodenum, or any other part of the GI system exposed to gastric juices containing acid and pepsin. Also called **gastric ulcer.**

■ OBSERVATIONS: Peptic ulcers may be acute or chronic. Acute lesions are almost always multiple and superficial. They may be totally asymptomatic and usually heal without scarring or other sequelae. Chronic ulcers are true ulcers. They are deep, single, persistent, and symptomatic; the muscular coat of the wall of the organ does not regenerate; a scar forms, marking the site, and the mucosa may heal completely. Peptic ulcers are caused by a combination of poorly understood factors, including an excessive secretion of gastric acid, inadequate protection of the mucous membrane, stress, heredity, and the use of certain drugs, including the corticosteroids, certain antihypertensives, and antiinflammatory medications (especially acetylsalicylic acid and nonsteroidal antiinflammatory drugs). There is growing evidence from research that a bacterium present in the gut—***Helicobacter pylori***—may be responsible for peptic ulcer disease. Characteristically ulcers cause a gnawing pain in the epigastrium that does not radiate to the back, is not aggravated by a change in position, and has a temporal pattern that mimics the diurnal rhythm of gastric acidity.

■ INTERVENTIONS: Symptomatic relief is provided with drugs that either neutralize or block secretion of acid and frequent small bland meals. The underlying cause is treated if known. If *H. pylori* is present, a 2-week triple therapy regimen of tetracycline, metronidazole, and bismuth may be given. Hemorrhage caused by perforation of the muscle and blood vessels may require surgical resection of the damaged area. The diagnosis and evaluation of peptic ulcers involve serial radiographic studies using a contrast medium and endoscopy. A definitive diagnosis is important because the early signs of cancer of the stomach and duodenum resemble those of peptic ulcers.

■ NURSING CONSIDERATIONS: The patient is reassured that in most cases the ulcers heal completely and that the pain may be controlled with simple measures. The nurse emphasizes the correct use of antacids and the other medications prescribed. Usually the patient is instructed to eat frequent small meals consisting of foods known to be nonirritating. For many but not all patients, fatty, highly spiced, heavy, or fibrous foods are likely to provoke pain. The use of tobacco and alcohol is discouraged.



Peptic ulcer *(Goldman et al, 2008/Courtesy Dr. Pankaj Jay Pasricha)*

peptidase /pep′tidās/ [Gk, *peptein,* to digest, *ase,* enzyme suffix], a protein-splitting enzyme that breaks peptides into amino acids. It occurs naturally in plants, yeasts, certain microorganisms, and digestive juices.

peptide /pep′tīd/ [Gk, *peptein,* to digest], a molecular chain compound composed of two or more amino acids joined by peptide bonds. See also **amino acid, polypeptide, protein.**

peptidergic /pep′tidur′jik/, using small peptides as neurotransmitters.

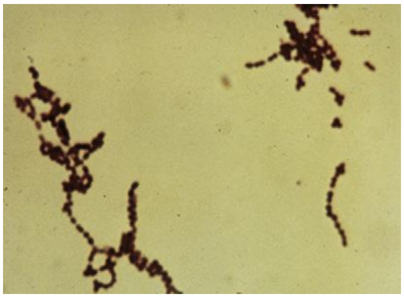
peptide YY. See **neuropeptide Y.**

peptidyl-dipeptidase A. See **angiotensin-converting enzyme.**

peptogenic /pep′təjen′ik/, pertaining to an agent that produces peptones or pepsin.

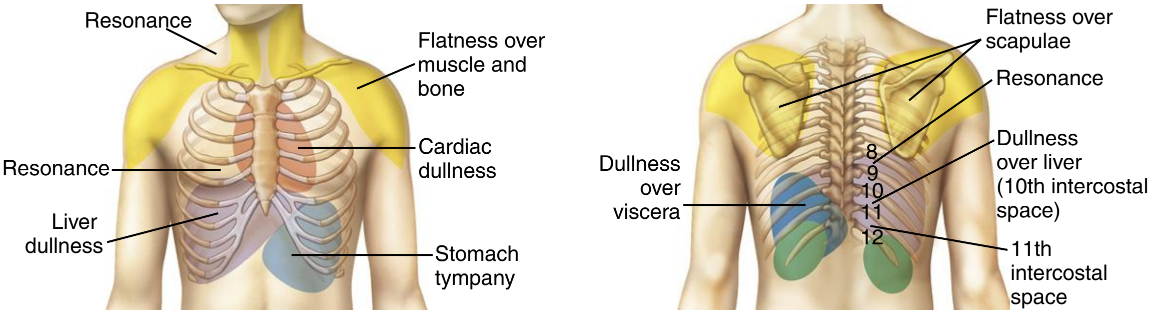
peptone /pep′tōn/, a derived protein, which may be produced by hydrolysis of a native protein with an acid or enzyme.

Peptostreptococcus /pep′təstrep′təkok′əs/, a genus of gram-positive anaerobic chemoorganotrophic bacteria that occur in pairs or chains. The potentially pathogenic organisms are found in normal and pathological female genital tracts and in the intestinal and respiratory tracts of normal humans. They have been associated with a variety of disorders ranging from appendicitis to putrefactive wounds.

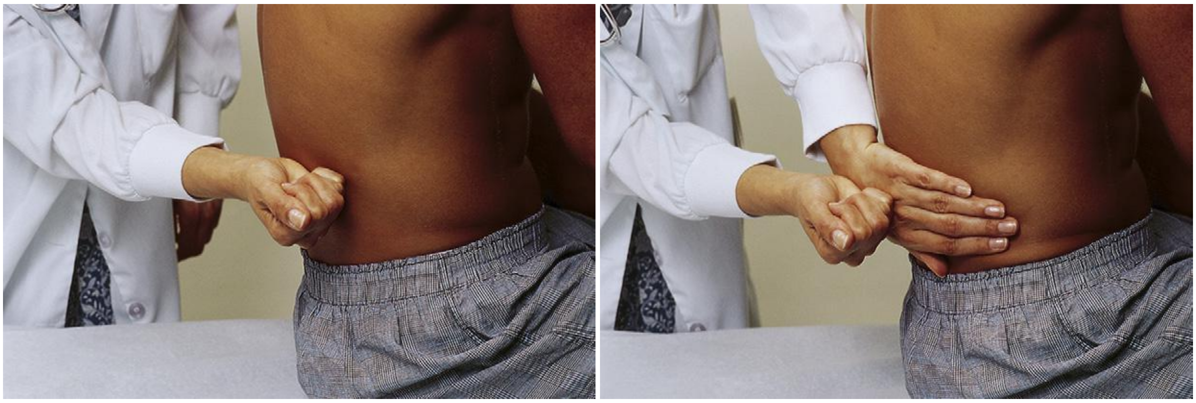


Peptostreptococcus *(Mahon, Lehman, and Manuselis, 2007/Courtesy Suzette L. Bartley, James D. Howard, and Ray Simon, Centers for Disease Control and Prevention)*

Peptostreptococcus anaerobius, a potentially pathogenic species of anaerobic bacterium found throughout the body, including the mouth, the intestinal and respiratory tracts, and body cavities, particularly the vagina.



Percussion: normal notes over the anterior *(left)* and posterior *(right)* chest and upper abdomen
(Harkreader, Hogan, and Thobaben, 2007)



Percussion: direct *(left)* and indirect *(right)* *(Wilson and Giddens, 2001)*

per-, **1.** prefix meaning "throughout, or completely": *peracephalus, perfuse, permeable*. **2.** prefix meaning "a large amount (in chemical terms)" or designating a combination of an element in its highest valence: *peracetate, peracid, perhydride*. **3.** prefix meaning "around, near, enclosing": *periapical, pericardium*.

peracephalus /pur′əsef′ələs/ *pl. peracephali* [L, *per,* completely; Gk, *a* + *kephale,* not head], a fetus or individual with a malformed head.

peracetic acid /per′ah-se′tik/, peroxyacetic acid, CH_3COOOH, a strong oxidizing agent sometimes used for sterilization.

per an., abbreviation for the Latin phrase *per annum,* 'yearly.'

perceived severity /pərsēvd′/ [L, *percipere,* to perceive, *severus,* serious], (in health belief model) a person's perception of the seriousness of the consequences of contracting a disease. Compare **perceived susceptibility.**

perceived susceptibility, (in health belief model) a person's perception of the likelihood of contracting a disease. Compare **perceived severity.**

percentage depth dose /pərsen′tij/ [L, *per,* completely, *centum,* hundred; ME, *dep,* deep; L, *dosis,* something given], the amount of therapeutic radiation delivered at a specified dose, expressed as a percentage of the skin dose.

percentile, the 100th part of a statistical distribution. A percentile rank of 80 indicates that 20% of the total number of cases scored above and 80% scored below in whatever characteristics were being studied.

percent solution, a relationship of a quantity of solute to the quantity of solution, multiplied by 100, expressed in terms of mass of solute per mass of solution. It can be expressed in terms of mass solute per mass solution, volume solute per volume solution, or mass solute (g) per volume (mL) solution. An example of a 5% by mass solution is 5 g of glucose dissolved in 95 g of water, forming 100 g of solution.

percent systole [L, *per* + *centum* + Gk, *systole,* contraction], the fraction of the duration of each heartbeat that is devoted to the contraction of the ventricles.

percept /pur′sept/ [L, *percipere,* to perceive], the mental impression of an object that is gained through the use of the senses.

perception /pərsep′shən/ [L, *percipere,* to perceive], **1.** the conscious recognition and interpretation of sensory stimuli that serve as a basis for understanding, learning, and knowing or for motivating a particular action or reaction. **2.** the result or product of the act of perceiving. Kinds of perception include **depth perception, extrasensory perception, facial perception,** and **stereognostic perception.** —*perceptive,* **perceptual,** *adj*.

perceptivity /pur′səptiv′itē/, the ability to receive sense impressions.

perceptual. See **perception.**

perceptual constancy /pərsep′cho͞o·əl/ [L, *percipere,* to perceive, *cum,* together with, *stare,* to stand], (in Gestalt psychology) the phenomenon in which an object is seen in the same way under varying circumstances.

perceptual defect, any of a broad group of disorders or dysfunctions of the central nervous system that interfere with the conscious mental recognition of sensory stimuli. Such conditions are caused by lesions at specific sites in the cerebral cortex that may result from any illness or trauma affecting the brain at any age or stage of development. Impairment of mental activity, cognitive processes, and emotional responses may be diffuse, as occurs in organic mental disorders, such as the psychoses, delirium, and dementia, and in attention deficit disorder, or they may be manifested focally, as in aphasia, apraxia, epilepsy, disorders of memory, cerebrovascular disorders, and various intercranial neoplasms.

perceptual deprivation, the absence of or decrease in meaningful groupings of stimuli, which may result from a constant background noise or constant inadequate illumination.

perceptual monotony, a mental state characterized by a lack of variety in the normal pattern of everyday stimuli.

perchloromethane. See **carbon tetrachloride.**

Percodan, a trademark for a fixed-combination medication containing aspirin and an opioid analgesic (oxycodone) used to treat moderate to severe pain.

Percogesic, a trademark for a fixed-combination drug containing an antihistamine **(phenyltoloxamine citrate)** and an analgesic (acetaminophen) used to treat mild to moderate pain.

percolation /pur′kəlā′shən/ [L, *percolare,* to strain], **1.** the act of filtering any liquid through a porous medium. **2.** (in pharmacology) the removal of the soluble parts of a crude drug by passing a liquid solvent through it.

per con., abbreviation for the Latin phrase *per contra,* "the other side."

per contiguum, spreading from one body structure to a contiguous area.

per continuum, describing the spread of an inflammation or other disease process from one body part to another through continuous tissue.

percuss /pərkus′/ [L, *percutere,* to strike hard], to perform percussion by striking, for example, the thoracic or abdominal wall, thereby producing sound vibrations that aid in diagnosis.

percussion /pərkush′ən/ [L, *percutere,* to strike hard], a technique in physical examination of tapping the body with the fingertips or fist to evaluate the size, borders, and consistency of some of the internal organs and to discover the presence of and evaluate the amount of fluid in a body cavity. **Immediate** or **direct percussion** is percussion performed by striking the fingers directly on the body surface. **Indirect, mediate,** or **finger percussion** involves striking a finger of one hand on a finger of the other hand (normally the second phalanx of the third digit) as it is placed over the organ. See also **cupping and vibrating, percussor, pleximeter.** **—percuss,** *v.,* **percussible,** *adj.*

percussor /pərkus′ər/ [L, a striker], a small hammerlike diagnostic tool having a rubber head that is used to tap the body lightly in percussion. Also called **plexor.** See also **percussion.**

percutaneous /pur′kyo͞otā′nē·əs/ [L, *per* + *cutis,* skin], performed through the skin, such as a biopsy; aspiration of fluid from a space below the skin with a needle, catheter, and syringe; or instillation of a fluid in a cavity or space by similar means.

percutaneous absorption, the process of absorption through the skin from topical application.

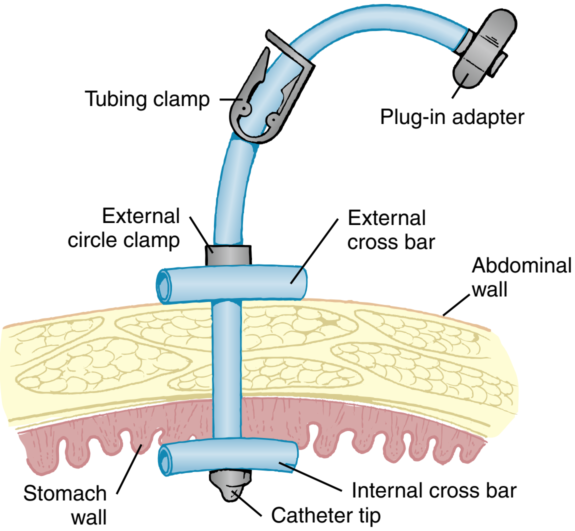
percutaneous catheter, a catheter inserted through the skin rather than through an orifice, such as a central venous catheter or one used for hemodialysis or peritoneal dialysis.

percutaneous catheter placement, a technique in which an intracatheter is introduced through the skin into an artery and placed at a site or structure to be studied by selective angiography and other diagnostic procedures. The puncture site is infiltrated with a local anesthetic before insertion of the catheter. A special needle is inserted into the artery, and a long, flexible, spring guide is passed through the needle for approximately 15 cm. The needle is then removed, the catheter is advanced to the desired position, and the guide is withdrawn. The catheter is withdrawn at the end of the procedure.

Percussor *(Wilson and Giddens, 2005)*

percutaneous coronary intervention (PCI), the management of coronary artery occlusion by any of various catheter-based techniques, such as percutaneous transluminal coronary angioplasty, atherectomy, angioplasty using the excimer laser, and implantation of coronary stents and related devices.

percutaneous endoscopic gastrostomy (PEG), the creation of a new opening in the stomach for enteral tube feedings. It can also be used for gastric decompression. PEG is accomplished by puncturing the abdominal wall after the stomach has been distended. A tube is then inserted through the abdominal wall into the stomach under endoscopic guidance. It can be performed with the patient under local anesthesia or moderate sedation or analgesia in the endoscopic suite, in the operating room, or at bedside in the critical care unit.

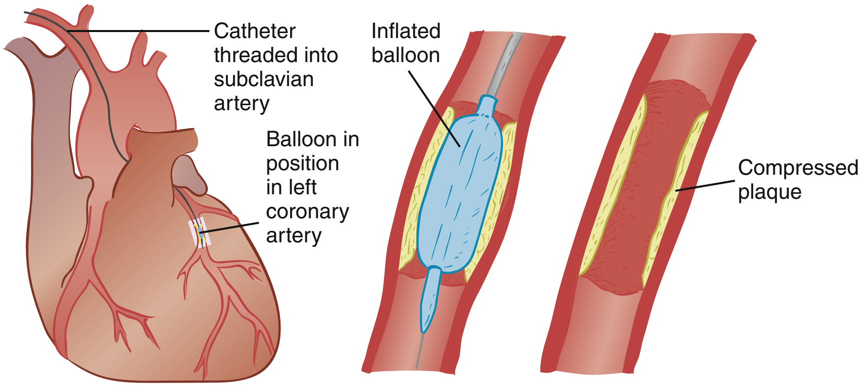


Percutaneous endoscopic gastrostomy tube
(Black and Hawks, 2009)

percutaneous epididymal sperm aspiration, retrieval of sperm from the epididymis by using fine-needle aspiration, done in men with obstructive azoospermia.

percutaneous nephrolithotomy, a uroradiological procedure performed to extract stones from within the kidney or proximal ureter by percutaneous surgery after the stones have been visualized radiologically.

percutaneous nephroscope, a thin fiberoptic probe that can be inserted into the kidney through an incision in the skin. Light transmitted along the fibers allows visualization of the inside of the kidney. The device is equipped with a tool that can be used to grasp and remove small kidney stones.

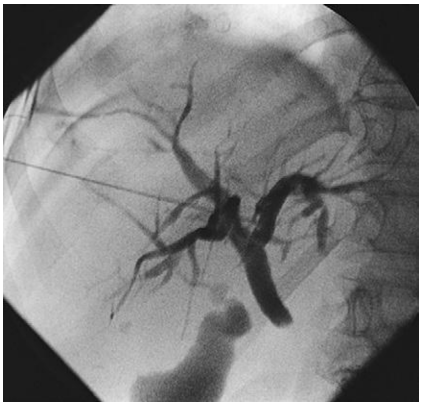


Catheter threaded into subclavian artery
Inflated balloon
Balloon in position in left coronary artery
Compressed plaque

Percutaneous transluminal coronary angioplasty *(Black and Hawks, 2009)*

percutaneous transhepatic biliary drainage, drainage of the biliary tree by the introduction of a catheter through the liver and into the biliary tree under radiological guidance. Also called *percutaneous transhepatic cholangiodrainage*.

percutaneous transhepatic cholangiography (PTC), the radiographic examination of the structure of the bile ducts. A contrast medium is injected through a needle passed directly into a hepatic duct.



Percutaneous transhepatic cholangiogram showing the biliary system *(Kowalczyk and Mace, 2009)*

percutaneous transluminal angioplasty (PTA), a procedure for dilating blood vessels in the treatment of peripheral artery disease. Under fluoroscopic guidance a balloon-tipped catheter is inserted into a stenotic artery and the balloon is inflated. The inflated balloon may dilate the artery by stretching its elastic fibers or by flattening accumulation of plaque. See also **percutaneous transluminal coronary angioplasty.**

percutaneous transluminal coronary angioplasty (PTCA), a technique in the treatment of atherosclerotic coronary heart disease and angina pectoris in which some plaques in the arteries of the heart are flattened against the arterial walls, resulting in improved circulation. The procedure involves threading a catheter through the vessel to the atherosclerotic plaque, inflating and deflating a small balloon at the tip of the catheter several times, and then removing the catheter. The procedure is performed under radiographic or ultrasonic visualization. When it is successful, the plaques remain compressed and the symptoms of heart disease, including the pain of angina, are decreased. The alternative to this treatment is coronary bypass surgery, which is more expensive and dangerous and requires longer hospitalization and rehabilitation.

percutaneous transluminal renal angioplasty (PTRA), percutaneous transluminal angioplasty to enlarge the lumen of a sclerotic renal artery, preserve renal function, and treat renovascular hypertension.

per diem rate /pər dē′əm, dī′əm/ [L, *per diem,* daily, *ratus,* reckoned], an established rate of payment for hospital services.

per discharge payment, a payment method in which costs of resources used for the entire hospital stay are the responsibility of the hospital. The hospital is then compensated according to a contractually determined amount per discharge.

perencephaly /per′ensef′əlē/, a condition characterized by one or more cerebral cysts.

Perez reflex /pərez′, per′ez/ [Bernard Perez, French physician, 1836–1903; L, *reflectere,* to bend back], the normal response of an infant to cry, flex the limbs, and elevate the head and pelvis when supported in a prone position with a finger pressed along the spine from the sacrum to the neck. Persistence of the reflex beyond the 6 months of age may indicate brain damage.

perfectionism /pərfek′shəniz′əm/ [L, *perficere,* to complete], a subjective state in which a person pursues an extremely high standard of performance and, in many cases, demands the same standards of others. Failure to attain the goals may lead to feelings of defeat and other adverse psychological consequences.

perflation /pərflā′shən/, a method of opening a passage or cavity entrance with air pressure.

perfluorocarbon /pərflŏŏr′ōkär′bən/, any of a group of chemicals with limited capacity for transporting oxygen through the circulatory system. They can be used for certain blood substitute purposes, regardless of the blood type of the patient. They are stable at room temperatures, have a pH of 7.4, and are free of infectious pathogens. Also called **artificial blood** or **blood substitute.**

perforans /pur′fôrənz/ [L, *perforare,* to pierce], penetrating. The term applies mainly to nerves, muscles, or other anatomical features that penetrate other structures, such as perforans gasseri, or nerves of the musculocutaneous tissues.

perforate [L, *perforare,* to pierce], **1.** *v,* /pur′fôrāt/ to pierce, punch, puncture, or otherwise make a hole. **2.** *adj,* /purfôrit/ riddled with small holes. **3.** *adj,* /pur′fôrit/ (of the anus) having a normal opening; not imperforate. **—perforation,** *n.*

perforating arteries, three arteries that branch from the deep artery of the thigh as it descends anterior to the adductor brevis muscle. All three penetrate through the adductor magnus near its attachment to the linea aspera to enter and supply the posterior compartment of thigh. The ascending and descending branches of the vessels interconnect to form a longitudinal channel that participates in forming an anastomotic network of vessels around the hip and inferiorly anastomoses with branches of the popliteal artery behind the knee.

perforating capsular plexus, a vascular plexus around the renal capsule, supplied by the perforating radiate, inferior, suprarenal, renal, and testicular or ovarian arteries.

perforating cutaneous nerve, a nerve that originates in the sacral plexus and penetrates directly through the sacrotuberous ligament to course to the skin over the inferior aspect of the buttocks.

perforating fracture, an open fracture caused by a projectile, making a small surface wound.

perforating radiate arteries, small arteries that are continuations of the cortical radiate arteries and perforate the renal capsule.

perforating ulcer /pur′fôrā′ting/ [L, *perforare,* to pierce, *ilcus*], **1.** an ulcer that penetrates the thickness of a wall or membrane, such as a peptic ulcer of the digestive tract. **2.** a deep, painless ulcer, often on the sole of the foot, of a person whose skin is insensitive because of a disease such as diabetes.

perforation /pur′fôrā′shən/ [L, *perforare,* to pierce], a hole or opening made through the entire thickness of a membrane or other tissue or material.

perforation of stomach or intestines, a condition in which disease or injury has resulted in a leakage of digestive tract contents into the peritoneal cavity. A common cause is a ruptured appendix or perforating peptic ulcer. Immediate surgical intervention is needed to prevent peritonitis.

perforation of the uterus, a puncture of the uterus, as may be caused by a curet or by an intrauterine contraceptive device.

perfusion /pərfyo͞o′zhən/ [L, *perfundere,* to pour over], **1.** the passage of a fluid through a specific organ or an area of the body. **2.** a therapeutic measure whereby a drug intended for an isolated part of the body is introduced via the bloodstream.

perfusionist /pərfyo͞o′zhənist/ [L, *perfundere,* to pour over], an allied health professional who assists in performing procedures that involve extracorporeal circulation, such as during open-heart surgery or hypothermia.

perfusion lung scan, a radiographic examination of the lungs and their function performed after an IV injection of a radioactive material. It is performed to detect areas of lung perfusion as an aid in the diagnosis of pulmonary embolism. The procedure is usually done in conjunction with a ventilation scan, in which the patient inhales radioactive material and the lung is scanned to detect lung areas receiving ventilation. Also called **perfusion scan.**

perfusion rate, the rate of blood flow through the capillaries per unit mass of tissue, expressed in milliliters per minute per 100 g.

perfusion scan. See **perfusion lung scan.**

perfusion technologist, a person who, under the supervision of a physician, operates a heart-lung machine used for cardiopulmonary bypass during surgery.

per gene, a gene that is associated with circadian rhythms of some animal species. Mutations of the per gene locus result in alterations of their biorhythms. A similar DNA sequence occurs in the human genome, but its effect on human circadian rhythms is unknown.

pergolide /per′golīd/, a long-acting ergot derivative with dopaminergic properties, used as the mesylate salt in treatment of parkinsonism. It is administered orally.

Pergonal, a trademark for human menopausal gonadotropin used to treat anovulation and infertility.

peri-, prefix meaning "around": *periaxial, pericardial, pericolitis.*

periacinous /per′e·as′inus/, near or around a small saclike dilation, particularly in the lung or a gland.

Periactin, a trademark for an antihistamine and antipruritic used to treat rash and other symptoms of allergies **(cyproheptadine hydrochloride).**

periadenitis /per′i·ad′ənī′tis/, an inflammation of tissues around a gland.

periadenitis mucosa necrotica recurrens. See **Sutton's disease.**

perianal /per′i·ā′nəl/ [Gk, *peri,* around; L, *anus*], pertaining to the area around the anus.

perianal abscess [Gk, *peri,* around; L, *anus* + *abscedere,* to go away], a focal, purulent, subcutaneous infection in the region of the anus. Treatment includes hot soaks, antibiotics, and possibly incision and drainage. If a rectal fistula or perianal space is found to be the cause of recurrent perianal abscesses, surgical excision is usually performed.

periangitis. See **periarteritis.**

periaortic /per′i·ā·ôr′tik/ [Gk, *peri,* around, *aerein,* to raise], pertaining to the area around the aorta.

periaortitis /per′i·ā′ôrtī′tis/, an inflammation of the adventitia or surrounding tissues of the aorta.

periapical /per′i·ap′ikəl/ [Gk, *peri* + L, *apex,* top], pertaining to the tissues surrounding the apex of a tooth root, including the periodontal membrane and the alveolar bone.

periapical abscess, an infection around the root of a tooth, usually a result of spreading of dental caries leading to pulpal necrosis. Radiographically, the infection will appear radiolucent around the apex of the tooth. The abscess may perforate into the oral cavity or maxillary sinus; extend into nearby bone, causing osteomyelitis; or, more often, spread to soft tissues, causing cellulitis and a swollen face. There may be associated fever, malaise, and nausea. Treatment includes access into the pulp chamber of the tooth to establish drainage and relieve pain, followed by antibiotics and late root canal therapy or tooth extraction. Also called **dental abscess** or **tooth abscess.**

periapical cyst. See **radicular cyst.**

periapical fibroma, a mass of benign connective tissue that may form at the apex of a tooth with normal pulp. Also called **first-state cementoma.**

periapical infection, infection surrounding the root of a tooth, often accompanied by toothache.

periapical radiograph, a dental x-ray film or dental imaging used to detect changes in the bone surrounding the roots of the teeth. Also called *periapical image.*

periappendicitis decidualis /per′i·apen′disī′tis/, an inflammation of the vermiform appendix, with the presence of decidual cells in the peritoneum of the appendix. It occurs in cases of right tubal pregnancy with adhesions between the appendix and the fallopian tubes.

periappendicular /per′i·ap′əndik′yələr/ [Gk, *peri,* around; L, *appendere,* to hang upon], pertaining to the area around the appendix.

periarterial /per′i·ärtir′ē·əl/ [Gk, *peri,* around, *arteria,* airpipe], pertaining to the area around an artery.

periarteritis /per′i·är′tərī′tis/ [Gk, *peri* + *arteria,* airpipe, *itis*], inflammation of the outer coat of one or more arteries and the tissue surrounding them. Kinds of periarteritis are **periarteritis nodosa** and **syphilitic periarteritis.** Also called **periangitis.**

periarteritis gummosa. See **syphilitic periarteritis.**

periarteritis nodosa, a progressive polymorphic disease of the connective tissue that is characterized by numerous large and palpable nodules or clusters of visible nodules along segments of middle-sized arteries, particularly near points of bifurcation. The disease causes occlusion of vessels, resulting in regional ischemia, hemorrhage, necrosis, and pain. Early signs of the disease include tachycardia, fever, weight loss, and pain in the viscera. Kidney, lung, and intestinal involvement is common. Other systems and organs of the body may also be affected. Periarteritis nodosa is treated with corticosteroids and cytotoxic drugs. Also called **necrotizing angiitis.**

periarthritis /per′i·ärthrī′tis/, inflammation of tissues around a joint.

periarticular /per′i·ärtik′yələr/ [Gk, *peri,* around; L, *articulus,* joint], pertaining to the area around a joint.

peribronchial /-brong′kē·əl/, surrounding a bronchus.

peribronchiolar /-brong′kē·ō′lər/ [Gk, *peri,* around, *bronchiolus*], pertaining to the area around the bronchioles.

pericalyceal /per′ikal′isē′al/, near or around a renal calyx.

pericardia. See **pericardium.**

pericardiac /-kär′dē·ak/ [Gk, *peri,* around, *kardia,* heart], **1.** pertaining to the pericardium. **2.** pertaining to the area around the heart. Also **pericardial.**

pericardial. See **pericardium.**

pericardial adhesion /-kär′dē·əl/ [Gk, *peri,* around, *kardia,* heart; **L,** *adhesio,* sticking to], an attachment of the pericardium to the heart muscle, sometimes restricting the muscle's action. In some cases a previous inflammation or surgery may result in dense fibrous adhesions that obliterate the pericardium. The condition may be general or localized and may involve adhesion between the two layers of pericardium (internal adhesive pericarditis), obstructing the pericardial cavity, or between one layer and surrounding tissues such as the diaphragm, mediastinum, or chest wall (external adhesive pericarditis) as a result of an inflammatory process. Also called **adherent pericardium.**

pericardial artery [Gk, *peri* + *kardia,* heart, *arteria,* airpipe], one of several small vessels branching from the thoracic aorta, supplying the dorsal surface of the pericardium.

pericardial effusion [Gk, *peri,* around, *kardia,* heart; L, *effundere,* to pour out], the escape of blood or other fluid into the pericardium. Also called **hydropericardium.**

pericardial friction rub [Gk, *peri,* around, *kardia,* heart; L, *fricare,* to rub; ME, *rubben*], the rubbing together of inflamed membranes of the pericardium, as may occur in pericarditis or after a myocardial infarction. It produces a sound audible on auscultation. Also called *pericardial murmur,* **pericardial rub.**

pericardial tamponade. See **cardiac tamponade.**

pericardiectomy /per′i·kär′dē·ek′tə·mē/ [Gk, *peri,* around + *kardia,* heart + *ektomē,* excision], excision of the pericardium.

pericardiocentesis /per′ikär′dē·ō′sintē′sis/ [Gk, *peri* + *kardia,* heart, *kentesis,* pricking], a procedure for drawing fluid in the pericardial space between the serous membranes by surgical puncture and aspiration of the pericardial sac. Also called **pericardicentesis.**

pericardioperitoneal canals, a pair of passages in the embryo connecting the primordial pericardial and peritoneal cavities.

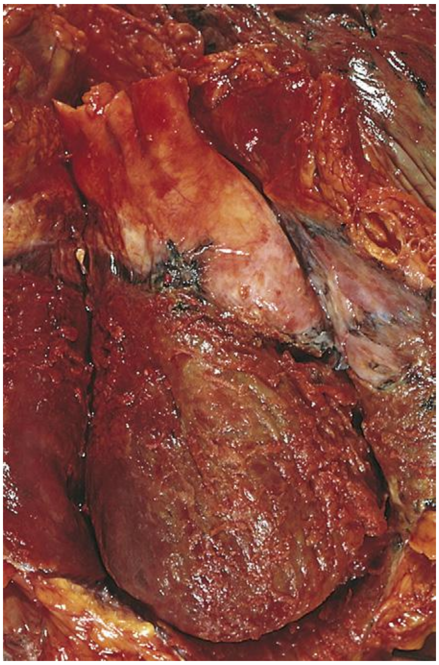
pericardiotomy /-kär′di·ot′əmē/, a surgical incision in the pericardium.

pericarditis /per′ikärdī′tis/ [Gk, *peri* + *kardia,* heart, *itis*], inflammation of the pericardium associated with trauma, malignant neoplastic disease, infection, uremia, myocardial infarction, collagen disease, or unknown causes. See also **acute nonspecific pericarditis.**

■ OBSERVATIONS: Two stages are observed if treatment in the first stage does not halt progress of the condition to the extremely grave second stage. The first stage is characterized by fever; substernal chest pain that radiates to the shoulder or neck; dyspnea; a dry, nonproductive cough; a rapid and forcible pulse; a pericardial friction rub; and a muffled heartbeat over the apex. The patient becomes increasingly anxious, tired, and orthopneic. During the second stage a serofibrinous effusion develops within the pericardium, restricting cardiac activity. If the effusion is purulent (caused by bacterial infection), a high fever, sweat, chills, and prostration also occur. The heart sounds become muffled, weak, and distant on auscultation, and a bulge is visible on the chest over the precordial area.

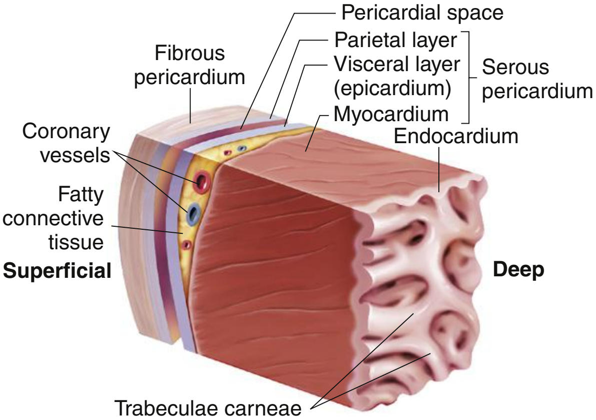
■ INTERVENTIONS: The patient is kept in bed, and the head of the bed is elevated 45 degrees to decrease dyspnea. Hypothermia treatment may be necessary to reduce the body temperature. An antibiotic or antifungal and analgesic may be ordered. Oxygen and parenteral fluids are usually given, vital signs are evaluated, and the chest is auscultated frequently. Pericardiocentesis or pericardiotomy may be performed to remove accumulated fluid or to make a diagnosis.

■ NURSING CONSIDERATIONS: Emotional support of a patient being treated for pericarditis requires remaining with the person if he or she is anxious and explaining all procedures thoroughly. During recovery, rest periods are planned and the person is urged to avoid fatigue and exposure to upper respiratory infections. The patient is told to report symptoms of recurrence, including fever, chest pain, and dyspnea.

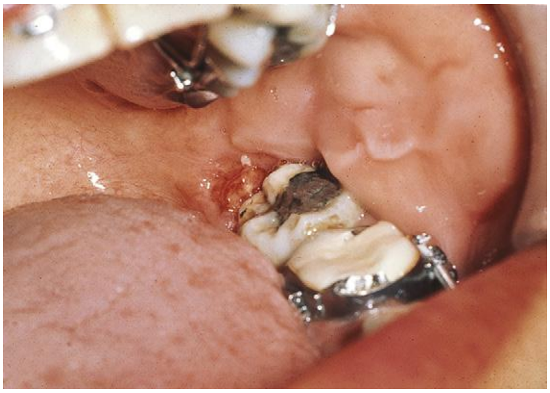


Acute suppurative pericarditis *(Kumar et al, 2007)*

pericardium /per′ikär′dē·əm/ *pl.* **pericardia** [Gk, *peri* + *kardia,* heart], a fibroserous sac that surrounds the heart and the roots of the great vessels. It consists of the serous pericardium and the fibrous pericardium. The serous



Pericardium *(Patton and Thibodeau, 2010)*



Pericoronitis *(Regezi, Sciubba, and Pogrel, 2000)*

pericardium consists of the parietal layer, which lines the inside of the fibrous pericardium, and the visceral layer, which adheres to the surface of the heart. Between the two layers is the pericardial space, which contains a few drops of pericardial fluid to lubricate opposing surfaces of the space and allow the heart to move easily during contraction. Injury or disease may cause fluid to accumulate in the space, causing a wide separation between the heart and the outer pericardium. The fibrous pericardium, which constitutes the outermost sac and is composed of tough, white fibrous tissue lined by the parietal layer of the serous pericardium, fits loosely around the heart and attaches to large blood vessels emerging from the top of the heart but not to the heart itself. It is relatively inelastic and protects the heart and the serous membranes. If pericardial fluid or pus accumulates in the pericardial space, the fibrous pericardium cannot stretch, causing a rapid increase of pressure around the heart. **—pericardial,** *adj.*

pericholangitis /per′əkō′lanjī′tis/ [Gk, *peri* + *chole,* bile, *angeion,* vessel, *itis,* inflammation], an inflammatory condition of the tissues surrounding the bile ducts in the liver. Pericholangitis is a complication of ulcerative colitis and portal hypertension. Treatment of the ulcerative colitis has little effect on the liver disease. See also **ulcerative colitis.**

perichondrial bone /-kon′drē·əl/ [Gk, *peri,* around, *chondros,* cartilage; AS, *ban*], bone that forms in the perichondrium of the cartilaginous template. Also called **chondrial bone, periosteal bone.**

perichondrium /-kon′drē·əm/, a fibrous, irregular connective tissue sheath and membrane surrounding both hyaline and elastic cartilages.

perichrome /per′ikrōm/, a nerve cell in which the stainable chromophil substance is scattered throughout the cytoplasm.

pericolic abscess, an abscess just outside the colon as a result of perforation complicating diverticulitis. Also called **peridiverticular abscess.**

pericolitis /-kōlī′tis/, an inflammation of the connective tissue around the colon. Also called *pericolonitis* /per′iko′lon-i′tis/.

pericoronitis /-kôr′ənī′tis/, inflammation of the gum tissue around the crown of a tooth, usually associated with the eruption of a third molar. Treatment depends on the severity of the condition and may include the use of antibiotics or extraction of the tooth. In most cases the inflammation subsides after the tooth has fully erupted.

pericranium /-krā′nē·əm/, the connective tissue membrane that surrounds the skull.

pericystium /-sis′tē·əm/, the tissues around a gallbladder or urinary bladder.

peridens, a supernumerary tooth found other than in the midline of the dental arch. Compare **mesiodens.**

periderm /per′idurm/, the outermost layer of flattened epidermis on an embryo or fetus during the first 6 months of gestation.

perididymitis /-did′imī′tis/, an inflammation of the tunica vaginalis testis.

peridiverticular abscess. See **pericolic abscess.**

peridontium. See **periodontium** (def. 1).

peridural anesthesia. See **epidural anesthesia.**

periencephalitis /per′i·ensef′əlī′tis/, an inflammation of the membranes and surface of the brain, including the cortex.

perifocal /-fō′kəl/, pertaining to tissues situated around a focus of infection.

perifollicular /-folik′yələr/ [Gk, *peri,* around; L, *folliculus,* small bag], pertaining to the area around a follicle.

perifolliculitis /-folik′yəlī′tis/ [Gk, *peri* + L, *folliculus,* small bag; Gk, *itis*], inflammation of the tissue surrounding a hair follicle. Compare **folliculitis.**

periglottic /-glot′ik/, around the tongue, particularly the base of the tongue.

periglottis /-glot′is/, the mucous membrane of the tongue.

perihepatitis /per′i·hep′ə·ti′tis/, inflammation of the peritoneal capsule of the liver and other nearby tissues.

periimplantoclasia /per′i·implan′tōklā′zhə/, a pathological tissue reaction surrounding implanted foreign material, characterized by local inflammation.

perikaryon /per′iker′ē·on/ [Gk, *peri* + *karyon,* nut], the cytoplasm of a cell body exclusive of the nucleus and any processes, specifically the cell body of a neuron. Also called **cyton.** —*perikaryontic, adj.*

perilymph /per′ilimf/ [Gk, *peri* + L, *lympha,* water], the clear fluid separating the osseous labyrinth from the membranous labyrinth in the internal ear. Compare **endolymph.**

perimenopause /-men′əpôs/, a span of 4 to 6 years preceding menopause when menstrual cycles and blood flow may be irregular. As estrogen levels decline, osteoporosis begins, and women are at increased risk for cardiovascular disease.

perimeter /pərim′ətər/ [Gk, *peri,* around, *metron,* measure], **1.** the circumference, outer edge, or periphery of an object. **2.** an instrument for measuring visual fields. **3.** an instrument for measuring the circumference of teeth.

perimetrium /per′imē′trē·əm/ [Gk, *peri* + *metra,* womb], the serous membrane enveloping the uterus.

perimetry /pərim′ətrē/, the determination and mapping of the limits of the visual field.

perimolysis /-mol′isis/, decalcification of the teeth caused by exposure to gastric acid in patients with chronic vomiting, as may occur in anorexia or bulimia. See **erosion.**

perinatal /per′inā′təl/ [Gk, *peri* + L, *natus*, birth], pertaining to the time and process of giving birth or being born.

perinatal AIDS, acquired immunodeficiency syndrome acquired by infants and children from their mothers during pregnancy, during delivery, or from ingesting infected breast milk. See **acquired immunodeficiency syndrome.**

perinatal asphyxia. See **asphyxia neonatorum.**

perinatal death, **1.** the death of a fetus weighing 500 g or more at 22 or more weeks of gestation. **2.** the death of an infant between birth and the end of the neonatal period.

perinatal mortality, the statistical rate of fetal and infant death, including stillbirth, from 28 weeks of gestation to the end of the neonatal period of 4 weeks after birth. Perinatal mortality is usually expressed as the number of deaths in a given period per 1000 live births in a specific geographic area or program.

perinatal period, an interval extending approximately from the 28th week of gestation to the 28th day after birth.

perinatal physiology, the physiology of the process of giving birth or being born.

perinatologic, perinatological. See **perinatology.**

perinatologist /-nātol′əjəst/, a physician who specializes in the diagnosis and treatment of disorders of pregnancy, childbirth, and the puerperium in the mother and child.

perinatology /-nātol′əgē/ [Gk, *peri* + L, *natus*, birth; Gk, *logos*, science], a branch of medicine concerned with the study of the anatomical and physiological characteristics of mothers and their unborn and newborns, with diagnosis and treatment of disorders occurring in them during pregnancy, childbirth, and the puerperium. **—perinatologic, perinatological,** *adj.*

perindopril, an antihypertensive.

■ INDICATION: It is used to treat hypertension.

■ CONTRAINDICATIONS: A history of angioedema and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Life-threatening effects are agranulocytosis, neutropenia, proteinuria, and renal failure. Other adverse effects include chest pain, tachycardia, arrhythmias, syncope, anxiety, nausea, vomiting, colitis, diarrhea, constipation, flatulence, rash, purpura, alopecia, hyperhidrosis, visual changes, double vision, dry burning eyes, increased frequency of polyuria or oliguria, rales, angioedema, and hyperkalemia. Common side effects include hypotension, insomnia, dizziness, and tinnitus.

perineal. See **perineum.**

perineal artery, an artery that originates near the anterior end of the pudendal canal and gives off a transverse perineal branch and a posterior scrotal or labial artery to surrounding skin and tissue.

perineal body [Gk, *perineos*, perineum; AS, *bodig*], a mass of tissue composed of muscle and fascia between the vagina and rectum in females and between the scrotum and rectum in males.

perineal care^{1} [Gk, *perineos*, perineum], a cleansing procedure prescribed for the perineum after various obstetric and gynecological procedures. Sterile or clean perineal care may be prescribed. It is done also after elimination and as a routine part of hygiene care (bed bath) using clean technique rather than sterile.

■ METHOD: In the sterile procedure the cleansing strokes always move from the vulva toward the anus and from the midline out. After each stroke, the disposable washcloth or pledget is discarded, and a new one is used for the next stroke. A sterile basin, gloves, forceps, pledgets, and pitcher or measure containing sterile solution are used. The draped patient is assisted into position on her back with a bedpan or a disposable pad beneath her buttocks, and 200 to 300 mL of solution is poured over the vulva. Then pledgets moistened with the solution are used to cleanse the area more thoroughly. The pledgets are held with sterile forceps or a sterile gloved hand. The area is dried using sterile pledgets, and the bedpan is removed. The patient then rolls to one side for cleansing and drying of the posterior area. Strokes should always move away from the perineal area. In providing clean perineal care disposable washcloths and a basin or a squeeze bottle of warm water are used. A fresh disposable washcloth is used for each cleansing stroke and each drying stroke. The strokes are always from anterior to posterior. Soap may be used.

■ INTERVENTIONS: Perineal care is given at prescribed intervals and after urination and defecation.

■ OUTCOME CRITERIA: Sterile and clean perineal care is practiced to remove secretions or dried blood from a wound and to prevent contamination of the urethral and vaginal areas or perineal wounds with fecal matter or urine.

perineal care^{2}**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as maintenance of perineal skin integrity and relief of perineal discomfort. See also **Nursing Interventions Classification.**

perineal dislocation. See **dislocation of the hip.**

perineal membrane, a thick triangular fascial sheet that fills the space between the arms of the pubic arch and has a free posterior border.

perineal pad [Gk, *perineos*, perineum], a cushion of soft material used to cover the perineum to absorb the menstrual flow or to protect a wound or incision.

perineal raphe, a ridge along the median line of the perineum that runs forward from the anus. In the male, it is continuous with the raphe of the scrotum and the raphe of the penis.

perineo-, prefix meaning “related to the perineum”: *perineostomy.*

perineocele /per′inē′əsēl′/, a hernia in the perineal area, around the rectum.

perineorrhaphy /per′inē·ôr′əfē/ [Gk, *perineos* + *rhaphe*, suture], a surgical procedure in which an incision, tear, or defect in the perineum is repaired by suturing.

perineostomy /per′inē·os′təmē/, the surgical creation of an opening between the urethra and the skin of the perineal region.

perineotomy /per′inē·ot′əmē/ [Gk, *perineos* + *temnein*, to cut], a surgical incision into the perineum. See also **episiotomy.**

perinephric abscess /-nef′rik/ [Gk, *peri*, around, *nephros*, kidney; L, *abscedere*, to go away], an abscess that develops in the fatty tissue around a kidney. It is usually secondary to an abscess originating earlier in the cortex of the organ. Also called **perinephritic abscess.**

perinephric fat. See **perirenal fat.**

perinephrium /-nef′rē·əm/, the connective tissue around the kidneys.

perineum /per′inē′əm/ [Gk, *perineos*], the part of the body situated dorsal to the pubic arch and the arcuate ligaments, ventral to the tip of the coccyx, and lateral to the inferior rami of the pubis and the ischium and the sacrotuberous ligaments. The perineum supports and surrounds the distal parts of the urogenital and GI tracts of the body. In the female the central fibrous perineal body is larger than in the male; the bulbospongiosus, which is a sphincter around the orifice of the vagina and a cover over the clitoris, does not exist in the male perineum. In men and women the muscles are innervated by the perineal branch of the pudendal nerve. **—perineal,** *adj.*

perinocele, a hernia in the perineum.

perinodal fiber /-nō′dəl/ [Gk, *peri* + L, *nodus,* knot], any of the atrial fibers surrounding the atrioventricular or sinus node.

period /pir′ē·od/, **1.** an interval of time. **2.** one of the stages of a disease. **3.** (in physics) the duration of a single cycle of a periodic wave or event. **4.** See **menses.**

periodic /pir′ē·od′ik/ [Gk, *peri* + *hodos,* way], (of an event or phenomenon) recurring at regular or irregular intervals. **—periodicity,** *n.*

periodic apnea of the newborn, a normal condition in the full-term newborn, characterized by an irregular pattern of rapid breathing followed by a brief period of apnea, usually associated with rapid eye movement (REM) sleep. Apnea in the newborn not associated with REM sleep or with periodic breathing is ominous because it is symptomatic of intracranial bleeding, seizure activity, infection, pneumonia, hypoglycemia, drug depression, or various cardiac defects. See also **sudden infant death syndrome.**

periodic breathing. See **Cheyne-Stokes respiration.**

periodic deep inspiration, an occasional deep breath that may be 1.5 times the normal tidal volume. Many mechanical ventilators can be set to provide a selected number of deep inspirations each hour. The process helps prevent atelectasis. Also called **sigh.**

periodic fever [Gk, *peri,* around, *hodos,* way; L, *febris*], **1.** a hereditary illness with intermittent episodes of fever accompanied by abdominal or pleuritic pain. It affects mainly Sephardic Jews, Armenians, and Arabs. Onset occurs between 10 and 20 years of age. Some cases are complicated by symptoms of arthritis, splenomegaly, and renal amyloidosis that may progress to a fatal kidney disorder. **2.** See **familial Mediterranean fever.**

periodic hyperinflation, a normal phenomenon of unconscious sighing or deep breathing. It tends to occur most frequently during periods of physical inactivity. Because of the apparent need for periodic hyperinflation, an artificial sigh is often programmed into mechanical ventilators. See also **periodic deep inspiration.**

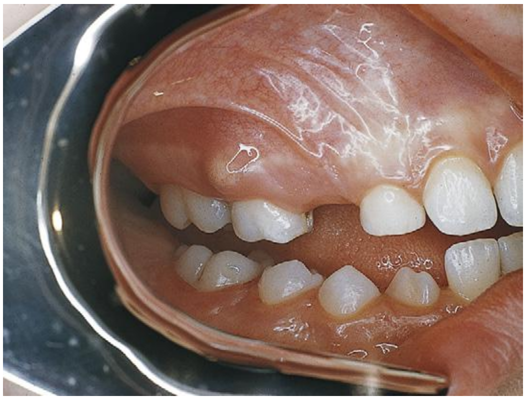
periodicity /pir′ē·ədis′itē/ [Gk, *periodikos,* periodical], events or episodes that tend to repeat at predictable intervals. For example, filarial worms may appear in cutaneous blood vessels at night but not in daylight hours, and malaria may cause paroxysms at 24-, 48-, or 72-hour intervals, depending on the species of pathogen.

periodic peritonitis, periodic polyserositis. See **familial Mediterranean fever.**

periodic table, a systematic arrangement of the chemical elements. An earlier version was devised in 1869 by Dmitri Ivanovich Mendeleev (Russian chemist, 1834–1907). By arranging the elements in order of their atomic weights, he was able to show relationships, such as valency, that occurred at regular intervals and was able to predict the properties of elements still undiscovered in the nineteenth century.

periodontal /per′ē·ōdon′təl/ [Gk, *peri* + *odous,* tooth], pertaining to the supporting structures of a tooth, including the fibrous connective tissue (periodontal membrane), cementum, alveolar bone, and gingiva.

periodontal abscess [Gk, *peri,* around, *odous,* tooth; L, *abscedere,* to go away], an infection in the area around a tooth. It is usually classified according to its location in the periodontal tissues, such as lateral, lateral alveolar, parietal, or peridental.



Periodontal abscess *(Regezi, Sciubba, and Pogrel, 2000)*

periodontal cyst, a fluid-filled, epithelium-lined sac at the apex of a tooth that has an infected pulp or, less often, is lateral to a tooth root. Also called **dental root cyst, dentoalveolar cyst.**

periodontal disease, a pathological condition of the tissues that support a tooth or teeth, such as an inflammation of the periodontal membrane or periodontal ligament.

periodontal disease index, a measure developed by Siguard Ramfjord in 1959 based on Russell's Periodontal Index. The index utilizes objective measures of plaque, calculus, and observed physical characteristics of the gingiva and periodontium. Six teeth (3, 9, 12, 19, 25, 28) called Ramfjord's teeth are selected and evaluated. Gingiva is evaluated first with the observation of changes in color, form or shape, presence or absence of stippling, and consistency, followed by measurement of gingival crevice depth.

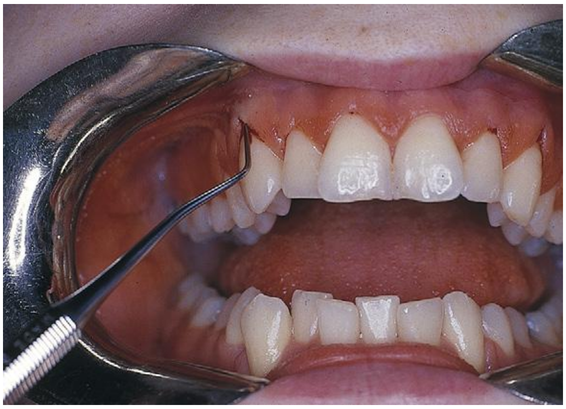
periodontal index, a measure of an individual's periodontal condition. It is determined by adding scores based on the condition of the gingiva and dividing the sum by the number of teeth present. Individuals with clinically normal gingiva have an index of 0 to 0.2. The index reaches a maximum of 8.0 in persons with severe terminal destructive periodontitis.

periodontal ligament (PDL), the fibrous connective tissue that surrounds a tooth and attaches the tooth to the alveolus. It is composed of many bundles of collagenous tissue arranged in groups, which lie at differing angles relative to the root of the tooth, the alveolus, and the gingiva due to the forces of mastication, between which lies loose connective tissue interwoven with blood vessels, lymphatic vessels, and nerves. Also called **periodontium.**

periodontal pocket [Gk, *peri,* around, *odous,* tooth; Fr, *pochette*], a pathological increase in the depth of the gingival crevice or sulcus surrounding a tooth at the gingival margin. Kinds of periodontal pockets include **gingival, infrabony, intraalveolar, intrabony, relative, simple, suprabony,** and **supracrestal.**

periodontal probe [Gk, *peri,* around, *odous,* tooth; L, *probare,* to test], **1.** a slender, tapered, flat or cylindric instrument with indentations spaced in millimeters, designed for introduction into the gingival sulcus for the purpose of measuring its depth. **2.** a slender tapered instrument with or without millimeter indentations or contrasting colors for measuring furcations of the roots of premolars and molars. also called **furcation probe.**

periodontics /-don′tiks/ [Gk, *peri,* around, *odous,* tooth], the branch of dentistry concerned with the diagnosis, treatment, and prevention of diseases of the periodontium. Also called *periodontia,* **periodontology.**



Periodontal pocket *(Regezi, Sciubba, and Pogrel, 2000)*

periodontist /-don′tist/, a dentist who specializes in treating the supporting structures of the teeth.

periodontitis /per′ē·ō′dontī′tis/, inflammation of the periodontium caused by a complex reaction initiated when subgingival plaque bacteria are in close contact with the epithelium of the gingival sulcus. Injury arises from toxins and enzymes produced by the bacteria and from host-mediated defense responses. Apical movement of the junctional epithelium, which indicates attachment loss and alveolar bone loss, is diagnostic of periodontitis. See also **periodontal disease.**

periodontium /per′ē·ō·don′shē·əm/ *pl.* **periodontia** [Gk, *peri,* around + *odous,* tooth], **1.** the tissues that invest or help invest and support the teeth, including the periodontal ligament, gingivae, cementum, and alveolar and supporting bone. also called **odontoperiosteum, paradentium, peridontium. 2.** See **periodontal ligament.**

periodontoclasia [Gk, *peri* + *odous,* tooth, *klasis,* breaking], the loosening of secondary teeth caused by breakdown and absorption of the supporting bone.

periodontology. See **periodontics.**

periodontosis /-dontō′sis/ [Gk, *peri* + *odous,* tooth, *osis,* condition], a rare disease that affects young people, especially women, and is characterized by idiopathic destruction of the periodontium without inflammation.

perioperative /per′i·op′ərətiv/ [Gk, *peri,* around; L, *operari,* to work], pertaining to the time before (preoperative), during (intraoperative), and after (postoperative) surgery.

perioperative nursing [Gk, *peri* + L, *operari,* to work, *nutrix,* nurse], nursing care provided to surgery patients before and during the procedure and in the recovery room.

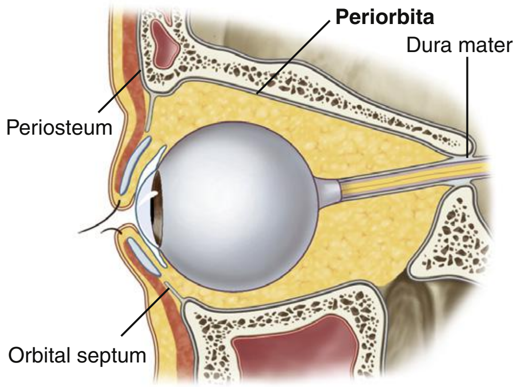
perioperative nursing data set, a nursing language specialized for vocabulary that addresses the perioperative patient experience from preadmission until discharge. See also **perioperative nursing.**

periorbita /per′i·ôr′bitə/ [Gk, *peri* + L, *orbita,* wheel mark], the periosteum of the orbit of the eye. It is continuous with the dura mater and the sheath of the optic nerve and extends a process at the margin of the orbit to form the orbital septum. The periorbita is loosely connected to the bones of the orbit, from which it can be easily detached.

periorbital /per′i·ôr′bitəl/, pertaining to the area surrounding the socket of the eye.

periosteal /per′i·os′tē·əl/ [Gk, *peri,* around, *osteon,* bone], pertaining to the periosteum, the membrane covering the bones.

periosteal bone. See **perichondrial bone.**

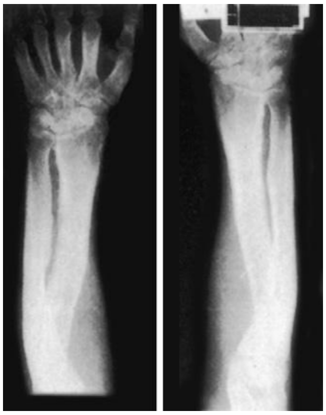


Periorbita *(Drake, Vogl, and Mitchell, 2010)*

periosteal layer, the outer layer of the dura mater; the periosteum of the cranial cavity. It is firmly attached to the skull and is continuous with the periosteum on the outer surface of the skull at the foramen magnum and other intracranial foramina. See also **dura mater.**

periosteum /per′i·os′tē·əm/ [Gk, *peri* + *osteon,* bone], a thick, fibrous vascular membrane covering the bones, except at their extremities. It consists of an outer layer of collagenous tissue containing a few fat cells and an inner layer of fine elastic fibers. Periosteum is permeated with the nerves and blood vessels that innervate and nourish underlying bone. The membrane is thick and markedly vascular over young bones but thinner and less vascular in later life. Bones that lose periosteum through injury or disease usually scale or die.

periostitis /per′i·ostī′tis/ [Gk, *peri* + *osteon,* bone, *itis*], inflammation of the periosteum. The condition is caused by chronic or acute infection or trauma and is characterized by tenderness and swelling of the affected bone, pain, fever, and chills. In severe cases blood or an albuminous serous exudate forms under the membrane. In syphilitic infections periostitis may occur as an early symptom.



Periostitis *(Moll, 1997)*

peripatetic /-pətet′ik/ [Gk, *peripatein,* to walk about], pertaining to an ambulatory typhoid patient.

peripelvic cyst. See **renal sinus cyst.**

peripelvic extravasation, extravasation of urine into the area around the renal pelvis.

peripheral /pərif′ərəl/ [Gk, *periphereia,* circumference], pertaining to the outside, surface, or surrounding area of an organ, other structure, or field of vision.

peripheral acrocyanosis of the newborn, a normal transient condition of the newborn characterized by pale cyanotic discoloration of the hands and feet, especially the fingers and toes. The blueness fades as the baby begins to breathe easily but returns if the baby is allowed to become chilled.

peripheral angiography [Gk, *peri,* around, *phereia,* boundary, *angeion,* vessel, *graphein,* to record], the study of the peripheral blood vessels by radiography after radiopaque dye is injected into the circulation.

peripheral arterial disease (PAD), a systemic form of atherosclerosis producing symptoms in the cardiac, cerebral, and renal vascular systems. It affects up to 2% of individuals between 37 and 69 years of age and about 10% of persons over 70 years of age. The incidence is highest among males with diabetes mellitus. Other risk factors include obesity and stress. Blood flow is restricted by an intraarterial accumulation of soft deposits of lipids and fibrin that harden over time, particularly at bends or bifurcations of the arterial walls. Patients generally are not aware of the changes until the diameter of the arterial lumen has been reduced by half. Early symptoms include intermittent claudication and ischemic rest pain. See also **arterial insufficiency.**

peripheral arteriovenography, the radiographic examination of the blood vessels in the peripheral parts of the body, such as the arms and legs, after the injection of a contrast medium into these vessels.

peripheral blood stem cells, stem cells that circulate in the peripheral blood rather than the bone marrow. Their numbers can be artificially increased by exposure to hematopoietic growth factors so that they can be harvested for peripheral blood stem cell transplantation Also called *peripheral blood progenitor cells.*

peripheral device, any hardware device that may be attached to a computer's central processing unit via a cable, such as a printer, monitor, or external backup drive.

peripheral giant cell granuloma, a relatively common oral tumorlike growth consisting of multinucleated giant cells which resemble osteoclasts or believed to be formations of mononuclear phagocytes. The lesion can be sessile or pedunculated and can develop at any age; it is caused by local irritation or trauma but is not thought to be a reparative reaction for the body. A similar lesion located within bone is called a central giant-cell granuloma. Compare **peripheral ossifying fibroma** and **cementifying fibroma.**

peripheral glioma. See **schwannoma.**

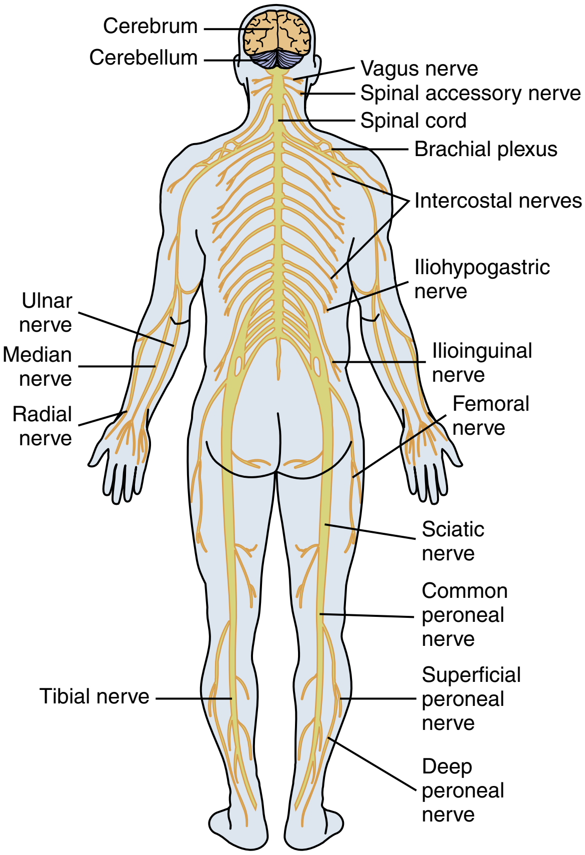
peripheral lesion [Gk, *perphereia* + L, *laesio,* hurting], an injury to any tissues distal to the main organ systems. A peripheral nerve lesion is usually traumatic and interrupts the flow of impulses between the site of the lesion and the nerve root or plexus.

peripherally inserted central catheter (PICC), a long catheter introduced through a vein in the arm, then through the subclavian vein into the superior vena cava or right atrium to administer parenteral fluids (as in hyperalimentation) or medications or to measure central venous pressure.

peripherally inserted central (PIC) catheter care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as insertion and maintenance of a peripherally inserted central catheter either midline or centrally located. See also **Nursing Interventions Classification.**

peripheral motor neuron [Gk, *periphereia* + L, *motor,* mover; Gk, *neuron,* nerve], an effector neuron located outside the central nervous system, usually in a ganglion of the sympathetic or parasympathetic nervous system.

peripheral nervous system, the motor and sensory nerves and ganglia outside the brain and spinal cord. The system consists of 12 pairs of cranial nerves, 31 pairs of spinal nerves, and their various branches in body organs. Sensory, or afferent, peripheral nerves transmitting information to the central nervous system and motor, or efferent, peripheral nerves carrying impulses from the brain usually travel together but separate at the cord level into a posterior sensory root and an anterior motor root. Fibers innervating the body wall are designated somatic. Those supplying internal organs are termed visceral. The autonomic system includes the peripheral nerves involved in regulating cardiovascular, respiratory, endocrine, and other automatic body functions. Nerves in the sympathetic or thoracolumbar division of the autonomic system secrete norepinephrine and cause peripheral vasoconstriction, cardiac acceleration, coronary artery dilation, bronchodilation, and inhibition of peristalsis. Parasympathetic nerves, which constitute the craniosacral division of the autonomic system, secrete acetylcholine; cause peripheral vasodilation, cardiac inhibition, and bronchoconstriction; and stimulate peristalsis. Injury to a peripheral nerve results in loss of movement and sensation in the area innervated distal to the lesion.



Peripheral nervous system *(Sorrentino, 2012)*

peripheral neuropathy, any functional or organic disorder of the peripheral nervous system. A kind of peripheral neuropathy is **paresthesia.**

peripheral odontogenic fibroma, a rare soft tissue lesion of fibrous connective tissue associated with the gingival margin or interdental papilla. The lesion is a sessile mass covered by normal-looking mucosa. It may also contain dysplastic dentin, cementum-like calcifications, and bony trabeculae. This lesion differs from **peripheral ossifying fibroma.** Compare with **central odontogenic fibroma.**

peripheral ossifying fibroma, a relatively common gingival growth of mesenchymal cells from the periosteum or the periodontal ligament. It is a sessile or pedunculated lesion, containing fibroblastic mineralized tissue surrounded by a fibropurulent membrane. May resemble pyogenic granuloma or peripheral giant cell granuloma. This lesion differs from a peripheral odontogenic fibroma or a central ossifying fibroma.

peripheral plasma cell myeloma. See **plasmacytoma.**

peripheral polyneuritis. See **multiple peripheral neuritis.**

peripheral polyneuropathy. See **multiple peripheral neuritis.**

peripheral pulse [Gk, *periphereia* + L, *pulsare,* to beat], the series of waves of arterial pressure caused by left ventricular systoles as measured in the limbs.

peripheral scotoma [Gk, *periphereia* + *skotos,* darkness, *oma* tumor], a lost area of the visual field that is located peripherally and does not involve the central 30° of vision.

peripheral sensation management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention or minimization of injury or discomfort in the patient with altered sensation. See also **Nursing Interventions Classification.**

peripheral vascular disease (PVD), any abnormal condition that affects the blood vessels and lymphatic vessels, except those that supply the heart. Different kinds and degrees of PVD are characterized by a variety of signs and symptoms, such as numbness, pain, pallor, elevated blood pressure, and impaired arterial pulsations. Causative factors include obesity, cigarette smoking, stress, sedentary occupations, and numerous metabolic disorders. PVD in association with bacterial endocarditis may involve emboli in terminal arterioles and produce gangrenous infarctions of distal parts of the body, such as the tip of the nose, the pinna of the ear, the fingers, and the toes. Large emboli may occlude peripheral vessels and cause atherosclerotic occlusive disease. Treatment of severe cases may require amputation of gangrenous body parts. Less severe peripheral vascular problems may be treated by eliminating causative factors, especially cigarette smoking, and by administering various drugs, such as salicylates and anticoagulants. Some kinds of peripheral vascular disease are **atherosclerosis** and **arteriosclerosis.**

peripheral vascular resistance, a resistance to the flow of blood determined by the tone of the vascular musculature and the diameter of the blood vessels. It is responsible for blood pressure when coupled with stroke volume.

peripheral vision, a capacity to see objects in the outer aspects of the field of view caused by reflected light waves that fall on areas of the retina distant from the macula.

peripheral zone, a large area of the prostate, just beneath the capsule, covering the posterior and lateral aspects and composed mainly of acinar glandular tissue. Its ducts drain into the prostatic urethra along most of its length.

periphery /pərif′ərē/ [Gk, *peri,* around, *phereia,* boundary], **1.** parts or areas near or outside a perimeter or boundary. **2.** the outer body parts, such as the skin or limbs.

perirectal /-rek′təl/ [Gk, *peri,* around; L, *rectus,* straight], pertaining to the area around the rectum.

perirenal fat, an accumulation of extraperitoneal fat that completely surrounds the kidney. Enclosing this fat is a membranous condensation of extraperitoneal fascia, the renal fascia. Also called **perinephric fat.** See also **pararenal fat.**

perirenal hematoma, a hematoma resulting from a perirenal hemorrhage.

perirenal hemorrhage, hemorrhage from the kidney into the perirenal space, such as from trauma, vasculitis, aneurysm, tumor, renal infarct, or cyst.

perirenal space, the part of the retroperitoneal space that is within the renal fascia and contains the kidney, perirenal fat, adrenal gland, and proximal ureter. Also called *perinephric space*.

perisinusitis /-sī′nəsī·tis/ [Gk, *peri,* around; L, *sinus,* hollow], an inflammation of the structures around a sinus.

peristalsis /-stal′sis, -stôl′sis/ [Gk, *peri* + *stalsis,* contraction], the coordinated, rhythmic serial contraction of smooth muscle that forces food through the digestive tract, bile through the bile duct, and urine through the ureters.

peristaltic /-stal′tik, -stôl′tik/ [Gk, *peri* + *stalsis,* contraction], pertaining to peristalsis.

peristaltic rush, a powerful wave of contractile activity that travels long distances down the small intestine, caused by intense irritation or unusual distension. Also called **peristaltic reflex.**

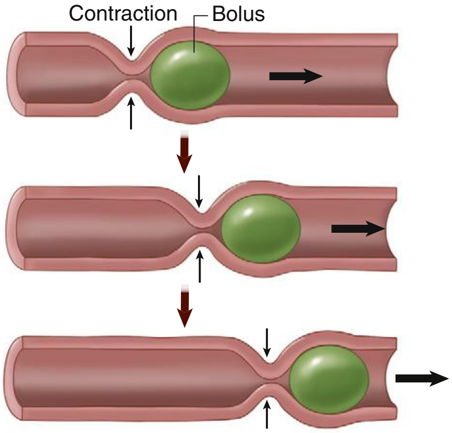
peristomal /per′istō′məl/, pertaining to the area of skin surrounding a stoma in the abdominal wall.

peritoneal /-tənē′əl/ [Gk, *peri* + *teinein,* to stretch], pertaining to the peritoneum.

peritoneal abscess [Gk, *peri* + *teinein* + L, *abscedere,* to go away], an abscess in the peritoneal cavity, the result of peritonitis and usually complicated by adhesions.

peritoneal cavity [Gk, *peri* + *teinein,* to stretch], the potential space between the parietal and visceral layers of the peritoneum, which are normally in contact. The peritoneal cavity is divided into the greater and lesser sac. The greater sac is the peritoneal cavity, and the lesser sac is the omental bursa. The omental bursa is associated with the dorsal surface of the stomach and the surrounding structures. See also **omental foramen.**

peritoneal dialysis (PD), a dialysis procedure performed to correct an imbalance of fluid or of electrolytes in the blood or to remove toxins, drugs, or other wastes normally excreted by the kidney. The peritoneum is used as a diffusible membrane. Peritoneal dialysis may be performed nightly for chronically ill children while they sleep and also may be carried out regularly at home. It is contraindicated in patients with extensive intraabdominal adhesions, localized peritoneal infection, and gangrenous or perforated bowels, although peritonitis may



Peristalsis *(Patton and Thibodeau, 2010)* itself sometimes be treated by peritoneal lavage and antibiotics administered during peritoneal dialysis.

■ METHOD: Under local anesthesia a many-eyed catheter is sutured in place in the peritoneum and a sterile dressing is applied. The catheter is connected to the inflow and outflow tubing with a Y connector, and the air in the tubing is displaced by the dialysate to prevent introduction of air into the peritoneal cavity. The amount and the kind of dialysate and the length of time for each exchange cycle vary with the age, size, and condition of the patient. There are three phases in each cycle. During inflow the dialysate is introduced into the peritoneal cavity. During equilibration (swell) the dialysate remains in the peritoneal cavity. By means of osmosis, diffusion, and filtration, the needed electrolytes pass via the vascular peritoneum to the blood vessels of the abdominal cavity, and the waste products pass from the blood vessels through the vascular peritoneum into the dialysate. During the third phase (drain) the dialysate is allowed to drain from the peritoneal cavity by gravity.

■ INTERVENTIONS: The fluid is warmed to body temperature before instillation, and heparin, antibiotics, or other substances may be added to the dialysate. The patient's fluid balance, respirations, pulse, blood pressure, temperature, and mental state are frequently evaluated, and blood glucose and electrolyte levels are tested regularly. The amount of fluid instilled and the amount and character of the fluid drained are noted. Bacteriological cultures of the drainage are performed regularly. A low-sodium, high-carbohydrate, high-fat 20- to 40-g protein diet is usually offered. Medication for pain may be necessary. Much peritoneal dialysis is now done in the home, not in facility. VNA referral is done for appropriate teaching and assessment with follow-up in dialysis centers. The need for dialysis and the techniques, dangers, and advantages of peritoneal dialysis are explained to the patient and the family.

■ OUTCOME CRITERIA: Peritoneal dialysis may result in several complications, including perforation of the bowel, peritonitis, atelectasis, pneumonia, pulmonary edema, hyperglycemia, hypovolemia, hypervolemia, and adhesions. Peritonitis, the most common problem, is usually caused by failure to use aseptic technique and is characterized by fever, cloudy dialysate, leukocytosis, and abdominal discomfort. Dialysis may usually be continued while the infection is treated with antibiotics, which are given systemically or intraperitoneally. Atelectasis and pneumonia may result from compression of the thoracic cavity, with decreased respiratory excursion and blood flow to the bases of the lungs caused by an excessive volume of dialysate in the peritoneal cavity. Dyspnea, tachypnea, rales, and tachycardia require reevaluating the amount of dialysate, raising the head of the bed, and administering respiratory therapy to prevent atelectasis and pneumonia. Because patients with diabetes are at risk of developing hyperglycemia, serum and urine glucose levels are monitored, and, if necessary, sorbitol may be substituted for glucose in the dialysate. If dialysate fluid is retained in the peritoneal cavity, hypervolemia may occur, predisposing the patient to pulmonary edema and congestive heart failure. If the dialysate is removed too rapidly or if the dialysate used is a hypotonic glucose solution, hypovolemia may result. Adhesions often develop as a result of local irritation to the surrounding tissues caused by the intraperitoneal catheter.

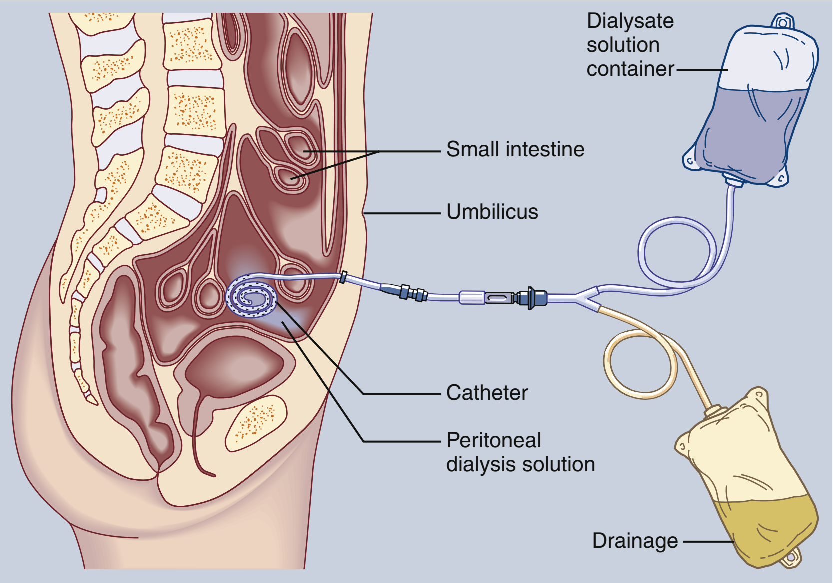
peritoneal dialysis solution, a solution of electrolytes and other substances that is introduced into the peritoneum to remove toxic substances from the body in some patients with renal failure.

peritoneal dialysis therapy, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administration and monitoring of dialysis solution into and out of the peritoneal cavity. See also **Nursing Interventions Classification.**

peritoneal endometriosis [Gk, *peri* + *teinein,* to stretch, *endon,* within, *metra,* womb], ectopic endometrial tissue found in the pelvic cavity. See also **implantation endometriosis.**

peritoneal equilibration test, the calculation of the ratio of plasma to dialysis solution concentrations of solutes, such as creatinine and glucose, after a certain specific dwell time.

peritoneal fluid, a naturally produced fluid in the abdominal cavity that lubricates surfaces, thereby preventing friction between the peritoneal membrane and internal organs.



Peritoneal dialysis *(Goldman et al, 2004)*

peritoneo-, prefix meaning “peritoneum”: *peritoneal, peritonitis*.

peritoneoscope. See **laparoscope.**

peritoneoscopy /-tō′nē·os′kəpē/ [Gk, *peri* + *teinein* + *skopein,* to view], the use of an endoscope to inspect the peritoneum through a stab incision in the abdominal wall.

peritoneum /per′itənē′əm/ [Gk, *peri* + *teinein,* to stretch], an extensive serous membrane that lines the entire abdominal wall of the body and is reflected over the contained viscera. It is divided into the parietal peritoneum and the visceral peritoneum. In men the peritoneum is a closed membranous sac. In women it is perforated by the free ends of the uterine tubes. The free surface of the peritoneum is smooth mesothelium, lubricated by serous fluid that permits the viscera to glide easily against the abdominal wall and against one another. The mesentery of the peritoneum fans out from the main membrane to suspend the small intestine. Other parts of the peritoneum are the transverse mesocolon, the greater omentum, and the lesser omentum. **—peritoneal,** *adj*.

peritonitis /per′itənī′tis/ [Gk, *peri* + *teinein,* to stretch, *itis*], an inflammation of the peritoneum. It is produced by bacteria or irritating substances introduced into the abdominal cavity by a penetrating wound or perforation of an organ in the GI tract or the reproductive tract. Peritonitis is caused most commonly by rupture of the appendix but also occurs after perforations of intestinal diverticula, peptic ulcers, gangrenous gallbladders, gangrenous obstructions of the small bowel, or incarcerated hernias, as well as ruptures of the spleen, liver, ovarian cyst, or fallopian tube, especially in ectopic pregnancy. In some cases, peritonitis is secondary to the release of pancreatic enzymes, bile, or digestive juices of the upper GI tract, and there are reports of postoperative peritonitis caused by cornstarch used to powder surgical gloves. The bacteria most frequently identified as causative agents in peritonitis are ***Escherichia coli, Bacteroides, Fusobacterium,*** and anaerobic and aerobic streptococci. Pneumococci occasionally found in peritonitis in girls are thought to enter the abdominal cavity via the vagina and fallopian tubes. See also **acute diffuse peritonitis, adhesive peritonitis.**

■ OBSERVATIONS: Characteristic signs and symptoms include abdominal distension, rigidity and pain, rebound tenderness, decreased or absent bowel sounds, nausea, vomiting, and tachycardia. The patient has chills and fever; breathes rapidly and shallowly; is anxious, dehydrated, and unable to defecate; and may vomit fecal material. Leukocytosis, an electrolyte imbalance, and hypovolemia are usually present, and shock and heart failure may ensue.

peritonitis meconium [Gk, *peri* + *teinein, itis,* inflammation, *mekon,* poppy], a condition of peritonitis in a newborn resulting from rupture of the digestive tract. The inflammation is caused by leakage of meconium, or fecal contents, into the peritoneal cavity.

peritonsillar /-ton′silər/ [Gk, *peri* + L, *tonsilla*], pertaining to the area around a tonsil.

peritonsillar abscess [Gk, *peri* + L, *tonsilla,* tonsil, *abscedere,* to go away], an infection of tissue between the tonsil and pharynx, usually after acute follicular tonsillitis. The symptoms include dysphagia, pain radiating to the ear, and fever. Redness and swelling of the tonsil and adjacent soft palate are present. Treatment includes antibiotics, warm saline solution irrigation, incision and drainage with suction if there is no spontaneous rupture of the abscess, and sometimes tonsillectomy. Also called **quinsy.** Compare **parapharyngeal abscess, retropharyngeal abscess.** See also **tonsillitis.**

peritubular capillary, any of the capillaries around the proximal and distal convoluted tubules of the kidney.

perityphlitis. See **paratyphlitis.**

periumbilical /per′i·umbil′ikəl/ [Gk, *peri,* around, *umbilicus,* navel], pertaining to the area around the umbilicus.

periungual /per′i·ung′gwəl/ [Gk, *peri* + L, *unguis,* nail], pertaining to the area around the fingernails or the toenails.

periurethral zone, a narrow area of the prostate consisting of the short ducts adjacent to the prostatic urethra. It is sometimes a site of benign prostatic hyperplasia, but not as commonly as the transitional zone.

periurethritis /per′-u′rē-thri′tis/, inflammation of the tissue around the urethra. Also called **spongiositis.**

perivascular goiter /per′ivas′kyo͝olər/ [Gk, *peri* + L, *vasculum,* little vessel, *guttur,* throat], an enlargement of the thyroid gland surrounding a large blood vessel.

perivascular spaces [Gk, *peri,* around; L, *vasculum,* little vessel, *spatium,* space], spaces that surround blood vessels as they enter the brain. They communicate with the subarachnoid space. Also called **Virchow-Robin spaces, Virchow’s spaces.**

perivertebral /-vur′təbrəl/ [Gk, *peri,* around, *vertebra,* joint], pertaining to the area around a vertebra.

perivesical spaces, subdivisions of the extraperitoneal space found anterior to the urinary bladder.

perivitelline /-vitel′ēn/ [Gk, *peri* + L, *vitellus,* yolk], surrounding the vitellus or yolk mass.

perivitelline space, the space between a mammalian ovum and the zona pellucida, into which the polar bodies are released at the time of maturation. In some animals it is a fluid-filled space that separates the fertilization membrane from the vitelline membrane surrounding the ovum after the penetration of a spermatozoon.

Perkin’s line, a line through the anterior inferior iliac spine, perpendicular to Hilgenreiner’s line, used in radiographic assessment of the hip joint.

perle /purl, perl/ [Fr, pearl], a soft gelatin capsule filled with liquid medicine.

perlèche, single or multiple fissures and cracks at the corner of the mouth on one side or both sides, which in advanced stages may spread to the lips and cheeks. Causes include primary or superimposed infection with microorganisms, such as *Candida albicans,* staphylococci, or streptococci; poor hygiene; drooling of saliva; overclosure of the jaws in patients without teeth or with ill-fitting dentures; or riboflavin deficiency. Also called **angular cheilitis, angular cheilosis, angular stomatitis.** See also **cheilitis, cheilosis.**

perlingual /pərling′gwəl/ [L, *per* + *lingua,* tongue], pertaining to the administration of drugs through the tongue, which absorbs substances through its surface. See also **sublingual administration of a medication.**

permanent dentition, adult teeth. See **secondary dentition.**

permanent pacemaker [L, *permanere,* to remain, *passus,* step; ME, *maken*], any electric pacemaker implanted inside a patient’s body for permanent use.

permanent teeth. See **secondary dentition.**

permeability /pur′mē·əbil′itē/ [L, *permeare,* to pass through], the degree to which one substance allows another substance to pass through it. See also **capillary permeability, magnetic permeability, osmosis. —permeable,** *adj*.

permeable /pur′mē·əbəl/ [L, *permeare,* to pass through], a condition of allowing fluids and certain other substances to pass through, such as a permeable membrane. See also **osmosis.**

per member per month (PMPM), usual unit of measure for capitation payments that payers provide to providers, both hospitals and physicians. These payments also include ancillary service use.

permethrin /pərməth′rin/, a topical pediculicide and scabicide.

■ INDICATIONS: It is used for the treatment of head lice and their nits, for the treatment of scabies, and as prophylaxis when there are epidemics of lice.

■ CONTRAINDICATIONS: Allergies to pyrethrin, pyrethroids, or chrysanthemum flowers prohibit its use.

■ ADVERSE EFFECTS: Among reported adverse effects are itching, mild burning or stinging, numbness, discomfort, mild erythema, and scalp rash.

permissible dose /pərmis′ibəl/ [L, *permittere,* to permit, *dosis,* something given], the maximum amount of radiation that may be expected to produce no significantly harmful results if given to an individual in a specified period.

permissible exposure limit (PEL), an occupational health standard instituted to safeguard workers against exposure to toxic material in the workplace. PELs are the result of the 1970 U.S. Occupational Safety and Health Act, which established the Occupational Safety and Health Administration (OSHA), the policing and enforcing arm of the Act, and the National Institute for Occupational Safety and Health (NIOSH), which represents the research arm. OSHA publishes PELs and short-term exposure limits based on recommendations of NIOSH. Also called **permissible exposure level.**

permissive hypercapnia, ventilation that allows $PaCO_2$ to rise slowly over time as the pH becomes normalized. The goal is to reduce tidal volume and rate while preventing volutrauma during mechanical ventilation. Patients may need to be sedated during this.

Permitil, a trademark for a tranquilizer **(fluphenazine hydrochloride).**

pernicious /pərnish′əs/ [L, *perniciosus,* destructive], potentially injurious, destructive, or fatal unless treated, such as pernicious anemia.

pernicious anemia [L, *perniciosus,* destructive; Gk, *a* + *haima,* not blood], a rare autoimmune form of megaloblastic anemia that results from autoantibodies to parietal cells and intrinsic factor essential for the absorption of cyanocobalamin (vitamin B_{12}). The maturation of red blood cells in bone marrow becomes disordered, the white blood cell count is reduced, and the polymorphonuclear neutrophils become hypersegmented. Weakness, numbness and tingling in the extremities, fever, pallor, anorexia, and weight loss may occur. The condition is usually treated with cyanocobalamin injection and with folic acid and iron therapy Also called **Addison anemia.** See also **atrophic gastritis, intrinsic factor, nutritional anemia.**

pernicious vomiting [L, *perniciosus,* destructive, *vomere,* to vomit], a severe life-threatening episode of vomiting that may occur during pregnancy. Also called **incoercible vomiting.** See also **hyperemesis gravidarum.**

pernio. See **chilblain.**

pero-, prefix meaning "maimed or deformed": *perobrachius, perodactylus, peromelus.*

perobrachius /pē′rōbrā′kē·əs/ [Gk, *peros,* damaged, *brachion,* arm], a fetus or individual with malformed arms.

perochirus /pē′rōkī′rəs/ [Gk, *peros* + *cheir,* hand], a fetus or individual with malformed hands.

perocormus. See **perosomus.**

perodactylia. See **perodactyly.**

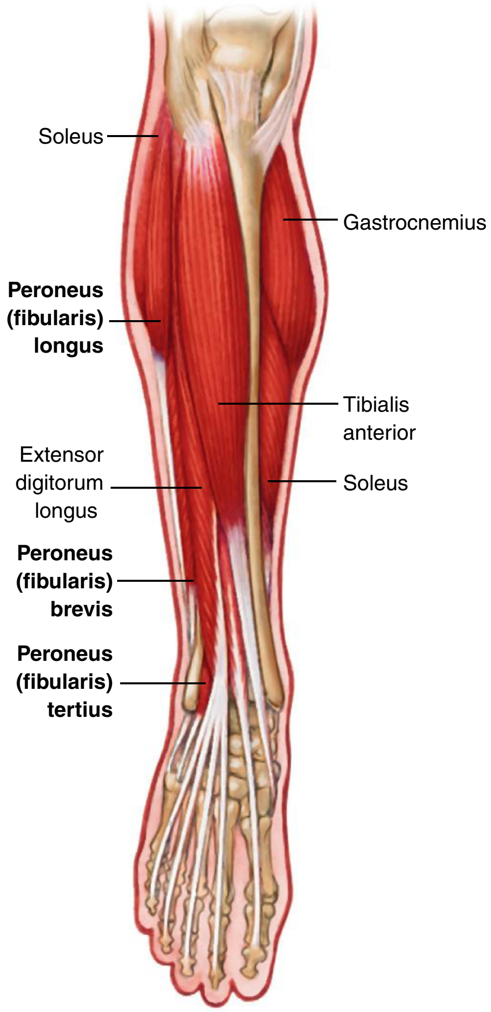
perodactylus /pē′rōdak′tiləs/, a fetus or an individual with a deformity of the fingers or the toes, especially the absence of one or more digits.

perodactyly /pē′rōdak′tilē/ [Gk, *peros* + *daktylos,* finger], a congenital anomaly characterized by a deformity of the digits, primarily the complete or partial absence of one or more of the fingers or toes. Also called **perodactylia.**

peromelia /pē′rōmē′lyə/ [Gk, *peros* + *melos,* limb], a congenital anomaly characterized by the malformation of one or more of the limbs. Also called *peromely.* —*peromelus, n.*

-perone, suffix for certain neuroleptics or antianxiety agents.

peroneal /per′ənē′əl/ [Gk, *perone,* brooch], pertaining to the outer part of the leg, over the fibula and the peroneal nerve.



Soleus
Gastrocnemius
Peroneus (fibularis) longus
Tibialis anterior
Extensor digitorum longus
Soleus
Peroneus (fibularis) brevis
Peroneus (fibularis) tertius

Peroneus brevis and peroneus longus
(Patton and Thibodeau, 2010)

peroneal muscular atrophy, symmetric weakening or atrophy of the foot and the ankle muscles and hammer toes. This disease is a dominantly inherited condition that occurs in a hypertrophic neuropathy form or in a neuronal form. The hypertrophic neuropathy form results in demyelination of nerve fibers and characteristic onion bulb formations. Affected individuals usually have high plantar arches and an awkward gait caused by weak ankle muscles. In the neuronal form this condition usually starts in the second decade of life and causes muscle weaknesses similar to those associated with the hypertrophic neuronal form. Both forms of the disease may also involve mild sensory loss in the lower limbs. Affected individuals may be helped by corrective surgery and leg braces that stabilize weak ankle joints.

peroneo-, prefix meaning "related to the fibula or surrounding area": *peroneal.*

peroneus brevis /per′ənē′əs/ [Gk, *perone* + L, *brevis,* short], the smaller of the two lateral muscles of the leg, lying under the peroneus longus. It pronates and plantar flexes the foot. Compare **peroneus longus.**

peroneus longus, the more superficial of the two lateral muscles of the leg. The muscle pronates and plantar flexes the foot. Compare **peroneus brevis.**

peronia /pərō′nē·ə/ [Gk, *peros,* damaged], a congenital malformation or developmental anomaly.

peropus /pərō′pəs/ [Gk, *peros* + *pous,* foot], a fetus or individual with malformed feet, often in association with some defect of the legs.

per os /pər os′/ [L], by mouth.

perosomus /pē′rōsō′məs/ [Gk, *peros* + *soma,* body], a fetus or individual whose body, especially the trunk, is severely malformed. Also called **perocormus.**

perosplanchnia /pē′rōsplangk′nē·ə/ [Gk, *peros* + *splanchnon,* viscera], a congenital anomaly characterized by the malformation of the viscera.

peroxide. See **hydrogen peroxide.**

peroxisome /pər·ok′si·sōm/, any of the microbodies present in vertebrate animal cells, especially liver and kidney cells, that are rich in the enzymes peroxidase, catalase, D-amino acid oxidase, and, to a lesser extent, urate oxidase. Their functions are not fully understood, but they participate in metabolic oxidations involving hydrogen peroxide, purine metabolism, cellular lipid metabolism, and gluconeogenesis. See **microbody.**

perphenazine /pərfen′əzēn/, a phenothiazine derivative used as an antipsychotic and antiemetic/antivertigo agent.

■ INDICATIONS: It is prescribed in the treatment of schizophrenia and in the control of severe nausea and vomiting in adults. Unlabeled uses include treatment of ethanol withdrawal, Huntington's chorea, Tourette's syndrome, spasmodic torticollis, and dementia in the elderly.

■ CONTRAINDICATIONS: Parkinson's disease, the concurrent administration of central nervous system depressants, liver or renal dysfunction, severe hypotension, bone marrow depression, blood dyscrasias, or known hypersensitivity to any phenothiazine prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, liver toxicity, extrapyramidal reactions, blood dyscrasias, and hypersensitivity reactions.

per primam intentionem [L], by primary (first) intention.

per pro., abbreviation for the Latin term *per procurationem,* "on behalf of."

per rectum [L], by rectum.

PERRLA /pur′lə/, abbreviation for *p*upils *e*qual, *r*ound, *r*eact to *l*ight, *a*ccommodation. While performing an assessment of the eyes, one evaluates the size and shape of the pupils, their reaction to light, and their ability to accommodate. If all findings are normal, the abbreviation is noted in the account of the physical examination.

Persantine, a trademark for an inhibitor of platelet aggregation **(dipyridamole).**

per se [L], by itself, or of itself.

per secundum intentionem [L], by second intention.

perseveration /pur′səvərā′shən/ [L, *persevero,* to persist], the involuntary and pathological persistence of the same verbal response or motor activity regardless of the stimulus or its duration. The condition occurs primarily in patients with brain damage or organic mental disorders, although it may also appear in schizophrenia as an association disturbance. It is caused by a neurological deficit.

Persian Gulf syndrome, a diffuse collection of symptoms reported by many veterans of the 1991 Persian Gulf war. Symptoms vary widely, but include fatigue, joint pain, headache, and sleep disturbances. Musculoskeletal and connective tissue diseases are also common. The specific cause is unknown, but explanations include exposure to chemicals from burning oil wells, insecticides, and poisons linked to inoculations against biological warfare or to chemical weapons used by the Iraqi army.

persistent cloaca /pərsis′tənt/ [L, *persistere,* to persist, *cloaca,* sewer], a congenital anomaly in which the intestinal, urinary, and reproductive ducts open into a common cavity, a result of the failure of the urorectal septum to form during prenatal development. Also called **congenital cloaca.**

persistent vegetative state, a state of wakefulness accompanied by an apparent complete lack of cognitive function, experienced by some patients in an irreversible coma. Vegetative functions and brainstem reflexes are intact, but the cortex is permanently damaged.

persona /pərsō′nə/ *pl. personae* [L, mask], (in analytic psychology) the personality façade or role that a person assumes and presents to the outer world to satisfy the demands of the environment or society or to express some intrapsychic conflict. The persona masks the person's inner being or unconscious self. Compare **anima.** See also **archetype.**

personal and social history /pur′sənəl/, (in a health history) an account of the personal and social details of a person's life that serves to identify the person. Place of birth, religion, race, marital status, number of children, military status, occupational history, and place of residence are the usual components of this part of the history, but it may often include other information, such as education; current living situation; and smoking, alcohol, and drug habits. The personal and social history is obtained at the initial interview and becomes a part of the permanent record.

personal assistance. See **custodial care.**

personal autonomy, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the personal actions of a competent individual to exercise governance in life decisions. See also **Nursing Outcomes Classification.**

personal care services, the services performed by health care workers to assist patients in meeting the requirements of daily living.

personal computer (PC). See **microcomputer.**

personal digital assistant (PDA), a small computer used to organize and easily access information, such as clinical guidelines.

personal health status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the overall physical, psychological, social, and spiritual functioning of an adult 18 years or older. See also **Nursing Outcomes Classification.**

personality /pur′sənal′itē/ [L, *personalis,* role], **1.** the composite of the behavioral traits and attitudinal characteristics by which one is recognized as an individual. **2.** the behavior pattern each person develops, both consciously and unconsciously, as a means of adapting to a particular environment and its cultural, ethnic, national, and provincial standards.

personality disorder, a *DSM-IV* psychiatry disorder characterized by disruption in relatedness. It is manifested in any of a large group of mental disorders characterized by rigid, inflexible, and maladaptive behavior patterns and traits that impair a person's ability to function in society by severely limiting adaptive potential. Some kinds of personality disorders are antisocial, borderline, and passive aggressive. See also **character disorder.**

personality test, any of a variety of standardized tests used in the evaluation or assessment of various facets of personality structure, emotional status, and behavioral traits. Compare **achievement test, aptitude test, intelligence test, psychological test.** See also **Minnesota Multiphasic Personality Inventory.**

personal orientation, **1.** a continually evolving process in which a person determines and evaluates the relationships that appear to exist between him or her and other people. **2.** the assessment of those relationships derived by a person.

personal protective equipment (PPE), a part of standard precautions for all health care workers to prevent skin and mucous membrane exposure when in contact with blood and body fluid of any patient. Personal equipment includes protective laboratory clothing, disposable gloves, eye protection, and face masks. See also **Standard Precautions.**

Personal protective equipment *(Chapleau, 2011)*

personal resiliency, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the positive adaptation and function of an individual following significant adversity or crisis. See also **Nursing Outcomes Classification.**

personal safety behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions that prevent physical injury to self. See also **Nursing Outcomes Classification.**

personal space, the area surrounding an individual that is perceived as private by the individual, who may regard a movement into the space by another person as intrusive. Personal space boundaries vary somewhat in different cultures, but in general they are regarded as a distance of about 1 meter (3 feet) around the individual.

personal unconscious, (in analytic psychology) the thoughts, ideas, emotions, and other mental phenomena acquired and repressed during one's lifetime. Compare **collective unconscious.**

personal well-being, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of one's health status. See also **Nursing Outcomes Classification.**

personal zone, an individual protective zone in which the boundaries may contract or expand according to contextual characteristics, usually between 18 inches and 4 feet.

person year, a statistical measure representing one person at risk of development of a disease during a period of 1 year.

perspiration /pur′spirā′shən/ [L, *per* + *spirare,* to breathe], **1.** the act or process of perspiring; the excretion of fluid by the sweat glands through pores in the skin. **2.** the fluid excreted by the sweat glands, consisting of water containing sodium chloride, phosphate, urea, ammonia, and other waste products. Perspiration serves as a mechanism for excretion and for regulation of body temperature. Abnormal amounts of perspiration usually result from organic causes but may also be precipitated by severe emotional stress. Kinds of perspiration are **insensible perspiration** and **sensible perspiration.** Also called **sweat.** See also **diaphoresis.** **—perspire** *v.*

per tertiam intentionem [L], by tertiary (third) intention.

Perthes disease, osteochondrosis of the head of the femur in children, characterized initially by epiphyseal necrosis or degeneration, followed by regeneration or recalcification. Also called **Calvé-Perthes disease, coxa plana, Legg-Calvé-Perthes disease, pseudocoxalgia.**

Pertofrane, a trademark for an antidepressant **(desipramine hydrochloride).**

perturbation /pur′tərbā′shən/ [L, *per* + *tubare,* to disturb], a cause or a condition of disturbance, disorder, or confusion.

pertussis /pərtus′is/ [L, *per* + *tussis,* cough], an acute, highly contagious respiratory disease characterized by paroxysmal coughing that ends in a loud whooping inspiration. It occurs primarily in infants and in children less than 4 years of age who have not been immunized. The causative organism, *Bordetella pertussis,* is a small, nonmotile gram-negative coccobacillus. A similar organism, *B. parapertussis,* causes a less severe form of the disease called parapertussis. Also called **whooping cough.**

■ OBSERVATIONS: Transmission occurs directly by contact or inhalation of infectious particles, usually spread by coughing and sneezing, and indirectly by contact with freshly contaminated articles. Diagnosis consists of positive identification of the organism in nasopharyngeal secretions. The initial stages of the disease are difficult to distinguish from bronchitis or influenza. A fluorescent antibody staining technique specific for *B. pertussis* provides an accurate means of early diagnosis. The incubation period averages 7 to 14 days, followed by 6 to 8 weeks of illness divided into three distinct stages: catarrhal, paroxysmal, and convalescent. Onset of the catarrhal stage is gradual, usually beginning with coryza, sneezing, a dry cough, a slight fever, listlessness, irritability, and anorexia. The cough becomes paroxysmal after 10 to 14 days; it occurs as a series of short rapid bursts during expiration followed by the characteristic whoop, caused by a spasm of the epiglottis, a hurried, deep inhalation that has a high-pitched crowing sound. There is usually no fever, and the respiratory rate between paroxysms is normal. During the paroxysm there is marked facial redness or cyanosis and vein distension, the eyes may bulge, the tongue may protrude, and the facial expression usually indicates severe anxiety and distress. Large amounts of a viscid mucus may be expelled during or after paroxysms, which occur from 4 to 5 times a day in mild cases and as many as 40 to 50 times a day in severe cases. Vomiting frequently occurs after the paroxysms as a result of gagging or choking on the mucus. In infants, choking may be more common than the characteristic whoop. This stage lasts from 4 to 6 weeks, with the attacks being most frequent and severe during the first 1 to 2 weeks, then gradually declining and disappearing. During the convalescent stage a simple persistent cough is usual. For a period of up to 2 years after the initial attack, paroxysmal coughing may accompany respiratory infections.

■ INTERVENTIONS: Routine treatment consists of bed rest, adequate nutrition, and adequate amounts of fluid. Erythromycin or another antibacterial may be prescribed to reduce transmission or to control secondary infection. Hospitalization may be necessary for infants and children with severe or prolonged paroxysms and for those with dehydration or other complications. Oxygen may be needed to relieve dyspnea and cyanosis. IV therapy may be necessary when prolonged vomiting interferes with adequate nutrition. Intubation is rarely necessary but may be lifesaving in infants if the thick mucus cannot be easily suctioned from the air passages. Pertussis immune globulin is available, but its efficacy has not been established and its use is not recommended. Active immunization is recommended with pertussis vaccine, usually in combination with diphtheria and tetanus toxoids in a series of injections at 2, 4, and 6 months of age and boosters at 12 to 18 months and 4 years of age. One attack of the disease usually confers immunity, although some second, usually mild, episodes have occurred.

■ NURSING CONSIDERATIONS: Severe paroxysms in an infant may require oxygen, suction, and intubation. The child needs to be kept calm and protected from respiratory irritants such as dirt, smoke, or dust. Overstimulation, noise, or excitement may precipitate paroxysms. Adequate nutrition and adequate fluids are encouraged through frequent small feedings. Common complications of the disease include bronchopneumonia; atelectasis; bronchiectasis; emphysema; otitis media; convulsions; hemorrhage, including subarachnoid and subconjunctival hemorrhage and epistaxis; weight loss; dehydration; hernia; prolapsed rectum; and asphyxia, especially in infants. Paroxysms can be fatal.

pertussis immune globulin, a passive immunizing agent against whooping cough. See also **pertussis.**

■ INDICATION: It is prescribed for immediate, but short-lived, immunization against whooping cough.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECT: Among the more serious adverse effects is anaphylaxis.

pertussis vaccine, an active immunizing agent.

■ INDICATION: It is prescribed for immunization against pertussis when the administration of diphtheria, pertussis, and tetanus vaccine is contraindicated.

■ CONTRAINDICATIONS: Thrombocytopenia or known hypersensitivity to the vaccine prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are severe allergic reactions, pain and induration at the site of injection, and fever.

per vaginam [L], via the vagina.

pervasive developmental disorders. See **autism spectrum disorders.**

perversion /pərvur′shən/ [L, *pervertere,* to turn about], **1.** any deviation from what is considered normal or natural. **2.** the act of causing a change from what is normal or natural. **3.** *(informal)* (in psychiatry) any of a number of sexual practices that deviate from what is considered normal adult behavior. See also **paraphilia.**

pervert /pur′vərt/ [L, *pervertere*], **1.** *(informal)* a person whose sexual pleasure is derived from stimuli almost universally regarded as unnatural, such as a fetishist or sadomasochist; a paraphiliac. **2.** one whose sexual behavior deviates from a social or statistical norm but is not necessarily pathologic.

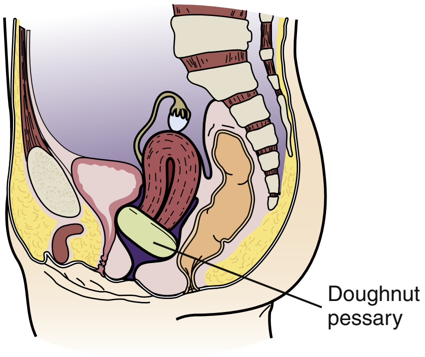
pes /pēz, pās/ *pl.* **pedes** [L, foot], the foot or a footlike structure.

pes cavus. See **clawfoot.**

pes equinus [L, *pes* foot, *equinus,* pertaining to a horse], a deformity of the foot in which the toes are extremely flexed, walking is done on the dorsal surface of the toes, and the heel does not touch the ground. Treatment is by splinting, serial casts, or surgery. Also called **talipes equinus.**

pes planus. See **flatfoot.**

pessary /pes′ərē/ [Gk, *pessos,* oval stone], a device inserted in the vagina to treat uterine prolapse, uterine retroversion, or cervical incompetence. It is used in the treatment of women whose advanced age or poor general condition precludes surgical repair. Pessaries are also used in younger women in evaluating symptomatic uterine retroversion and in managing cervical incompetence in pregnancy. A pessary must be removed, usually daily, for cleaning. A **Smith-Hodge pessary** is a rubber- or vinyl-covered wire rectangle that fits between the pubic bone and the posterior vaginal fornix, supporting the uterus and holding the cervix in a posterior position. A **Gellhorn pessary** is an inflexible device made of acrylic resin or plastic (Lucite) in the form of a large collar button. It has a canal through the stem that allows drainage of vaginal secretions. The large end of the pessary is placed deep in the vagina, the small end of the stem protruding at the introitus. A **doughnut pessary** is a permanently inflated flexible rubber doughnut that is inserted to support the uterus by blocking the canal of the vagina. An **inflatable pessary** is a collapsible rubber doughnut to which a flexible stem containing a rubber valve is attached. The collapsed pessary is inserted, inflated with a bulb similar to that of a sphygmomanometer, and deflated for removal. A **bee cell pessary** is a soft rubber cube. In each face of the cube is a conical depression that acts as a suction cup when the pessary is in the vagina. A **diaphragm pessary** is a contraceptive diaphragm used for uterovaginal support. A similar device of somewhat heavier construction is sometimes used. A *stem pessary* is a slim curved rod that can be fitted into the cervical canal for uterine positioning. It is rarely used today.



Doughnut pessary to correct uterine prolapse
(Phillips, 2012)

pessary management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as placement and monitoring of a vaginal device for treating stress urinary incontinence, uterine retroversion, genital prolapse, or incompetent cervix. See also **Nursing Interventions Classification.**

pessimism /pes′imiz′əm/ [L, *pessimus,* worst], the inclination to anticipate the worst possible results from any action or situation or to emphasize unfavorable conditions, even when progress or gain might reasonably be expected. —*pessimist, n.*

pesticide poisoning /pes′tisīd/ [L, *pestis,* plague, *caedere,* to kill, *potio,* drink], a toxic condition caused by the ingestion or inhalation of a substance used for the eradication of pests. Kinds of pesticide poisoning include **malathion poisoning** and **parathion poisoning.** See also **herbicide poisoning, rodenticide poisoning.**

pestilence /pes′tiləns/ [L, *pestilentia,* infectious disease], any epidemic of a virulent infectious or contagious disease.

pestis. See **bubonic plague.**

pes valgus [L, *pes,* foot, *valgus,* bent outward], deviation of the foot outward at the talocalcanean joint.

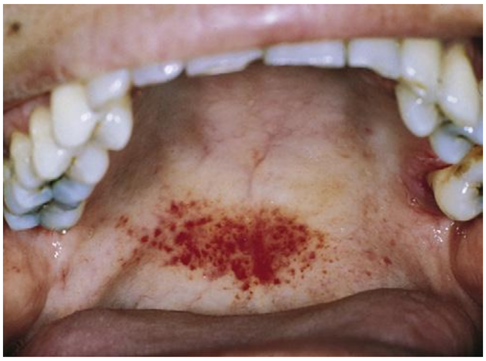
PET /pet/, abbreviation for **positron emission tomography.**

peta-, prefix indicating a number in the range of 10^{15}.

petaling /pet′əling/, a process of smoothing the raw or ragged edges of a plaster cast to prevent skin irritation.

petalo-, prefix meaning "leaf": *petalobacteria, petalococcus.*

petechiae /pētē′kē·ē/ *sing. petechia* [It, *petecchie,* fleabites], numerous tiny purple or red spots appearing on the skin as a result of tiny hemorrhages within the dermal or submucosal layers. Petechiae range from pinpoint to pinhead size and are flush with the surface. Compare **ecchymosis.** —**petechial,** *adj.*



Palatal petechiae *(Eisen and Lynch, 1998)*

petechial [It, *petecchie*], pertaining to tiny red or purple spots caused by an extravasation of blood into the skin. Compare **ecchymosis**.

petechial fever /pitē′kē·əl/ [It, *petecchie* + L, *febris,* fever], any febrile illness accompanied by small petechiae on the skin, such as seen in meningococcemia or in the late stage of typhoid fever.

petechial hemorrhage [It, *petecchie* + Gk, *haima,* blood, *rhegnynei,* to gush], a small discrete hemorrhage under the skin.

pethidine. See **meperidine hydrochloride.**

petit mal epilepsy. See **absence seizure.**

petit mal seizure. See **absence seizure.**

petit pas gait /pet′ē pä, ptē′pä′/, a manner of walking with short, mincing steps and shuffling with loss of associated movements. It is seen in cases of parkinsonism as well as in diffuse cerebral disease resulting from multiple small infarcts.

Petit's sinus. See **aortic sinus.**

Petren's gait /pet′rənz/, a hesitant form of walking in which a patient takes a few steps, halts, and then takes a few more steps. In some cases the patient must be encouraged to begin the next brief walking period. The condition is seen in elderly people and those with paretic disease.

Pétrissage *(Harkreader, Hogan and Thobaben, 2007)*

Petri dish /pē′trē, pā′trē/ [Julius R. Petri, German bacteriologist, 1852–1921], a shallow circular glass dish used to hold solid culture media.

petrification /pet′rifikā′shən/, the process of becoming calcified or stonelike.

pétrissage /pā′trisäzh′/ [Fr, *petrir,* to knead], a technique in massage in which the skin is gently lifted and squeezed. Pétrissage promotes circulation and relaxes muscles. Compare **effleurage, rolling effleurage.**

petrolatum /pet′rəlā′təm/ [L, *petra,* rock, *oleum,* oil], a purified mixture of semisolid hydrocarbons obtained from petroleum and commonly used as an ointment base or skin emollient. The common trade name is Vaseline.

petrolatum gauze, absorbent gauze permeated with white petrolatum.

petroleum distillate poisoning /pətrō′lē·əm/, [L, *petra* + *oleum* + *distillare,* to drop down, *potio,* drink], a toxic condition caused by the ingestion or inhalation of a petroleum distillate, such as fuel oil, lubricating oil, glue used in making model airplanes or the like, and various solvents. Nausea, vomiting, chest pain, dizziness, and severe depression of the central nervous system characterize the condition. Severe or fatal pneumonitis may occur if the substance is aspirated. Therefore induced emesis is contraindicated. See also **kerosene poisoning.**

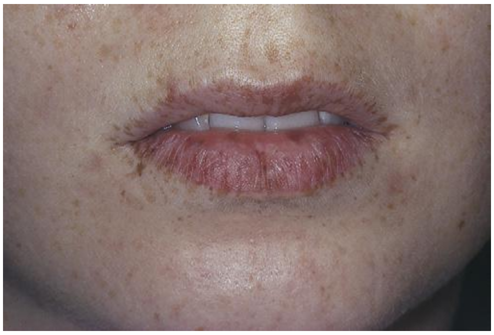
petroleum jelly, a nonliquid colloidal solution or gel of soft paraffin. It is an intermediate product of the distillation of petroleum and is used as a topical soothing medication for burns and abrasions. Also called **mineral jelly.** See also **petrolatum.**

petrosal sinuses, channels, superior and inferior, that drain the cavernous sinuses into the transverse sinuses. The superior petrosal sinuses receive cerebral and cerebellar veins, whereas the inferior petrosal sinuses receive cerebellar veins and veins from the internal ear and brainstem. Basilar sinuses connect the inferior petrosal sinuses to each other and to the vertebral plexus of veins.

petrosphenoidal fissure /pet′rōsfēnoi′dəl/ [L, *petra,* rock; Gk, *sphen,* wedge, *eidos,* form], a fissure on the floor of the cranial fossa between the posterior edge of the great wing of the sphenoid bone and the petrous part of the temporal bone.

petrous /pet′rəs/ [L, *petra,* rock], resembling a rock or stone.

petr-, petro-, prefix meaning "stone or the petrous region of the temporal bone": *petrifaction, petroleum, petrous.*



Peutz-Jeghers syndrome
(Regezi, Sciubba, and Jordan, 2008)

PET scan, positron emission tomography, or the image obtained from it.

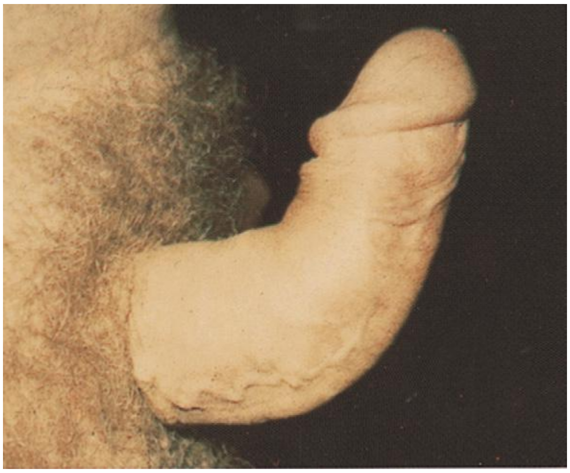
Peutz-Jeghers syndrome /poits′ jeg′ərz/ [J.L.A. Peutz, Dutch physician, 1886–1957; Harold J. Jeghers, American physician, b. 1904], an inherited disorder transmitted as an autosomal-dominant trait, characterized by multiple intestinal polyps and abnormal mucocutaneous pigmentation, usually over the lips and buccal mucosa. If obstruction or bleeding occurs, surgical removal of the polyps may be indicated.

-pexis, -pexia, -pexy, suffix meaning "a fixation of something specified": *glycopexis, hemopexis, splenopexis*.

Peyer's patches, one of a group of solitary nodules or groups of lymph nodes forming a single layer in the mucous membrane of the ileum opposite the mesenteric attachment. They are oval patches about 1 cm wide that extend for about 4 cm along the intestine. In most individuals they appear in the distal ileum, but they also appear in the jejunum of a few individuals.

peyote /pā·ō′tē/ [Aztec, *peyotl*], **1.** a cactus from which a hallucinogenic drug, mescaline, is derived. **2.** See **mescaline.**

Peyronie's disease /pārōnēz′/ [François de la Peyronie, French physician, 1678–1747], a disease of unknown cause resulting in fibrous induration of the corpora cavernosa of the penis. An association with Dupuytren's contracture of the palm has been recognized. The chief symptom of Peyronie's disease is painful erection. Palliative treatment includes radiation therapy and intralesional corticosteroid injections. There is no known cure.



Peyronie's disease *(Seidel et al, 2011/Courtesy Patrick C. Walsh, MD, The Johns Hopkins University School of Medicine, Baltimore, Maryland)*

Pezzer's catheter /pezāz/ [Oscar M. de Pezzer, French surgeon, 1853–1917], a self-retaining catheter with a bulbous tip.

pF, abbreviation for *picofarad*.

Pfizerpen-AS, a trademark for an antibacterial in Canada (penicillin G procaine).

PFT, abbreviation for **pulmonary function test.**

PG, abbreviation for **prostaglandin.**

PGI_2, abbreviation for **prostacyclin.**

PGY, abbreviation for *postgraduate year,* describing medical school graduates during their postgraduate training as interns (PGY-1, first year), residents (PGY-2, 3, 4), or fellows (PGY-4, 5).

pH, abbreviation for *potential hydrogen,* a scale representing the relative acidity (or alkalinity) of a solution, in which a value of 7.0 is neutral, below 7.0 is acid, and above 7.0 is alkaline. The numeric pH value indicates the relative concentration of hydrogen ions in the solution compared with that of a standard (1 molar) solution. It is equal to the negative log of the hydrogen ion concentration expressed in moles per liter. See also **acid, acid-base balance.**

Ph, symbol or abbreviation for **phenyl,** C_6H_5.

Ph^1, symbol for **Philadelphia chromosome.**

PHA, **1.** abbreviation for **paraaminohippuric acid.** **2.** abbreviation for **phytohemagglutinin.**

phaco-, phako-, prefix meaning "lens": *phacocele, phacocyst, phacoglaucoma*.

phacolytic glaucoma, an abnormal condition characterized by an acute autoimmune reaction of the eye. It is caused by hypersensitivity of the eye to the protein of the crystalline lens and commonly follows trauma to the crystalline lens or cataract surgery. Associated symptoms include swelling and inflammation of the eye, severe pain, and blurred vision. The substance of the lens is invaded by polymorphonuclear cells and mononuclear phagocytes. Accurate diagnosis must differentiate between this condition and infectious endophthalmitis. Therapy is supportive and commonly includes the administration of corticosteroids and atropine. Refractory cases may require surgical removal of the lens. Also called **endophthalmitis phacoanaphylactica.** Compare **uveitis.**

phacomalacia /fak′ōməlā′shə/ [Gk, *phalos,* lens, *malkia,* softness], an abnormal condition of the eye in which the lens becomes soft as a result of the presence of a soft cataract.

phacomatosis. See **phakomatosis.**

phaeohyphomycosis /fē′ōhī′fōmīkō′sis/, an opportunistic fungal infection, other than mycetoma and chromoblastomycosis, caused by the dematiaceous, or darkly pigmented, molds.

phage. See **bacteriophage.**

-phage, -phag, -phagia, -phagy, suffix meaning to "to eat or consume": *autophage, hemophage, mycophage, osteophage*.

phage typing /fāj/ [Gk, *phagein,* to eat, *typos,* mark], the identification of bacteria by testing their vulnerability to bacterial viruses.

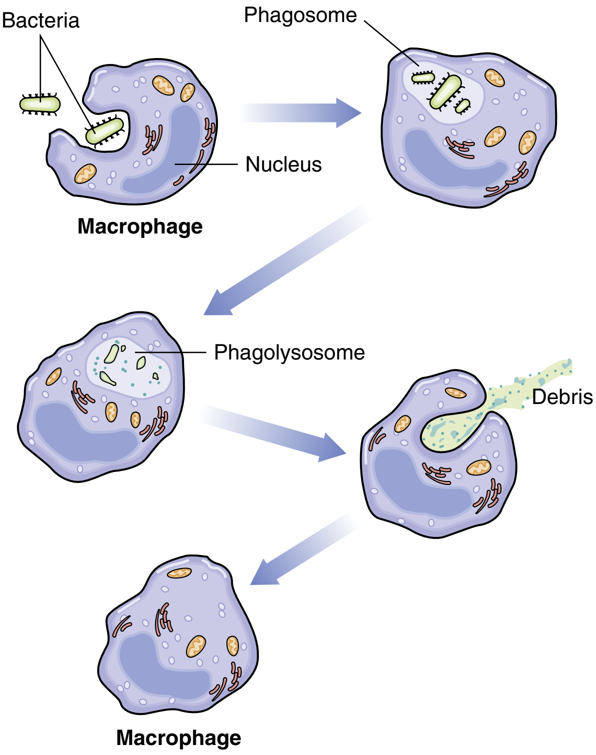
-phagia. See **-phage.**

phago-, prefix meaning "eating or ingestion": *phagocyte, phagokaryosis, phagology*.

phagocyte /fag′əsīt/ [Gk, *phagein* + *kytos,* cell], a cell that is able to surround, engulf, and digest microorganisms and cellular debris. **Fixed noncirculating phagocytes** include the fixed macrophages. **Free circulating phagocytes** include the polymorphonuclear neutrophils . **—phagocytic,** *adj*.

phagocytic /-sit′ik/ [Gk, *phagein,* to eat, *kytos,* cell], pertaining to phagocytes or phagocytosis.

phagocytic vacuole. See **phagosome.**



Phagocytosis *(Monahan et al, 2007)*

phagocytize /fag′əsitīz′/ [Gk, *phagein,* to eat, *kytos,* cell], to engulf and destroy bacteria or other foreign materials. Also called *phagocytose*.

phagocytosis /fag′əsītō′sis/ [Gk, *phagein* + *kytos* + *osis,* condition], the process by which certain cells engulf and destroy microorganisms and cellular debris. The process includes five steps: (1) invagination, (2) engulfment, (3) internalization and formation of the phagocyte vacuole, (4) fusing of lysosomes to digest the phagocytosed material, and (5) release of digested microbial products. **—phagocytize,** *v.*

phagolysosome, a cytoplasmic body formed by the fusion of a phagosome, or ingested particle, with a lysosome containing hydrolytic enzymes. The enzymes digest most of the material within the phagosome.

phagosome /fag′əsōm/, a membrane-bound cytoplasmic vesicle within the phagocyte that engulfs it. The vesicle contains phagocytized materials and may fuse with a lysosome, forming a phagolysosome within which the lysosome digests the phagocytized material. Also called **phagocytic vacuole.**

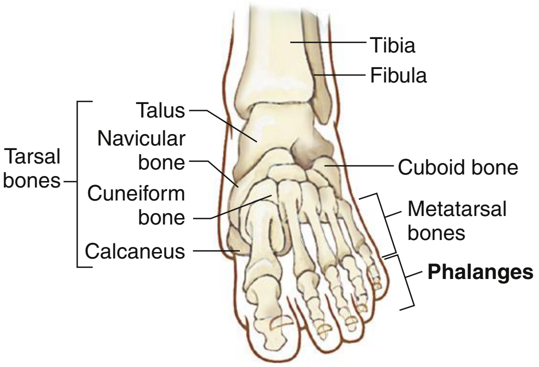
-phagy. See **-phage.**

-phakia, suffix meaning a "lens": *aphakia, microphakia, pseudophakia*.

phako-. See **phaco-.**

phakomatosis /fak′ōmətō′sis/ *pl. phakomatoses* [Gk, *phako,* lens, *oma,* tumor, *osis,* condition], (in ophthalmology) any of several hereditary syndromes characterized by benign tumorlike nodules of the eye, skin, and brain. The four disorders designated phakomatoses are neurofibromatosis (Recklinghausen's disease), tuberous sclerosis (Bourneville's disease), encephalotrigeminal angiomatosis (Sturge-Weber syndrome), and cerebroretinal angiomatosis (von Hippel-Lindau disease). Also spelled **phacomatosis.**

phal, **1.** abbreviation for **phalanges.** **2.** abbreviation for **phalanx.**



Phalanges of the foot *(Patton and Thibodeau, 2010/Yvonne Wylie Walston, used with permission)*

phalangeal /fəlan′jē·al/ [Gk, *phalanx,* line of soldiers], pertaining to a phalanx.

phalanges (phal). See **phalanx.**

-phalangia, suffix meaning a "condition of the bones of the fingers or toes": *bradyphalangia, symphalangia, triphalangia*.

phalanx (phal) /fā′langks/ *pl.* **phalanges** /phal / [Gk, line of soldiers], any of the 14 tapering bones composing the fingers of each hand and the toes of each foot. They are arranged in three rows at the distal end of the metacarpus and the metatarsus. The fingers each have three phalanges (proximal, middle, and distal); the thumb has two. Toes 2 through 5 each have three phalanges; the great toe has two (proximal and distal). The phalanges of the foot are smaller and less flexible than those of the hand.

phall-. See **phallo-.**

phallic /fal′ik/ [Gk, *phallos,* penis], pertaining to the penis or penis-shaped.

phallic stage [L, *phallos,* penis, *stare,* to stand], (in psychoanalysis) the period in psychosexual development occurring between 3 and 6 years of age when emerging awareness and self-manipulation of the genitals are a predominant source of pleasurable experience. Fixation at this stage may lead to extreme aggressiveness in adulthood, or it may be a precipitating factor in the development of psychosexual disorders. The **Oedipus complex** and **Electra complex** develop at this stage. See also **psychosexual development.**

phallic symbol [Gk, *phallos,* penis, *symbolon,* sign], (in psychoanalysis) any object that may be thought to resemble a penis.

phallo-, phall-, prefix meaning "penis": *phallocampsis, phallodynia, phalloplasty*.

phalloidine /faloi′din/, a poison present in the mushroom *Amanita phalloides*. Ingestion of phalloidine results in bloody diarrhea, vomiting, severe abdominal pain, kidney failure, and liver damage. Approximately 50% of phalloidine poisonings are fatal. Also spelled *phalloidin*.

phalloidine poisoning. See **food poisoning, mushroom poisoning.**

phalloplasty /fal′ōplas′tē/, a surgical procedure to lengthen, thicken, reconstruct, or otherwise reshape the penis. It may be performed to correct congenital defects, such as epispadias.

phallus. See **penis.**

-phane, -phan, suffix meaning a "thing with a (specified) appearance": *diaphane, rhodophane, xanthophane*.

phanero-, prefix meaning "visible or apparent": *phanerogenetic, phaneromania, phaneroplasm*.

phantasm /fan′taz′əm/ [Gk, *phantasma,* vision], an illusory image, such as an optical illusion of something that does not exist. See also **phantom vision.**

phantom /fan′təm/ [Gk, *phantasma,* vision], a mass of material similar to human tissue used to investigate the effect of radiation beams on human beings. Phantom materials can range from water to complex chemical mixtures that faithfully mimic the human body as it would interact with radiation.

phantom image, an image that appears in a CT scan but is not actually in the focal plane. It is created by the incomplete blurring or fusion of the blurred margins of some structures characteristic of the type of tomographic motion used.

phantom limb syndrome, a phenomenon common after amputation of a limb in which sensation or discomfort is experienced in the missing limb. In some people severe pain persists. See also **pseudesthesia.**

phantom tumor, a swelling resembling a tumor, usually caused by muscle contraction or gaseous distension of the intestines.

phantom vision, a sense perception occurring in the form of a visual illusion or hallucination. It is usually regarded as a pseudohallucination in that the person sensing the perception is aware that the phenomenon is illusory. Also called **phantasm, pseudohallucination.**

phao-. See **pheo-.**

phar, **1.** abbreviation for **pharmacy.** **2.** abbreviation for **pharmacology.** **3.** abbreviation for **pharmaceutic.**

Phar.B., abbreviation for *Bachelor of Pharmacy.*

Phar.D., abbreviation for *Doctor of Pharmacy.*

pharmaceutic (phar) /fär′məso͞o′tik/ [Gk, *pharmakeuein,* to give drugs], **1.** *adj,* pertaining to pharmacy or drugs. **2.** *n,* a drug.

pharmaceutical chemistry (Pharm Chem), the science dealing with the composition and preparation of chemical compounds used in medical diagnoses and therapies.

pharmaceutic necessity, a substance having slight or no value therapeutically but used in the preparation of various pharmaceutics, including preservatives; solvents; ointment bases; and flavoring, coloring, diluting, emulsifying, and suspending agents.

pharmacist /fär′məsist/ [Gk, *pharmakon,* drug], a person prepared to formulate, dispense, and provide clinical information on drugs or medications to health professionals and patients, through completion of a university program in pharmacy of at least 4 years' duration and passing state and federal licensure exams.

pharmacodynamics /-dīnam′iks/ [Gk, *pharmakon,* drug, *dynamis,* power], the study of how a drug acts on a living organism, including the pharmacological response and the duration and magnitude of response observed relative to the concentration of the drug at an active site in the organism.

pharmacogenetics /-jənet′iks/ [Gk, *pharmakon,* drug, *genesis,* origin], the study of the effect of the genetic factors belonging to a group or to an individual on the response of the group or the individual to certain drugs.

pharmacognosy, the study of chemicals taken from natural sources to be used as drugs or in the preparation of drugs. Sources may include plants, animals, or other life forms such as fungi, molds, and yeasts.

pharmacokinetics /fär′məkōkinet′iks/ [Gk, *pharmakon* + *kinesis,* motion], the study of the action of drugs within the body, which can, in many respects, be envisioned more accurately as the actions of the body on an administered drug. It includes studies of the mechanisms of drug absorption, distribution, metabolism, and excretion; onset of action; duration of effect; biotransformation; and effects and routes of excretion of the metabolites of the drug.

pharmacological agent /-loj′ik/, any oral, parenteral, or topical substance used to alleviate symptoms and treat or control a disease process or aid recovery from an injury.

pharmacological treatment. See **treatment.**

pharmacological vagotomy, the use of medications to curtail functions of the vagus nerve. Also called **medical vagotomy.**

pharmacologist /fär′məkol′əjist/, a specialist in the preparation, properties, uses, and actions of drugs.

pharmacology (phar) /-kol′əjē/ [Gk, *pharmakon* + *logos,* science], the study of the preparation, properties, uses, and actions of drugs.

pharmaco-, pharmo-, prefix meaning "drugs or medicine": *pharmacochemistry, pharmacomania, pharmacopsychosis.*

pharmacopoeia /fär′məkəpē′ə/ [Gk, *pharmakon* + *poiein,* to make], **1.** a compendium containing descriptions, recipes, strengths, standards of purity, and dosage forms for selected drugs. **2.** the available stock of drugs in a pharmacy. **3.** the total of all authorized drugs available within the jurisdiction of a given geographic or political area. Also spelled **pharmacopeia.** See also ***British Pharmacopoeia, United States Pharmacopeia.***

pharmacotherapy /-ther′əpē/ [Gk, *pharmakon,* drug, *therapeia*], the use of drugs to treat diseases.

pharmacy (phar) /fär′məsē/ [Gk, *pharmakon*], **1.** the study of preparing and dispensing drugs. **2.** a place for preparing and dispensing drugs.

pharmacy technician, a person who prepares and dispenses prescriptions under the supervision of a pharmacist.

Pharm Chem, abbreviation for **pharmaceutical chemistry.**

-pharmic, combining form meaning "drugs or medicinal remedies": *alexipharmic, antipharmic, polypharmic.*

pharmo-. See **pharmaco-.**

pharyng-. See **pharyngo-.**

pharyngeal /ferin′jē·əl/ [Gk, *pharynx,* throat], pertaining to the pharynx.

pharyngeal aponeurosis [Gk, *pharynx,* throat, *apo,* from, *neuron,* sinew], a sheet of connective tissue immediately beneath the mucosa of the pharynx.

pharyngeal bursa, a blind sac at the base of the pharyngeal tonsil.

pharyngeal membrane, a thin fold of ectoderm and endoderm that separates the pharyngeal pouches from the branchial clefts in a developing embryo.

pharyngeal nerve, a nerve that passes posteriorly from the pterygopalatine ganglion and through the palatovaginal canal to supply the mucosa and glands of the nasopharynx.

pharyngeal recess. See **torus tubarius.**

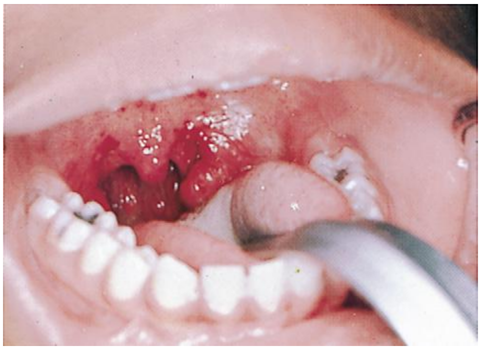
pharyngeal reflex. See **gag reflex.**

pharyngeal suction catheter, a device that allows direct visualization of a pharyngeal suctioning procedure. See also **Yankauer suction catheter.**

pharyngeal tonsil. See **adenoid.**

pharynges. See **pharynx.**

pharyngitis /fer′injī′tis/ [Gk, *pharynx* + *itis*], inflammation or infection of the pharynx, usually causing a sore throat. Some causes of pharyngitis are diphtheria, herpes simplex virus, infectious mononucleosis, and streptococcal infection. **Acute pharyngitis** is a sudden, severe inflammation of the pharynx. **Chronic pharyngitis** is a persistent throat inflammation that may be associated with the lymphoid granules in the pharyngeal mucosa. Specific treatment depends on the cause. The appearance of the mouth, nose, and throat and throat culture aid in differential diagnosis of a bacterial or viral cause. Symptoms may be relieved by analgesic medication, drinking of warm or cold liquids, or saline solution irrigation of the throat. See also **strep throat.**



Acute viral pharyngitis *(Barkauskas, Baumann, and Darling-Fisher, 2002/Courtesy Dr. Edward Applebaum, Head, Department of Otolaryngology, University of Illinois Medical Center)*

pharyngobasilar fascia, a thick layer of fascia that lines the inner surface of the pharyngeal wall and, with the buccopharyngeal fascia, reinforces the pharyngeal wall where muscle is deficient, particularly above the level of the superior constrictor where the pharyngeal wall is formed almost entirely of fascia.

pharyngoconjunctival fever /fəring′gōkon′jungktī′vəl/ [Gk, *pharnyx* + L, *conjunctivus,* connecting, *febris,* fever], an adenovirus infection characterized by fever, sore throat, and conjunctivitis. This epidemic illness is particularly prevalent in the summer, and it is spread by droplet infection and direct contact. Contaminated water in lakes and swimming pools is a common source of infection. See also **adenovirus.**

pharyngoesophageal constriction, the narrowing where the pharynx ends and the cervical esophagus begins, the site of the pharyngoesophageal sphincter.

pharyngo-, pharyng-, prefix meaning "pharynx": *pharyngocele, pharyngoglossus, pharyngorrhagia.*

pharyngoplasty /fəring′gōplas″tē/ [Gk, *pharynx,* throat, *plassein,* to mold], surgical repair of the pharynx.

pharyngoscope /fəring′gəskōp/ [Gk, *pharynx* + *skopein,* to view], an endoscopic device for examining the lining of the pharynx.

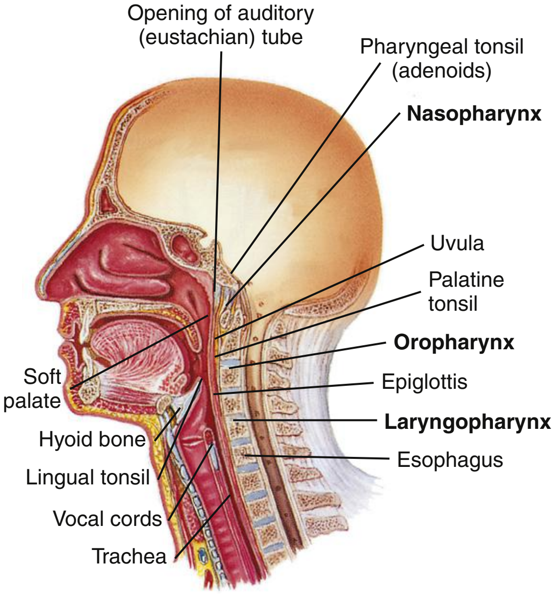
pharyngoscopy /fer′ing·gos′kəpē/ [Gk, *pharynx,* throat, *skopein,* to view], the examination of the throat with a pharyngoscope.

pharyngotonsillitis /-ton′silī′tis/ [Gk, *pharynx* + L, *tonsilla* + Gk, *itis,* inflammation], an inflammation involving the pharynx and the tonsils.

pharynx /fer′inks/ *pl. pharynxes, pharynges* [Gk], the throat, a tubular structure about 13 cm long that extends from the base of the skull to the esophagus and is situated immediately in front of the cervical vertebrae. The pharynx serves as a passageway for the respiratory and digestive tracts and changes shape to allow the formation of various vowel sounds. The pharynx is composed of muscle, is lined with mucous membrane, and is divided into the nasopharynx, the oropharynx, and the laryngopharynx. It contains the openings of the right and left auditory tubes, the openings of the two posterior nares, the fauces, the opening into the larynx, and the opening into the esophagus. It also contains the pharyngeal tonsils, the palatine tonsils, and the lingual tonsils. Also called **throat.** See also **larynx.**

phase /fāz/ [Gk, *phasis,* appearance], in a periodic function, such as rotational or sinusoidal motion, the position relative to a particular part of the cycle.

phase 0, (in cardiology) the upstroke of the action potential.



Pharynx *(Thibodeau and Patton, 2007)*

phase 1, (in cardiology) the initial rapid repolarization phase of the action potential, seen in ventricular and His-Purkinje action potentials.

phase 2, (in cardiology) the plateau of the action potential, occurring during repolarization.

phase 3, (in cardiology) the terminal rapid repolarization phase of the action potential.

phase 4, (in cardiology) the period of electrical diastole. A graph of phase 4 shows a gradual upward slope in a pacemaker cell, whereas phase 4 in a nonpacemaker cell is flat.

phase-contrast microscopy, a type of light microscopy in which a special condenser and objective with a phase-shifting ring are used to visualize small differences in refractive index as differences in intensity or contrast. It is useful in viewing unstained specimens that appear transparent.

phased array /fāzd/, an array transducer assembly that has very thin rectangular elements arranged side by side. It relies on electronic beam steering to sweep sound beams over a sector-shaped scanned region. Beam steering is done by using electronic time delays in the transmitting and receiving circuits.

phase microscope, a microscope with a special condenser and objective containing a phase-shifting ring that allows the viewer to see small differences in refraction indexes as differences in image intensity or contrast. The phase microscope is used especially for examining transparent specimens, such as living or unstained cells and tissues.

phase of maximum slope, the time of rapid cervical dilation and rapid fetal descent in the active phase of labor. See also **Friedman curve.**

phase one study, a clinical trial to assess the risk that may arise from administering a new treatment modality. A phase two study evaluates the clinical effectiveness of the new modality, and a phase three study compares its effectiveness with that of the best existing treatment.

phasic /fā′zik/ [Gk, *phasis*], **1.** pertaining to a process proceeding in stages or phases. **2.** pertaining to a type of afferent or sensory nerve receptor of the proprioceptive system that responds to rate versus length changes in a muscle spindle. It is triggered by such stimuli as quick stretching, vibrations, and tapping.

-phasis, -phasia, -phasic, -phasy, suffix meaning "speech, utterance": *allophasis, aphasia, heterophasis, aphasic.*

Ph.D., abbreviation for *Doctor of Philosophy.*

Phe, abbreviation for **phenylalanine.**

-phemia, suffix meaning a "(specified) disorder of speech": *dysphemia, paraphemia, spasmophemia.*

phen-, prefix indicating derivation from benzene: *phenacitin, phenicate, phenobarbitone.*

phenacetin /fənas′itin/, an analgesic no longer marketed because of its carcinogenic properties. Also called **acetophenetidin.**

Phenaphen with Codeine, a trademark for an analgesic-antipyretic (acetaminophen and codeine).

phenazopyridine hydrochloride /fen′əzōpī′ridēn/, a urinary tract analgesic.

■ INDICATIONS: It is prescribed to reduce the pain of cystitis or other urinary tract infections or to relieve the pain following clinical procedures of the urinary tract.

■ CONTRAINDICATIONS: Renal or hepatic insufficiency or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are headache and GI disturbances.

phencyclidine hydrochloride (PCP) /fensī′klidēn/, a piperidine derivative administered parenterally to achieve neuroleptic anesthesia. Because of its marked hallucinogenic properties, it is not used therapeutically in the United States. Its reported use as an abused substance has declined in recent years. Also called **angel dust.**

phendimetrazine tartrate /fen′dīmet′rəsēn/, a sympathomimetic amine used as an anorectic agent.

■ INDICATIONS: It is prescribed to reduce appetite during the first few weeks of dieting during treatment of exogenous obesity. Its beneficial effects slowly disappear over 3 to 12 weeks.

■ CONTRAINDICATIONS: Cardiovascular disease, hypertension, hyperthyroidism, glaucoma, nervousness, a history of drug abuse, concomitant administration of central nervous system stimulants or monoamine oxidase inhibitors, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are central nervous system stimulation, elevated blood pressure, insomnia, dry mouth, and tolerance to the drug.

-phene, -phen, suffix denoting members of the phenol group: *camphene, phlobaphene, phosphene.*

phenelzine sulfate /fē′nəlzēn/, a monoamine oxidase inhibitor.

■ INDICATIONS: It is prescribed in the treatment of depression, especially atypical endogenous depression and depression associated with adverse life events.

■ CONTRAINDICATIONS: Liver dysfunction, congestive heart failure, pheochromocytoma, concomitant use of sympathomimetic drugs or foods high in tryptophan or tyramine, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are orthostatic hypotension, vertigo, constipation, blurred vision, headache, overactivity, and dryness of the mouth. Monoamine oxidase inhibitors produce many adverse drug interactions.

Phenergan, a trademark for a phenothiazine derivative (promethazine).

phenic acid. See **carbolic acid, phenol.**

phenobarbital /fē′nəbär′bital/, a barbiturate anticonvulsant and sedative-hypnotic. Also called **sodium phenobarbital.**

■ INDICATIONS: It is prescribed in the treatment of seizure disorders and as a long-acting sedative.

■ CONTRAINDICATIONS: Porphyria, severe pain, respiratory problems, or known hypersensitivity to this drug or other barbiturates prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are ataxia, porphyria, paradoxic excitement, drowsiness, occasional rashes, and, rarely, blood dyscrasias. It is involved in many drug interactions.

phenobarbital-phenytoin serum levels /-fen′itō′in/, the concentration of phenobarbital and phenytoin in the serum, monitored to maintain concentrations sufficient to control seizures but not high enough to cause toxic reactions. The control of seizures is commonly obtained in adults with plasma concentrations of phenobarbital that average 10 μg/mL per daily dose of 1 μg/kg; in children, 5 to 7 μg/mL per daily dose of 1 μg/kg. The control of seizures is commonly obtained with plasma concentrations of phenytoin that average 10 μg/mL, whereas toxic effects, such as nystagmus, typically develop with a concentration of 20 μg/mL. Ataxia may develop at a concentration of 30 μg/mL and lethargy at a concentration of 40 μg/mL.

phenocopy /fē′nōkop′ē/ [Gk, *phainein,* to appear; L, *copia,* plenty], a phenotypic trait or condition that is induced by environmental factors but closely resembles a phenotype usually produced by a specific genotype. The trait is neither inherited nor transmitted to offspring. Such conditions as deafness, cretinism, mental retardation, and congenital cataracts are caused by mutant genes but can also result from a number of different agents, such as the rubella virus in the case of congenital cataracts. Because phenocopies may present problems in genetic screening and genetic counseling, all exogenous factors must be ruled out before any congenital trait or defect is labeled hereditary.

phenol /fē′nol/ [Gk, *phainein,* to appear; L, *oleum,* oil], **1.** See **carbolic acid. 2.** any of a large number and variety of chemical products closely related in structure to the alcohols and containing a hydroxyl group attached to a benzene ring. The phenols are components of dyes, plastics, disinfectants, antimicrobials, and other drugs, including salicylic acid.

phenol block, neurolytic block using hydroxybenzene (phenol), intended to anesthetize a particular nerve permanently. The technique is sometimes used to control spasticity in specific muscle groups or to block transmission of nerve impulses in chronic pain conditions such as cancers. Morbidity can be high, and pain frequently recurs.

phenol camphor, an oily mixture of camphor and phenol, used as an antiseptic and toothache remedy.

phenol coefficient, a measure of the disinfectant activity of a given chemical in relation to carbolic acid. The activity is expressed as the ratio of a dilution of the chemical that kills in 10 minutes but not in 5 minutes to the 1:90 dilution of carbolic acid, which kills in 10 minutes but not in 5 minutes.

phenolphthalein /fē′nolthal′ē·in, -thā′lēn/, **1.** a cathartic and pH indicator with a range of 8.5 (colorless) to 9.0 (red). **2.** an indicator of hydrogen ion in urine and gastric juice.

phenol poisoning, corrosive poisoning caused by the ingestion of compounds containing phenol, such as carbolic acid, creosote, cresol, guaiacol, and naphthol. Characteristic of phenol poisoning are burns of the mucous membranes; weakness; pallor; pulmonary edema; seizures; and respiratory, circulatory, cardiac, and renal failure. Rarely esophageal stricture may develop as a complication of extensive tissue damage. Also called **carbolic acid poisoning, carbolism.**

phenolsulfonphthalein /fē′nəlsul′fōnfthal′ē·in/, a bright red water-soluble triphenylmethane dye used as an indicator at pH 7.7. Also called *phenol red*. See also **cystochromoscopy.**

phenomenon /finom′ənən/ *pl. phenomena* [Gk, *phainomenon,* something seen], a sign that is often associated with a specific illness or condition and is therefore diagnostically important.

phenothiazine /fē′nōthī′əzēn/, a yellow to green crystalline compound that is a source of dyes and is used in veterinary medicine to treat infestations of threadworms and roundworms. It is too toxic for human use, but derivatives of phenothiazine are used in antipsychotic and antihistamine medications. See also **phenothiazine derivatives.**

phenothiazine derivatives, any of a group of drugs that have a three-ring structure in which two benzene rings are linked by a nitrogen and a sulfur. They represent the largest and oldest group of antipsychotic compounds in clinical medicine. Chlorpromazine and prochlorperazine can be viewed as the prototypes of the many phenothiazines and their congeners that are used as adjuncts to general anesthesia and as antiemetics, antipsychotic agents (major tranquilizers), and antihistamines. This group of drugs largely revolutionized the practice of psychiatric medicine, a process that is now continuing with the introduction of the newer atypical antipsychotics such as risperidone and olanzapine. Unlike the barbiturates, which act exclusively on the central nervous system (CNS), the phenothiazines exert significant influence on many organ systems of the body at once. For example, they exert antiadrenergic, anticholinergic, and antihistaminic activity. The effects on the CNS differ according to individual drug and patient status. All phenothiazine tranquilizers are withheld from patients with severe CNS depression or epilepsy and are given with caution to those with liver disease. See also specific drugs.

phenotype /fē′nətīp/ [Gk, *phainein,* to appear, *typos,* mark], **1.** the complete observable characteristics of an organism or group, including anatomical, physiological, biochemical, and behavioral traits, as determined by the interaction of genetic makeup and environmental factors. **2.** a group of organisms that resemble each other in appearance. Compare **genotype.** —*phenotypic, adj.*

phenoxy-, prefix indicating the presence of a chemical group composed of phenyl and an atom of oxygen: *phenoxycaffeine*.

phenoxybenzamine hydrochloride /fēnok′sēben′zəmēn/, an irreversible (noncompetitive) alpha$_1$-adrenergic receptor blocker producing long-lasting blockade.

■ INDICATIONS: It is prescribed in the control of pheochromocytoma and other instances of hypertensive crisis. If tachycardia is excessive, concomitant administration of propranolol may be necessary.

■ CONTRAINDICATIONS: Hypotension or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are severe hypotension, tachycardia, and GI irritation.

phenoxymethyl penicillin. See **penicillin V.**

phentermine hydrochloride /fen′tərmēn/, a sympathomimetic amine used as an anorectic agent.

■ INDICATIONS: It is prescribed as a short-term adjunct to decrease appetite during treatment of obesity with a regimen of caloric reduction, exercise, and behavioral modification.

■ CONTRAINDICATIONS: Arteriosclerosis, cardiovascular disease, hypertension, glaucoma, hyperthyroidism, or known hypersensitivity to this drug or to other sympathomimetic drugs prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are restlessness, insomnia, tachycardia, increased blood pressure, and dry mouth. The combination of phentermine with fenfluramine or dexfenfluramine has been linked to cases of primary pulmonary hypertension, which can be fatal.

phentolamine /fentol′əmēn/, an alpha$_1$-adrenergic receptor blocker.

■ INDICATIONS: It is prescribed in the control of symptoms of pheochromocytoma before and during surgery and for dermal necrosis and sloughing after extravasation of parenteral drugs with alpha-adrenergic effects (e.g., norepinephrine, epinephrine, dopamine).

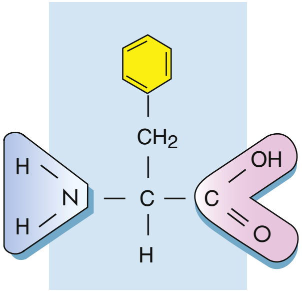
■ CONTRAINDICATIONS: History of myocardial infarction, angina, coronary artery disease, cerebrovascular disease, renal impairment, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are tachycardia, cardiac arrhythmias, anginal pain, and hypotension.

phenyl (Ph) /fē′nil, fen′il/, a monovalent organic radical, C_6H_5, derived from benzene.

phenylacetic acid /fen′iləsē′tik/, a catabolite of phenylalanine, excessively formed and excreted, sometimes conjugated with glutamine, in phenylketonuria.

phenylalanine (Phe) /fen′ilal′ənēn/, an essential amino acid necessary for the normal growth and development of infants and children and for normal protein metabolism throughout life. The normal value of this amino acid in serum is less than 3 mg/dL in adults and 1.2 to 3.5 mg/dL in newborns. It is abundant in milk, eggs, and other common foods. See also **amino acid, phenylketonuria, protein.**



Chemical structure of phenylalanine

phenylalaninemia /fen′il′aləninē′mē·ə/, the presence of phenylalanine in the blood. See also **hyperphenylalaninemia.**

phenyl carbinol. See **benzyl alcohol.**

phenylephrine hydrochloride /-ef′rēn/, an alpha-adrenergic agonist.

■ INDICATIONS: It is prescribed for maintenance of blood pressure and is used locally as a nasal or ophthalmic vasoconstrictor.

■ CONTRAINDICATIONS: Narrow-angle glaucoma, concomitant administration of monoamine oxidase inhibitors, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects to the systemic administration of this drug are arrhythmias and an excessive rise in blood pressure. Anxiety, congestion, and hypersensitivity reactions may result from local administration.

phenylethyl alcohol ($C_6H_5CH_2CH_2OH$) /-eth′il/, a colorless fragrant liquid with a burning taste, used as a bacteriostatic agent and preservative in medicinal solutions. Also called **benzyl carbinol,** *2-phenylethanol*.

phenylic acid, phenylic alcohol. See **carbolic acid.**

phenylketonuria (PKU) /fen′əlkē′tōnyo͝or′ē·ə, fē′nəl-/, abnormal presence of phenylketone and other metabolites of phenylalanine in the urine, characteristic of an inborn metabolic disorder caused by the absence or a deficiency of phenylalanine hydroxylase, the enzyme responsible for the conversion of the amino acid phenylalanine into tyrosine. Accumulation of phenylalanine is toxic to brain tissue. Untreated individuals have very fair hair, eczema, a mousy odor of the urine and skin, and progressive mental retardation. Treatment consists of a diet low in phenylalanine. Phenylketonuria occurs approximately once in 16,000 births in the United States. Most states require a screening test for all newborns. See also **Guthrie's bacterial inhibition assay.** —*phenylketonuric, adj.*

phenylketonuria (PKU) test, a blood or urine test performed to determine the presence of PKU in infants.

phenyl methanol. See **benzyl alcohol.**

phenylpyruvic acid /fen′ilpīro͞o′vik/, a product of the metabolism of phenylalanine. The presence of phenylpyruvic acid in the urine is indicative of phenylketonuria.

phenylpyruvic amentia. See **phenylketonuria.**

phenyl salicylate, the salicylic ester of phenol. Also called *salol*. See also **salol camphor.**

phenyltoloxamine citrate /fen′iltəlok′səmēn/, an antihistamine usually used in a fixed-combination drug with an analgesic.

phenytoin /fen′ətō′in/, a drug that alters cells, membrane conductances of Na^+ and Ca^{2+}, ions whose conductances are important during the function of excitable nerve, heart, and muscle tissues.

■ INDICATIONS: It is prescribed as an anticonvulsant for the treatment and prevention of tonic-clonic seizures, complex partial seizures, and seizures resulting from head trauma or surgery. It has an unlabeled use as an antiarrhythmic agent, particularly in digitalis-induced ventricular arrhythmias. Establishing and maintaining the desired plasma concentration can be difficult because phenytoin has a high but variable amount of protein binding (typically 80%) and undergoes capacity-limited metabolism (Michaelis-Menten kinetics), with a half-life ranging from approximately 7 to 42 hrs.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to other hydantoins prohibits its use. It is used with caution in patients with a history of hepatic or hematologic abnormalities and in the presence of certain arrhythmias. Phenytoin has been shown to cause fetal malformations, but the benefit to risk ratio can often justify continued use during pregnancy.

■ ADVERSE EFFECTS: Among the more serious adverse effects are ataxia, nystagmus, hypersensitivity reactions, and gingival hyperplasia. Rarely, a variety of severe reactions occurs. This drug interacts with many other drugs.

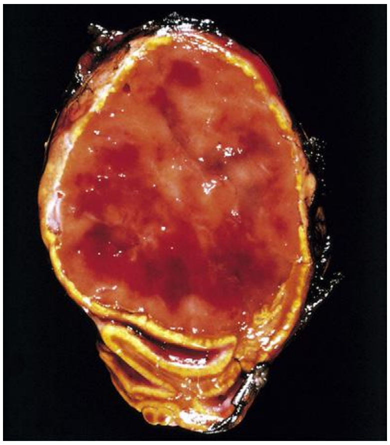
pheo-, phao-, prefix meaning "dusky": *pheochrome*, *pheochromoblast*, *pheophytin*.

pheochromocytoma /fē′ōkrō′mōsītō′mə/ *pl.* *pheochromocytomas*, *pheochromocytomata* [Gk, *phaios*, dark, *chroma*, color, *kytos*, cell, *oma*, tumor], a vascular tumor of chromaffin tissue of the adrenal medulla or sympathetic paraganglia, characterized by hypersecretion of epinephrine and norepinephrine, causing persistent or intermittent hypertension. Typical signs include headache, flushing, palpitation, sweating, nervousness, hyperglycemia, nausea, vomiting, and syncope. Weight loss, myocarditis, cardiac arrhythmia, and heart failure may occur. The tumor occurs most commonly at 40 to 60 years of age, and only a small percentage of the lesions are malignant. The cause is unknown. The diagnosis may be established by laboratory assays showing increased catecholamines and their metabolites in urine and by pressor tests; intravenously injected histamine causes a sharp increase in blood pressure, and the administration of phentolamine produces a marked decrease. Surgical excision is the usual treatment; patients with nonresectable tumors may be treated with adrenergic blocking agents or with methyl tyrosine, a drug that reduces norepinephrine production. Also spelled *phaeochromocytoma*.

■ OBSERVATIONS: The most prominent sign is severe sustained or episodic hypertension. This is accompanied by a classic symptom triad of severe, pounding paroxysmal headache, palpitations, and profuse sweating. Visual disturbances, dilated pupils, lower extremity paresthesia, nausea and vomiting, dizziness, tremors, and tachycardia are also seen during paroxysm. An elevated plasma concentration of normetanephrine or metanephrine from a 24-hour urine collection is a 100% sensitive test for pheochromocytoma. A clonidine suppression test reveals persistent elevations in plasma norepinephrine. CT scans and MRIs are useful for tumor location. Complications that typically result from nontreatment or advanced disease include uncontrolled hypertension, diabetes, cardiomyopathy, cardiac arrhythmias, and heart failure.

■ INTERVENTIONS: The primary treatment for pheochromocytoma is surgical removal of the tumor via laparoscopic adrenalectomy. Individuals are stabilized, starting about 2 weeks preoperatively, with a combination of sympathetic blocking agents and liberal salt and fluid intake. Preoperative palpation of the abdomen is contraindicated because it could cause sudden release of catecholamine and severe hypertension. Any persistent hypertension or postoperative hypertension after surgery is managed with conventional antihypertensive drug therapy. Individuals with nonresectable tumors are treated with alpha blockers or methyl tyrosine.

■ NURSING CONSIDERATIONS: Careful monitoring of blood pressure is crucial in preoperative and postoperative periods to detect abrupt and severe fluctuations. Cardiac monitoring is done to detect cardiac complications, such as arrhythmia. Rest, nourishment, hydration, and emotional support are also needed. Nursing plays a crucial role in screening and case finding. Screening should be done for anyone who exhibits signs of malignant or paradoxical hypertension or displays a poor response to antihypertensive drug therapy. Individuals with neurofibromatosis are also at increased risk for pheochromocytoma.



Pheochromocytoma *(Kumar et al, 2007)*

pheochromocytoma suppression and provocative testing, a blood test to diagnose pheochromocytoma, consisting of either the administration of glucagon to provoke a rise in catecholamine levels or the administration of clonidine to suppress catecholamine levels.

pheresis. See **apheresis.**

pheromone /fer′əmōn′/ [Gk, *pherein,* to carry, *hormaein,* to stimulate], a substance secreted by an organism that elicits a particular response from another individual of the same species, usually of the opposite sex. Pheromones may be sexual stimulants or attractants or alarm or trail-making substances; in social insects they have a role in the determination of castes.

phi /fī/, Φ, φ, the twenty-first letter of the Greek alphabet.

Phialophora /fī′älof′ərə/, a genus of imperfect fungi. *P. verrucosi* is a cause of chromoblastomycosis, and *P. jeanselmei* is a cause of maduromycosis.

phil-, prefix meaning "having an affinity for or having a love for": *philanthropist, philocatalase, philoneism.*

-phil, -philic, -philous, suffix meaning "of that which has an attraction to or is stained by": *chromaphil, hydrophil, lipophil.*

Philadelphia chromosome (Ph[1]) [Philadelphia, Pennsylvania], a translocation of the long arm of chromosome 22, often seen in the abnormal myeloblasts, erythroblasts, and megakaryoblasts of patients who have chronic myelocytic leukemia.

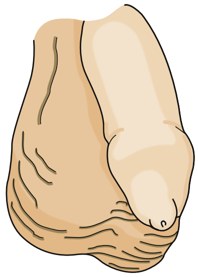
-phile, **1.** suffix meaning "a lover or admirer" of something specified: *sarcophile.* **2.** suffix meaning "having an affinity for or being strongly attracted to a specified thing": *electrophile, pedophile.*

-philia, -phily, -philous, suffix meaning "having a love, craving, affinity for": *cyanophilous, hydrophily, spasmophilia, necrophilia.*

philtrum /fil′trəm/, the vertical groove in the center of the upper lip.

-phily. See **-philia.**

phimosis /fīmō′sis/ [Gk, muzzle], tightness of the prepuce of the penis that prevents the retraction of the foreskin over the glans. The condition is usually congenital but may be the result of infection. Circumcision is the usual treatment. An analogous condition of the clitoris occurs rarely. Compare **paraphimosis.** See also **phimosis vaginalis.**



Phimosis *(Monahan et al, 2007)*

phimosis vaginalis /vaj′inā′lis/, congenital narrowness or closure of the vaginal opening.

pHisoHex, a trademark for a detergent containing a topical antibiotic **(hexachlorophene).**

phleb-. See **phlebo-.**

phlebectomy /fləbek′təmē/ [Gk, *phleps,* vein, *ektomē,* excision], the surgical removal of a vein or part of a vein.

phlebitis. See **thrombophlebitis.**

phlebo-, phleb- /fleb′ō-/, prefix meaning "vein or veins": *phlebocarcinoma, phlebograph, phlebostenosis.*

phlebogram /fleb′əgram/ [Gk, *phleps,* vein, *gramma,* record], **1.** a radiograph obtained by phlebography. **2.** a graphic representation of the venous pulse obtained by phlebography. Also called **venogram.**

phlebograph /fleb′əgraf′/, a device for producing a graphic record of the venous pulse.

phlebography /fləbog′rəfē/ [Gk, *phleps* + *graphein,* to record], **1.** the radiographic examination of veins injected with a radiopaque contrast medium. **2.** the graphic recording of the venous pulse. Also called **venography.**

phlebography of the lower extremities, an x-ray study with contrast dye designed to identify and locate thrombi within the venous system of the lower extremities.

phlebostasis /-stā′sis/, an abnormally slow flow of blood in the veins, which are usually distended. Also called **venostasis.**

phlebostatic axis /-stat′ik/ [Gk, *phleps* + *stasis,* standing still], the approximate location of the right atrium, found at the intersection of the midaxillary and a line drawn from the fourth intercostal space at the right side of the sternum. The phlebostatic axis is used extensively in hemodynamics.

phlebothrombosis /fleb′ōthrombō′sis/ [Gk, *phleps* + *thrombos,* lump, *osis,* condition], an abnormal condition in which a clot forms within a vein. It is usually caused by hemostasis, hypercoagulability, or occlusion. In contrast to that in thrombophlebitis, the wall of the vein is not inflamed. Also called **venous thrombosis.** Compare **thrombophlebitis.**

phlebotomist /fləbot′əmist/ [Gk, *phleps,* vein + *ektomē*], a person with special training in the practice of drawing blood.

phlebotomize /fləbot′əmīz/ [Gk, *phleps,* vein, *ektomē,* excision], to open a vein to remove blood.

phlebotomus fever /fləbot′əməs/ [Gk, *phleps* + *tomos,* cutting; L, *febris,* fever], an acute mild infection caused by one of five distinct arboviruses transmitted to humans by the bite of an infected sandfly, characterized by rapidly developing fever, headache, eye pain, conjunctivitis, myalgia, and occasionally a macular or urticarial rash. Aseptic meningitis also may occur. The disease is widespread in hot, dry areas where sandflies abound, and it has been seen in Panama and Brazil. Phlebotomus fever is self-limited, no fatalities have been recorded, and no specific therapy is available. Bed rest, fluids, and aspirin are recommended. A second attack may occur a few weeks after the first. Also called **ephemeral fever, pappataci fever, sandfly fever, three-day fever.**

phlebotomy /fləbot′əmē/ [Gk, *phleps* + *temnein,* to cut], the incision of a vein for the letting of blood, as in collecting blood from a donor. Phlebotomy is the chief treatment for polycythemia vera and may be performed every 2 to 3 months or more frequently if required. The procedure is sometimes used to decrease the amount of circulating blood and pulmonary engorgement in acute pulmonary edema. At one time phlebotomy was practiced for almost every disorder. Also called **venesection.**

phlebotomy: arterial blood sample, a nursing intervention from the Nursing Interventions Classification (NIC) defined as obtaining a blood sample from an uncannulated artery to assess oxygen and carbon dioxide levels and acid-base balance. See also **Nursing Interventions Classification.**

phlebotomy: blood unit acquisition, a nursing intervention from the Nursing Interventions Classification (NIC) defined as procuring blood and blood products from donors. See also **Nursing Interventions Classification.**

phlebotomy: cannulated vessel, a nursing intervention from the Nursing Interventions Classification (NIC) defined as aspirating a blood sample through an indwelling vascular catheter for laboratory tests. See also **Nursing Interventions Classification.**

phlebotomy: venous blood sample, a nursing intervention from the Nursing Interventions Classification (NIC) defined as removal of a sample of venous blood from an uncannulated vein. See also **Nursing Interventions Classification.**

phleg-. See **phlogo-.**

phlegm /flem/ [Gk, *phlegma,* mucus, sluggishness], thick mucus secreted by the tissues lining the airways of the lungs.

phlegmasia alba dolens [Gk, *phlegmone,* inflammation; L, *albus,* white, *dolens,* painful], thrombophlebitis of the femoral vein, resulting in pain and edema of the leg. It may occur after childbirth or a severe febrile illness. Also called **thrombotic phlegmasia.**

phlegmasia cerulea dolens. See **blue phlebitis.**

phlegmatic /flegmat′ik/ [Gk, *phlegma,* mucus, sluggishness], pertaining to a person who may be dull or apathetic, or calm and composed to an extent that excitation is difficult.

phlegmon /fleg′mon/ [Gk, *phlegmone,* inflammation], an inflammation of connective tissue.

phlegmonous gastritis /fleg′mənəs/ [Gk, *phlegmone* + *osis,* condition], a rare but severe form of gastritis involving the connective tissue layer of the stomach wall. It occurs as a complication of systemic infection, peptic ulcer, cancer, surgery, or other severe stress and represents an acute abdominal emergency. Treatment includes surgery, antibiotics, and analgesics.

phlegn-, prefix meaning "mucus": *phlegmatic.*

phlogo-, phleg-, rarely used prefix meaning "inflammation": *phlegmon, phlogocyte, phlogogen.*

phlyctenular keratoconjunctivitis /flikten′yələr/ [Gk, *phlyktaina,* blister], an inflammatory condition of the cornea, characterized by tiny ulcerating nodules. It is seen most often in children as a response to allergens found in *Mycobacterium tuberculosis,* gonococci, *Candida albicans,* or various parasites. Vitamin deficiency may be a factor. The condition responds to topical corticosteroids, but corneal scars may remain. Also called *phlyctenulosis,* **scrofulous keratitis.** See also **eczematous conjunctivitis.**

PHO, abbreviation for **physician-hospital organization.**

phob-, prefix meaning "fear, panic, or morbid dread": *phobia, phobic, phobophobia.*

-phobe, -phobiac, -phobist, suffix meaning "one who fears" something specified: *dermatophobe, heliophobe, nosophobe.*

phobia /fō′bē·ə/ [Gk, *phobos,* fear], an obsessive, irrational, and intense fear of a specific object, such as an animal or dirt; of an activity, such as meeting strangers or leaving the familiar setting of the home; or of a physical situation, such as heights and open or closed spaces. Typical manifestations of phobia include faintness, fatigue, palpitations, perspiration, nausea, tremor, and panic. Some kinds of phobias are **agoraphobia, algophobia, claustrophobia, erythrophobia, gynephobia, lalophobia, mysophobia, nyctophobia, photophobia, xenophobia,** and **zoophobia.** Also called **phobic anxiety, phobic disorder, phobic reaction.** Compare **compulsion.** See also **simple phobia, social phobia.** **—phobic,** *adj.*

-phobia, suffix meaning "abnormal fear" of the object, experience, or place specified: *agoraphobia, claustrophobia, nyctophobia.*

phobiac /fō′bē·ak/, a person who exhibits or is afflicted with a phobia.

-phobiac. See **-phobe.**

phobic /fō′bik/ [Gk, *phobos,* fear], pertaining to or resembling phobia.

-phobic, -phobous, **1.** suffix meaning "exhibiting or possessing an aversion to or fear of (something)": *Anglophobic, necrophobic, zoophobic.* **2.** suffix meaning the "absence of a strong affinity": *chromophobic, gentianophobic, osmiophobic.*

phobic anxiety. See **phobia.**

phobic desensitization [Gk, *phobos,* fear; L, *de* + *sentire,* to feel], a method of resolving an ego dystonic or uncomfortable behavior pattern by gradual reentry into the emotionally upsetting life situation in stages, first in fantasy and then in real life. It is similar to the psychotherapeutic techniques of **flooding.**

phobic disorder. See **anxiety disorder, phobia.**

phobic neurosis. See **phobia.**

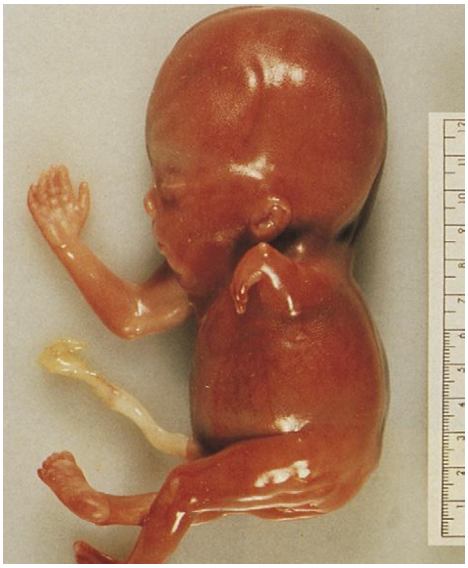
phobic reaction. See **phobia.**

phobic state, a condition characterized by extreme anxiety resulting from the excessive, irrational fear of a particular object, situation, or activity. See also **phobia.**

-phobist. See **-phobe.**

-phobous. See **-phobic.**

phocomelia /fō′kəmē′lyə/ [Gk, *phoke,* seal, *melos,* limb], a developmental anomaly characterized by absence of the upper part of one or more of the limbs so that the feet or hands or both are attached to the trunk of the body by short, irregularly shaped stumps, resembling the fins of a seal. The condition, caused by interference with the embryonic development of the long bones, is rare and is seen primarily as a side effect of the drug thalidomide taken during early pregnancy. Also called **seal limbs.** Compare **amelia.** **—***phocomelic, adj.*



Phocomelia of the left upper limb *(Moore, Persaud, and Shiota, 2000/Courtesy Dr. D.K. Kalousek, Department of Pathology, University of British Columbia, Children's Hospital)*

phocomelic dwarf /fō′kəmē′lik/, a dwarf in whom the long bones of any or all of the extremities are abnormally short.

phocomelus /fōkom′ələs/, an individual who has phocomelia.

phon-. See **phono-.**

phonation /fōnā′shən/ [Gk, *phone,* sound; L, *atio,* process], the production of voice through the vibration of the vocal folds of the larynx coupled with airflow directed upward from the lungs.

-phone, suffix meaning "sound or voice": *osteophone*.

phonetics /fōnet′iks/ [Gk, *phone,* voice], **1.** the science of speech sounds used in language. **2.** a written code used by speech-language pathologists and linguists to represent speech sounds.

-phonia. See **-phony.**

phonic, pertaining to voice, sounds, or speech.

-phonic. See **-phony.**

phono-, phon-, prefix meaning "sound, often specifically the sound of the voice": *phonocardiograph, phonopathy, phonopsia*.

phonocardiogram /fō′nōkär′dē·əgram′/, a graphic recording obtained from a phonocardiograph.

phonocardiograph /-kär′dē·əgraf′/ [Gk, *phone,* sound, *kardia,* heart, *graphein,* to record], an electroacoustic device that produces graphic heart sound recordings using a system of microphones and associated recording equipment. One microphone is usually placed on the chest near the base of the heart. It records the timing of the aortic and pulmonary components of the second heart sound and the loudest murmurs. Another microphone is positioned on the chest over the apex of the heart. It is connected to filters that allow the recording of low-frequency sounds, such as those associated with atrial and ventricular gallops, as well as higher-frequency sounds, such as those associated with mitral regurgitation and ventricular septal defect. To ensure an accurate recording, the examiner also uses audiophones to monitor the sounds and an oscilloscope to monitor cardiac impulses. Phonocardiographs are used in the diagnosis and monitoring of heart disorders. Also called **electrocardiophonograph. —phonocardiographic,** *adj*.

phonocardiography /-kär′dē·og′rəfē/ [Gk, *phone* + *kardia* + *graphein,* to record], the recording of heart sounds and murmurs by a phonocardiograph.

phonological disorder /fō·nə·loj′i·k/, a communication disorder of unknown cause, characterized by failure to use age- and dialect-appropriate sounds in speaking, with errors in the selection, production, or articulation of sounds. The most common errors are omissions, substitutions, and distortions of speech sounds.

phonology /fōnol′əjē/, the study of speech sounds, particularly the principles governing the way speech sounds are used in a given language.

phonophoresis /fō′nōfərē′sis/, a therapeutic technique in which ultrasound waves are used to force topical medicines, such as hydrocortisone, aspirin, and lidocaine, into subcutaneous tissues. Continuous phonophoresis for up to 10 minutes can drive a drug applied to the skin surface about 5 cm into muscle tissue. Because of the risk that the patient may be hypersensitive to the medication, the technique is used with caution.

phonoreceptor /-risep′tər/ [Gk, *phone,* sound; L, *recipere,* to receive], a device for receiving sound impulses.

-phony, -phonia, -phonic, suffix meaning "sound or to a type of speech": *autophony, aphonia, organophonic*.

phor-, prefix meaning "bearing, carrying": *phoresis, phoroblast, phorology*.

-phore, -phor, suffix meaning a "bearer or possessor": *gluciphore, physaliphore, trochophore*.

-phoresis, suffix meaning a "movement in a (specified) manner or medium": *aphoresis, cataphoresis, diaphoresis*.

-phoria, **1.** suffix meaning "(condition of the) visual axes of the eye": *anophoria, esophoria, exophoria*. **2.** suffix meaning an "emotional state": *adiaphoria, euphoria, ideaphoria*.

phoropter /for-op′ter/, an instrument for evaluation of vision, with lenses placed on dials in a unit that is positioned in front of the patient.

phosphatase /fos′fətāz/, an enzyme that acts as a catalyst in chemical reactions involving phosphorus. It is present in serum, semen, the kidney, and the prostate. It is essential in the calcification of bone. See also **catalyst, enzyme.**

phosphate (PO_4^{3-}) /fos′fāt/, **1.** an anion of phosphoric acid. **2.** a salt of phosphoric acid. Phosphates are extremely important in living cells, particularly in the storage and use of energy and the transmission of genetic information within a cell and from one cell to another. See also **adenosine diphosphate, adenosine triphosphate, phosphorus.**

phosphate binder, a substance, such as aluminum hydroxide, calcium acetate, or calcium carbonate, that binds phosphate in the blood, removing it from circulation. It is used in treatment of hyperphosphatemia in patients with end-stage renal disease or hypoparathyroidism.

phosphate-bond energy, the Gibbs energy for hydrolysis of a phosphate compound; a measure of relative phosphorylation power.

phosphatemia /fos′fətē′mē·ə/ [Gk, *phosphoros,* bringer of light; Gk, *haima,* blood], a condition of excessive levels of phosphates in the blood.

phosphate (PO_4) test, a blood test used to detect hyperphosphatemia and hypophosphatemia. Abnormal phosphate levels are associated with renal failure, acromegaly, hyperparathyroidism or hypoparathyroidism, liver disease, advanced lymphoma or myeloma, hemolytic anemia, hypercalcemia, chronic alcoholism, vitamin D deficiency, diabetic acidosis, hyperinsulinism, and sepsis, among other conditions.

phosphatide /fos′fətīd/, phosphatidic acid or any of its esters. Phosphatidic acid (diacylglycerol phosphate) consists of glycerol esterified to phosphoric acid and to two fatty acids. Phosphatides are major components of cell membranes. Also called **phosphoglyceride, phosphotidate.**

phosphaturia /fos′fətŏŏr′ē·ə/ [Gk, *phosphoros,* bringer of light, *ouron,* urine], an excessive level of phosphates in the urine. Also called **phosphuria.**

phosphoglycerate kinase /fos′fōglis′ərāt/, an enzyme that catalyzes the reversible transfer of a phosphate group from adenosine triphosphate to D-3-phosphoglycerate, forming d-1,3-biphosphoglycerate. The reaction is one of the steps in gluconeogenesis.

phosphoglyceride. See **phosphatide.**

Phospholine Iodide, a trademark for a cholinergic **(echothiophate iodide).**

phospholipase /fos′fōlī′pās/, any of a group of enzymes that catalyze the hydrolysis of phospholipids. Various phospholipases digest cell membranes, aid in the synthesis of prostaglandins, and help produce arachidonic acid, one of the essential fatty acids.

phospholipid /fos′fōlip′id/ [Gk, *phos,* light, *pherein,* to bear, *lipos* fat], a phosphorus-containing lipid. Two kinds of phospholipids are **phosphatides** and **sphingomyelins.**

phospholipid as phosphorus. See **lipid.**

phospholipid transfer protein (PLTP), a ubiquitous protein having multiple functions in lipoprotein metabolism. In plasma, it plays an important role in high-density lipoprotein (HDL) metabolism by mediating the transfer of phospholipids from triglyceride-rich lipoproteins to HDL and the transfer of phospholipids between HDL molecules.

phosphomevalonate kinase /fos′fōməval′ənāt/, an enzyme that catalyzes the transfer of a phosphate group from adenosine triphosphate to produce adenosine diphosphate and 5-pyrophosphomevalonate.

phosphorescence /fos′fôres′əns/ [Gk, *phos*, light, *pherein*, to bear], **1.** a glow of yellow phosphorus caused by slow oxidation. **2.** the emission of visible light without accompanying heat as observed in phosphorus that has been exposed to radiation, which continues beyond a few nanoseconds after radiation has ceased.

phosphoric acid (H_3PO_4) /fosfôr′ik/, a clear, colorless, odorless liquid that is irritating to the skin and eyes and moderately toxic if ingested. It is used in the production of fertilizers, soaps, detergents, animal feeds, and certain drugs.

phosphorus (P) /fos′fərəs/ [Gk, *phos*, light, *pherein*, to bear], a nonmetallic chemical element occurring extensively in nature as a component of phosphate rock. Its atomic number is 15; its atomic mass is 30.975. Phosphorus forms a series of sulfides used commercially in the manufacture of matches. It can be prepared in yellow or white, red, and black allotropic forms. Phosphorus is essential for the metabolism of protein, calcium, and glucose. The body uses phosphorus in its combined forms, which are obtained from such nutritional sources as milk, cheese, meat, egg yolk, whole grains, legumes, and nuts. A nutritional deficiency of phosphorus can cause weight loss, anemia, and abnormal growth. Phosphorus is essential to the body for the production of adenosine triphosphate and for the process of glycolysis. Elemental white or yellow phosphorus is extremely poisonous and produces severe GI irritation. If ingested, it can produce hemorrhage, cardiovascular failure, and death. Chronic poisoning by phosphorus is characterized by anemia, cachexia, bronchitis, and necrosis of the mandible. Normal adult blood levels of phosphorus are 3 to 4.5 mg/dL or 0.97 to 1.45 mmol/L (SI units).

phosphorus poisoning, a toxic condition caused by the ingestion of white or yellow phosphorus, sometimes found in rat poisons, certain fertilizers, and fireworks. Intoxication is characterized initially by nausea, throat and stomach pain, vomiting, diarrhea, and an odor of garlic on the breath. After a few days of apparent recovery, nausea, vomiting, and diarrhea recur with renal and hepatic dysfunction. Physical contact with the vomitus and feces of the patient is avoided.

phosphorylase /fosfôr′ilās/ [Gk, *phosphoros*, bringer of light + *ase*, enzyme suffix], any of a group of physiologically important enzymes that catalyze reactions between phosphates and glycogen or other starch components, yielding glucose-1-phosphate.

phosphorylation /fosfôr′ilā′shən/, the process of attaching a phosphate group to a protein, sugar, or other compound.

phosphotidate. See **phosphatide.**

phosphuria. See **phosphaturia.**

phot /fot/ [Gk, *phos*, light], the centimeter-gram-second unit of illumination, being one lumen per square centimeter.

phot-. See **photo-.**

photic /fō′tik/ [Gk, *phos*, light], pertaining to light.

-photic, suffix meaning "ability to see at a (specified) light level": *euryphotic, stenophotic, sthenophotic*.

photic epilepsy [Gk, *phos*, light, *epilepsia*, seizure], a condition in which epileptic attacks may be triggered by flickering light. During an electroencephalogram, a bright light is flashed to try to stimulate this kind of epilepsy. Also called **photogenic epilepsy.**

photoablation /fo′to·ah-bla′shun/, volatilization of tissue by ultraviolet rays emitted by a laser.

photoaging /fo′to·āj′ing/, premature aging of the skin caused by long-term exposure to sunlight or other ultraviolet radiation.

photoallergic /-əlur′gik/ [Gk, *phos*, light, *allos*, other, *ergein*, to work], exhibiting a delayed hypersensitivity reaction after exposure to light. Compare **phototoxic.** See also **photoallergic contact dermatitis.**

photoallergic contact dermatitis, a papulovesicular, eczematous, or exudative skin reaction that occurs 24 to 48 hours after exposure to light in a previously sensitized person. The sensitizing substance concentrates in the skin and requires chemical alteration by light to become an active antigen. Among common photosensitizers are phenothiazines, hexachlorophene, oral hypoglycemic agents, and sulfanilamide. Prevention requires avoidance of the photosensitizer and of sunlight. Treatment is the same as that for any other inflammatory dermatitis.

photoallergy /-al′ərjē/ [Gk, *phos*, light, *allos*, other + *ergein*, to work], a sensitivity to light that causes allergic reactions.

photobiology /-bī·ol′əjē/, the study of the effects of light on organisms.

photochemistry /fō″tōkem′istrē/ [Gk, *phos*, light, *chemeia*, alchemy], the branch of chemistry that deals with the chemical properties or effects of light rays or other radiation.

photochemotherapy /-kē′mōther′əpē/ [Gk, *phos* + *chemeia*, alchemy, *therapeia*, treatment], a kind of chemotherapy in which the effect of the administered drug is enhanced by exposing the patient to light. Also called **photodynamic therapy.** See also **chemotherapy.**

photochromogen /-krō′məjen/, **1.** a pigment that develops as a result of exposure to light. **2.** a type of mycobacterium that is nonpigmented in the dark but produces a yellow pigment on constant exposure to light.

photodisintegration /-disin′təgrā′shən/, the emission of a nuclear fragment caused by the interaction of a high-energy x-ray with an atomic nucleus. It may occur when an x-ray photon with energy greater than 10 MeV escapes interaction with the electron cloud or nuclear force field of an atom and is absorbed directly by the nucleus.

photodynamic therapy. See **photochemotherapy.** Also called **Levulan Kerastick therapy.**

photoelectron /-ilek′tron/ [Gk, *phos*, light + *elektron*, amber], any electron that is discharged when light strikes a metal surface.

photogenic epilepsy. See **photic epilepsy.**

photokinetic /-kinet′ik/ [Gk, *phos*, light, *kinesis*, movement], pertaining to any movement that is stimulated by light rays.

photometer /fōtom′ətər/ [Gk, *phos* + *metron*, measure], an instrument that measures light intensity. It usually is composed of a source of radiant energy, a filter for wavelength selection, a cuvette holder, a detector, and a readout device.

photomultiplier /-mul′tiplī′ər/ [Gk, *phos*, light; L, *multiplex*, many folds], a device used in many radiation detection applications that converts low levels of light into electrical pulses. A bank of such tubes is used in gamma cameras to view a crystal.

photon /fō′ton/ [Gk, *phos*, light], the smallest quantity of electromagnetic energy. It has no mass and no charge but travels at the speed of light. Photons may occur in the form of x-rays, gamma rays, or quanta of light. The energy (E) of a photon is expressed as the product of its frequency (v) and Planck's constant (h), as in the equation $E = hv$. X-ray photons occur in frequencies of 10^{18} to 10^{21} Hz and energies that range upward from 1 KeV.

photophobia /-fō′bē·ə/ [Gk, *phos* + *phobos*, fear], **1.** abnormal sensitivity to light, especially of the eyes. The condition is prevalent in albinism and various diseases of the conjunctiva and cornea and may be a symptom of such disorders as measles, psittacosis, encephalitis, Rocky Mountain spotted fever, and Reiter's syndrome. **2.** (in psychiatry) a morbid fear of light with an irrational need to avoid light places. The anxiety disorder is seen more often in women than in men and is usually caused by a repressed intrapsychic conflict symbolically related to light. —*photophobic, adj.*

photo-, phot-, prefix meaning "light": *photoelectric, photoreceptor, phototropism.*

photopic eye. See **light-adapted eye.**

photopic vision /fōtop′ik/, daylight vision, which depends primarily on the function of the retinal cone cells.

photoprotective /-prətek′tiv/, protective against the potential adverse effects of ultraviolet light.

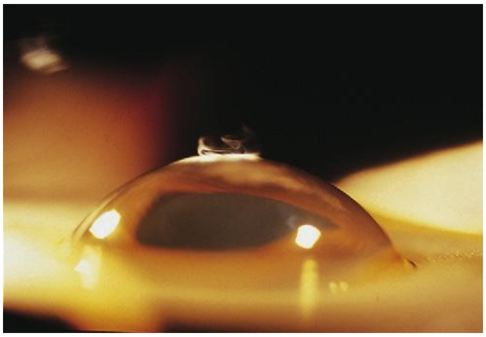
photoreaction /-rē·ak′shən/ [Gk, *phos* + L, *re,* again, *agere,* to act], any chemical reaction that is stimulated by the influence of light.

photoreceptor /-risep′tər/ [Gk, *phos,* light; L, *recipere,* to receive], a nerve cell that is receptive to light stimuli.

photoreceptor layer [L, *columna,* column; AS, *lecgan*], the layer of rods and cones in the retina.

photorefractive /fo′to-re-frak′tiv/, pertaining to the refraction of light. See also **photorefractive keratectomy.**

photorefractive keratectomy (PRK) /-refrak′tiv/, a surgical procedure in which an excimer laser is used to reshape the human cornea to improve the refractive properties of the eye and reduce or eliminate the need for eyeglasses. The excimer laser does not require that incisions be made in the cornea. Rather than cutting, the laser shaves off preprogrammed outer layers of corneal tissue. The excimer laser is programmed to emit a measured and concentrated light beam to reshape a small part of the central cornea. It allows for correction of myopia of up to −10.0 diopters. See also **refractive keratotomy.** Compare **radial keratotomy.**



Photorefractive keratectomy

(Kanski and Bowling, 2011/Courtesy C. Barry)

photoscan /fō′tōskan′/, a radiograph that shows the distribution of a radiopharmaceutical in the body.

photosensitive /-sen′sitiv/ [Gk, *phos* + L, *sentire,* to feel], pertaining to increased reactivity of the skin to sunlight caused by a disorder such as albinism or porphyria, or, more frequently, by the use of certain drugs. Relatively brief exposure to sunlight or to an ultraviolet lamp may cause edema, papules, urticaria, or acute burns in individuals with endogenous or acquired photosensitivity. Treatment involves avoidance of exposure to sunlight or the photosensitizing agent.

photosensitivity /-sen′sitiv′itē/, **1.** sensitivity of a cell to light. **2.** any abnormal response to exposure to light, specifically, a skin reaction requiring the presence of a sensitizing agent and exposure to sunlight or its equivalent. Photosensitivity includes photoallergic and phototoxic reactions and is common in systemic lupus erythematosus.

photosensitization /-sen′sitīzā′shən/ [Gk, *phos,* light; L, *sentire,* to feel], the process of rendering an organism sensitive to the effects of light.—*photosensitizer, n.*

photostimulable phosphor, a material used to capture radiographic images in computed radiography systems.

photosynthesis /fōtōsin′thəsis/ [Gk, *phos* + *synthesis,* putting together], a process by which plants, algae, and some bacteria containing chlorophyll synthesize organic compounds, chiefly carbohydrates, from atmospheric carbon dioxide and water, using light for energy and liberating oxygen in the process. —*photosynthetic, adj.*

phototherapy /-ther′əpē/ [Gk, *phos* + *therapeia* treatment], the treatment of disorders by the use of light, especially ultraviolet light. Ultraviolet light may be used in the therapy of acne, pressure ulcers and other indolent ulcers, psoriasis, and hyperbilirubinemia. Also called **lucotherapy.** See also **photochemotherapy.** —*phototherapeutic, adj.*

phototherapy in the newborn, a treatment for hyperbilirubinemia and jaundice in the newborn that involves the exposure of an infant's bare skin to intense fluorescent light. The blue range of light accelerates the excretion of bilirubin in the skin, decomposing it by photooxidation.

■ METHOD: The infant is placed nude under the fluorescent lights with the eyes and genitalia covered. The baby is turned frequently, and the body temperature is monitored, using a skin thermistor. All vital signs are carefully noted, and details regarding position of the bulbs, time and duration of treatment, and the infant's response are charted. Adverse effects of phototherapy include dehydration: An infant may need 25% more fluid during treatment. Loose stools and "bronze baby" syndrome may occur.

■ INTERVENTIONS: The nurse performs phototherapy and may be responsible for collecting specimens for serial tests for bilirubin level in the blood. The lights may scorch the nurse's hair and irritate the eyes. As protection, a cap and sunglasses may be worn. Breastfeeding may be discontinued during treatment but often is not. Additional water is always given. The family is encouraged to visit and to participate in caring for the infant. They may be told that the eye shields are necessary but do not seem to bother the infant.

■ OUTCOME CRITERIA: Bilirubin levels usually decrease by 3 to 4 mg/dL in the first 8 to 12 hours of therapy. Thus simple jaundice clears rapidly. Excess bilirubin and jaundice that are the result of hemolytic disease or infection may be controlled with phototherapy, but the underlying cause is treated separately. Recovery is usually complete. The long-term safety of phototherapy has not been established. Short-term efficacy and practicality of use are certain.

phototherapy: mood/sleep regulation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the administration of doses of bright light in order to elevate mood and/or normalize the body's internal clock. See also **Nursing Interventions Classification.**

phototherapy: neonate, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of light therapy to reduce bilirubin levels in newborn infants. See also **Nursing Interventions Classification.**

phototoxic /-tok′sik/ [Gk, *phos* + *toxikon,* poison], characterized by a rapidly developing nonimmunological reaction of the skin when it is exposed to a photosensitizing substance and light. Compare **photoallergic.** See also **phototoxic contact dermatitis.**

phototoxic contact dermatitis, a rapidly appearing, sunburnlike response of areas of skin that have been exposed to the sun after contact with a photosensitizing substance. Hyperpigmentation may follow the acute reaction. Coal tar derivatives, oil of bergamot (often used in cosmetics and beverages), and many plants containing furocoumarin (cowslip, buttercup, carrot, parsnip, mustard, and yarrow) are known photosensitizing materials. Treatment includes Burrow's solution, emollient creams such as Acid Mantle, and topical corticosteroids.

-phragma, -phragm, suffix meaning a "septum or musculomembranous barrier between cavities": *inophragma, mesophragma, telophragma*.

-phrasia, suffix meaning an "abnormal condition of speech": *aphrasia, echophrasia, embolophrasia*.

phren /fren/ [Gk, mind], **1.** the diaphragm. **2.** the mind.

phrenetic /frənet′ik/ [Gk, *phren*], frenzied, delirious, maniacal.

phreni-, phrenico-, phreno-, prefix meaning "mind or the diaphragm": *phrenology, phrenalgia*.

-phrenia, suffix meaning a "disordered condition of mental activity": *hebephrenia, ideophrenia, schizophrenia*.

phrenic /fren′ik/ [Gk, *phren,* mind], **1.** pertaining to the diaphragm. **2.** pertaining to the mind.

-phrenic, **1.** suffix meaning the "diaphragm or adjacent regions of the body": *costophrenic, postphrenic, subphrenic*. **2.** suffix meaning "characteristic of a disorder of the mind": *hebephrenic, ideophrenic, schizophrenic*.

phrenic nerve, one of a pair of branches of the cervical plexus, arising from the first four cervical nerves and passing to the diaphragm. It contains about half as many sensory as motor fibers and is generally known as the motor nerve to the diaphragm, although the lower thoracic nerves also help innervate the diaphragm. The pleural branches of the phrenic nerve are very fine filaments supplying the mediastinal pleura. The pericardial branches are delicate filaments passing to the upper pericardium. The terminal branches diverge after passing separately through the diaphragm and are distributed on the abdominal surface of the diaphragm. On the right side, a branch near the inferior vena cava communicates with the phrenic plexus in association with a phrenic ganglion. There is no phrenic ganglion on the left side. Also called **internal respiratory nerve of Bell.** Compare **accessory phrenic nerve.**

phrenico-. See **phreni-.**

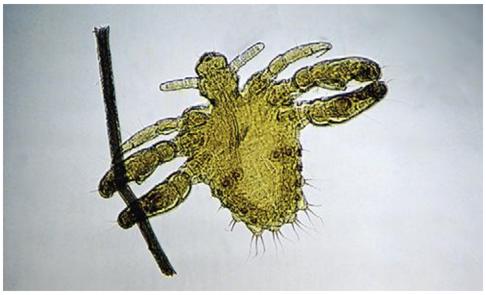
phrenicoceliac part of suspensory muscle of duodenum, a band of skeletal muscle that passes from the right crus of the diaphragm to join the celiacoduodenal part (pars coeliacoduodenalis) and attach to the celiac trunk.

phreno-. See **phreni-.**

phrenology [Gk, *phren,* mind], the study of the conformation of the skull based on the assumption that mental faculties are localized in particular sites on the surface of the brain. According to phrenologists, intelligence or other faculties of a person may be mirrored through elevations in the skull overlying the particular area of the brain.

PHSP, abbreviation for **physician health service plan.**

Phthirus /thī′rəs/ [Gk, *phtheir,* louse], a genus of blood-sucking lice that includes the species *P. pubis,* the **crab louse.**



***Phthirus pubis* grasping a hair** *(Auerbach, 2012)*

phthisis /tis′is, thī′sis/ [Gk, *phthisis,* wasting away], any wasting disease involving all or part of the body, such as pulmonary tuberculosis.

-phthongia, suffix meaning a "condition of speech": *aphthongia, diphthongia, heterophthongia*.

phyco-, prefix meaning "seaweed": *phycochrome, phycocyan, phycology*.

phycologist /fēkol′əjist/, a person who specializes in the study of algae. Also called **algologist.**

phycology /fēkol′əjē/ [Gk, *phykos,* seaweed, *logos,* science], the branch of science that is concerned with algae. Also called **algology.**

phycomycosis /fī′kōmīkō′sis/ [Gk, *phykos* + *mykes,* fungus, *osis,* condition], a fungal infection caused by a species of the order Phycomycetes. These organisms are common in the soil and are not usually pathogenic. Severe nosocomial pulmonary phycomycosis sometimes occurs with advanced diabetes mellitus that is untreated or out of control and complicated by ketoacidosis. See also **zygomycosis.**

-phyl. See **-phyll.**

phyl-, prefix meaning "guarding or preservation": *phylacagogic, phylactic, phylaxis*.

phylactic /filak′tik/ [Gk, *phylax,* guard], **1.** serving to protect. **2.** something that produces phylaxis.

-phylaxis, suffix meaning "protection": *anaphylaxis, prophylaxis*.

-phyll, -phyl, suffix meaning a "leaf": *chlorophyll, leukophyll*.

phyllo- /fil′ō-/, prefix meaning "leaves": *phyllochlorin, phyllode, phyllosan*.

phylloquinone. See **vitamin K_1.**

phylo- /fī′lō-/, prefix meaning "type, kind, race, or tribe": *phylobiology, phylogenesis, phylogeny*.

phylogenesis. See **phylogeny.**

phylogenetic /fī′lōgənet′ik/ [Gk, *phylon,* tribe, *genesis,* origin], **1.** relating to or acquired during phylogeny. **2.** based on a natural evolutionary relationship, such as a system of classification. Also called *phylogenic*.

phylogeny /filoj′ənē/ [Gk, *phylon* + *genesis*], the development of the structure of a particular race or species as it evolved from earlier forms of life. Also called **phylogenesis.** Compare **ontogeny.** See also **comparative anatomy.**

phylum /fī′ləm/ [Gk, *phylon,* tribe], a major subdivision of a kingdom of organisms, representing one or more classes.

-phyma, suffix meaning a "swelling or tumor": *adenophyma, celiophyma, onychophyma*.

Physalia /fisā′lēə/, a genus of marine invertebrates of the phylum Cnidaria. See **Portuguese man-of-war.**

physi-. See **physio-.**

physiatrics. See **physiatry.**

physiatrist /fiz′ē·at′rist/, a physician specializing in physical medicine and rehabilitation who has been certified by the American Board of Physical Medicine and Rehabilitation after completing residency and other requirements.

physiatry /fizī′ətrē/, the branch of medicine that deals with the prevention, diagnosis, and treatment of disease or injury and the rehabilitation from resultant impairments and disabilities by using physical agents such as light, heat, cold, water, electricity, therapeutic exercise, mechanical apparatus, and sometimes pharmaceutic agents. Also called **physiatrics, physical medicine, physical medicine and rehabilitation.**

-physical, suffix meaning "natural": *iatrophysical, medicophysical, psychophysical*.

physical abuse /fiz′ikəl/ [Gk, *physikos,* natural; L, *abuti,* to abuse], one or more episodes of aggressive behavior, usually resulting in physical injury with possible damage to internal organs, sense organs, the central nervous system, or the musculoskeletal system of another person.

physical aging, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as normal physical changes that occur with the natural aging process. See also **Nursing Outcomes Classification.**

physical allergy, a hypersensitive reaction to physical factors, such as cold, heat, light, or trauma. Common characteristics include pruritus, urticaria, and angioedema. Usually specific antibodies are found in people having physical allergies. Photosensitivity may be caused by the use of certain cosmetics or drugs. Prophylaxis typically includes an attempt to remove the stimulus, and treatment involves the use of antihistamines or steroids. Compare **contact dermatitis.** See also **atopic dermatitis.**

physical assessment, the part of the health assessment representing a synthesis of the information obtained in a physical examination. It involves the detailed examination of the body from head to toe using the techniques of observation/inspection, palpation, percussion, and auscultation.

physical chemistry, the natural science dealing with the relationship between chemical and physical properties of matter.

physical dependence, substance dependence in which there is evidence of tolerance, withdrawal, or both.

physical diagnosis, the diagnostic process accomplished by the study of the physical manifestations of health, disease, and illness revealed in the physical examination, as guided by the patient's complete history and supported by various laboratory tests. Physical diagnosis is to medicine what the health assessment is to nursing.

physical examination, an investigation of the body to determine its state of health, using any or all of the techniques of inspection, palpation, percussion, auscultation, and smell. The physical examination, history, and initial laboratory tests constitute the data base on which a diagnosis is made and on which a plan of treatment is developed.

Equipment used during a physical examination
(Potter and Perry, 2005)

physical fitness[1], the ability to carry out daily tasks with alertness and vigor, without undue fatigue, and with enough energy reserve to meet emergencies or to enjoy leisure time pursuits.

physical fitness[2], a nursing outcome from the Nursing Outcomes Classification (NOC) defined as performance of physical activities with vigor. See also **Nursing Outcomes Classification.**

physical injury severity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of injuries from accidents and trauma. See also **Nursing Outcomes Classification.**

physical maturation: female, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as normal physical changes in the female that occur with the transition from childhood to adulthood. See also **Nursing Outcomes Classification.**

physical maturation: male, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as normal physical changes in the male that occur with the transition from childhood to adulthood. See also **Nursing Outcomes Classification.**

physical medicine, physical medicine and rehabilitation. See **physiatry.**

physical restraint, a nursing intervention from the Nursing Interventions Classification (NIC) defined as application, monitoring, and removal of mechanical restraining devices or manual restraints used to limit physical mobility of a patient. See also **Nursing Interventions Classification.**

physical science, the study of the properties and behavior of nonliving matter. Some kinds of physical science are **chemistry,** geology, and **physics.** Compare **life science.**

physical sign [Gk, *physikos,* natural; L, *signum*], an objective indicator found during physical diagnosis or detected by inspection, palpation, percussion, or auscultation.

physical therapist (PT), a person who is licensed in the examination, evaluation, and treatment of physical impairments through the use of special exercise, application of heat or cold, and other physical modalities. The goal is to assist persons who are physically challenged to maximize independence and improve mobility, self-care, and other functional skills necessary for daily living. A physical therapist becomes qualified by studying a 4- to 7-year college curriculum leading to a bachelor's or master's degree in physical therapy (usually B.S., M.S., or M.P.T.).

physical therapy (PT), the treatment of disorders with physical agents and methods, such as massage, manipulation, therapeutic exercises, cold, heat (including paraffin, shortwave and microwave diathermy, and ultrasonic heat), hydrotherapy, electrical stimulation, and light to assist in habilitating or rehabilitating patients and restoring function after an illness or injury. Also called **physiotherapy.**

physical therapy assistant (PTA), a person who, under the supervision of a physical therapist, assists in carrying out patient treatment programs, providing treatment that improves mobility, relieves pain, and prevents or lessens physical disabilities of patients. An assistant usually has an associate's degree and in some states is licensed.

physician /fizish′ən/ [Gk, *physikos,* natural], a health professional who has earned a degree of Doctor of Medicine (M.D.) or Doctor of Osteopathic Medicine (DO) after completing an approved course of study at an approved medical school. Satisfactory completion of National Board Examinations, usually given during both the second and the final years of medical school and after graduation, is also required. An M.D. or D.O. usually enters a hospital internship or residency program for at least 2 years of postgraduate training before beginning practice or further training in a specialty. To practice medicine, an M.D. or D.O. is required to obtain a license from the state in which professional services will be performed. See also **osteopath.**

physician assistant (PA), a person academically and clinically prepared to practice medicine under the supervision of a licensed doctor of medicine or osteopathy. Within the physician/PA relationship, PAs exercise autonomy in medical decisions and provide a wide range of diagnostic and therapeutic services. Training programs average 25 to 27 months. National certification is available to graduates of approved training programs, a master's degree level in most states.

physician extender, a health care provider who is not a physician but who performs medical activities typically performed by a physician. It is most commonly a nurse practitioner or physician assistant.

physician health service plan (PHSP), (in the United States) a general term relating to an arrangement for provision of professional (physician) services only.

physician-hospital organization (PHO), (in the United States) a management service organization in which the partners are physicians and hospitals. The PHO organization contracts for physician and hospital services.

Physician's Desk Reference (PDR), a compendium compiled annually, containing information supplied by their manufacturers about drugs, primarily prescription drugs and products used in diagnostic procedures in the United States.

physician support, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collaborating with physicians to provide quality patient care. See also **Nursing Interventions Classification.**

physicist /fis′isist/, a scientist who specializes in physics.

physico-, prefix meaning "natural or knowledge of nature": *physical, physiology.*

physics /fiz′iks/ [Gk, *physikos,* natural], the study of matter and energy, particularly as related to motion and force.

-physics, suffix meaning the "science of the nature of": *cytophysics, medicophysics, microphysics.*

physio-, physi-, prefix meaning "related to nature or to physiology": *physiochemical, physiognosis, physiotherapy.*

physiognomy /fiz′ē·og′nəmē/ [Gk, *physis,* nature, *gnosis,* knowledge], a method of judging the personality and other characteristics of a client by studying the face and general carriage of the body.

physiological age [Gk, *physis,* nature, *logos,* science; L, *aetas,* age], the age of the body as determined by its stage of development in terms of functional norms for various systems.

physiological /fiz′ē·əloj′ik/ [Gk, *physis,* nature, *logos,* science], pertaining to physiology, particularly normal functions as opposed to the pathological.

physiological albuminuria [Gk, *physis,* nature, *logos,* science; L, *albus,* white; Gk, *ouron,* urine], the presence of albumin in the urine in the absence of any disease.

physiological chemistry. See **biochemistry.**

physiological amenorrhea [Gk, *physis,* nature, *logos,* science, *a* + *men,* month, *rhoia,* to flow], an absence of menstruation having a nonpathological cause, such as pregnancy, lactation, menopause, or a prepubertal state of maturity.

physiological antidote [Gk, *physis* + *logos* + *anti,* against, *dotos,* that which is given], a drug that has the opposite effect on the body from that caused by a poisonous or toxic substance.

physiological contracture [Gk, *physis* + *logos,* science; L, *contractio,* drawing together], a temporary condition in which muscles may contract and shorten for a considerable period. Drugs, temperature extremes, and local accumulation of lactic acid are possible causes.

physiological dead space. See **dead space,** def 2.

physiological dwarf. See **primordial dwarf.**

physiological flexion, an excessive amount of flexor tone that is normally present at birth because of the existing level of central nervous system maturation and fetal positioning in the uterus.

physiological fourth heart sound. See **S_4.**

physiological hypertrophy, a temporary increase in the size of an organ or part caused by normal physiological functions, such as occurs in the walls of the uterus and in the breasts during pregnancy.

physiological incompatibility, a condition in which substances, such as drugs, may have mutually antagonistic effects on the body.

physiological jaundice [Gk, *physis,* nature, *logos,* science; Fr, *jaune,* yellow], a simple jaundice of newborns that involves the breaking down of the excessive number of red blood cells that may be present at birth.

physiological motivation, a body need, such as for food or water, that initiates behavior directed toward satisfying the particular need. Also called **organic motivation.** Compare **social motivation.**

physiological murmur. See **functional murmur.**

physiological occlusion, **1.** a closure of the teeth that complements and enhances the functions of the masticatory system. **2.** a closure of the teeth that produces no pathological effects on the stomatognathic system, normally dissipating the stresses placed on the teeth and creating a balance between the stresses and the adaptive capacity of the supporting tissues. **3.** an acceptable occlusion in a healthy gnathic system.

physiological psychology, the study of the interrelationship of physiological and psychological processes, especially the effects of a change from normal to abnormal.

physiological retraction ring, a ridge around the inside of the uterus that forms during the second stage of normal labor at the junction of the thinned lower uterine segment and thickened upper segment. It forms as a result of progressive lengthening of the muscle fibers of the lower segment and concomitant shortening of the muscle fibers of the upper segment. Compare **constriction ring, pathological retraction ring.**

physiological saline. See **saline solution.**

physiological salt solution, a normal saline solution, usually consisting of a sterile 0.9% w/v solution of sodium chloride in distilled water. It is isotonic with normal body fluids.

physiological tetanus, a state of sustained muscular contraction without periods of relaxation caused by repetitive stimulation of the motor nerve trunk at frequencies so high that individual muscle twitches are fused and cannot be distinguished from one another. Also called **tetanic spasm, tonic spasm.** See also **tetanic contraction, tonic convulsion.**

physiological third heart sound. See **S_3.**

physiological tremor [Gk, *physis* + *logos;* L, *tremor,* shaking], any shaking or trembling caused by physiological factors, such as fatigue, fear, or cold.

physiologist /fiz′ē·ol′əjist/ [Gk, *physis,* nature, *logos,* science], a person who specializes in the science of living organisms.

physiology /fiz′ē·ol′əjē/ [Gk, *physis* + *logos,* science], **1.** the study of the processes and function of the human body. **2.** the study of the physical and chemical processes involved in the functioning of organisms and their parts. Kinds of physiology include **comparative physiology, developmental physiology, hominal physiology,** and **pathological physiology.** Compare **anatomy.**

physiopathological /fiz′ē·əpath′əloj′ik/ [Gk, *physis,* nature, *pathos,* disease, *logos,* science], pertaining to the physiological approach to disease.

physiotherapy. See **physical therapy.**

physique /fizēk′/, the body structure and development of a person.

-physis, suffix meaning a "growth or growing": *metaphysis, onychophysis, zygapophysis.*

physo-, prefix meaning "air or gas": *physocele, physocephaly, physometra.*

physostigmine salicylate, an acetylcholinesterase inhibitor.
■ INDICATIONS: It is an ophthalmic preparation prescribed as a miotic agent for the treatment of glaucoma, and it is administered systemically for treating the toxic effects of excessive cholinergic receptors blockade (e.g., resulting from atropine poisoning).
■ CONTRAINDICATIONS: Asthma, gangrene, diabetes, cardiovascular disease, or mechanical obstruction of the intestines or urinary tract prohibits its use. It is also not administered to patients in any vagotonic state or to those receiving choline esters or depolarizing neuromuscular blocking agents.
■ ADVERSE EFFECTS: Among the adverse effects are hypersalivation, diaphoresis, lacrimation, miosis, bradycardia, palpitations, nervousness, and convulsions.

phytanic acid storage disease /fītan′ik/, a rare genetic disorder of lipid metabolism in which phytanic acid accumulates in the plasma and tissues. The condition is characterized by ataxia, peripheral neuropathy, retinitis pigmentosa, and abnormalities of the bone and skin. Also called **Refsum's syndrome.**

phyte-. See **phyto-.**

-phyte, suffix meaning a "plant that grows in or on or produces": *epiphyte, paraphyte, pteridophyte*.

phytochemical, the active chemical components, or constituents, present in a plant that account for its medicinal properties.

phytogenesis /fī′tōjen′əsis/ [Gk, *phyton,* plant, *genein,* to produce], the origin and evolution of algae and plants.

phytogenous /fītoj′ənəs/ [Gk, *phyton,* plant, *genein,* to produce], **1.** produced by or originating in algae or plants. **2.** pertaining to phytogenesis.

phytohemagglutinin (PHA) /fī′tōhem′əgl o͞o′tinin/ [Gk, *phyton,* plant, *haima,* blood; L, *agglutinare,* to glue], a hemagglutinin that is derived from a plant, specifically the lectin obtained from the red kidney bean. Also called **phytolectin.**

phytohemagglutinin test, a test to identify genetic carriers of cystic fibrosis, performed by exposing white blood cells to phytohemagglutinin. A normal reaction involves a noticeable increase in cell protein. Molecular genetic markers are now available for the diagnosis of cystic fibrosis.

phytolectin. See **phytohemagglutinin.**

phytonadione, **1.** See **vitamin K_1.** **2.** an agent used to promote the production of prothrombin to treat hypoprothrombinemia. It is administered via the oral and parenteral routes.

phyto-, phyt-, phyte-, prefix meaning "plant or plants": *phytobezoar, phytochemistry, phytoncide*.

phytotherapy. See **herbal medicine.**

pi /pī/, **1.** Π, π, the sixteenth letter of the Greek alphabet. **2.** (in mathematics) the ratio of a circle's circumference to its diameter.

P.I., **1.** (in patient records) abbreviation for *present illness*. **2.** abbreviation for *International Pharmacopeia*. **3.** (in research) abbreviation for *principal investigator.* **4.** (in pharmacology) abbreviation for package insert.

pia, abbreviation for **pia mater.**

pia-arachnoid /pī′ə·arak′noid/ [L, *pia,* tender; Gk, *arachne,* spider, *eidos,* form], pertaining to both the pia mater and arachnoid layers of the meninges covering the brain and spinal cord.

piagetian /pī′äzhe′tē·ən/, pertaining to the theories and viewpoints of **Piaget.**

Piaget, Jean /zhän pē·äzhā′/, (1896–1980), a Swiss psychologist and genetic epistemologist who established the Genevan school of developmental psychology. From his original training in zoology and his early work in testing schoolchildren in the laboratory, Piaget developed a premise that human intelligence is an extension of biological adaptation. He assumed that human intelligence evolves in a series of stages that are related to age. At each successive stage, intellectual adaptation is more general and shows a higher level of logical organization.

pia mater (pia) /pē′ə mā′tər, pī′ə/ [L, *pia,* tender, *mater,* mother], the innermost of the three meninges covering the brain and the spinal cord. It is closely applied to both structures and carries a rich supply of blood vessels, which nourish the nervous tissue. The cranial pia mater covers the surface of the brain and dips into the fissures and sulci of the cerebral hemispheres. The spinal pia mater is thicker, firmer, and less vascular than the cranial pia mater and consists of two layers. The outer layer is composed of longitudinal collagenous fibers. The inner layer wraps the entire spinal cord and, at the end of the cord, is prolonged into the filum terminale. The pia mater also forms the denticulate ligament, which extends the entire length of the spinal cord on both sides. Compare **arachnoid, dura mater.** See also **meninges.**

pian. See **yaws.**

pian bois. See **forest yaws.**

pica /pī′kə/ [L, magpie], a craving to eat nonfood substances, such as dirt, clay, chalk, glue, ice, starch, or hair. The appetite disorder may occur with some nutritional deficiency states (particularly iron deficiency), with pregnancy, and in some forms of mental illness.

Pick's disease^1 [Arnold Pick, Czech neurologist, 1851–1924], a form of dementia that may occur in middle age. This disorder mainly affects the frontal and temporal lobes of the brain and characteristically produces slow disintegration of intellect, personality, and emotions and degeneration of cognitive abilities. See also **dementia.**

Pick's disease^2 [Friedel Pick, Czech physician, 1867–1926], constrictive inflammation of the mediastinum and pericardium, leading to chronic venous congestion and cirrhosis. Also called **Pick's syndrome.**

pickwickian syndrome /pikwik′ē·ən/ [*Pickwick Papers* by Charles Dickens], an abnormal condition characterized by obesity, decreased pulmonary function, somnolence, and polycythemia.

pico-, prefix meaning "one trillionth" (10^{-12}) of the unit designated: *picogram, picoliter, picometer.*

picogram (pg) /pī′kəgram/, a unit of measure equal to one trillionth of a gram, or 10^{-12} gram.

picornavirus /pīkôr′nəvī′rəs/ [It, *pico,* small; *RNA,* ribonucleic acid; L, *virus,* poison], a member of a group of small ribonucleic acid (RNA) viruses that are ether-resistant. The two main genera are ***Enterovirus*** and *Rhinovirus*. These viruses cause poliomyelitis, herpangina, aseptic meningitis, encephalomyocarditis, and foot-and-mouth disease.

picosecond (ps), a unit of measure equal to one trillionth of a second (10^{-12} sec).

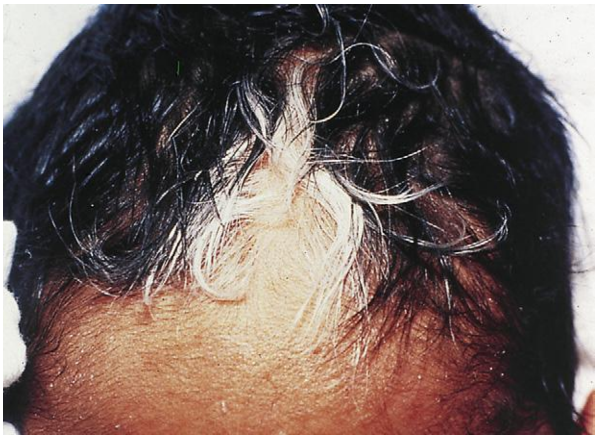
picro-, prefix meaning "bitter": *picroadonidin, picropyrine, picrotoxin*.

picrotoxin /pik′rōtok′sin/ [Gk, *pikros,* bitter, *toxikon,* poison], a central nervous system stimulant obtained from the seeds of *Anamirta cocculus,* formerly used as an antidote for acute barbiturate poisoning.

PID, abbreviation for **pelvic inflammatory disease.**

PIE, abbreviation for **pulmonary infiltrate with eosinophilia.**

piebald /pī′bôld/ [L, *pica,* magpie; ME, *balled,* smooth], **1.** having patches of white hair or skin caused by an absence of melanocytes in those nonpigmented areas. It is a hereditary condition. Compare **albinism, vitiligo. 2.** having two colors: black and white or brown and white; mottled. *—piebaldism, n.*



Piebaldism *(Zitelli and Davis, 2007)*

Piedmont fracture /pēd′mənt/, an oblique break in the distal radius, with fragments of bone pulled into the ulna.

piedra /pē·ā′drə/, fungal disease of the hair shaft characterized by the presence of small black or white nodules. Black piedra is caused by *Piedria bortae*. White piedra (called trichosporosis) is caused by *Trichosporon beigelii*. See also **trichosporosis.**

Pierre Robin's syndrome /pyer rob′inz, pyer rōbans′/ [Pierre Robin, French histologist, 1867–1950], a complex of congenital anomalies including a small mandible, cleft lip, cleft palate, other craniofacial abnormalities, and defects of the eyes and ears, including glaucoma. Intelligence is usually normal. Plastic surgery may achieve satisfactory cosmetic repair, but speech therapy, orthodontia, and psychological counseling and support are often necessary.

-piesis, suffix for certain terms relating to pressure.

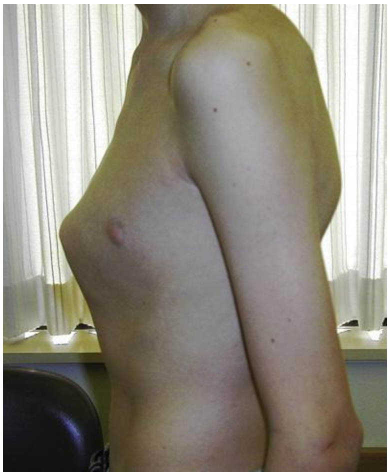
piez-, prefix meaning "pressure": *piezallochromy, piezesthesia, piezotherapy*.

piezochemistry /pī·ē′zōkem′istrē/ [Gk, *piezein,* to press, *chemeia* alchemy], a branch of chemistry concerned with reactions that occur under pressure.

piezoelectric activity, the changing of electric surface charges of a structure that force the structure to change shape. Also called **electropiezo activity.**

piezoelectric effect /pī·ē′zō·ilek′trik/ [Gk, *piezein,* to press, *elektron* amber; L *effectus*], **1.** the generation of a voltage across a solid when a mechanical stress is applied. **2.** the dimensional change resulting from the application of a voltage. **3.** (in ultrasound) the conversion of one form of energy into another, such as the conversion of electrical energy into mechanical energy.

pigeon breast /pij′ən/ [L, *pipio,* young bird; AS, *broest,* breast], a congenital structural defect characterized by a prominent anterior projection of the xiphoid and the lower part of the sternum and by a lengthening of the costal cartilages. It may cause cardiorespiratory complications but rarely warrants surgical correction. Also called **pectus carinatum, pigeon chest.** *—pigeon-breasted, adj.*



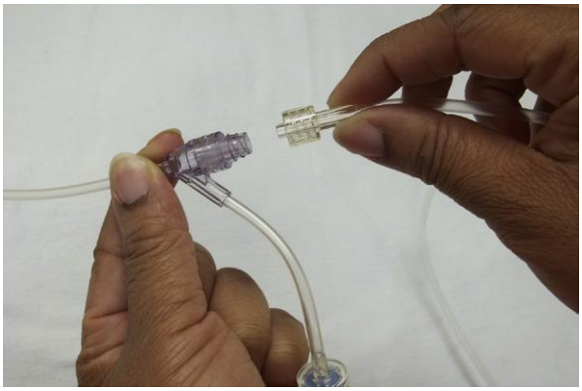
Pigeon breast *(Townsend et al, 2008)*

pigeon breeder's lung, a respiratory disorder caused by acquired hypersensitivity to antigens in bird droppings. It is characterized by chills, fever, and difficult breathing. The symptoms subside when exposure to the allergen ceases. Also called **bird breeder's lung, hen worker's lung.**

pigeon chest. See **pigeon breast.**

pigeon-toed. See **metatarsus varus.**

piggyback port [AS, *piken,* pick; ME, *pakke,* pack; L, *portus,* haven], a special coupling in the primary IV tubing that allows a supplementary, or piggyback, solution to run into the IV system. The piggyback port includes a back check valve that automatically prevents the primary IV solution from flowing while the piggyback solution is flowing. When the piggyback solution stops flowing, the back check valve allows the flow of the primary IV solution. Piggyback ports are part of piggyback IV sets, which are used solely for intermittent drug administration.



Piggyback IV equipment *(Courtesy the University of Medicine and Dentistry of New Jersey, School of Nursing)*

pigment /pig′mənt/ [L, *pigmentum,* paint], **1.** any organic coloring material produced in the body, such as melanin. **2.** any colored, paintlike medicinal preparation applied to the skin surface. *—pigmentary, pigmented, adj.,* **pigmentation,** *n.*

pigmentary retinopathy /pig′mənter′ē/, a disorder of the retina characterized by deposits of pigment and increasing loss of vision.

pigmentation, pigmented. See **pigment.**

pigmented villonodular synovitis /pig′məntid/, a disease of the joints characterized by fingerlike proliferative growths of synovial tissue, with hemosiderin deposition within the synovial tissue. The cause of the disorder is unknown.

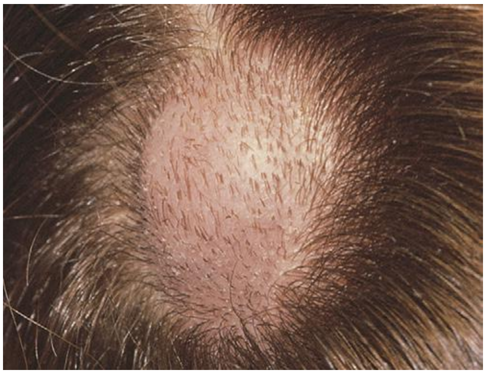
pigment layers, the parts of the eye comprising the pigmented strata of the ciliary body, iris, and retina.

pigmy. See **pygmy.**

pigtail stent, a ureteral stent with a curl near the end like that of a pig's tail to maintain it in place.

pil, abbreviation for the Latin words *pilula,* "pill," and *pilulae,* "pills."

pilar cyst /pī′lər/ [L, *pilus,* hair; Gk, *kystis,* bag], an epidermoid cyst of the scalp. Its keratinized contents are firmer and less cheesy than the material in epidermoid cysts found elsewhere. The cyst originates from the middle part of the epithelium of a hair follicle. Treatment is surgical excision. Also called **wen.** Compare **epidermoid cyst.**



Pilar cyst *(Hordinsky, Sawaya, and Scher, 2000)*

Pilates method, a gentle but focused exercise-based system that tones, stretches, and strengthens the body in a non-impact, balanced system of body-mind exercise and mobilizes the body to move with maximum efficiency and minimum effort. Classes include mat work and use of equipment designed to provide resistance against tensioned springs to isolate and develop specific muscle groups. This method can achieve an improvement of body alignment and breathing, increased body awareness, and efficient and graceful movement.

piles. See **hemorrhoid.**

pili. See **pilus.**

pili annulati [L, *pilus,* hair + *annulus* ring], a condition in which the individual hairs appear to be marked by alternating bands of white as a result of some barrier in the hair that prevents passage of light and causes the rays to be reflected back, giving the appearance of white bands.

piliform /pī′lifôrm/ [L, *pilus,* hair], having the appearance of hair.

pi lines /pī/, radiograph artifacts that result from dirt or chemical stains on a processing roller. They occur at intervals of pi (3.14) times the diameter of the roller.

pill. See **tablet.**

pillion fracture /pil′yən/ [Gael, *pillean,* couch; L, *fractura,* break], a T-shaped break in the distal femur with displacement of the condyles posterior to the femoral shaft, caused by a severe blow to the knee.

pill-rolling tremor. See **parkinsonian tremor.**

pilo-, prefix meaning "resembling or composed of hair": *pilocystic, pilomotor, pilose.*

pilocarpine and epinephrine /pī′lōkär′pēn/, a fixed-combination drug used in the treatment of glaucoma, containing a cholinergic (pilocarpine hydrochloride) and an adrenergic vasoconstrictor (epinephrine bitartrate).

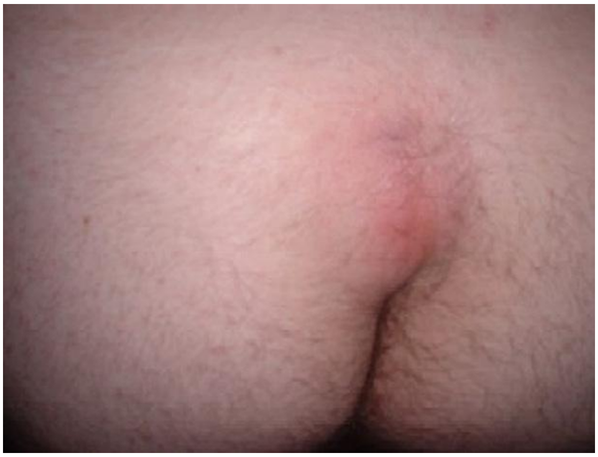
pilocarpine and physostigmine, a fixed-combination drug used in the treatment of glaucoma, containing a cholinergic (pilocarpine hydrochloride) and a short-acting cholinesterase inhibitor (physostigmine salicylate). Both ingredients reduce intraocular pressure.

pilocarpine hydrochloride, a cholinergic derived from the leaves of the jaborandi tree and other species of *Pilocarpus*. It is used mainly in a topical ophthalmic preparation as a miotic to contract the pupil in cases of glaucoma. Pilocarpine is administered orally to increase saliva production in patients with xerostomia. Other consequences of cholinergic receptor stimulation include diaphoresis, bronchoconstriction, urinary urgency, nausea, and diarrhea.

pilomotor reflex /pī′lōmō′tər/ [L, *pilus,* hair, *motor,* mover, *reflectere,* to bend back], erection of the hairs of the skin caused by contraction of small involuntary arrector muscles (arrectores pilorum) in response to a chilly environment, emotional stimulus, or skin irritation. This normal reaction is abolished below the level of a transverse spinal cord lesion and may be exaggerated on the affected side in a patient with hemiplegia. Also called **gooseflesh, horripilation, piloerection.**

pilonidal /pī′lənī′dəl/ [L, *pilus,* hair, *nidus,* nest], a growth of hair in a cyst or other internal structure.

pilonidal cyst [L, *pilus* + *nidus,* nest], a cyst that often develops in the sacral region of the skin. Pilonidal cysts may sometimes be recognized at birth by a depression, sometimes by a hairy dimple in the midline of the back in the sacrococcygeal area. Usually these cysts do not cause any problems, but occasionally a sinus or fistula develops in early adulthood that communicates with the skin, resulting in infection. A fistula also may develop to the spinal tract from a pilonidal cyst. If a cyst becomes infected or inflamed, it is excised, and the space is surgically closed after the infection or inflammation has been effectively treated. A pilonidal cyst is not a true cyst but a poorly drained anaerobic abscess.



Pilonidal cyst
(Courtesy of Pilonidal Support Alliance, Long Beach, California)

pilonidal cystectomy, a procedure performed to remove an abscessed pilonidal cyst with sinus tracts. Most common in young men, abscesses are drained during the acute stage and surgically excised during remission.

pilonidal fistula, an abnormal channel containing a tuft of hair, situated most frequently over or close to the tip of the coccyx but also occurring in other regions of the body. Treatment is surgical. Also called **pilonidal sinus.**

pilonidal sinus [L, *pilus* + *nidus* + *sinus,* curve], a cavity or sinus containing hair, in a dermoid cyst or the deepest layers of the skin. In most instances the hair originates in another area and becomes lodged in the sinus.

pilosebaceous /pī′lōsibā′shəs/ [L, *pilus* + *sebum,* fat], pertaining to a hair follicle and its oil gland.

PILOT /pī′lət/, a computer interpreter language, similar to BASIC, used in computer-assisted instruction.

pilot study, a small, preliminary version of a proposed research study, conducted to refine the methodology of subsequent studies.

pilule. See **parvule.**

pilus /pē′ləs/ *pl.* **pili** [L, hair], **1.** a hair or hairlike structure. **2.** (in microbiology) a fine filamentous appendage found on certain bacteria and similar to flagellum except that it is shorter, straighter, and found in greater quantities in the organism. Pili consist solely of protein and are associated with antigenic properties of the cell surface.

Pima, a trademark for an expectorant **(potassium iodide).**

pimelo-, prefix meaning "fat": *pimeloma, pimelopterygium, pimelorrhea.*

pimelorrhea. See **fatty diarrhea.**

pimozide /pim′əzīd/, an antipsychotic agent from the diphenylbutylpiperidine class.

■ INDICATIONS: It is prescribed for the suppression of motor and phonic tics associated with Gilles de la Tourette's syndrome.

■ CONTRAINDICATIONS: It may cause electrocardiography changes, including a prolonged QT interval, and should not be given to patients with a congenital prolonged QT interval or a history of cardiac arrhythmias. It also may lower the seizure threshold of patients who are also taking an anticonvulsant drug. It should not be taken concurrently with drugs that are inhibitors of CYP3a4 (e.g., ketoconazole, erythromycin).

■ ADVERSE EFFECTS: Among the more serious adverse effects are extrapyramidal effects, persistent tardive dyskinesia, sedation, drowsiness, constipation, dry mouth, visual disturbances, and electrocardiograph changes.

pimple [ME, *pinple*], a small papule, pustule, or furuncle.

pin [AS, *pinn*], **1.** *v,* (in orthopedics) to secure and immobilize fragments of bone with a nail. **2.** See **nail,** def. 2. **3.** *n,* (in dentistry) a small metal rod or peg, used as a support in rebuilding a tooth.

pinch, a compression or squeezing of the end of the thumb in opposition to the end of one or more of the fingers. An example is the **pulp pinch,** a type of grasp in which the pulp, or fleshy mass at the end of the fingers, is pressed against the pulp at the end of the thumb. See also **lateral pinch, palmar pinch, tip pinch.**

pinch graft [Fr, *pince* + Gk, *graphion,* stylus], a small circular deep graft of skin only a few millimeters in diameter. It is cut so that the center is of whole skin but the edges consist of only epidermis.

pinch grip. See **tip pinch.**

pinch meter, a type of dynamometer that measures the strength of a finger pinch.

pincushion distortion, **1.** inward bowing of gridded straight lines in an image as a result of lens distortion. **2.** the image of a square object thus resembling a pincushion or pillow. **3.** a distortion of a fluoroscopic image associated with the use of image intensifier tubes. See also **barrel distortion.**

pindolol /pin′dəlol/, a beta-adrenergic blocker with intrinsic sympathomimetic activity.

■ INDICATIONS: It is prescribed in the treatment of hypertension, alone or concomitantly with a diuretic.

■ CONTRAINDICATIONS: Bronchial asthma, overt cardiac failure, cardiogenic shock, second- and third-degree heart block, or severe bradycardia prohibits its use. It must be used with caution in patients with diabetes.

■ ADVERSE EFFECTS: Among the most serious adverse effects are bradycardia, hypotension, syncope, tachycardia, aggravation of bronchospasm, and GI disturbances.

pineal /pin′ē·əl/ [L, *pineus,* pine cone], **1.** pertaining to the pineal body. **2.** resembling a pine cone.

pineal body [L, *pineas,* pine cone; AS, *bodig,* body], a cone-shaped structure in the brain, situated between the superior colliculi, the pulvinar, and the splenicum of the corpus callosum. Its precise function has not been established. It may secrete the hormone melatonin, which appears to inhibit the secretion of luteinizing hormone. Also called **epiphysis cerebri, pineal gland.**

pinealectomy /pin′ē·əlek′təme/ [L, *pineus* + Gk, *ektomē,* excision], the surgical removal of the pineal body.

pineal gland. See **pineal body.**

pineal hyperplasia syndrome, an abnormal condition caused by overgrowth of the pineal gland. It is characterized by severe insulin resistance, dry skin, thick nails, hirsutism, early dentition, and sexual precocity. Teeth develop prematurely and are malformed. External genitalia may reach adult size by 4 years of age. Ketoacidosis may occur despite high levels of endogenous insulin. Similar abnormalities are associated with some pineal tumors.

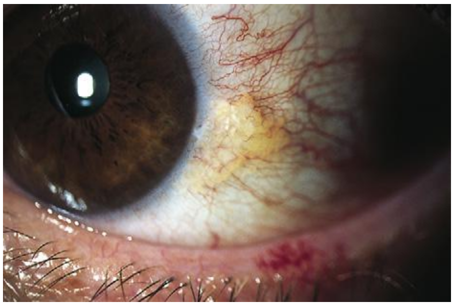
pinealoma /pin′ē·əlō′mə/ *pl. pinealomas, pinealomata* [L, *pineas* + Gk, *oma,* tumor], a rare neoplasm of the pineal body in the brain, characterized by hydrocephalus, pupillary changes, gait disturbances, headache, nausea, and vomiting.

pineal peduncle [L, *pineus,* pine cone, *peduncle,* small foot], the stalk of the pineal body.

pineal tumor, a neoplasm of the pineal body. See also **pinealoma.**

pine tar [L, *pinus,* pine; AS, *teoru,* tar], a topical antieczematic and a rubefacient. It is a common ingredient in creams, soaps, and lotions used in the treatment of chronic skin conditions, such as eczema or psoriasis.

pinguecula /ping·gwe′kyo͞o·lə/ *pl. pingueculae* [L, somewhat fatty], a yellowish spot of proliferation on the bulbar conjunctiva near the junction of the sclera and cornea, usually on the nasal side, likely related to ultraviolet light exposure and chronic environmental irritation. It is seen in elderly people with an extensive history of sun exposure.



Pinguecula *(Kanski and Bowling, 2011)*

pinhole pupil [ME, *pyn* + *hol* + L, *pupilla,* little girl], a very small pupil, which may be a congenital condition, an effect of the use of miotics, or the result of an inflamed iris.

pinhole retention [ME, *pyn* + *hol* + L, *retinere,* to hold], retention developed by drilling one or more holes, 2 to 3 mm in depth, in suitable areas of a cavity preparation to supplement resistance and retention form.

pinhole test, **1.** a test performed on a person who has diminished visual acuity to distinguish a refractive error from organic disease. A refractive error may be corrected with glasses, whereas organic disease may signal the development of preventable blindness. Several pinholes, 0.5 to 2 mm in diameter, are punched in a card. The patient selects one and looks through it with one eye at a time, without wearing corrective lenses. If visual acuity is improved, the defect is refractive; if not, it is organic. The pinhole effect results from blocking peripheral light waves, which are most distorted by refractive error. **2.** a test to determine the size of the focal spot of an x-ray tube. **3.** a test to trace the path of x-ray tube movement.

Pin-Indexed Safety System, a subsection of the American Standard Safety System that applies only to valve outlets of small cylinders and employs a yoke and pin connection.

Pin-Index Safety System (PISS), a system for identifying connectors for certain small cylinders of medical gases that have flush valve outlets rather than threaded outlets. The identifying code consists of a specific combination of two holes in the face of the valve into which connecting pins for a particular type of gas must fit in perfect alignment. For example, the index hole position for a cylinder of oxygen is 2–5, for nitrous oxide it is 3–5, and so on. See also **Diameter-Index Safety System.**

pink disease. See **acrodynia.**

pinkeye. See **conjunctivitis.**

Pink or Blue Test™, a blood test that can determine the sex of a fetus as early as seven weeks gestation.

Pinkus' disease. See **lichen nitidus.**

pinna. See **auricle.**

pinocyte /pī′nəsīt′/ [Gk, *pinein,* to drink, *kytos,* cell], a cell that can absorb liquids by pinocytosis. *—pinocytic, adj.*

pinocytosis /pī′nōsītō′sis/ [Gk, *pinein* + *kytos* + *osis,* condition], the process by which extracellular fluid is taken into a cell. The plasma membrane develops a saccular indentation filled with extracellular fluid and then pinches off the indentation, forming a vesicle or vacuole of fluid within the cell.

pinprick test, a test of a person's ability to detect a cutaneous pain sensation and to differentiate such sensations from pressure stimuli. The test is performed with a pin or needle gently applied to a skin area where it cannot be observed by the subject. The application of the pin is alternated with the pressing of a dull object against the skin. Care is taken to prevent penetration of the dermis, and the sharp object used should be sterilized or discarded after the test.

pinta /pēn′tə/ [Sp, spot], an infection of the skin caused by *Treponema carateum,* a common organism in South and Central America. The bacterium gains entry into the body through a break in the skin. Prolonged exposure and close contact appear to be necessary for transmission. The primary lesion is a slowly enlarging papule with regional lymph node enlargement, followed in 1 to 12 months by a generalized red to slate-blue macular rash. Eventually these lesions become depigmented. Diagnosis is based on serological tests and dark-field microscopic al examination of scrapings from skin lesions. Treatment with penicillin G is effective. Also called **azul, azula, carate, mal del pinto.** Compare **yaws.**

pin track infection [ME, *pyn* + *trak,* trace; L, *inficere,* to taint], an abnormal condition associated with skeletal traction or external fixation devices and characterized by infection of superficial, deeper, or soft tissues or by osteomyelitis. These infections may develop at skeletal traction pin sites. Some of the signs of pin track infection are erythema at the pin sites, drainage and odor, pin slippage, elevated temperature, and pain. Superficial infection at the pin site is treated with antibiotics administered topically or orally. Deeper infection at the pin sites usually requires removal of the pins and antibiotic therapy.

pinworm. See ***Enterobius vermicularis.***

pio-, prefix meaning "fat": *pionemia, piorthopnea, pioscope.*

PIO_2, symbol for *partial pressure of inspired oxygen.*

pioglitazone, an oral antidiabetic.

■ INDICATION: It is used to treat stable type 2 diabetes mellitus.

■ CONTRAINDICATIONS: Lactation, diabetic ketoacidosis, and known hypersensitivity to this drug prohibit its use. It is also contraindicated in children.

■ ADVERSE EFFECTS: Common adverse effects include myalgia, sinusitis, upper respiratory infection, pharyngitis, headache, and aggravated diabetes mellitus.

pion /pī′on/ [Gk, *pi,* 16th letter of Greek alphabet, *meson,* nuclear particle], any of a family of subatomic particles that can be created in nuclear reactions. Pions are unstable but can exist long enough to be formed into beams and used in certain types of medical therapy, such as the treatment of brain tumors. Pions of suitable energy can penetrate the skull and deliver most of their energy to a tumor while sparing overlying normal tissue. See also **negative pi meson pion.**

pipecuronium /pip′ĕ-ku-ro′ne-um/, a nondepolarizing neuromuscular blocking agent used as an adjunct to anesthesia, inducing skeletal muscle relaxation and facilitating management of patients on mechanical ventilation. It is administered intravenously.

Piper forceps. See **obstetric forceps.**

pipestem ureter, stenosis and calcification of a ureter, seen as a complication of renal tuberculosis that has spread into the ureter.

pipet /pi-pet′/, pipette.

pipette /pīpet′, pipet′/ [Fr, little pipe], **1.** also called **pipet.** a calibrated transparent open-ended tube of glass or plastic used for measuring or transferring small quantities of a liquid or gas. **2.** use of a pipette to dispense liquid.

Pipracil, a trademark for an antibiotic (piperacillin sodium).

piriform /pir′ifôrm/ [L, *pirum,* pear, *forma*], pear-shaped. Also spelled **pyriform.**

piriform aperture [L, *pirum,* pear, *forma,* form, *apertura,* opening], the pear-shaped anterior nasal opening in the skull.

piriform fascia. See **fascia of piriform muscle.**

piriformis /pir′ifôr′mis/ [L, *pirum* + *forma*], a flat pyramidal muscle lying almost parallel to the posterior margin of the gluteus medius. It is partly within the pelvis and partly at the back of the hip joint. It is innervated by branches of the first and second sacral nerves and functions to rotate the thigh laterally and to abduct and to help extend it. Compare **obturator externus, obturator internus.**

Pirogoff's amputation [Nikolai I. Pirogoff, Russian surgeon, 1810–1881], an ankle joint amputation in which the posterior process of the calcaneum is retained at the skin flap and opposed to the cut end of the tibia.

Pirquet's test /pirkāz′/ [Clemens P. von Pirquet, Austrian physician, 1874–1929], a tuberculin skin test that consists of scratching the tuberculin material onto the skin. Also called **von Pirquet's test.** See also **tuberculin test.**

pisiform /pī′sifôrm, pē′-/ [L, *pisum,* pea, *forma*], pea-shaped.

pisiform bone [L, *pisa,* pea, *forma,* form; AS, *ban,* bone], a small pea-shaped spheroidal carpal bone in the proximal row of carpal bones. It articulates with the triangular bone and is attached to the flexor retinaculum, the flexor carpi ulnaris, and the abductor digiti minimi.

Piskacek's sign /pis′kə·cheks/ [Ludwig Piskacek, Austrian obstetrician, 1854–1933], asymmetric enlargement of the body of the pregnant uterus as a result of its enlargement in the cornual region, usually over the site of implantation.

pisohamate ligament, the ligament that connects the pisiform bone to the hamate. It is an extension of the flexor carpi ulnaris.

pisometacarpal ligament, the ligament that connects the pisiform bone to the fifth metacarpal.

PISS, abbreviation for **Pin-Index Safety System.**

pistol-shot sound, a sharp slapping sound heard by auscultation over the femoral pulse of a patient with aortic incompetence. It is caused by a large-volume pulse with a sharp rise in pressure.

pit and fissure cavity [AS, *pytt* + L, *fissura,* cleft, *cavum,* cavity], a cavity or area of decay that starts in a tiny groove or fault in tooth enamel, usually on an occlusal surface of a molar or premolar. In the classification of caries, it represents class I caries.

pit and fissure sealant. See **dental sealant.**

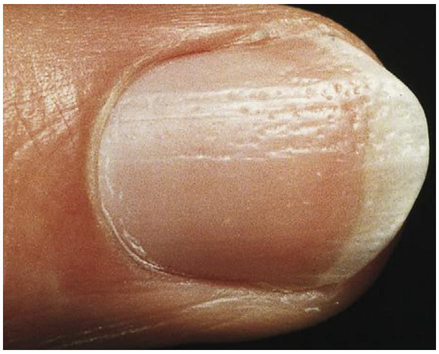
pitch [ME, *picchen*], **1.** the highness or lowness of a tone or sound depending on the rate of vibration of the sound source. **2.** (in helical computed tomography) the ratio of table advancement per 360-degree rotation of the x-ray tube to the detector collimator.

pithing /pith′ing/ [AS, *pitha*], the destruction of the central nervous system of an experimental animal in preparation for physiological research. It is usually done by inserting a blunt probe through a foramen.

Pitocin, a trademark for an oxytocic **(oxytocin).**

Pitressin, a trademark for an antidiuretic hormone **(vasopressin).**

pitting [AS, *pytt*], **1.** small, punctate indentations in fingernails or toenails, often a result of psoriasis. **2.** an indentation that remains for a short time after pressing edematous skin with a finger. **3.** small depressed scars in the skin or other organ of the body. **4.** the removal by the spleen of material from within erythrocytes without damage to the cells.



Pitting of the fingernails *(du Vivier, 2002)*

pitting edema [AS, *pytt* + Gk, *oidema,* swelling], an edema characterized by a condition in which a finger pressed into the skin over an accumulation of fluid will result in a temporary depression in the skin. Normal skin and subcutaneous tissues quickly rebound when the pressure is released.

pituicyte /pit(y)o͞o′isīt/ [L, *pituita,* phlegm; Gk, *kytos,* cell], a primary cell of the posterior lobe of the pituitary gland.

pituit-, prefix meaning "phlegm": *pituita, pituitary, pituitous.*

pituitarism /pit(y)o͞o′itəriz′əm/ [L, *pituita,* phlegm], any condition caused by a defect or failure of the pituitary gland.

pituitary /pit(y)o͞o′iter′ē/, pertaining to the pituitary gland.

pituitary adamantinoma. See **craniopharyngioma.**

pituitary cachexia. See **panhypopituitarism, postpubertal panhypopituitarism.**

pituitary dwarf [L, *pituita,* phlegm; AS, *dweorge*], a dwarf whose retarded development is caused by a deficiency of growth hormone resulting from hypofunction of the anterior lobe of the pituitary. In most cases the cause is unknown and the defect is limited to a lack of somatotropin, although in some instances gonadotropins, adrenocorticotropic hormone, and thyroid stimulating hormone also may be deficient. The body is properly proportioned, with no facial or skeletal deformities, and mental and sexual development is normal. The condition is usually diagnosed in childhood by radiographic examination of the bones and radioimmunoassay of levels of plasma growth hormone. Also called **hypophyseal dwarf, Lévi-Lorain dwarf, Paltauf's dwarf.**

pituitary eunuchism, a form of failure of sexual development and impotence resulting from disease or dysfunction of the pituitary gland.

pituitary gland [L, *pituita,* phlegm], an endocrine gland suspended beneath the brain in the pituitary fossa of the sphenoid bone, supplying numerous hormones that govern many vital processes. It is divided into an anterior adenohypophysis and a smaller posterior neurohypophysis. The anterior lobe of the gland is composed of polygonal cells related to the production of seven hormones. The hormones, controlled by hypothalamic releasing factors, include growth hormone (somatotropin), prolactin, thyroid-stimulating hormone, follicle-stimulating hormone, luteinizing hormone, adrenocorticotropic hormone, and melanocyte-stimulating hormone. The posterior lobe is morphologically an extension of the hypothalamus and the source of vasopressin (antidiuretic hormone) and oxytocin. Vasopressin inhibits diuresis by promoting nephron water reabsorption and raises blood pressure. Oxytocin stimulates the contraction of smooth muscle, especially in the uterus. Also called **hypophysis, hypophysis cerebri.** See also **adenohypophysis, neurohypophysis.**

pituitary myxedema [L, *pituita* + Gk, *myxa,* mucus, *oidema,* swelling], a type of hypothyroid condition secondary to an anterior pituitary disease.

pituitary nanism, a type of dwarfism associated with hypophyseal infantilism. See also **pituitary dwarf.**

pituitary snuff lung, a type of hypersensitivity pneumonitis that sometimes occurs among users of pituitary snuff. The antigens to which the hypersensitivity reaction occurs are found in serum proteins of cows and pigs and in pituitary tissue. Symptoms of the acute form of the disease include chills, cough, fever, dyspnea, anorexia, nausea, and vomiting. The chronic form of the disease is characterized by fatigue, chronic cough, weight loss, and dyspnea on exercise. Also called *pituitary snuff takers' disease.*

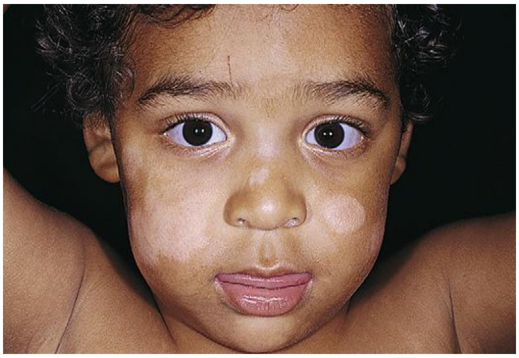
pituitary stalk, a structure that connects the pituitary gland with the hypothalamus.

pit viper [AS, *pytt* + L, *vipera,* snake], any one of a family of venomous snakes found in the Western Hemisphere and Asia, characterized by a heat-sensitive pit between the eye and nostril on each side of the head and hollow perforated fangs that are usually folded back in the roof of the mouth. With the exception of coral snakes, all indigenous poisonous snakes in the United States are pit vipers. See also **copperhead, cottonmouth, rattlesnake.**

Pit viper *(Courtesy St. Louis Zoo)*

pityriasis /pitərī′əsis/ [Gk, *pityron,* bran], any of a number of skin diseases that have in common lesions that resemble dandrufflike scales without obvious signs of inflammation.

pityriasis alba [Gk, *pityron,* bran; L, *albus,* white], a common idiopathic dermatosis characterized by round or oval finely scaling patches of hypopigmentation, usually on the cheeks. The lesions are sharply demarcated and occasionally pruritic and are found primarily in children and adolescents. The condition may recur, but spontaneous clearing is the usual prognosis. Treatment includes lubricating creams and topical corticosteroids. Compare **pityriasis rosea.**



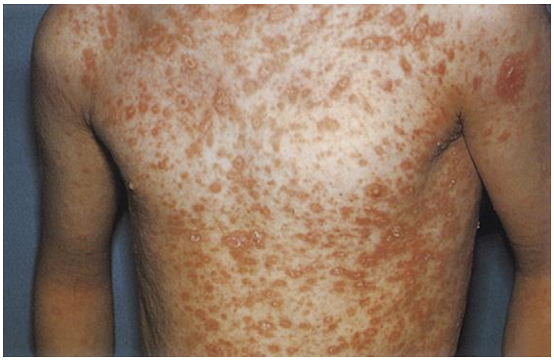
Pityriasis alba *(Callen et al, 2000)*

pityriasis lichenoides, a rare, self-limited skin disease with discolored papular lesions, encompassing a spectrum from pityriasis lichenoides et varioliformis acuta to pityriasis lichenoides chronica.

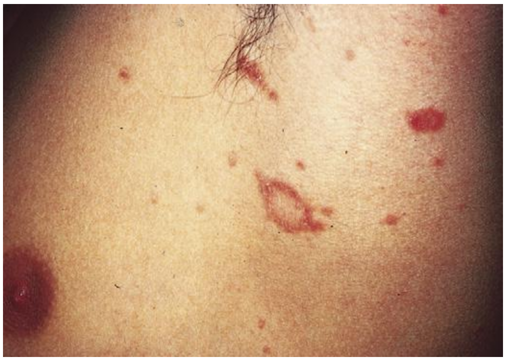
pityriasis lichenoides et varioliformis acuta. See **Mucha-Habermann disease.**

pityriasis nigra. See **tinea nigra.**

pityriasis rosea, a self-limited skin disease in which a slightly scaling pink macular rash spreads over the trunk and other unexposed areas of the body. A characteristic feature is the **herald patch,** a larger, more scaly lesion that precedes the diffuse rash by several days. The smaller lesions tend to line up with the long axis parallel to normal lines of cleavage of the skin. Mild itching is the only symptom. The disease lasts 4 to 8 weeks and rarely recurs. Compare **pityriasis alba.**

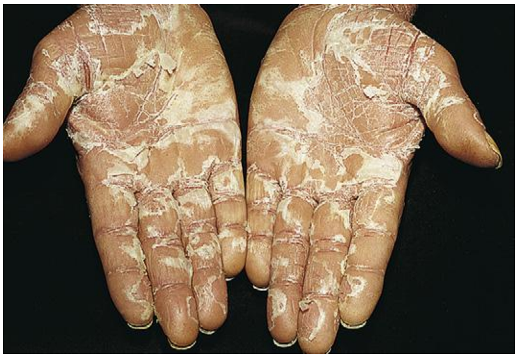


Pityriasis rosea: macular rash *(Cohen, 1993)*



Pityriasis rosea: herald patch *(Swartz, 2009)*

pityriasis rubra pilaris [Gk, *pityron,* bran; L, *ruber* red, *pilus,* hair], a chronic inflammatory cutaneous disease characterized by tiny acuminate, reddish brown follicular papules topped by central horny plugs in which are embedded hairs; disseminated yellowish pink scaling patches; and often solid confluent hyperkeratosis of the palms and soles with a tendency to fissuring.



Pityriasis rubra pilaris *(Callen et al, 2000)*

Pityrosporum ovale. See ***Malassezia.***

pivot joint /piv′ət/ [Fr, hinge; L, *jungere,* to join], a synovial joint in which movement is limited to rotation. The joint is formed by a pivotlike process that may turn within a ring composed partly of bone and partly of ligament. The proximal radioulnar articulation is a pivot joint in which the head of the radius rotates within the ring formed by the radial notch of the ulna and the annular ligament. Also called **trochoid joint.** Compare **ball-and-socket joint, condyloid joint, gliding joint, hinge joint, saddle joint.**

pivot transfer, the movement of a person from one site to another, such as from a bed to a wheelchair, when there is a loss of control of one side of the body or when one side of the body is immobile. The person is helped to a position on the strong side of the body, either left or right, with both feet on the floor, heels behind the knees, and knees lower than the hips. The person stands with the weight on the strong leg, pivots on it, and carefully lowers the body into the wheelchair.

pixels, abbreviation for *picture elements,* small cells of information that make up the matrix of a digital image on a computer monitor screen.

PJC, abbreviation for *premature junctional complex.*

PK, abbreviation for **psychokinesis.**

pK_a, the negative logarithm of the ionization constant of an acid, a measure of the strength of an acid. The lower the pKa, the stronger the acid.

PKA, abbreviation for **protein kinase.**

PKD, abbreviation for **polycystic kidney disease.**

PK test, abbreviation for **Prausnitz-Küstner test.**

PKU, abbreviation for **phenylketonuria.**

placebo /pləsē′bō/ [L, shall please], an inactive substance, such as saline solution, distilled water, or sugar, or a less than effective dose of a harmless substance, such as a water-soluble vitamin, prescribed as if it were an effective dose of a needed medication. Placebos are used in experimental drug studies to compare the effects of the inactive substance with those of the experimental drug. They are also prescribed for patients who cannot be given the medication they request or who, in the judgment of the health care provider, do not need that medication.

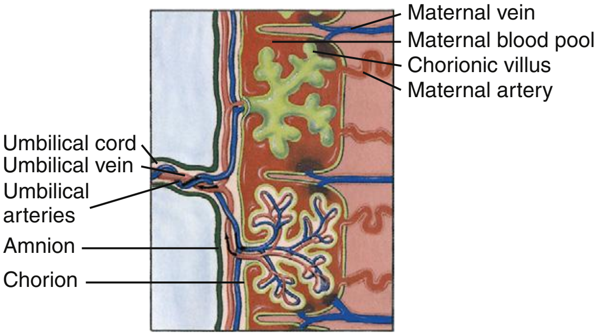
placebo effect, a physical or emotional change occurring after a substance is taken or administered that is not the result of any special property of the substance. The change may be beneficial, reflecting the expectations of the patient and often those of the person giving the substance.

placement /plās′mənt/ [Fr, *placer,* to place], the positioning of a dental prosthesis, such as a removable denture in its planned site on the dental arch.

placement path, the direction of insertion and removal of a removable partial denture on its supporting oral structures. The path can be varied by altering the plane to which the guiding abutment surfaces of the denture are made parallel. The choice of a placement path is considered a compromise that best fulfills five requirements: minimal torque on abutment teeth, minimal interference, maximum retention, establishment of adequate guide plane surfaces, and acceptable aesthetic qualities. Also called *path of insertion.*

placent-, prefix meaning "a cakelike mass": *placenta, placentapepton, placentogenesis.*

placenta /pləsen′tə/ [L, flat cake], a highly vascular fetal organ that exchanges with the maternal circulation, mainly by diffusion of oxygen, carbon dioxide, and other substances. It begins to form on approximately the eighth day of gestation when the blastocyst touches the wall of the uterus and adheres to it. Placentation begins as the trophoblast is able to digest cells of the endometrium, causing a small erosion on the uterine wall in which an embryo nidates. Human chorionic gonadotropin (HCG), which is chemically identical to luteinizing hormone, is secreted by the developing placenta and promotes survival and hormone production of the corpus luteum. The presence of HCG in the maternal blood and urine is an indicator of early pregnancy. The trophoblastic layer continues to infiltrate the maternal tissues with fingerlike projections, called chorionic villi. By the third month of pregnancy the placenta is able to secrete large amounts of progesterone, enough to relieve the corpus luteum of that function. At term the normal placenta is one seventh to one fifth of the weight of the infant. The maternal surface is lobulated and has a dark red rough, liverlike appearance. The fetal surface is smooth and shiny, covered with the fetal membranes, and marked by large white blood vessels beneath the membranes that fan out from the centrally inserted umbilical cord. The time between the infant's birth and the expulsion of the placenta is the third and last stage of labor.



Cross section of the placenta *(Applegate, 2011)*

-placenta, suffix meaning an "organ shaped like a flat cake": *ectoplacenta, hemiplacenta, subplacenta.*

placenta abruptio. See **abruptio placentae.**

placenta accreta, a placenta that invades the uterine muscle, making separation from the muscle difficult. See also **adherent placenta.**

placenta battledore. See **battledore placenta.**

placenta bipartitia. See **bilobate placenta.**

placental /pləsen′təl/ [L, *placenta,* flat cake], pertaining to the placenta.

placental abruption. See **abruptio placentae.**

placental bruit [L, *placenta,* flat cake; Fr, *bruit,* noise], a humming noise caused by fetal circulation, heard in the pregnant uterus. It is synchronized with the mother's pulse.

placental dysfunction. See **placental insufficiency.**

placental dystocia, a prolonged or otherwise difficult delivery of the placenta. See also **dystocia.**

placental hormone, one of the hormones produced by the placenta, including human placental lactogen, chorionic gonadotropin, estrogen, progesterone, and a thyrotropin-like hormone.

placental infarct, a localized ischemic hard area on the fetal or maternal side of the placenta.

placental insufficiency, an abnormal condition of pregnancy, manifested clinically by a retarded rate of fetal and uterine growth. One or more placental abnormalities cause dysfunction of maternal-placental or fetal-placental circulation sufficient to compromise fetal nutrition and oxygenation. Some of the abnormalities that can result in placental insufficiency are abnormal implantation of the placenta, multiple pregnancy, abnormal attachments of the umbilical cord or anomalies of the cord itself, and abnormalities of the placental membranes. Histopathological abnormalities that can cause placental insufficiency include intervillous thrombi, placental infarction, and breaks in the placental membrane that result in fetal bleeding into the maternal circulation. Placental insufficiency also may result from placental senescence in postmaturity; systemic diseases, such as erythroblastosis fetalis and diabetes mellitus; or bacterial, viral, parasitic, or fungal infections. Also called **placental dysfunction.** See also **intrauterine growth retardation, postmature infant.**

placental membrane, a layer of tissue in the placenta between the fetal and maternal blood systems. The membrane regulates the diffusion of materials between the two systems.

placental presentation [L, *placenta,* flat cake, *praesentare,* to show]. See **placenta previa.**

placental scan, a scan of the uterus of a pregnant woman, performed after an IV injection of a contrast medium, used for locating the fetus and placenta and for detecting intrauterine bleeding.

placental sinus. See **marginal sinus.**

placental stage of labor, the third stage of labor, when the placenta and membranes are expelled from the uterus after the birth of the child.

placental thrombosis [L, *placenta,* flat cake; Gk, *thrombos,* lump, *osis,* condition], intravascular coagulation that occurs in the placenta and veins of the uterus.

placental transmission [L, *placenta,* flat cake; L, *transmittere,* to transmit], the transference of a drug or other substance across the placenta.

placenta previa /prē′vē·ə/, a condition of pregnancy in which the placenta is implanted abnormally in the uterus so that it impinges on or covers the internal os of the uterine cervix. It is the most common cause of painless bleeding in the third trimester of pregnancy. Its cause is unknown. The incidence of the condition increases with increased parity from approximately 1 in 1500 primiparas to approximately 1 in 20 grand multiparas. Even slight dilation of the internal os can cause enough local separation of an abnormally implanted placenta to result in bleeding. If severe hemorrhage occurs, immediate cesarean section is usually required to stop the bleeding and to save the mother's life; it is performed regardless of the stage of fetal maturity. Before hemorrhage, placenta previa may be diagnosed by ultrasonography and treated with complete bed rest under close observation. Even at rest sudden massive hemorrhage can occur without warning. Vaginal examination is usually contraindicated if placenta previa is present or suspected because palpation can cause local placental separation and precipitate hemorrhage. Cautious and very gentle intracervical palpation may be performed to determine the existence and exact extent of placenta previa. Before this examination an IV infusion is begun, the woman's blood is typed and crossmatched, and preparations for immediate cesarean section are made. If the placenta is next to or near, rather than touching or covering, the cervical os, labor and vaginal delivery may be attempted. **Central placenta previa** refers to a placenta that has grown to cover the internal cervical os completely; **low-lying placenta** identifies a placenta that is just within the lower uterine segment; and **partial** or **marginal placenta previa** is a condition in which the placenta partially covers the internal cervical os. Also called *(informal)* **previa, placental presentation.** Compare **abruptio placentae.**

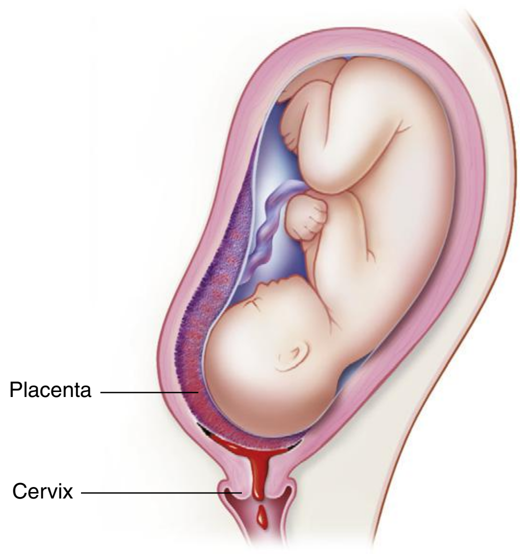
placenta previa partialis, a placenta that partially obstructs the internal cervical os.

placenta souffle [L, *placenta,* flat cake; Fr, *souffle,* puff], a soft blowing or humming sound produced by fetal circulation at the placenta.

placenta succenturiate, an accessory placenta.

plafond fracture, a fracture that involves the buttress part of the malleolus of a bone.

plagiocephaly /plā′jē·ōsef′əlē/ [Gk, *plagios,* askew, *kephale,* head], a congenital malformation of the skull in which premature or irregular closure of the coronal or lambdoidal sutures results in asymmetric growth of the head, giving it a twisted, lopsided appearance so that the maximum length is not along the midline but on a diagonal. Also called *plagiocephalism.* See also *craniostenosis.* —*plagiocephalic, plagiocephalous, adj.*



Placenta previa *(Patton and Thibodeau, 2010)*

plague /plāg/ [L, *plaga,* blow], an infectious disease transmitted by the bite of a flea from a rodent infected with the bacillus *Yersinia pestis.* Plague is primarily an infectious disease of rats: The rat fleas feed on humans only when their preferred rodent hosts, usually rats, have been killed by the plague in a rat epizootic. Therefore epidemics occur after rat epizootics. Kinds of plague include **bubonic plague, pneumonic plague,** and **septicemic plague.** Aerosolized *Y. pestis* could be used to cause the pneumonic form in a bioterrorism attack. See also ***Yersinia pestis.***

plague vaccine, an active immunizing agent prepared with killed plague bacilli.

■ INDICATIONS: It is prescribed for immunization against plague after probable exposure or as protection for travelers in endemic areas, such as Southeast Asia.

■ CONTRAINDICATIONS: Immunosuppression or acute infection prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are allergic reactions, inflammation at the site of injection, headache, and malaise.

plaintiff /plān′tif/ [ME, *plaintif,* one who complains], (in law) a person who files a lawsuit initiating a legal action. The plaintiff complains or sues for remedial relief and names a complainant in various civil actions. In criminal actions the prosecution is the plaintiff, acting in behalf of the people of the jurisdiction.

-plakia, suffix meaning "a plate or flat plane, usually on a mucous membrane": *leukoplakia, malacoplakia, melanoplakia.*

planar, **1.** See **plane. 2.** a method for representing pixel colors on a computer screen.

planar view, a two-dimensional view of a process or function.

planar xanthoma /plā′nər/ [L, *planum,* level; Gk, *xanthos,* yellow, *oma,* tumor], a yellow or orange flat macule or slightly raised papule containing foam cells and occurring in clusters in localized areas, such as the eyelids. These lesions may be widely distributed over the body. Also called **plane xanthoma, xanthoma planum.** See also **xanthelasmatosis.**

Planck's constant (h) /plangks/ [Max Planck, German physicist, 1858–1947], a fundamental physical constant that relates the energy of radiation to its frequency. It is expressed as 6.63 × 10^{-27} erg-seconds or 6.63 × 10^{-34} joule-seconds. See also **photon.**

plane [L, *planum,* level], **1.** *n,* a flat surface determined by three points in space. **2.** *n,* an extension of a longitudinal section through an axis, such as the coronal, horizontal, transverse, frontal, and sagittal planes, used to identify the position of various parts of the body in the study of anatomy. **3.** *v,* the act of paring or of rubbing away. **4.** *n,* a superficial incision in the wall of a cavity or between tissue layers, especially in plastic surgery. **—planar,** *adj.*

plane xanthoma. See **planar xanthoma.**

-plania, suffix meaning the "deviation from its normal location": *choloplania, pyoplania, spiloplania.*

planigraphic principle /plan′igraf′ik/, a rule of tomography in which the fulcrum or axis of rotation is raised or lowered to alter the level of the focal plane but the tabletop height remains constant.

plankton /plangk′tən/ [Gk, *planktos,* wandering], nearly microscopic floating or weakly swimming organisms (both photosynthetic and nonphotosynthetic) found in lakes and oceans that provide the initial level in the food chain for aquatic animals.

planned change, an alteration of the status quo by means of a carefully formulated program that follows four steps: unfreezing the present level, establishing a change relationship, moving to a new level, and freezing at the new level. The program can be implemented by collaborative, coercive, or emulative means.

planned parenthood, a philosophic framework central to the development of contraceptive methods, contraceptive counseling, and family planning programs and clinics. Advocates hold that each woman has the right to decide when to conceive and bear children and that contraceptive and gynecological care and information should be available to help her become or prevent becoming pregnant. See also **contraception.**

planning [L, *planum*], (in five-step nursing process) a category of nursing behavior in which a strategy is designed to achieve the goals of care for an individual patient, as established in assessing and analyzing. Planning includes developing and modifying a care plan for the patient, collaborating with other personnel, and recording relevant information. To develop the plan the nurse anticipates the patient's needs according to established priorities; involves the patient and the patient's family and significant others in designing the plan; uses all information necessary for managing the patient's care, including recorded information from other health professionals and the age, sex, culture, ethnicity, and religion; plans for the patient's comfort, activity, and function; and chooses nursing measures that are necessary to deliver care as planned. With the cooperation of other health personnel, the nurse coordinates care for the benefit of the patient and identifies resources in the health care facility or community for social or health assistance as needed by the client or the patient's family. All information relevant to the management of the patient's care plan is recorded. Planning follows analyzing and precedes implementing in the five-step nursing process. See also **analyzing, assessing, evaluating, implementing, nursing process.**

plano-, prefix meaning "wandering": *planocyte, planotopokinesia.*

planoconcave lens, a lens with one plane and one concave side.

planoconvex lens, a lens with one plane and one convex side.

plant /plant/, any multicellular eukaryotic organism that performs photosynthesis to obtain its nutrition. Plants comprise one of the five kingdoms in the most widely used classification of living organisms.

plantago seed /plantā′gō/, a bulk-forming laxative derived from *Plantago psyllium* seeds.

■ INDICATIONS: It is prescribed in the treatment of constipation and nonspecific diarrhea.

■ CONTRAINDICATIONS: Symptoms of appendicitis, intestinal obstruction, or GI ulceration prohibit its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are intestinal obstruction and allergic reactions.

plantar /plan′tər/ [L, *planta,* sole], pertaining to the sole of the foot. See also **volar.**

plantar aponeurosis, the tough fascia surrounding the muscles of the soles of the feet. Also called **plantar fascia.**

plantar arch [L, *planta,* sole, *arcus,* bow], the hollow on the sole of the foot.

plantar calcaneocuboid joint, a synovial joint between the facet on the anterior surface of the calcaneus and the corresponding facet on the posterior surface of the cuboid that allows sliding and rotating movements involved with inversion and eversion of the foot. It also contributes to pronation and supination of the forefoot on the hindfoot.

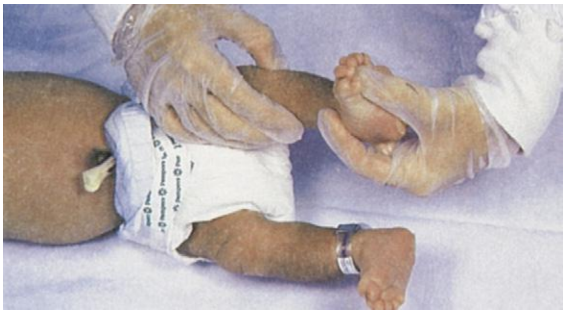
plantar calcaneonavicular ligament, a broad, thick ligament of the foot that spans the space between the sustentaculum tali and the navicular bones, supports the head of the talus, and resists depression of the medial arch of the foot.

plantar fascia. See **plantar aponeurosis.**

plantar fasciitis, painful inflammation of the thick fibrous band on the sole of the foot.

plantar flexion [L, *planta,* sole, *flectere,* to bend], a toe-down motion of the foot at the ankle. It is measured in degrees from the 0-degree position of the foot at rest on the ground with the body in a standing position.

plantar grasp reflex, a reflex characterized by the flexion of the toes when the sole of the foot is stroked gently. It is present in infants at birth but should disappear after 6 weeks.

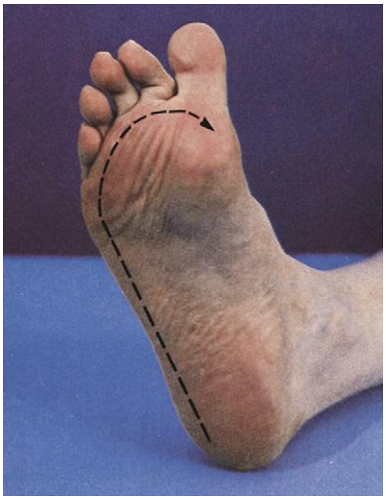


Plantar grasp reflex in the newborn *(Seidel et al, 2011)*

plantaris /planter′is, plantä′ris/ [L, *planta*], one of three superficial muscles at the back of the leg, between the soleus and the gastrocnemius. The plantaris is a small muscle that arises from the distal part of the linea aspera of the femur and from the oblique popliteal ligament of the knee joint. It has a small fusiform belly, ending in a long, slender tendon that inserts into the calcaneus. The plantaris is innervated by a branch of the tibial nerve containing fibers from the fourth and the fifth lumbar and the first sacral nerves. It plantar-flexes the foot and the leg. Compare **gastrocnemius, soleus.**

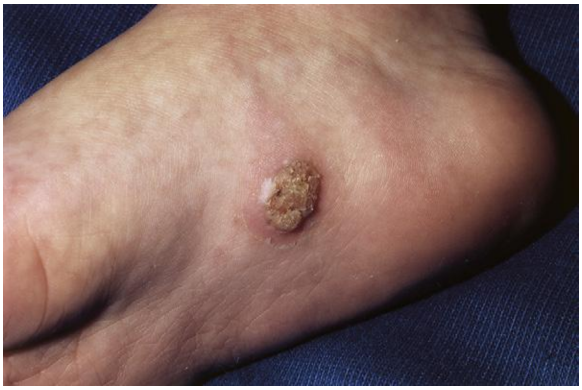
plantar neuroma, a tumor or growth of nerve cells and nerve fibers on the sole of the foot.

plantar reflex, the normal response elicited by firmly stroking the outer surface of the sole from heel to toes, characterized by flexion of the toes. Compare **Babinski's reflex.**



Plantar reflex *(Seidel et al, 2011)*

plantar wart, a painful verrucous lesion on the sole of the foot, primarily at points of pressure, such as over the metatarsal heads and the heel. Caused by the common wart virus, it appears as a soft central core and is surrounded by a firm hyperkeratotic ring resembling a callus. Multiple tiny black spots on the surface represent bits of coagulated blood. It is distinguished from a callus in that skin markings are interrupted by a plantar wart. Treatment methods include excision, electrodesiccation, cryotherapy, laser treatment, topical acids, and use of cantharidin. See also **mosaic wart.**



Plantar wart *(Weston, Lane, and Morelli, 2007)*

plantigrade /plan′tigrād′/ [L, *planta,* sole, *gradi,* to walk], **1.** *adj,* pertaining to or characterizing the human gait; walking on the sole of the foot with the heel touching the ground. **2.** *n,* a position in which an individual is standing flexed at the hips and bearing some weight through the upper extremities.

plant toxin [ME, *plante* + Gk, *toxikon,* poison], any poisonous substance derived from a plant, such as ricin, which is produced by castor-oil seeds.

plaque /plak/ [Fr, plate], **1.** a flat, often raised patch on the skin or any other organ of the body. **2.** a patch of atherosclerosis. **3.** also called **bacterial plaque,** a usually thin film on the teeth. It is made up of mucin and colloidal material found in saliva and often secondarily invaded by bacteria.

Plaquenil Sulfate, a trademark for an antimalarial, antiarthritic, and lupus erythematosus suppressant agent **(hydroxychloroquine sulfate).**

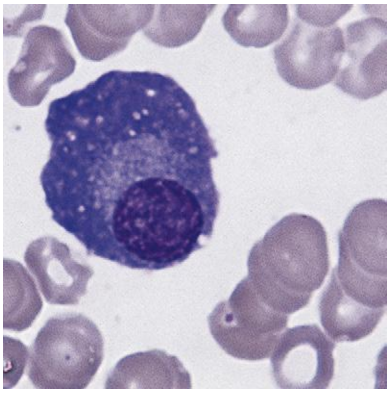
-plasia, -plastia, suffix meaning "(condition of) formation or development": *alloplasia, anosteoplasia, cacoplasia.*

-plasm, -plasma, suffix meaning "cell or tissue substance": *deutoplasm, mitoplasm, phytoplasm.*

plasma /plaz′mə/ [Gk, something formed], the watery light yellow fluid part of the lymph and the blood in which leukocytes, erythrocytes, and platelets are suspended. Plasma is made up of water, electrolytes, proteins, glucose, fats, bilirubin, and gases and is essential for carrying the cellular elements of the blood through the circulation, transporting nutrients, maintaining the acid-base balance of the body, and transporting wastes from the tissues. Plasma and interstitial fluid correspond closely in content and concentration of proteins. Therefore plasma is important in maintaining the osmotic pressure and the exchange of fluids and electrolytes between the capillaries and the tissues. Compare **serum.**

plasma-, combining form meaning "the liquid part of the blood": *plasmablast, plasmacyte, plasmapheresis, ectoplasma, hydroplasma, ovoplasma.*

plasma cell, a lymphoid or lymphocyte-like cell normally found in the bone marrow, the end stage of B lymphocyte maturation. On a Wright-stain marrow smear, plasma cells possess an eccentric nucleus with dark blue-staining chromatin arranged in a pattern like the spokes of a wheel. Plasma cells secrete immunoglobulins. Malignant plasma cells, called myeloma cells, are seen in bone marrow sheets and often in peripheral blood in multiple myeloma. See also **B cell, multiple myeloma.**



Plasma cell *(Carr and Rodak, 2008)*

plasma cell leukemia, an unusual neoplasm of blood-forming tissues in which the predominant cells are plasmacytes. The disease may develop with multiple myeloma or arise independently. Bence Jones proteinuria, abnormal serum globulins, hepatomegaly, and splenomegaly are usual in plasma cell leukemia. In most cases plasma cell leukemia is fatal, but some patients respond to treatment with alkylating agents and glucocorticoids.

plasma cell myeloma. See **multiple myeloma.**

plasma cell tumor, **1.** a plasma cell dyscrasia. **2.** See **extramedullary myeloma.**

plasmacytoma /plaz′məsītō′mə/, *pl. plasmacytomas, plasmacytomata,* a focal neoplasm containing plasma cells that may develop in the bone marrow, as in multiple myeloma, or outside the bone marrow, as in tumors of the viscera and the mucosa of the nasal, oral, and pharyngeal areas. Also called **peripheral plasma cell myeloma, plasma cell tumor.**

plasma exchange [Gk, *plassein,* to mold; L, *ex* + *cambire,* to change; Gk, *therapeia,* treatment], a method of treating certain diseases by removing a part of the patient's plasma and replacing it with albumin, plasma, or other fluids. The goal may be to reduce a pathogenic molecule, protein, autoantibody, alloantibody, immune-complex, drug, toxin, or inhibitor, or to replace deficient plasma with normal plasma. Also called **therapeutic plasmapheresis.**

plasma expander, a 5% glucose solution that is administered intravenously to increase the plasma volume and oncotic pressure of a patient. See **volume expander.**

plasma membrane, the outer covering of a cell, often having projecting microvilli and containing the cellular cytoplasm. The plasma membrane is so thin and delicate that it is barely visible with a light microscope and can be studied in detail only with an electron microscope. The membrane controls the exchange of materials between the cell and its environment by various processes, such as osmosis, phagocytosis, pinocytosis, and secretion. Also called **cell membrane.**

plasmapheresis /plaz′məfərē′sis/, the removal of plasma from previously withdrawn blood by centrifugation, reconstitution of the cellular elements in an isotonic solution, and reinfusion of this solution into the donor or another client who needs red blood cells rather than whole blood. Compare **leukapheresis, plateletpheresis.** See also **apheresis.**

plasma protein, albumin, fibrinogen, prothrombin, and the gamma globulins, which constitute 6% to 7% of the blood plasma. Proteins maintain osmotic pressure, increase blood viscosity, and help maintain blood pressure. All the plasma proteins except the gamma globulins are synthesized in the liver. See also **antibody, serum.**

plasma refilling rate, in hemodialysis, the rate at which plasma that has been withdrawn and dialyzed flows back into the patient's circulatory system.

plasma renin activity, the action of the enzyme renin (produced by the kidney), measured in plasma to aid in the diagnosis of adrenal disease associated with hypertension. The normal adult value in plasma is 0.2 to 4 ng/mL/hr, depending on salt intake and the time the patient is in an upright position before a renin activity test. An upright position raises production of renin, and a high salt intake lowers it.

plasma renin assay (PRA), a blood test that measures the rate of generation of angiotensin. The most commonly used renin assay, it is a screening procedure for detecting essential, renal, or renovascular hypertension, and it is also performed to diagnose and separate primary from secondary hyperaldosteronism.

plasmasome. See **plasmosome.**

plasma thromboplastin component deficiency. See **hemophilia.**

plasma thromboplastin antecedent (PTA). See **factor XI.** This term is no longer in common usage.

plasma volume, the total volume of plasma in the body, elevated in diseases of the liver and spleen and in vitamin C deficiency and lowered in Addison's disease, dehydration, and shock. The normal plasma volume in males is 39 mL/kg of body weight; in females, 40 mL/kg.

plasma volume extender [Gk, *plassein* + L, *volumen,* paper roll, *extendere,* to stretch], an IV solution of dextran, proteins, or other substances used to treat shock caused by blood volume loss.

plasmid /plaz′mid/ [Gk, *plasma,* something formed], in a bacterium, a small, circular molecule of DNA that is separate from the bacterial chromosome. Plasmids often carry genes that affect the ability of bacteria to respond to environmental challenges. For example, a bacterium containing the R (resistance) plasmid is able to resist many antibacterial drugs that act in different ways. Plasmids may be passed from one bacterium to another and are replicated in later generations of any bacterium carrying them. Molecular geneticists often use plasmids to insert specific genes into the chromosomes of bacteria and other organisms.

plasmidotrophoblast. See **syncytiotrophoblast.**

plasmin. See **fibrinolysin.**

plasminogen, inactive precursor of plasmin, the enzyme that digests fibrinogen during fibrinolysis. See **fibrinogen.**

plasminogen activator, the enzyme that converts plasminogen to plasmin. Also called **tissue activator.**

plasminogen activator inhibitor 1 (PAI-1) test, a blood test to determine the level of PAI-1. Increased levels are indicative of acute coronary syndrome, coronary artery disease, restenosis after coronary angioplasty, infection, inflammation, trauma, type 1 diabetes, insulin resistance syndrome, or pregnancy. Decreased levels are indicative of bleeding disorders.

plasminogen test, a blood test used to diagnose suspected plasminogen deficiency in patients who present with multiple thromboembolic episodes. Abnormal levels of plasminogen are also characteristic of disseminated intravascular coagulation, primary fibrinolysis, cirrhosis and other severe liver diseases, pregnancy, eclampsia, and some inflammatory conditions.

plasmo-, prefix meaning "of or related to plasma, or to the substance of a cell": *plasmocyte, plasmodium, plasmosome.*

Plasmodium /plazmō′dē·əm/*pl.* **plasmodia** [Gk, *plasma* + *eidos,* form], a genus of protozoa, several species of which cause malaria, transmitted to humans by the bite of an infected ***Anopheles*** mosquito. *Plasmodium falciparum* causes falciparum malaria, the most severe form of the disease; *P. malariae* causes quartan malaria; *P. ovale* causes mild tertian malaria with oval red blood cells; and *P. vivax* causes common tertian malaria. See also ***Anopheles,*** **blackwater fever.**

plasmosome /plaz′məsōm/ [Gk, *plasma* + *soma,* body], the true nucleolus of a cell as distinguished from the karyosomes in the nucleus. Also spelled **plasmasome.**

plast-, prefix meaning "to form, mold, or develop": *plastidogenetic, plastodynamia, plastogamy.*

-plast, -plastia, -plasia, -plastic, suffix meaning "pertaining to the formation or development of a": *anaplastic, hemoplastic.*

plaster [Gk, *emplastron*], **1.** any composition of a liquid and a powder that hardens when it dries, used in shaping a cast to support a fractured bone as it heals, such as plaster of paris. **2.** a home remedy consisting of a semisolid mixture applied to a part of the body as a counterirritant or for other therapeutic reasons, such as a mustard plaster.

plaster cast [Gk, *emplastron,* plaster; ONorse, *kasta*], a traditional cast used to encase and immobilize a part of the body, made from a gauze roll impregnated with plaster of paris. The gauze is dipped in warm water and wrapped around the body part. Modern casts are often made of materials such as fiberglass or plastic instead of plaster of paris.

plaster of paris [Gk, *emplastron,* plaster; Paris, France], a white powder, calcium sulfate hemihydrate, that is mixed with water to make a paste that can be molded to encase a body part.

-plastia. See **-plasia, -plast.**

plastic /plas′tik/ [Gk, *plastikos*], **1.** *adj,* tending to build up tissues or to restore a lost part. **2.** *adj,* conformable; capable of being molded. **3.** *n,* a high-molecular-weight polymeric material, usually organic, capable of being molded, extruded, drawn, or otherwise shaped and then hardened into a form. **4.** *n,* material that can be molded.

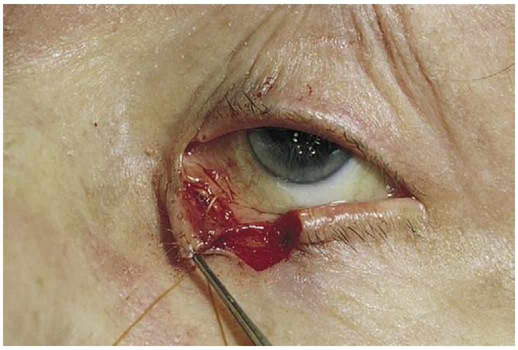
plasticity /plastis′itē/ [Gk, *plassein,* to mold], the quality of being plastic or formative.

plastic surgery [Gk, *plassein,* to mold, *cheirourgia,* surgery], surgery to heal, reconstruct, restore function, and correct disfigurement or scarring resulting from trauma or acquired or congenital lesions or defects. In performing corrective plastic surgery, the surgeon may use tissue from the patient or from another person or an inert material that is nonirritating, has a consistency appropriate to the use, and is able to hold its shape and form indefinitely. Implants are commonly used in mammoplasty for breast augmentation. Skin grafting is the most common procedure in plastic surgery. Z-plasty and Y-plasty are simpler techniques often performed instead of grafting in areas of the body covered by skin that is loose and elastic, such as the neck, axilla, throat, and inner aspect of the elbow. Dermabrasion is used to remove pockmarks, acne scars, or signs of traumatic skin damage. Chemical peeling is another technique in corrective plastic surgery. It is used primarily for removing fine wrinkles on the face. Tattooing, in which a pigment is tattooed into the skin of a graft, is performed to change the color of the graft to resemble more closely the surrounding skin. Reconstructive plastic surgery is performed to correct birth defects, to repair structures destroyed by trauma, and to replace tissue removed in other surgical procedures. Cleft lip and cleft palate repair and other maxillofacial surgical procedures, including rhinoplasty, otoplasty, and rhytidoplasty, are among these reconstructive procedures. Care of the patient before and after plastic surgery may require considerable sensitivity and tact. The patient may be exceedingly uncomfortable about the real or perceived appearance of the defect. An accepting, nonjudgmental attitude of all staff members is to the patient's benefit. Optimal nutritional status helps a graft to "take" and speeds healing. Each procedure and technique involves particular kinds of care in the preoperative and postoperative periods. Instructions and assistance in self-care activities are also specific to the procedure. Success of most of the procedures depends greatly on the patient's cooperation and on fastidious nursing care. The correction of a visible abnormality may be of inestimable benefit to the patient's assurance, self-esteem, and function in society. See also specific procedures. Also called **cosmetic surgery, reconstructive surgery.**

-plasty, suffix meaning "molding, formation, or surgical repair on a (specified) body part or by (specified) means": *bronchoplasty, cervicoplasty, uveoplasty.*

plate [Fr, *plat,* flat dish], **1.** a flat structure or layer, such as a thin layer of bone or the frontal plate between the sides of the ethmoid cartilage and the sphenoid bone in the fetus. **2.** a single partitioning unit of a chromatographic system.

platelet aggregation, platelet cohesion, mediated by glycoprotein membrane receptors and fibrinogen, part of a sequential mechanism leading to the initiation and formation of a thrombus or hemostatic plug. Aggregation is used as an in vitro platelet function assay, and is induced by adenosine diphosphate, arachidonic acid, thrombin, and collagen.



Plastic surgery: excision of excess lid tissue

(Tyers and Collin, 2008)

platelet aggregation test, a blood test that can detect diseases that affect either platelet number or function, thereby prolonging bleeding time. This test can provide information about prolonged platelet aggregation times, connective tissue disorders such as lupus erythematosus, recent cardiopulmonary or dialysis bypass, various myeloproliferative diseases, primary protein disease, von Willebrand's disease, uremia, and congenital disorders such as Wiskott-Aldrich syndrome, Bernard-Soulier syndrome, and glycogen storage disorders.

platelet antibody detection test, a blood test used to detect immune-mediated destruction of platelets. Such destruction can cause paroxysmal hemoglobinuria as well as immunological thrombocytopenia, which includes idiopathic thrombocytopenia purpura, posttransfusion purpura, neonatal thrombocytopenia, and drug-induced thrombocytopenia.

platelet count, a blood test that is performed on all patients who develop petechiae, spontaneous bleeding, or increasingly heavy menses. It is also used to monitor the course of the disease or therapy for thrombocytopenia or bone marrow failure.

plateletpheresis /plat′litfer′əsis/ [Fr, *platelet* + Gk, *aphairesis,* to carry away], collection of platelets from a donor using the apheresis technique. Also called **thrombapheresis, thrombotapheresis.** Compare **leukapheresis, plasmapheresis.** See also **apheresis.**

platelets /plat′lits/ [Fr, small plate], anucleate blood cells, 1-3 μm in diameter. Platelets are formed from bone marrow megakaryocytes. Approximately one third of circulating platelets become temporarily sequestered in the spleen. Platelets are disk-shaped, contain no hemoglobin, and are essential for coagulation and in maintenance of hemostasis. The platelet count reference interval is 150,000-450,000/uL. Also called **thrombocyte.** Compare **erythrocyte, leukocyte.** See also **thrombocytopenia, thrombocytosis.**

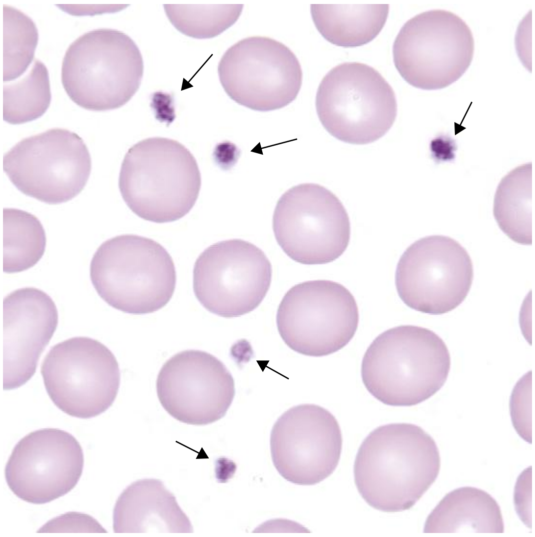
platform, a collective term for computer hardware and software components of a particular system.

-platin, suffix for platinum-based antineoplastics.

platinized gold foil /plat′inīzd/ [Sp, *plata,* silver; AS, *geolu,* gold; L, *folium,* leaf], a thin sheet of platinum sandwiched between two sheets of gold, used for making parts of dental restorations requiring greater hardness than that obtained with other materials, such as copper amalgam.

Platinol, a trademark for an antineoplastic **(cisplatin).**

platinum (Pt) /plat′ənəm/ [Sp, *plata,* silver], a silver-white soft metallic element. Its atomic number is 78; its atomic mass (weight) is 195.09. Platinum is used in dentistry, jewelry, and manufacture of chemical apparatus that must withstand high temperatures. Platinum is a good catalyst for a variety of chemical reactions.



Platelet *(Carr and Rodak, 2008)*

platinum foil, a very thin sheet of pure platinum that has a high fusing point, making it an ideal matrix in various soldering procedures for fabricating orthodontic appliances and dentures. It is also commonly used as the internal form of porcelain dental restorations during fabrication.

platy-, prefix meaning "broad or flat": *platybasia, platycephalous, platycnemic*.

Platyhelminthes /plat′ihelmin′thēz/ [Gk, *platys,* broad, *helmins,* worm], a phylum of flatworms that includes parasitic tapeworms (class Cestoda) and flukes (classes Monogenea and Trematoda) as well as mostly free-living species, such as planarians (class Turbellaria).

platypelloid pelvis /plat′əpel′oid/ [Gk, *platys,* broad, *pella,* bowl, *eidos,* form; L, *pelvis,* basin], a rare type of pelvis in which the inlet is round like the gynecoid type in the anterior section, but the posterior section is foreshortened by its flat and heavy border. The sacrum is hollow and inclines posteriorly, and the sidewalls are convergent. In the midplane the transverse diameter is much wider than the narrowed anteroposterior diameter. Vaginal delivery is not usually possible in the 3% of women who have platypelloid pelves.

platysma /plətiz′mə/ [Gk, *platys,* broad], one of a pair of platelike, wide muscles at the side of the neck. It arises from the fascia covering the superior parts of the pectoralis major and the deltoideus, crosses the clavicle, and rises obliquely and medially along the side of the neck. The platysma covers the external jugular vein as the vein descends from the angle of the mandible to the clavicle. The platysma is innervated by the cervical branch of the facial nerve and serves to draw down the lower lip and the corner of the mouth. When the platysma fully contracts, the skin over the clavicle is drawn toward the mandible, increasing the diameter of the neck.

play [AS, *plegan,* sport], any spontaneous or organized activity that provides enjoyment, entertainment, amusement, or diversion. It is essential in childhood for the development of a normal personality and as a means for physical, intellectual, and social development. Play provides an outlet for releasing tension and stress, as well as a means for testing and experimenting with new or fearful roles or situations. It is an indispensable part of the nursing care of children, especially in the hospital. It helps relieve the tension and anxiety of being in unfamiliar surroundings and separated from parents, and it gives the child a sense of security and a means of expressing fears and fantasies. Play also offers the nurse one of the most effective methods of communicating with and gaining the trust of the child and helping him or her to understand treatments and procedures. Kinds of play include **active play, associative play, cooperative play, dramatic play, parallel play, passive play, skill play,** and **solitary play.** See also **play therapy.**

play participation, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the use of activities by a child from 1 year through 11 years of age to promote enjoyment, entertainment, and development. See also **Nursing Outcomes Classification.**

play therapy, a form of psychotherapy in which a child plays in a protected and structured environment with games and toys provided by a therapist, who observes the behavior, affect, and conversation of the child to gain insight into thoughts, feelings, and fantasies. As conflicts are discovered, the therapist often helps the child understand and work through them.

pleasure principle /plezh′ər/ [Fr, *plaisir,* pleasure; L, *principium*], (in psychoanalysis) the need for immediate gratification of instinctual drives. Compare **reality principle.**

pledget /plej′ət/, a small flat compress made of cotton gauze, or a tuft of cotton wool, lint, or a similar synthetic material, used to wipe the skin, absorb drainage, or clean a small surface.

-plegia, -plegic, suffix meaning "a (specified) paralysis": *cycloplegia, paraplegic*.

Plegine, a trademark for an anorexiant **(phendimetrazine tartrate).**

pleio-. See **pleo-.**

pleiotropic gene /plī′ətrop′ik/, a gene that produces many effects in the phenotype.

pleiotropy /plī·ot′rəpē/ [Gk, *pleion,* more, *trepein* to turn], the production by a single gene of a complex of unrelated phenotypic effects. The effects may be a manifestation of a particular disorder, such as the cluster of symptoms in Marfan's syndrome; aortic aneurysm; dislocation of the optic lens; skeletal deformities; and arachnodactyly, any or all of which may be present. *—pleiotropic, adj.*

Plenaxis, a trademark for **abarelix.**

pleo-, pleio-, prefix meaning "more": *pleochromatic, pleomastia, pleomorphism*.

pleocytosis /plē′ōsītō′sis/, presence of a greater than normal number of cells in the cerebrospinal fluid.

plerocercoid /plir′ōsur′koid/, the second larval stage of the cestode ***Diphyllobothrium latum.*** It develops in the second intermediate host, a freshwater fish, and is infective to humans if ingested.

plessimeter. See **pleximeter.**

plethora /pleth′ərə/ [Gk, *plethore,* fullness], a term applied to the beefy red coloration of a newborn. The "boiled lobster" hue of the infant's skin is caused by an unusually high proportion of erythrocytes per volume of blood. The term formerly was used to describe any red-faced person. *—plethoric, adj.*

plethysmogram /pləthiz′məgram′/ [Gk, *plethynein,* to increase, *gramma,* to record], a tracing produced by a plethysmograph.

plethysmograph /pləthiz′məgraf′/, an instrument for measuring and recording changes in the size and volume of extremities and organs by measuring changes in their blood volume. *—plethysmographic, adj.*

plethysmography /pleth′izmog′rəfē/ [Gk, *plethynein,* to increase, *graphein,* to record], the measurement of changes in the volume of organs or other body parts, particularly those changes resulting from blood flow.

pleur-. See **pleuro-.**

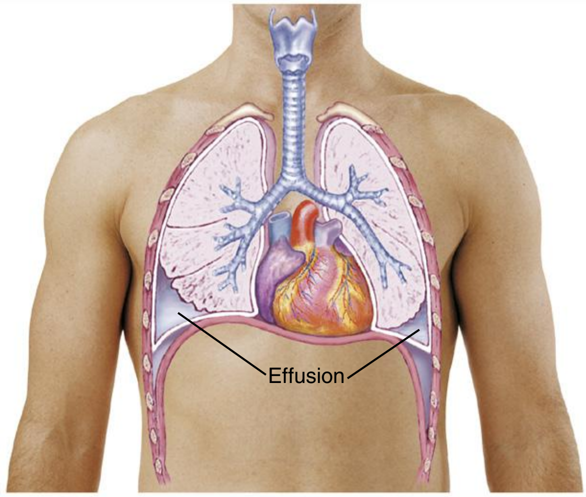
pleura /plo͝or′ə/ *pl. pleurae* [Gk, rib], a delicate serous membrane enclosing the lung, composed of a single layer of flattened mesothelial cells resting on a delicate membrane of connective tissue. Beneath the membrane is a stroma of collagenous tissue containing yellow elastic fibers. The pleura divides into the visceral pleura, which covers the lung, dipping into the fissures between the lobes, and the parietal pleura, which lines the chest wall, covers the diaphragm, and reflects over the structures in the mediastinum. The parietal and visceral pleurae are separated from each other by a small amount of fluid that acts as a lubricant as the lungs expand and contract during respiration. See also **pleural cavity, pleural space. —pleural,** *adj.*

pleural biopsy, the removal of pleural tissue for histological examination after exudative fluid indicative of infection, neoplasm, or tuberculosis is obtained by thoracentesis or when a pleural-based tumor, reaction, or thickening is indicated by a chest x-ray.

pleural cavity [Gk, *pleura,* rib; L, *cavum,* cavity], the space within the thorax that contains the lungs. Between the ribs and the lungs are the visceral and parietal pleurae.

pleural cupola. See **cervical pleura.**

pleural effusion, an abnormal accumulation of fluid in the intrapleural spaces of the lungs. It is characterized by chest pain, dyspnea, adventitious lung sounds, and nonproductive cough. The fluid is an exudate or a transudate from inflamed pleural surfaces and may be aspirated or surgically drained. An exudate may result from pulmonary infarction, trauma, tumor, or infection, such as tuberculosis. The specific cause of the exudate is treated. Treatment of the effusion may include the administration of corticosteroids, diuretics, or vasodilators; oxygen therapy; intermittent positive-pressure breathing; or thoracentesis or use of a mobile system such as the Pleurx catheter.



Pleural effusion *(Wilson and Giddens, 2009)*

pleural friction rub. See **pleuropericardial rub.**

pleural space, the potential space between the visceral and parietal layers of the pleurae. The space contains a small amount of fluid that acts as a lubricant, allowing the pleurae to slide smoothly over each other as the lungs expand and contract with respiration.

pleurisy /plo͝or′əsē/ [Gk, *pleura* + *itis,* inflammation], inflammation of the parietal pleura of the lungs. It is characterized by dyspnea and stabbing pain, leading to restriction of ordinary breathing with spasm of the chest on the affected side. A pleural friction rub may be heard on auscultation. Simple pleurisy with undetectable exudate is called fibrinous or dry pleurisy. Pleural effusion indicates extensive inflammation with considerable amounts of exudate in the pleural spaces. Common causes of pleurisy include bronchial carcinoma, lung or chest wall abscess, pneumonia, pulmonary infarction, and tuberculosis. The condition may result in permanent adhesions between the pleura and adjacent surfaces. Treatment consists of pain relief and therapy for the primary disease. See also **acute pleurisy, adhesive pleurisy, pleural effusion, pleurodynia, pulmonary edema. —pleuritic,** *adj.*

pleurisy with effusion [Gk, *pleura* + *itis,* inflammation; L, *effundere,* to pour out], pleurisy in which there is an accumulation of fluid in the intrapleural space. The fluid has a high specific gravity as a result of a high concentration of fibrin and clots.

pleuritic /plo͝orit′ik/ [Gk, *pleura,* rib], pertaining to a condition of pleurisy.

pleuritis. See **pleurisy.**

pleuro-, pleur-, prefix meaning "the pleura or side": *pleurocentrum, pleurography, pleuropulmonary.*

pleurodynia /plo͝or′ōdin′ē·ə/ [Gk, *pleura* + *odyne,* pain], acute inflammation of the intercostal muscles and the muscular attachment of the diaphragm to the chest wall. It is characterized by sudden, severe pain and tenderness, fever, headache, and anorexia. These symptoms are aggravated by movement and breathing. The lungs are not affected, and characteristically there is no cough or pleural effusion. See also **epidemic pleurodynia.**

pleuropericardial folds, a pair of small ridges that originate along the lateral body walls in the fifth week of embryonic development and project into the cranial ends of the pericardioperitoneal canals to divide the pleural cavities from the pericardial cavity. They later develop into the pleuropericardial membranes.

pleuropericardial rub /-per′ikär′dē·əl/ [Gk, *pleura* + *peri,* around, *kardia,* heart; ME, *rubben,* to scrape], an abnormal coarse, grating sound heard on auscultation of the lungs during late inspiration and early expiration. It occurs when the visceral and parietal pleural surfaces rub against each other. The sound is not affected by coughing. A pleuropericardial rub indicates primary inflammatory, neoplastic, or traumatic pleural disease or inflammation secondary to infection or neoplasm. Also called **pleural friction rub.** See also **breath sound, Kussmaul breathing, rhonchus, wheeze.**

pleuroperitoneal cavity. See **splanchnocoele.**

pleuroperitoneal hiatus, a posterolateral opening in the fetal diaphragm. Its failure to close leaves a congenital posterolateral defect that may become a site for a congenital diaphragmatic hernia. Also called *foramen of Bochdalek.*

pleuropneumonia /plo͝or′ōno͞omō′nē·ə/ [Gk, *pleura* + *pneumon,* lung], **1.** a combination of pleurisy and pneumonia. **2.** an infection of cattle resulting in inflammation of both the pleura and lungs, caused by microorganisms of the ***Mycoplasma*** group. See also **pleuropneumonia-like organism.**

pleuropneumonia-like organism (PPLO), a group of filterable organisms of the genus ***Mycoplasma*** similar to *M. mycoides,* the cause of pleuropneumonia in cattle.

pleurothotonos /plo͝or′əthot′ənəs/ [Gk, *pleurothen,* side of the body, *tonos,* tension], an involuntary, severe, prolonged contraction of the muscles of one side of the body, resulting in an acute arch to that side. It is usually associated with tetanus infection or strychnine poisoning. Compare

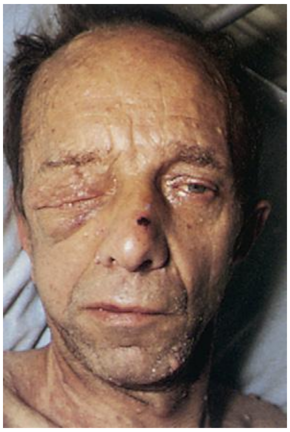
emprosthotonos, opisthotonos, orthotonos. —*pleurothotonic, adj.*

plex-, prefix meaning "a stroke or to strike": *plexalgia, pleximeter, plexor.*

-plex, -plexus, suffix meaning "a braid, nerve, network": *brachiplex, cerviplex, veniplex.*

-plexia, -plexy, suffix meaning "condition resulting from a crippling or serious occurrence": *apoplexia, pagoplexia, selenoplexia.*

plexiform neuroma /plek′sifôrm/ [L, *plexus,* braided, *forma,* form; Gk, *neuron,* nerve, *oma,* tumor], a neoplasm composed of twisted bundles of nerves. Also called **Verneuil's neuroma.**



Plexiform neuroma *(Moll, 1997)*

pleximeter /pleksim′ətər/ [Gk, *plessein,* to strike, *metron,* measure], a mediating device, such as a percussor or finger, used to receive light taps in percussion. Also called **plessimeter.** See also **percussion.**

plexor. See **percussor.**

plexus /plek′səs/ *pl.* **plexuses** [L, braided], a network of intersecting nerves and blood vessels or of lymphatic vessels. The body contains many plexuses, such as the brachial plexus, the cardiac plexus, the cervical plexus, and the solar plexus.

-plexus. See **-plex.**

plexuses. See **plexus.**

-plexy. See **-plexia.**

plic-, prefix meaning a "fold or ridge": *plicadentin, plication, plicotomy.*

plica /plī′kə/ *pl.* **plicae** [L, plicare, to fold], a fold of tissue within the body, such as the plicae transversales of the rectum and the plicae circulares of the small intestine. —**plical,** *adj.*

plica circularis. See **circular fold.**

plicae. See **plica.**

plical. See **plica.**

plicamycin /plī′kəmī′sin/, an antineoplastic agent. Formerly called **mithramycin.**

■ INDICATIONS: It is prescribed primarily in the treatment of malignant tumors of the testis. It is also prescribed in the treatment of hypercalcemia and hypercalciuria associated with cancer.

■ CONTRAINDICATIONS: Clotting disorders, thrombocytopenia, kidney or liver dysfunction, bone marrow depression, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are thrombocytopenia and clotting defects. Nausea and stomatitis commonly occur.

plica semilunaris conjunctivae. See **semilunar fold of the conjunctiva.**

plication /plīkā′shən/, any operation that involves folding, shortening, or decreasing the size of a muscle or hollow organ, such as the stomach, by taking in tucks.

plication of stomach [L, *plicare,* to fold; Gk, *stomakhos,* gullet], a surgical treatment for obesity in which tucks are created in the wall of the stomach.

plica umbilicalis lateralis. See **lateral umbilical fold.**

plica umbilicalis mediana. See **middle umbilical fold.**

pliers /plī′ərz/, small tong-jawed pincers for bending metals or holding small objects. Various forms are often used in dentistry.

Plimmer's bodies [Henry G. Plimmer, English biologist, 1857–1918], small round encapsulated bodies found in cancers and once thought to be the causative parasites. Also called **Behla's bodies.**

-ploid, -ploidy, suffix meaning "having a (specified) number of chromosome sets": *heptaploid, octaploid, polyploid.*

ploidy /ploi′dē/ [Gk, *eidos,* form], the status of a cell nucleus in regard to the number of complete chromosome sets it contains.

plosive. See **stop.**

plug [D, *plugge,* stopper], a mass of tissue cells, mucus, or other matter that blocks a normal opening or passage of the body, such as a cervical plug.

plugger, an instrument for condensing or consolidating a filling material, such as a dental amalgam into a tooth restoration or gutta-percha into a root canal. See also **packer.**

plumbism /plum′izəm/ [L, *plumbum,* lead], a chronic form of lead poisoning caused by absorption of lead or lead salts. See also **lead poisoning.**

Plummer's disease [Henry S. Plummer, American physician, 1874–1937], goiter characterized by a hyperfunctioning nodule or adenoma and thyrotoxicosis. Also called **toxic nodular goiter.**

Plummer-Vinson syndrome /plum′ər vin′sən/ [Henry S. Plummer; Porter P. Vinson, American physician, 1890–1959], a rare disorder associated with severe and chronic iron deficiency anemia, characterized by glossitis, koilonychia, and dysphagia caused by esophageal webs at the level of the cricoid cartilage. Also called **Paterson-Kelly syndrome, sideropenic dysphagia.**

plunging goiter. See **diving goiter.**

pluri-, prefix meaning "more": *pluriceptor, plurimenorrhea, pluritissular.*

pluricentric blastoma. See **blastoma.**

pluripara /plo͞orip′ərə/ [L, *plus,* more, *parere,* to bear], a woman who has borne three or more children.

pluripolar mitosis. See **multipolar mitosis.**

pluripotential stem cell. See **stem cell.**

plutonium (Pu) /plo͞otō′nē·əm/ [planet *Pluto*], a synthetic transuranic metallic element. Its atomic number is 94; the atomic mass of its longest-lived isotope is 242. A highly toxic heavy metal, plutonium is used in nuclear power plants, and was used in the assembly of early nuclear weapons.

plyometrics, bounding or high-velocity exercise that entails eccentric and rapid concentric contractions, such as jumping or weighted ball throwing and catching. Also called **plyometric training.**

pm, abbreviation for *picometer.*

Pm, symbol for the element **promethium.**

P.M.D., abbreviation for *private medical doctor.* Also called **L.M.D.**

PMDD, abbreviation for **premenstrual dysphoric disorder.**

pmh, abbreviation for *past medical history.*

PMI, abbreviation for **point of maximum impulse.**

PMN, abbreviation for **polymorphonuclear.**

PMS, pms, abbreviation for **premenstrual syndrome.**

PMT, abbreviation for *premenstrual tension*. See **premenstrual syndrome.**

PND, **1.** abbreviation for **paroxysmal nocturnal dyspnea.** **2.** abbreviation for **postnasal drip.**

-pnea, -pnoea, pneo-, combining form meaning "breath or breathing": *brachypnea, dyspnea, pneoscope*.

pneopneic reflex /nē′ōnē′ik/ [Gk, *pnoe,* breath; L, *reflectere,* to bend back], a change in the normal breathing rhythm when an irritating gas is introduced into the lungs.

pneuma-. See **pneumato-.**

pneumatic /no͞omat′ik/ [Gk, *pneuma,* air], pertaining to air or gas.

pneumatic antishock garment. See **shock trousers.**

pneumatic condenser [Gk, *pneuma,* air; L, *condensare,* to thicken], a pneumatic device that delivers compacting blows of variable force to restorative material used in filling tooth cavities. The frequency of the blows may be up to 360 per minute. Also called **Hollenback condenser.**

pneumatic heart driver, a mechanical device that regulates compressed air delivery to an artificial heart, controlling heart rate, percent systole, and delay in systole.

pneumatic lithotripsy, lithotripsy in which a rigid probe is inserted through the ureter and pneumatic pressure is applied directly to the calculus.

pneumatic retinopexy, a treatment for retinal detachment involving injection of gas into the posterior vitreous cavity in such a way that the gas bubble presses against the area of torn retina, forcing it back into place.

pneumatic splint. See **inflatable splint.**

pneumatic tourniquet precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as applying a pneumatic tourniquet while minimizing the potential for patient injury from use of the device. See also **Nursing Interventions Classification.**

pneumato-, pneuma-, prefix meaning "air or gas, or respiration": *pneumatology, pneumatophore, pneumatothorax*.

pneumatocele /no͞omat′əsēl′/, **1.** a thin-walled cavity in the lung parenchyma caused by partial airway obstruction. **2.** a hernial protrusion of lung tissue. **3.** a tumor or sac containing gas, especially of the scrotum. Also called **pneumonocele** /no͞omon′əsēl/.

pneumatocephalus. See **pneumocephalus.**

pneumatogram /no͞omat′əgram′/ [Gk, *pneuma,* air, *gramma,* to record], a tracing made by a pneumograph of chest movements during breathing. Also called **pneumogram.**

pneumo-, pneumono-, prefix meaning "lungs, air, or the breath": *pneumobacillin, pneumocele, pneumolith*.

pneumobelt /no͞o′mōbelt/, a corset with an inflatable bladder that fits over the abdominal area. The bladder is connected by a hose to a ventilator that delivers positive pressure at an adjustable rate and pressure. It is used to assist in the respiratory rehabilitation of patients with high cervical injuries to alleviate strain.

pneumocentesis /-sentē′sis/ [Gk, *pneumon,* lung, *kentesis,* pricking], a procedure in which a lung is punctured to drain fluid contents.

pneumocephalus /no͞o′mō·sef′ə·ləs/ [Gr, *pneuma* air + *kephalē* head], the presence of air in the intracranial cavity. Also called **intracranial pneumatocele, pneumatocephalus, pneumocrania, pneumoencephalocele.**

pneumococcal /no͞o′mōkok′əl/ [Gk, *pneumon,* lung, *kokkos,* berry], pertaining to bacteria of the genus *Pneumococcus*.

pneumococcal heptavalent conjugate vaccine, a preparation of capsular polysaccharides from the seven serotypes of ***Streptococcus pneumoniae*** most commonly isolated from children 6 years of age or younger coupled with a nontoxic variant of diphtheria toxin, used as an active immunizing agent for infants and children at risk for pneumococcal disease. It is administered intramuscularly.

pneumococcal meningitis [Gk, *pneumon,* lung, *kokkos,* berry, *meninx,* membrane, *itis,* inflammation], meningitis caused by pneumococcal infection. See also ***Streptococcus pneumoniae.***

pneumococcal nephritis, nephritis or glomerulonephritis from infection with ***Streptococcus pneumoniae,*** usually as a complication of pneumonia or empyema.

pneumococcal pneumonitis, inflammation of the lungs caused by an infection by pneumococcal bacteria.

pneumococcal vaccine, an active immunizing agent containing antigens of the 23 types of *Pneumococcus* associated with more than 98% of the cases of pneumococcal pneumonia in the United States and Europe.

■ INDICATIONS: It is prescribed for persons over 2 years of age who are at high risk of development of severe pneumococcal pneumonia, all adults over 65 years of age, and immunocompromised adults.

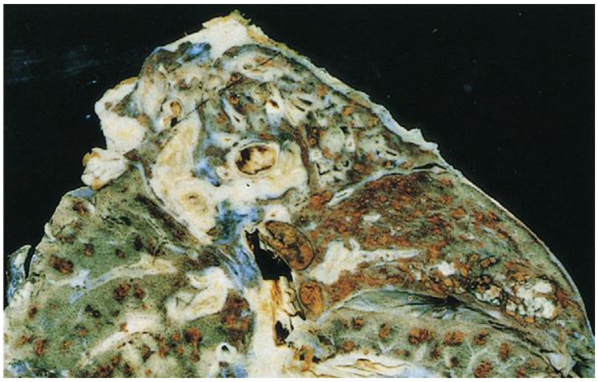
■ CONTRAINDICATIONS: Pregnancy, early childhood (less than 2 years of age), or known hypersensitivity to the vaccine prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are inflammation at the site of injection, fever, and hypersensitivity.

pneumococcal vaccine polyvalent, a preparation of purified capsular polysaccharides from the 23 serotypes of *Streptococcus pneumoniae* causing the majority of pneumococcal disease, used as an active immunizing agent in persons more than 2 years of age. It is administered intramuscularly.

pneumococcus /no͞o′mōkok′əs/ *pl.* pneumococci [Gk, *pneumon* + *kokkos,* berry], a gram-positive diplococcal bacterium of the species *Streptococcus pneumoniae,* the most common cause of bacterial pneumonia. More than 85 subtypes of this organism are known. A vaccine protective against 35 serotypes has been developed and is recommended for those over 65 years of age, those with a chronic lung disease, or those with human immunodeficiency virus infection. See also **lobar pneumonia, pneumonia, *Streptococcus pneumoniae.***

pneumoconiosis /no͞o′mōkō′nē·ō′sis/ [Gk, *pneumon* + *konis,* dust, *osis,* condition], any disease of the lung caused by chronic inhalation of dust, usually mineral dust of occupational or environmental origin. Some kinds of pneumoconioses are **anthracosis, asbestosis, silicosis.**



Hematite pneumoconiosis *(Skarin, 2010)*

pneumoconstriction /no͞o′mōkənstrik′shən/, an area of collapsed lung tissue that results from mechanical stimulation of an exposed part of the lung. It is produced by local reflex muscular closure of alveolar ducts and alveoli.

pneumocrania. See **pneumocephalus.**

Pneumocystis jiroveci /no͞o′mōsis′tis/, a microorganism that causes pneumocystosis, a type of interstitial cell pneumonitis.

***Pneumocystis* pneumonia (PCP)** [Gk, *pneuma*, air, *kystis*, bag, *pneumon*, lung], a type of interstitial plasma cell pneumonia in which the alveoli become honeycombed with an acidophilic material. The patient may or may not be febrile but usually is weak, dyspneic, and cyanotic.

pneumocystosis /no͞o′mōsistō′sis/ [Gk, *pneuma*, air, *kystis*, bag, *osis*, condition], infection with the fungus ***Pneumocystis jiroveci,*** usually seen in patients with human immunodeficiency virus infection; premature, malnourished infants; or debilitated or immunosuppressed people, particularly those with hematologic malignancies. It is characterized by fever, cough, tachypnea, and frequently cyanosis. The diagnosis is difficult to make and usually requires obtaining a specimen by an induced sputum procedure or bronchoalveolar lavage and special staining techniques. Mortality rates are near 100% in untreated patients. Treatment with pentamidine isethionate or a combination of trimethoprim and sulfamethoxazole, trimetrexate plus folic acid, trimethoprim plus dapsone, atovaquone, or primaquine plus clindamycin is effective. Patients at risk should receive prophylaxis against acute infection. Also called **interstitial plasma cell pneumonia.**

pneumoencephalocele. See **pneumocephalus.**

pneumoencephalography /no͞o′mō·ensef′əlog′rəfē/ [Gk, *pneuma*, air, *enkephalos*, brain, *graphein*, to record], a procedure for the radiographic visualization of the ventricular space, basal cisterns, and subarachnoid space overlying the cerebral hemispheres of the brain. Air, helium, or oxygen is injected into the lumbar subarachnoid space after the intermittent removal of the cerebrospinal fluid by lumbar puncture. See also **encephalography, ventriculography.** *—pneumoencephalographic, adj.*

pneumogastric nerve. See **vagus nerve.**

pneumogram. See **pneumatogram.**

pneumograph /no͞o′məgraf/, a device that records breathing movements by means of an inflated coil around the chest. It mainly measures the ventilatory cycle rather than the amplitude of breathing movements.

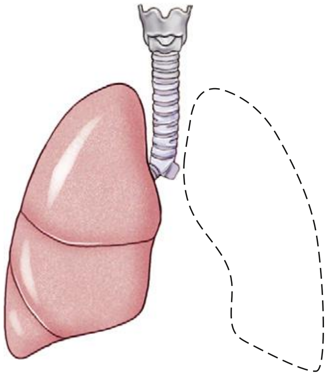
pneumohemopericardium. See **hemopneumopericardium.**

pneumohemothorax /-hem′ōthôr′aks/ [Gk, *pneuma*, air, *haima*, blood, *thorax*, chest], an accumulation of air and blood in the pleural cavity.

pneumolysin /no͞omol′isin/, virulence factor produced by *Streptococcus pneumoniae* associated with cytolysis.

pneumomediastinum /no͞o′mōmē′dē·əstī′nəm/ [Gk, *pneuma*, air, *mediastinus*, midway], the presence of air or gas in the mediastinal tissues. In infants it may lead to pneumothorax or pneumopericardium, especially in those with respiratory distress syndrome or aspiration pneumonitis. In older children the condition may result from bronchitis, acute asthma, pertussis, cystic fibrosis, or bronchial rupture from cough or trauma. Also called **Hamman's disease.**

pneumonectomy /no͞o′mənek′təmē/ [Gk, *pneumon*, lung, *ektomē*, excision], the surgical removal of all or part of a lung. See also **lobectomy.**



Surgical absence of right lung after pneumonectomy
(LaFleur Brooks and LaFleur Brooks, 2012)

pneumonia /no͞omō′nē·ə/ [Gk, *pneumon*, lung], an acute inflammation of the lungs, often caused by inhaled pneumococci of the species *Streptococcus pneumoniae*. The alveoli and bronchioles of the lungs become plugged with a fibrous exudate. Pneumonia may also be caused by other bacteria, as well as by viruses, rickettsiae, and fungi. Kinds of pneumonia are **aspiration pneumonia, bronchopneumonia, eosinophilic pneumonia, interstitial pneumonia, lobar pneumonia, mycoplasma pneumonia,** and **viral pneumonia.** See also **acute lobar pneumonia, atypical pneumonia.**

Factors predisposing to pneumonia

- Aging
- Air pollution
- Altered consciousness: alcoholism, head injury, seizures, anesthesia, drug overdose, stroke
- Altered oropharyngeal flora secondary to antibiotics
- Bed rest and prolonged immobility
- Chronic diseases: chronic lung disease, diabetes mellitus, heart disease, cancer, end-stage renal disease
- Debilitating illness
- Human immunodeficiency virus (HIV) infection
- Immunosuppressive drugs (corticosteroids, cancer chemotherapy, immunosuppressive therapy after organ transplant)
- Inhalation or aspiration of noxious substances
- Intestinal and gastric feedings via nasogastric or nasointestinal tubes
- Malnutrition
- Smoking
- Tracheal intubation (endotracheal intubation, tracheostomy)
- Upper respiratory tract infection
- Resident of a long-term care facility

From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St Louis, 2011, Mosby.

-pneumonia, suffix meaning an "inflammation of the lungs": *necropneumonia, splenopneumonia, typhopneumonia.*

-pneumonic, **1.** suffix meaning "related to pneumonia": *bronchopneumonic, peripneumonic, pleuropneumonic.* **2.** suffix meaning "related to the lungs": *gastropneumonic, hepatopneumonic.*

pneumonic plague /no͞omon′ik/ [Gk, *pneumon*, lung; L, *plaga*, stroke], a highly virulent and rapidly fatal form of plague characterized by bronchopneumonia. There are two forms: **primary pneumonic plague,** which results from involvement of the lungs in the course of bubonic plague, and *secondary pneumonic plague,* which results from the inhalation of infected particles of sputum from a person having pneumonic plague. Aerolized ***Yersinia pestis*** could be used to cause pneumonic plague in a bioterrorism attack. Compare **bubonic plague, septicemic plague.** See also **plague, *Yersinia pestis.***

pneumonitis /no͞o′mənī′tis/ *pl. pneumonitides* [Gk, *pneumon* + *itis*], inflammation of the lung. Pneumonitis may be caused by a virus or may be a hypersensitivity reaction to chemicals or organic dusts, such as bacteria, bird droppings, or molds. It is usually an interstitial, granulomatous, fibrosing inflammation of the lung, especially of the bronchioles and alveoli. Dry cough is a common symptom. Treatment depends on the cause but includes removal of any offending agents and administration of corticosteroids to reduce inflammation. Compare **pneumonia.**

pneumono-. See **pneumo-.**

pneumonocele. See **pneumatocele.**

pneumonopathy /no͞o′mənop′əthē/, any disease or disorder involving the lungs.

pneumonopleuritis /-plo͝orī′tis/, a combined disorder of pneumonia and pleurisy.

pneumonotherapy /-ther′əpē/, the treatment of lung disease.

pneumopericardium /-per′ikär′dē·əm/, the presence of air or gas in the pericardial sac.

pneumoperitoneum /no͞o′mōper′itənē′əm, -per′itənē′əm/ [Gk, *pneuma,* air, *peri,* around, *teinein,* to stretch], the presence of air or gas within the peritoneal cavity of the abdomen. It may be spontaneous, such as from rupture of a hollow, gas-containing organ, or induced for diagnostic or therapeutic purposes.

pneumoperitonitis /no͞o′mōper′itənī′tis/, an acute inflammation of the peritoneal cavity accompanied by the presence of air or gas.

pneumotachometer /-takom′ətər/, a device that measures the flow of respiratory gases. The pressure gradient is directly related to flow, thus allowing a computer to derive a flow curve measured in liters per minute.

pneumothorax /no͞o′mōthôr′aks/ [Gk, *pneuma,* air, *thorax,* chest], the presence of air or gas in the pleural space, causing a lung to collapse. Pneumothorax may be the result of an open chest wound that permits the entrance of air, the rupture of an emphysematous vesicle on the surface of the lung, or a severe bout of coughing. It may also occur spontaneously without apparent cause.

■ OBSERVATIONS: The onset of pneumothorax is accompanied by a sudden sharp chest pain, followed by difficult, rapid breathing; decreased breath sounds and cessation of normal chest movements on the affected side; tachycardia; a weak pulse; hypotension; diaphoresis; an elevated temperature; pallor; dizziness; and anxiety.

■ INTERVENTIONS: The patient is assured that the condition can be treated, is urged to remain still, and is placed in bed in Fowler's position. Oxygen is administered through a nasal cannula, unless contraindicated, and the air in the pleural space is immediately aspirated. A chest tube is inserted and attached to an underwater seal; a waterless, disposable system; or a mobile chest drain; the tube is not removed until air is no longer expelled through the seal and a radiographic examination shows that the lung is completely expanded. Pain may be controlled by administering appropriate analgesics, but the use of respiratory depressants is avoided. Intermittent positive-pressure breathing may be administered.

■ NURSING CONSIDERATIONS: The patient is taught how to turn, cough, breathe deeply, and perform passive exercises and is told to avoid stretching, reaching, or making sudden movements. The patient is advised not to smoke but to drink fluids copiously, to exercise, to avoid fatigue and strenuous activity, and to report any symptoms of recurrence, such as chest pain, difficult breathing, fever, or respiratory infection.

PNF, abbreviation for **proprioceptive neuromuscular facilitation.**

PNH, abbreviation for **paroxysmal nocturnal hemoglobinuria.**

-pnoea. See **-pnea.**

PNP, abbreviation for **pediatric nurse practitioner.**

Po, symbol for the element **polonium.**

p.o., PO, abbreviation for the Latin phrase **per os,** "by mouth"; a route for administration of medications.

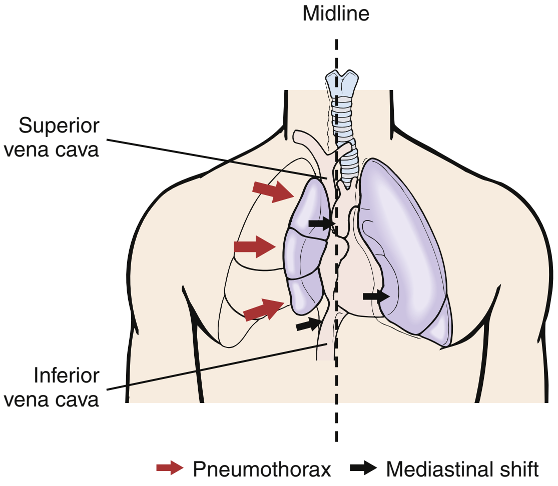
PO_2, symbol for *partial pressure of oxygen.* See **partial pressure.**

pocket /pok′ət/, a saclike space. See also **cavity, pouch, recess.**

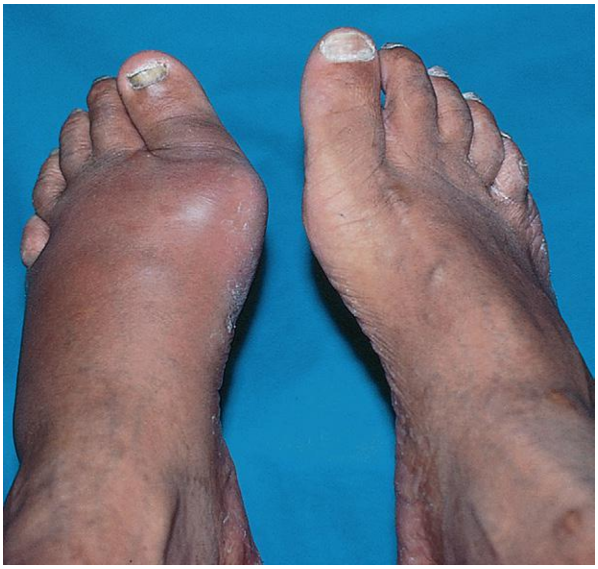
pockmark [AS, *pocc* + *meark*], a pitted scar on the skin, usually the result of acne or a smallpox or chickenpox pustule at the site.

pod-. See **podo-.**

podagra, inflammation involving the great toe caused by gout.



Pneumothorax *(Lewis et al, 2011)*



Podagra *(Swartz, 2009)*

podalgia, foot pain.

podalic /pōdal′ik/ [Gk, *pous,* foot], pertaining to the feet.

podalic version, the shifting of the position of a fetus to position the feet at the outlet during labor.

podiatrist /pədī′ətrist/, a health professional who diagnoses and treats disorders of the feet. Podiatrists complete a 4-year postgraduate educational program leading to a degree of Doctor of Podiatric Medicine (D.P.M.). Also called **chiropodist** in Canada.

podiatry /pədī′ətrē/ [Gk, *pous* + *iatros,* healer], the diagnosis and treatment of diseases and other disorders of the feet. Also called **chiropody** in Canada.

-podium, suffix meaning "something footlike": *axiopodium, phyllopodium, pseudopodium.*

podo-, pod-, prefix meaning "foot": *podogram, podology, podotrochilitis.*

podofilox /po-dof′-iloks/, a corrosive preparation that inhibits cell mitosis and is used for topical treatment of venereal warts.

podophyllotoxin /pō′dōfil′ətok′sin/ [Gk, *pous* + *phyllon,* leaf, *toxikon,* poison], any one of a group of substances derived from the roots of *Podophyllum peltatum,* a common plant species known as mayapple or American mandrake. Podofilox, a derivative, is prescribed in the topical treatment of condyloma acuminatum and other types of warts. Several podophyllotoxin derivatives have been used as purgatives and studied for their antineoplastic effects, including the inhibition of mitosis. Podophyllotoxins are not recommended for use in early pregnancy.

poecil-. See **poikilo-.**

POEMS syndrome, a multisystem syndrome combining *p*olyneuropathy, *o*rganomegaly, *e*ndocrinopathy, *m*onoclonal gammopathy, and *s*kin changes. It may be linked to a dysproteinemia such as the presence of unusual monoclonal proteins and light chains. Also called **Crow-Fukase syndrome, PEP syndrome.**

-poesis, -poiesis, suffix meaning "formation or production of": *cholanopoiesis, erythropoiesis, hemopoiesis.*

-poetic, -poietic, suffix meaning "production of something specified": *cholepoetic, oenopoetic, uropoetic.*

poetry therapy, a form of bibliotherapy in which a selected poem is used to evoke feelings and responses for discussion in a therapeutic setting. The poem may be a published work or one created by the patient, and poetic devices, such as rhythm, image, and metaphor contribute to the therapeutic effect.

pogonion /pō·gō′nē·on/ [Gk, diminutive of *pōgōn,* beard], the most anterior point in the contour of the chin in the sagittal plane.

-poiesis. See **-poesis.**

-poietic. See **-poetic.**

poikilo-, pecilo-, poecil-, prefix meaning "varied or irregular": *poikilocarynosis, poikiloderma, poikilothymia.*

poikilocytosis /poi′kilō′sītō′sis/ [Gk, *poikilos,* variation, *kytos,* cell, *osis,* condition], abnormal variation or red blood cell shape in a Wright-stained peripheral blood film. The term "poikilocytosis" is used only when the red blood cell shape cannot be more specifically defined. Compare **sickle cell, target cell, ovalocytes, schistocyte.**

poikiloderma atrophicans vasculare /-dur′mə/ [Gk, *poikilos,* variation, *derma,* skin, *a* + *trophe,* not nourishment; L, *vasculum,* little vessel], an abnormal skin condition characterized by hyperpigmentation or hypopigmentation, telangiectasia, and atrophy of the epidermis. It may be symmetric or patchy, localized, or widespread. It tends to be permanent.

poikiloderma congenitale. See **Rothmund-Thomson syndrome.**

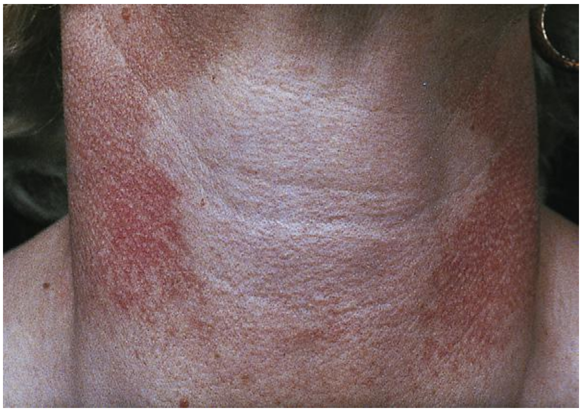
poikiloderma of Civatte, a common benign progressive dermatitis characterized by erythematous patches on the face and neck that become dry and scaly. As the condition progresses, pigment is deposited around the hair follicles, extending down the lateral aspects of the neck. Photosensitivity is sometimes associated with this dermatitis. Also called **reticulated pigmented poikiloderma.**

poikilothermic. See **cold-blooded.**

point [L, *punctus,* pricked], a small spot or designated area.

point A. See **subspinale.**

point behavior [L, *punctus,* pricked; AS, *bihabban,* to behave], the orientation of body parts in a certain direction within a quantum of space.



Poikiloderma of Civatte *(du Vivier, 2002)*

point forceps, a dental hand instrument with a flexible metal quick-release lock used to hold filling cones during their placement in root canal filling. Also called **insertion forceps, lock forceps,** or *locking forceps.*

point lesion, a disruption of single chemical bonds caused by effects of ionizing radiation on a macromolecule. Also called **molecular lesion.**

point mutation [L, *punctus,* pricked, *mutare,* to change], a mutation in which only a single nucleotide of DNA is changed.

point of maximum impulse (PMI), the place where the apical pulse is palpated as strongest, often in the fifth intercostal space of the thorax, just medial to the left midclavicular line.

point-of-service plan, (in the United States) a plan in which the member may seek care outside the network or directly from preferred providers with initial evaluation by a primary care provider but must pay a deductible and/or copayment.

point Po. See **porion.**

point system, (in the United States) a specialty capitation method in which points are assigned for each patient seen in specific diagnostic or service categories. Periodically points are totaled and income distributed proportionately.

poise /poiz/ [Jean L.M. Poiseuille, French physiologist, 1799–1869], a unit of liquid or gas (fluid) viscosity expressed in terms of grams per centimeter per second (g × cm^{-1} × sec^{-1}). The centipoise, or 1/100 of a poise, is more commonly used.

poison /poi′zən/ [L, *potio,* drink], any substance that impairs health or destroys life when ingested, inhaled, or absorbed by the body in relatively small amounts. Some toxicologists suggest that, depending on the dose, all substances are poisons. Many experts state that it is impossible

Point of maximum impulse *(Seidel et al, 2011)*

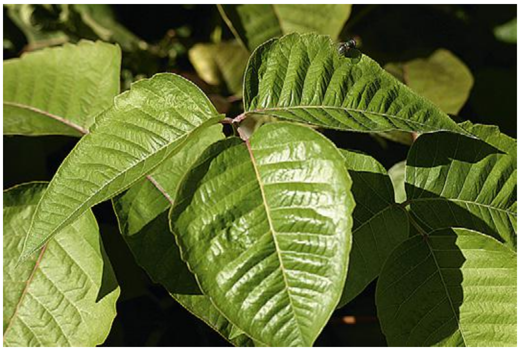
to categorize any chemical as either safe or toxic and that the real concern is the risk or hazard associated with the use of any substance. Clinically all poisons are divided into those that respond to specific treatments or antidotes and those for which there is no specific treatment. Research continues to develop effective antitoxins for poisons, but there are relatively few effective antidotes. Maintaining respiration and circulation is the most important aspect of treatment. See also **poisoning treatment.** **—poisonous,** *adj*.

poison center, a telephone service with toxicology experts providing emergency treatment advice for all kinds of poisonings 24 hours a day. Poison control centers also provide poison prevention information to the community and education about recognition and treatment of poison exposures for health care providers. By gathering data about the outcomes of poison exposures, they also identify new or unexpected toxic hazards, allowing for product recalls, reformulations, or repackaging. Their staffs include physicians, nurses, and pharmacists with training in toxicology. Poison centers provide 24-hour service and can be reached by calling 1-800-222-1222. Also called *poison control center.*

poisoning, **1.** the act of administering a toxic substance. **2.** the condition or physical state produced by the ingestion of, injection of, inhalation of, or exposure to a poisonous substance. Identification of the poison ingredients and presentation of a container label are critical to expeditious diagnosis and treatment.

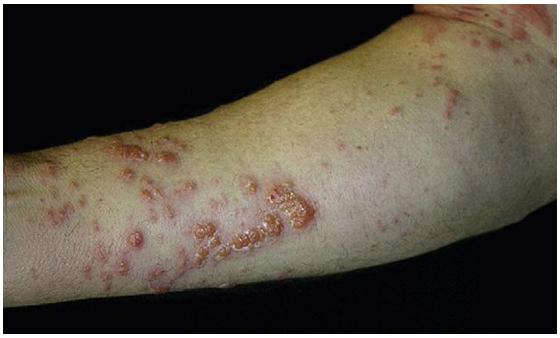
poisoning treatment, the symptomatic and supportive care given a patient who has been exposed to or who has ingested a toxic drug, commercial chemical, or other dangerous substance. In the case of oral poisoning a primary effort should be directed toward recovery of the toxic substance before it can be absorbed into the body tissues. If vomiting does not occur spontaneously, it usually should be induced after first identifying the poison, if possible, and calling a poison control center. If the poison is a petroleum distillate, such as kerosene, or a caustic or corrosive substance, vomiting should not be induced. Before any attempt to induce emesis, the victim, if conscious, should be given one or two glasses of milk or water. A carbonated beverage should never be given to an oral poisoning patient. Because of the danger of hypernatremia, the patient, particularly a child, should not be given water containing salt or mustard. Syrup of ipecac can be given, if available, to induce vomiting, and the dose can be repeated one time. If the ipecac fails to induce vomiting, vomiting should be encouraged by stimulating the patient's gag reflex at the back of the throat. Ipecac, which can be a GI irritant, should not be allowed to remain in the stomach. It also should not be given with milk or charcoal, both of which can interfere with its action. In certain cases an antidote may be administered to render the poison inert or to prevent its absorption, as by giving a mild solution of vinegar or citrus juice to neutralize an alkali. A physician should be summoned to take charge of the case.

poison ivy, any of several species of climbing vine of the genus ***Rhus,*** characterized by shiny three-pointed leaves. It is common in North America and causes severe allergic contact dermatitis in many people. Localized vesicular eruption with itching and burning results and may be treated with antipruritic lotions, cool compresses, or topical corticosteroid ointment or cream. Severe cases may require corticosteroids given intramuscularly or orally. See also **rhus dermatitis, urushiol.**



Poison ivy *(Sasseville, 2009)*

poison ivy dermatitis [L, *potio,* drink; ME, *ivi* + Gk, *derma,* skin, *itis,* inflammation], an allergic contact dermatitis caused by exposure to a nonvolatile oil, toxicodendrol, present in the leaves and other plant parts of poison ivy, a member of the *Rhus toxicodendron* species. Other ***Rhus*** species producing the same kind of contact dermatitis are poison oak and poison sumac. Also called **rhus dermatitis.**



Poison ivy dermatitis *(Sasseville, 2009)*

poison oak, any of several species of shrub of the genus *Rhus,* common in North America. Skin contact results in allergic dermatitis in many people. The characteristics and treatment of the condition are similar to those of poison ivy. See also **poison ivy, rhus dermatitis, urushiol.**

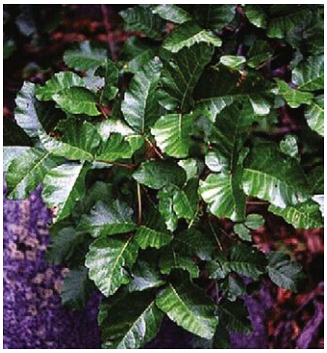
Poisonous plants

Plant	*Toxic parts*
Apple	Leaves, seeds
Apricot	Leaves, stem, seed pits
Azalea	All parts
Buttercup	All parts
Castor	Bean or seeds—extremely toxic
Cherry (wild or cultivated)	Twigs, seeds, foliage
Daffodil	Bulbs
Dumb cane (dieffenbachia)	All parts
Elephant ear	All parts
English ivy	All parts
Foxglove	Leaves, seeds, flowers
Holly	Berries, leaves
Hyacinth	Bulbs
Ivy	Leaves
Mistletoe*	Berries, leaves
Oak tree	Acorn, foliage
Philodendron	All parts
Plum	Pit
Poinsettia†	Leaves
Poison ivy, poison oak	Leaves, fruit, stems, smoke from burning plants
Pokeweed, pokeberry	Roots, berries, leaves (when eaten raw)
Pothos	All parts
Rhubarb	Leaves
Tulip	Bulbs
Water hemlock	All parts
Wisteria	Seeds, pods
Yew	All parts

*Eating one or two berries or leaves is probably nontoxic.

†Toxic if ingested in massive quantities.

From Hockenberry MJ, Wilson D: *Wong's nursing care of infants and children*, ed 9, St Louis, 2011, Mosby.



Poison oak *(Frogerg, Ibrahim, and Furbee, 2007)*

poisonous. See **poison.**

poison sumac /so͞o′mak/, a shrub of the genus *Rhus,* common in North America. Skin contact results in allergic dermatitis in many people. The characteristics and treatment of the condition are similar to those of poison ivy. See also **poison ivy, rhus dermatitis, urushiol.**

poker spine. See **bamboo spine.**

Poland's syndrome /pō′ləndz/ [Alfred Poland, British physician, 1820–1872], unilateral absence of the sternocostal head of the pectoralis major muscle and ipsilateral syndactyly. Also called **Poland's anomaly.**

polar [L, *polus,* pole], pertaining to molecules that have atoms bearing substantial partial electric charges that are not distributed symmetrically. These molecules are hydrophilic, tending to attract or aggregate with water. Polar substances tend to dissolve in polar solvents. Compare **nonpolar.** See also **pole, polus.**

Polaramine, a trademark for an antihistaminic **(dexchlorpheniramine maleate).**

polar body, one of the small cells produced during the two meiotic divisions in the maturation of a female gamete, or ovum. Polar bodies are nonfunctional and incapable of being fertilized. See also **oogenesis.**

polarity /pōler′itē/ [L, *polus*], **1.** the existence or manifestation of opposing qualities, tendencies, or emotions, such as pleasure and pain, love and hate, strength and weakness, dependence and independence, and masculinity and femininity. The concept is central to various psychotherapeutic approaches, such as client-centered therapy, in which the key to self-actualization lies in accepting polarity within oneself. **2.** (in physics) the distinction between a negative and a positive electric charge.

polarity therapy, a bodywork technique that combines tissue manipulation with theories of vital energy derived from ayurveda and acupuncture. It is believed that energy blockages within the body result in imbalances, which in turn manifest as pain. Manipulation, using light touch and medium and deep pressure, is used to release these energy blockages and restore balance. Exercise and nutritional and life-style counseling may also be included in the therapy.

polarization /pō′lərīzā′shən/ [L, *polus* + Gk, *izein,* to cause], the concentration, within a population or group, of members' interests, beliefs, and allegiances around two conflicting positions.

polarization microscope [L, *polus,* pole; Gk, *mikros,* small, *skopein,* to view], a microscope that uses polarized light for special diagnostic purposes, such as examining crystals of chemicals found in patients with gout and related disorders.

polarized light /po′lərīzd/ [L, *polus* + AS, *leoht*], light that is propagated in such a way that the radiation waves occur in only one direction in the vibration plane and not at random.

polarographic oxygen analyzer /pō′lərōgraf′ik/, an electrochemical device used to analyze the proportion of oxygen molecules in respiratory care systems. The oxygen is measured in terms of an electron current produced after it acquires electrons from a negative electrode in a hydroxide bath. Batteries are used to polarize the electrodes in the bath.

pole [L, *polus*], **1.** (in biology) an end of an imaginary axis drawn through the symmetrically arranged parts of a cell, organ, ovum, or nucleus. **2.** one of a pair of opposite forces or attractants, as in magnetism or electricity. **3.** (in anatomy) the point on a nerve cell at which a dendrite originates. **—polar,** *adj.*

poles of kidney, either end of an axis through the length of a kidney. They are designated as the **upper pole of kidney** (extremitas superior renis) and the **inferior pole of kidney** (extremitas inferior renis).

pol gene, a segment of a retrovirus, such as the human immunodeficiency virus, that encodes its reverse transcriptase enzyme.

policy /pol′isē/ [Gk, *politeia,* the state], a principle or guideline that governs activities in a facility that employees or members of the institution or organization are expected to follow.

polio. See **poliomyelitis.**

polio-, prefix meaning "gray matter in the nervous system": *polioclastic, polioencephalitis, poliomyelitis.*

polioencephalitis /pō′lē·ō′ensef′əlī′tis/ [Gk, *polios,* gray, *enkephalos,* brain, *itis*], an inflammation of the gray matter of the brain caused by infection of the brain by a poliovirus.

polioencephalomeningomyelitis /pō′lē·ō′ensef′əlō′məning′gōmī′əlī′tis/ [Gk, *polios*, gray, *enkephalos*, brain, *meninx*, membrane, *myelos*, marrow, *itis*, inflammation], an inflammation that involves the gray matter of the brain and spinal cord and also the meninges.

polioencephalomyelitis /pō′lē·ō′ensef′əlōmī′əlī′tis/ [Gk, *polios* + *enkephalos* + *myelos*, marrow, *itis*], inflammation of the gray matter of the brain and the spinal cord, caused by infection by a poliovirus.

polioencephalopathy /pō′lē·ō′ensef′əlop′əthē/ [Gk, *polios*, gray, *enkephalos*, brain, *pathos*, disease], a pathological condition affecting the gray matter of the brain.

poliomyelitis /pō′lē·ōmī′əlī′tis/ [Gk, *polios* + *myelos*, marrow, *itis*], an infectious disease caused by one of the three polioviruses. Asymptomatic, mild, and paralytic forms of the disease occur. Several factors influence susceptibility to the virus and the course of the disease: More boys than girls are severely affected, stress increases susceptibility, more pregnant than nonpregnant women acquire the paralytic form of the disease, and the severity of the infection increases with age. It is transmitted from person to person through fecal contamination or oropharyngeal secretions. The disease is prevented by vaccination. Also called *(informal)* **polio.** See also **acute atrophic paralysis, poliovirus.**

■ OBSERVATIONS: Asymptomatic infection has no clinical features, but it confers immunity. Abortive poliomyelitis lasts only a few hours and is characterized by minor illness with fever, malaise, headache, nausea, vomiting, and slight abdominal discomfort. Nonparalytic poliomyelitis is longer lasting and is marked by meningeal irritation with pain and stiffness in the back and by all the signs of abortive poliomyelitis. Paralytic poliomyelitis begins as abortive poliomyelitis. The symptoms abate, and for several days the person seems well. Malaise, headache, and fever recur; pain, weakness, and paralysis develop. The peak of paralysis is reached within the first week. In spinal poliomyelitis, viral replication occurs in the anterior horn cells of the spine, causing inflammation, swelling, and, if severe, destruction of the neurons. The large proximal muscles of the limbs are most often affected. Bulbar poliomyelitis results from viral multiplication in the brainstem. Bulbar and spinal poliomyelitis often occur together.

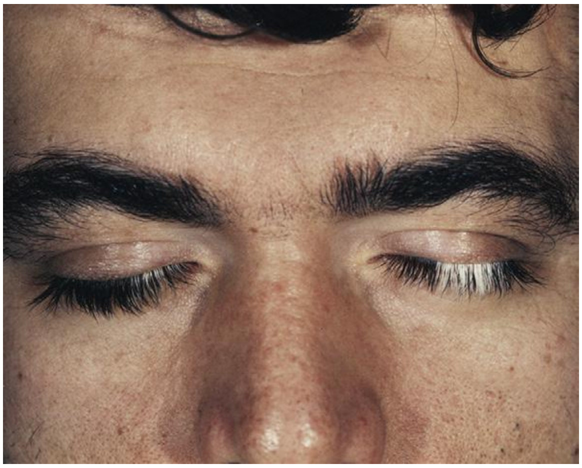
poliomyelitis vaccine. See **poliovirus vaccine.**

poliomyelitis virus. See **poliovirus.**

poliosis /pō′lē·ō′sis/ [Gk, *polios* + *osis*, condition], depigmentation of the hair on the scalp, eyebrows, eyelashes, mustache, beard, or body. The condition may be inherited and generalized or acquired and localized in patches. Acquired localized poliosis often occurs in alopecia areata.

poliovirus /-vī′rəs/ [Gk, *polios* + L, *virus*, poison], a member of the family Picornaviridae and the causative organism of poliomyelitis. This very small ribonucleic acid virus has three serologically distinct types. Infection or immunization with one type does not protect against the others. Also called **poliomyelitis virus.**

poliovirus vaccine, a vaccine prepared from poliovirus to confer immunity to it. The inactivated poliovirus vaccine (IPV) is a suspension of three strains of polioviruses that have been inactivated in formalin so that normal activity of the organisms has been destroyed. IPV is given subcutaneously at 2 mo, 4 mo, between 6 and 18 mo, and between 4 and 6 yr, and is the form of vaccination recommended in the United States. A trivalent live oral form of vaccine, TOPV, rarely causes vaccine-associated paralysis after administration. This reaction has not occurred with IPV and is the reason that use of TOPV is being discontinued in the United States. TOPV is, nevertheless, the treatment of choice in areas of the world where polio is still endemic. Also called **poliomyelitis vaccine; poliovirus vaccine, inactivated; Salk vaccine**.



Poliosis *(Hordinsky, Sawaya, and Scher, 2000)*

poliovirus vaccine, inactivated. See **poliovirus vaccine.**

polishing [L, *polire*, to make smooth], **1.** creation of a smooth and glossy finish on a surface, as of a tooth, dental restoration, or denture. **2.** a tendency of patients with right temporal lobe lesions to deny dysphoric affect and minimize socially disapproved behavior while exaggerating other qualities.

Politano-Leadbetter technique, a type of ureteroneocystostomy in which the ureter is excised from its attachment to the bladder and reattached in a more medial and superior position.

political nursing /pəlit′ikəl/ [Gk, *politia*, the state, *nutrix*, nurse], the use of knowledge about power processes and strategies to influence the nature and direction of health care and professional nursing. The constituency of political nursing is patients, both diagnosed and potential, as communities, groups, or individuals.

pollen allergy. See **hay fever**.

pollen coryza. See **hay fever.**

pollenogenic, pertaining to a plant that produces pollen or something that is produced by pollen.

pollex /pol′eks/ *pl.* **pollices** [L], **1.** the thumb. **2.** the big toe.

pollinosis. See **hay fever.**

pollutant /pəlo͞o′tənt/ [L, *polluere*, to defoul], an unwanted substance that occurs in the environment, usually with health-threatening effects. Pollutants may exist in the atmosphere as gases or fine particles that may be irritating to the lungs, eyes, and skin; in drinking water as dissolved or suspended substances; and in foods or beverages as carcinogens or mutagens.

polonium (Po) /pəlō′nē·əm/ [Polonia, Poland], a radioactive element that is one of the disintegration products of uranium. Its atomic number is 84; its atomic mass is approximately 210.

polus /pō′ləs/ *pl.* *poli* [L, pole], either of the opposite ends of any axis; the official anatomical designation for the extremity of an organ. See also **pole.** **—polar,** *adj*.

poly-, prefix meaning "many or much": *polyacid*, *polycholia*, *polydactylia*.

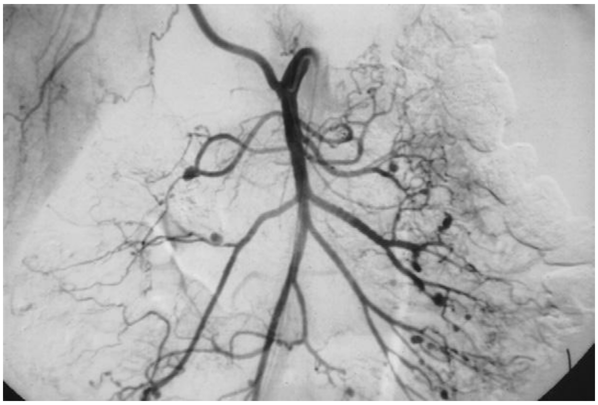
polyacrylamide /-akril′əmīd/, a polymer of acrylamide and, usually, some cross-linking derivative.

polyamine /pol′ē·am′ēn/, any compound that contains two or more amine groups, such as spermidine, spermine, and putrescine that are normally found in human tissue. Many polyamines function as essential growth factors in microorganisms such as in DNA synthesis and gene expression.

polyanionic /pol′ē·an′ī·on′ik/ [Gk, *polys*, many, *ana*, not, jenai, to go], pertaining to multiple negative electric charges.

polyarteritis /pol′ē·är′tərī′tis/ [Gk, *polys* + *arteria*, airpipe, *itis*, inflammation], an abnormal inflammatory condition of several arteries.

polyarteritis nodosa, a severe and poorly understood collagen vascular disease in which widespread inflammation and necrosis of small and medium-sized arteries and ischemia of the tissues they serve occur. Any organ or organ system may be affected. The disease attacks men and women between 20 and 50 years of age. Its cause is unknown, although immunological factors are suspected. Polyarteritis nodosa may be acute and rapidly fatal or chronic and wasting. It is characterized by fever, abdominal pain, weight loss, neuropathy, and, if the kidneys are affected, hypertension, edema, and uremia. Some symptoms may mimic those of GI or cardiac disorders. Diagnosis is based on the clinical signs, results of laboratory tests, and findings of biopsy of sites affected by the disease. Aggressive treatment includes massive doses of corticosteroids and immunosuppressive drugs. Physical therapy helps the patient to maintain muscle tone and prevents or slows the development of disability.



Polyarteritis nodosa *(Goldman et al, 2012)*

polyarthralgia /pol′e·ärthral′jə/ [Gk, *polys* + *arthron*, joint, *algos*, pain], pain in several joints simultaneously.

polyarthritis /-ärthrī′tis/, an inflammation that involves more than one joint. The inflammation may migrate from one joint to another, or there may be simultaneous involvement of two or more joints.

polyarticular /-ärtik′yələr/ [Gk, *polys*, many, *articulus*, joint], pertaining to many joints.

polycarbonate glasses. See **safety glasses.**

polycarboxylate cement /pol′ēkär·bok′si·lāt/, a dental cement used as a luting agent for cementing restorations and as a cavity lining.

polychlorinated biphenyls (PCBs) /-klôr′inā′tid/, a group of more than 30 isomeric compounds used in plastics, insulation, and flame retardants and varying in physical form from oily liquids to crystals and resins. All are potentially toxic and carcinogenic. The toxicity varies with the type of PCB and concurrent exposure to other substances, such as carbon tetrachloride. Mild exposure may cause chloracne; severe exposure may result in hepatic damage.

polychondritis /pol′ēkon·drī′tis/ [Gk, *polys*, many + *chondros*, cartilage + *-itis*, inflammation], inflammation involving many cartilages of the body.

polychromasia, **1.** variation in the hemoglobin content of erythrocytes. **2.** See **polychromatophilia.**

polychromatic /-krōmatik/ [Gk, *polys* + *chroma*, color], a light of many colors or wavelengths. The term is usually applied to white light, although it may also refer to a defined part of the spectrum.

polychromatophil /pol′ēkrōmat′əfil/, any cell or structure that may be stained by several different dyes.

polychromatophilia /pol′ēkrō′matəfil′yə/ [Gk, *polys* + *chroma* + *philein*, to love], an elevated reticulocyte count on a peripheral blood film stained with new methylene blue dye or an increase in the number of polychromatophilic red blood cells on a Wright-stained blood film. Reticulocytosis or polychromatophilia indicates bone marrow regeneration in hemolytic anemia or chronic blood loss. Also called **polychromasia.**

Polycillin, a trademark for an antibacterial **(ampicillin).**

polyclinic, **1.** a hospital affiliated with a school that does not limit practice to a specific specialty. It is usually a component of a hospital's name in the United States. **2.** an institution providing a wide range of health services that does not require an overnight stay. Polyclinics are more numerous in the European Union, Russia, and India than in the U.S.

polyclonal /pol′ēklō′nəl/ [Gk, *polys* + *klon*, cutting], pertaining to or designating a group of cells or organisms derived from several cells. Compare **monoclonal.**

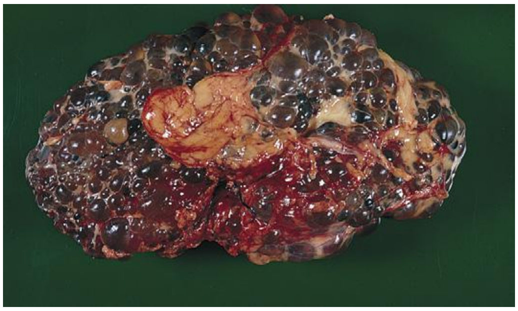
polyclonal gammopathy. See **gammopathy.**

Polycose, a trademark for an easily digestible and rapidly absorbed nutritional supplement for oral and tube feeding containing glucose polymers. It is not formulated for use as the sole source of nutrition.

polycystic /-sis′tik/ [Gk, *polys* + *kystis*, bag], characterized by the presence of many cysts.

polycystic kidney disease (PKD), an abnormal condition in which the kidneys are enlarged and contain many cysts. There are two unrelated hereditary diseases in which there is massive enlargement of the kidney with cyst formation: *Autosomal dominant polycystic kidney disease* (ADPKD), formerly called adult polycystic kidney disease, is the most common type of cystic disease of the kidneys. It is usually manifested during the third decade of life. Renal failure may appear by the fifth decade, with terminal failure occurring in the next 10 years, although in some cases it never appears. Although there is rarely any liver dysfunction accompanying this disorder, cyst formation in the liver does occur. *Autosomal recessive polycystic kidney disease* (ARPKD), formerly called childhood polycystic kidney disease, is diagnosed at birth or in the first 10 years of life and is much less common than the autosomal dominant form. Both the kidney and the liver are involved, causing renal failure and liver failure with portal hypertension Characteristic symptoms early in the process include pain, hematuria, urinary tract infection, kidney stones, and obstructive uropathy with anuria.

■ TREATMENT: Treatment of both types of polycystic kidney disease is largely symptomatic. Renal dialysis and kidney transplantation during end-stage renal disease can prolong life but offer no cure. Families with histories of polycystic kidney disease benefit from genetic counseling and may need help in coping with the prospect of future offspring affected with the disease.



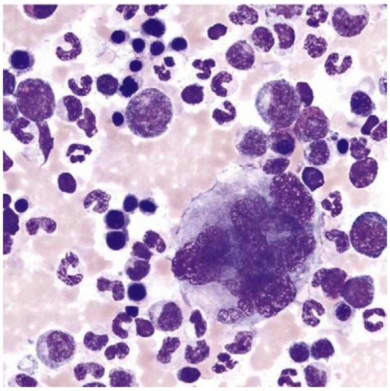
Polycystic kidney disease *(Damjanov, 2012)*

polycystic liver, congenital cystic disease of the liver. Also called **polycystic liver disease.**

polycystic ovary syndrome (PCOS), an endocrine disturbance characterized by anovulation, amenorrhea, hirsutism, and infertility. It is caused by increased levels of testosterone, estrogen, and luteinizing hormone (LH) and decreased secretion of follicle-stimulating hormone (FSH). The increased level of LH associated with this disorder may be the result of an increased sensitivity of the pituitary to stimulation by releasing hormone or of excessive stimulation by the adrenal gland. It may also be associated with a variety of problems in the hypothalamic-pituitary-ovarian axis, with extragonadal sources of androgens, or with androgen-producing tumors. This condition is transmitted as an X-linked dominant or autosomal-dominant trait. The depressed but continuous production of FSH associated with this disorder causes continuous partial development of ovarian follicles. Numerous follicular cysts, 2 to 6 mm in diameter, may develop. The affected ovary commonly doubles in size and is invested by a smooth pearly white capsule. The increased level of estrogen associated with this abnormality raises the risk of cancers of the breast and endometrium. Depending on the severity of symptoms and the patient's desire to become pregnant, treatment involves suppression of hormonal stimulation of the ovary, usually by use of female hormones or resection of part of one or both ovaries. Also called *hyperandrogenic chronic anovulations,* **Stein-Leventhal syndrome.**

polycythemia /pol′ēsīthē′mē·ə/ [Gk, *polys* + *kytos,* cell, *haima,* blood], an increase in the red blood cell count and circulating red blood cell mass that may be primary or secondary to pulmonary disease, heart disease, or prolonged exposure to high altitudes. Also called **Osler's disease, polycythemia vera.** Compare **hypoplastic anemia, leukemia.** See also **altitude sickness, erythrocytosis.**

■ OBSERVATIONS: Clinical manifestations for polycythemia include weakness and fatigue; headache and vertigo; visual disturbances (scotoma, double or blurred vision); dyspnea; nosebleeds; night sweats; and epigastric and joint pain. Later signs include pruritus, clubbing of digits, a reddened face with engorged retinal veins, and hepatosplenomegaly. Secondary polycythemia may display hypoxemia in the absence of hepatosplenomegaly and hypertension. Lab results in primary polycythemia include elevated red blood cell counts; elevated white blood cell counts with basophilia; elevated hemoglobin; thrombocytosis; elevated alkaline phosphatase, uric acid, and albumin, and elevated histamine levels with low serum erythropoietin levels. Bone marrow aspiration shows panmyelosis. Thrombosis, cerebrovascular accident, peptic ulcers, myeloid metaplasia, leukemia, and hemorrhage are common complications in primary polycythemia and result in the death of about 50% of untreated individuals within 18 months of the appearance of symptoms. The median survival rate in treated individuals is 7 to 15 years.



Polycythemia *(Carr and Rodak, 2008)*

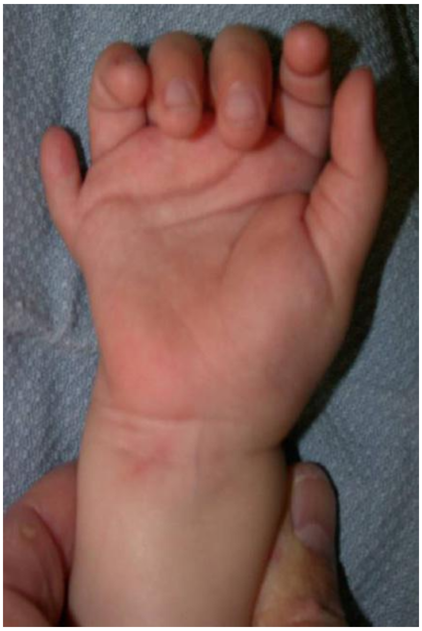
■ INTERVENTIONS: Management of secondary polycythemia is directed at treating the underlying causes. The treatment for primary polycythemia is directed at reducing blood volume and viscosity and inhibiting bone marrow activity. The treatment mainstay is serial phlebotomy and is used to reduce RBC mass. Hydration therapy is used to reduce blood viscosity. Chemotherapeutic agents may be used to induce myelosuppression. Adjunctive therapy includes allopurinol to treat hyperuricemia, antihistamines to reduce pruritus, analgesics for joint pain, and antacids for gastric hyperacidity. A splenectomy may be indicated to treat resistant splenomegaly.

■ NURSING CONSIDERATIONS: Nursing during the acute phase includes careful monitoring of intake and output during hydration therapy and phlebotomy to avoid overhydration or underhydration. Comfort measures are instituted to relieve joint pain, itching, and heartburn. Passive and active range of motion and ambulation are used to promote circulation and prevent thrombus formation. If chemotherapeutic agents are used, education is needed about effects and side effects. Education is also important, and stress is placed on the chronic nature of disease, the need for long-term phlebotomy treatment, and the impending complications that will occur if the disease is left untreated.

polycythemia rubra vera (PV) [Gk, *polys,* many, *kytos,* cell, *haima,* blood, L, *ruber,* red, *verus,* true], a myeloproliferative neoplasm characterized by an elevated red blood cell count and mass, hematocrit, hemoglobin, leukocytes, and thrombocytosis. The skin and mucous membranes acquire a maroon or plum color, and hepatomegaly, splenomegaly, hypertension, and neurological symptoms develop. The condition is associated with the JAK2 mutation. Also called **primary polycythemia.**

polycythemia vera. See **polycythemia.**

polydactyly /-dak′tilē/ [Gk, *polys* + *daktylos,* finger], a congenital anomaly characterized by the presence of more than the normal number of fingers or toes. The condition is usually inherited as an autosomal-dominant characteristic and can usually be corrected by surgery shortly after birth. Also called **hyperdactyly,** *polydactylia, polydactylism.*



Polydactyly *(Chung, 2009)*

polydipsia /pol′ēdip′sē·ə/ [Gk, *polys* + *dipsa,* thirst], **1.** excessive thirst. It is characteristic of several different conditions, including diabetes mellitus, in which an excessive concentration of glucose in the blood osmotically pulls intracellular fluid into the bloodstream and increases the excretion of fluid via increased urination, which leads to hypovolemia and thirst. In diabetes insipidus the deficiency of the pituitary antidiuretic hormone results in excretion of copious amounts of dilute urine, reduced fluid volume in the body, and polydipsia. In nephrogenic diabetes insipidus there is also copious excretion of urine with consequent polydipsia. Polyuria resulting from other forms of renal dysfunction also leads to polydipsia. The condition also may be psychogenic in origin. **2.** *(informal)* alcoholism.

polyelectrolyte /pol′ē·ilek′trəlīt/ [Gk, *polys* + *elektron,* amber, *lytos,* soluble], a substance with many charged or potentially charged groups.

polyendocrine deficiency syndromes. See **polyglandular autoimmune syndromes.**

polyene, **1.** a chemical compound with a carbon chain of four or more atoms and several conjugated double bonds. **2.** any of a group of antibiotic, antifungal agents with similar structure, such as Amphotericin B or Nystatin; they are produced by a species of *Streptomyces* that damage cell membranes by forming complexes with sterols.

polyesthesia /pol′ē·esthē′zhə/ [Gk, *polys* + *aisthesis,* feeling], a sensory disorder involving the sense of touch in which a stimulus to one area of the skin is also felt at nonstimulated sites.

polyestradiol phosphate /-es′trədī′ôl/, a polymer of estradiol phosphate having estrogenic activity similar to that of estradiol. Among the more serious adverse effects are loss of libido, impotence, gynecomastia, fluid retention and edema, and, rarely, cholestatic jaundice.

polyethylene /pol′ē·eth′ilēn/, a strong but flexible synthetic resin produced by the polymerization of ethylene. Polyethylene materials have been used in surgery.

polyethylene glycol, a polymer of ethylene oxide and water, available in liquid form or as waxy solids used in various pharmaceutical preparations as a water-soluble ointment base. Polyethylene glycol is also used as a laxative.

polygene /pol′ējēn′/ [Gk, *polys* + *genein,* to produce], any of a group of nonallelic genes that individually exert a small effect but interact in a cumulative manner to produce a particular characteristic, usually of a quantitative nature, such as size, weight, skin pigmentation, or degree of intelligence. Also called **cumulative gene, multiple factor, multiple gene.** See also **multifactorial inheritance.** *—polygenic, adj.*

polygenic inheritance. See **multifactorial inheritance.**

polyglactin, a filamentous material that is used for absorbable sutures.

polyglandular autoimmune syndromes, a group of disorders manifested by subnormal functioning of more than one endocrine gland. Type I is characterized by the appearance of mucocutaneous candidiasis, often occurring in childhood, and is associated with hypoparathyroidism and adrenal insufficiency. It occurs in siblings, without involvement of other generations in the family. Type II involves primary adrenal insufficiency and primary thyroid failure occurring in the same patient for unclear reasons. Many of these patients have an autoimmune disorder and form antibodies against cellular fractions of many endocrine glands. Type II is also called **Schmidt's syndrome.** Also called **polyendocrine deficiency syndromes,** *polyglandular autoimmune diseases.*

polyglandular deficiency syndrome, primary failure of any combination of endocrine glands, including the adrenals, thyroid, gonads, parathyroids, and endocrine pancreas. It is often accompanied by autoimmune abnormalities that affect systems other than the endocrine system. Also called **multiple endocrine deficiency syndrome, multiple glandular deficiency syndrome.**

polyglucosan /-glo͞o′kəsan/ [Gk, *polys* + *glykys,* sweet], a large molecule consisting of many anhydrous polysaccharides.

polygraph /pol′ē·graf/ [Gk, *polys* + *graphein,* to write], an apparatus for simultaneously recording several mechanical or electrical impulses, such as blood pressure, pulse and respiration, and variations in electrical resistance of the skin; popularly known as **lie detector.**

polyhedral, having many sides or surfaces.

polyhidrosis. See **hyperhidrosis.**

polyhybrid /-hī′brid/ [Gk, *polys* + L, *hybrida,* offspring of mixed parents], pertaining to or describing an individual, organism, or strain that is heterozygous for more than three specific traits or gene pairs or that is the offspring of parents differing in more than three specific gene pairs.

polyhybrid cross, the mating of two polyhybrid individuals, organisms, or strains.

polyhydramnios, an excessive amount of amniotic fluid (more than 2000 mL). See **hydramnios.**

polyidrosis. See **hyperhidrosis.**

polyleptic /pol′ēlep′tik/ [Gk, *polys* + *lambanein,* to seize], describing any disease or condition marked by numerous remissions and exacerbations.

■ INDICATIONS: This drug is used to treat facial fat loss in those with HIV.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

polymastia, the presence of supernumerary mammary glands or nipples.

polymenorrhea, an abnormally frequent recurrence of the menstrual cycle. Also called *polymenia.*

polymer /pol′imər/ [Gk, *polys* + *meros,* part], a compound formed by combining or linking a number of monomers, or small molecules. A polymer may be composed of many units of more than one type of monomer (a copolymer) or of many units of the same monomer (a homopolymer).

polymerase /pə·lim′ər·ās/, any enzyme that catalyzes polymerization, especially of nucleotides to polynucleotides.

polymerase chain reaction (PCR), a rapid technique for in vitro amplification of specific DNA or RNA sequences, allowing small quantities of short sequences to be analyzed without cloning. The process can be used to make prenatal diagnoses of genetic diseases and to identify an individual by analysis of a single tissue cell.

polymerization /pə·lim′ər·i·zā′shən/, the act or process of forming a compound (polymer), usually of high molecular weight, by the combination of simpler molecules **(monomers).**

polymerize /pol′əmərīz′/ [Gk, *polys,* many, *meros,* parts], to convert two or more molecules into a polymer.

polymethacrylate cement, a cement used in surgery and dentistry, consisting of an acrylic resin formed by the polymerization of methyl methacrylate monomers.

polymicrobial /-mīkrō′bē·əl/ [Gk, *polys,* many, *mikros,* small, *bios,* life], pertaining to a number of species of microbes.

polymicrobial necrotizing fasciitis. See **Fournier's gangrene.**

polymicrobic infection /-mīkrō′bik/ [Gk, *polys,* many, *mikros,* small, *bios,* life; L, *inficere,* to stain], an infection involving more than one species of pathogen. Also called **mixed infection.**

polymicrogyria. See **microgyria.**

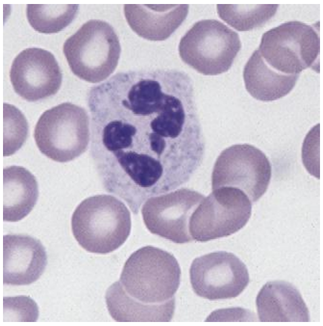
polymorphic /-môr′fik/ [Gk, *polys,* many, *morphe,* form], pertaining to the ability to assume two or more distinct forms, such as the existence of two or more forms of chromosomes or hemoglobins in a population.

polymorphism /pol′ēmôr′fizəm/ [Gk, *polys* + *morphe,* form], **1.** the state or quality of existing or occurring in several different forms. **2.** the state or quality of appearing in different forms at different stages of development. Kinds of polymorphism are **balanced polymorphism** and **genetic polymorphism. —polymorphic,** *adj.*

polymorphocytic leukemia /pol′ēmôr′fəsit′ik/ [Gk, *polys* + *morphe* + *kytos,* cell, *leukos,* white, *haima,* blood], a neoplasm of blood-forming tissues in which mature segmented granulocytes are predominant. Also called **mature cell leukemia, neutrophilic leukemia.**

polymorphonuclear /pol′ēmôr′fōno͞o′klē·ər/ [Gk, *polys* + *morphe* + L, *nucleus,* nut kernel], having a nucleus with a number of segments connected by fine threads of nuclear membrane.

polymorphonuclear neutrophil, a neutrophil with a segmented nucleus.



Polymorphonuclear cell *(Carr and Rodak, 2008)*

polymorphous /pol′ēmôr′fəs/ [Gk, *polys* + *morphe,* form], occurring in many varying forms, possibly changing in structure or appearance at different stages.

polymorphous light eruption, a common recurrent superficial vascular reaction to sunlight or ultraviolet light in susceptible individuals. Within 1 to 4 days after exposure to the light, small erythematous papules and vesicles appear on otherwise normal skin, then disappear within 2 weeks. A delayed allergic response is a possible cause. Tanning reduces the severity of the reaction.

polymyalgia rheumatica /-mī·al′jə/ [Gk, *polys* + *mys,* muscle, *algos,* pain, *rheuma,* flux], a chronic, episodic inflammatory disease of the large arteries that usually develops in people over 60 years of age. The disease primarily affects the arteries in muscles. It is characterized by pain and stiffness of the back, shoulder, or neck that is usually more severe on rising in the morning. There may also be a cranial headache, which affects the temporal and occipital arteries, causing a severe throbbing headache. Serious complications of polymyalgia rheumatica include arterial insufficiency, coronary occlusion, stroke, and blindness. Patients with the disease usually have a high erythrocyte sedimentation rate. The disease may follow a self-limited course. However, adrenocorticosteroids have proved highly effective in reducing inflammation and in speeding recovery.

polymyositis /pol′ēmī′ōsī′tis/ [Gk, *polys* + *mys,* muscle, *itis*], inflammation of many muscles, usually accompanied by deformity, edema, insomnia, pain, sweating, and tension. Some forms of polymyositis are associated with malignancy. See also **dermatomyositis.**

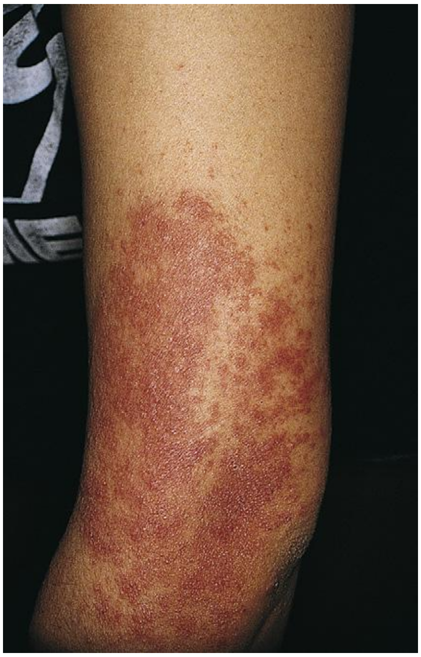
polymyxin B sulfate, an antibiotic.

■ INDICATION: It is commonly prescribed for infections of the eye and urinary tract.

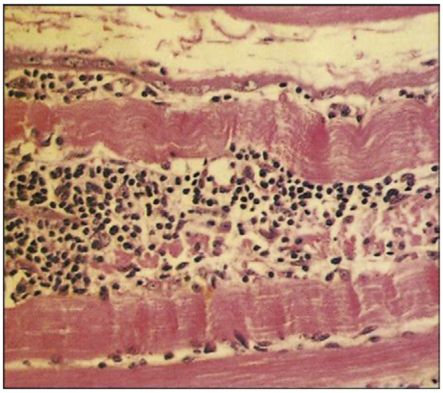
■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: When it is given topically, allergies are the most common problem.

polyneuralgia /-no͝oral′jə/ [Gk, *polys,* many, *neuron,* nerve, *algos,* pain], a type of neuralgia that affects several nerves at the same time.



Polymorphous light eruption *(Callen et al, 2000)*



Polymyositis: muscle biopsy *(Perkin, 2002)*

polyneuritis /-no͝orī′tis/ [Gk, *polys,* many, *neuron,* nerve, *itis,* inflammation], an inflammation involving many nerves.

polyneuropathy /-no͝orop′əthē/ [Gk, *polys,* many, *neuron,* nerve, *pathos,* disease], a condition in which many peripheral nerves are afflicted with a disorder.

polynuclear, having many nuclei.

polyoma papovavirus. See **papillocarcinoma.**

polyopia /pol′ē·ō′pē·ə/ [Gk, *polys* + *ops,* eye], a defect of sight in which one object is perceived as many images; multiple vision. The condition can occur in one or both eyes. See also **diplopia.**

polyp /pol′ip/ [Gk, *polys* + *pous,* foot], a small tumorlike growth that projects from a mucous membrane surface.

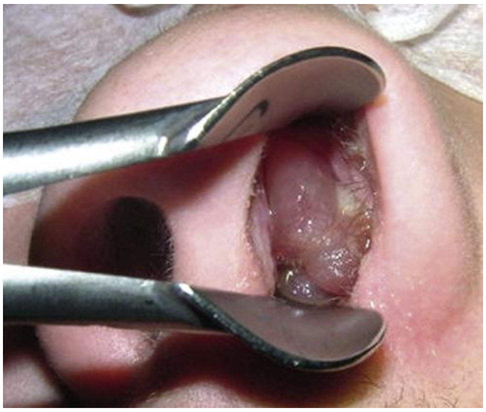
polypapilloma /-pap′ilō′mə/ [Gk, *polys,* many; L, *papilla,* nipple; Gk, *oma*], multiple papillomas or stalked tumors.

polypeptide /pol′ēpep′tīd/, a long chain of amino acids joined by peptide bonds. Very long polypeptides are usually called proteins. Polypeptides may be formed by partial hydrolysis of proteins or synthesized from free amino acids.

polyphagia /pol′ēfā′jē·ə/ [Gk, *polys* + *phagein,* to eat], excessive, uncontrolled eating. Also called **hyperphagia.** See also **bulimia.**

polypharmacy /-fär′məsē/, the use of a number of different drugs, possibly prescribed by different health care providers and filled in different pharmacies, by a patient who may have one or several health problems.

polyploid /pol′əploid/ [Gk, *polys* + *plous,* times], **1.** *n,* an individual, organism, strain, or cell that has more than twice the haploid number of chromosomes characteristic of the species. The multiple of the haploid number is denoted by the appropriate prefix, as in triploid, tetraploid, pentaploid, hexaploid, heptaploid, octaploid, and so on. Polyploidy is rare in animals, producing individuals that are abnormal in appearance and usually infertile. It is common in plants, however; such plants generally are larger, have larger cells, and are hardier than diploid plants. **2.** *adj,* also called **polyploidic.** pertaining to such an individual, organism, strain, or cell. Compare **aneuploid.** **—polyploidy,** *n.*



Nasal polyp *(Swartz, 2009)*

polyploidic. See **polyploid.**

polyploidy /pol′iploi′dē/, the state or condition of having more than two complete sets of chromosomes.

polypoid [Gk, *polys,* many, *pous,* foot, *eidos,* form], like a polyp or tumor on a stalk.

polyposis /-pōsis/ [Gk, *polys* + *pous,* foot, *osis,* condition], an abnormal condition characterized by the presence of numerous polyps. See also **familial polyposis.**

polyposis coli [Gk, *polys,* many, *pous,* foot, *osis,* condition, *kolikos* colon], a condition of multiple polyps in the large intestine.

polyradiculitis /pol′ērədik′yo͝olī′tis/ [Gk, *polys* + L, *radicula,* rootlet; Gk, *itis*], inflammation of many nerve roots, such as found in Guillain-Barré syndrome.

polyribosome. See **polysome.**

polysaccharide /-sak′ərīd/ [Gk, *polys* + *sakcharon,* sugar], a carbohydrate polymer that is formed from three or more molecules of simple carbohydrates. Examples of polysaccharides are dextrin, starch, glycogen, cellulose, gums, and insulin.

polysaccharide-iron complex, ferric iron complexed to a low-molecular-weight polysaccharide prepared by extensive hydrolysis of starch, used as an oral medication to increase iron levels.

polysome /pol′isōm/ [Gk, *polys* + *soma,* body], a group of ribosomes joined by a molecule of messenger RNA containing a portion of the genetic code that is to be translated. Polysomes are found in the cytoplasm during protein synthesis. Also called **ergosome, polyribosome.** See also **translation.**

polysomnographic technologist, a person who monitors sleep studies and records the relevant physiological variables. Also called **sleep technologist.**

polysomnography /pol′ē·som·nog′rə·fē/ [Gk, *polys,* many + L, *somnus,* sleep + Gk, *graphein,* to write or record], the polygraphic recording during sleep of multiple physiological variables, both directly and indirectly related to the state and stages of sleep, to assess possible biological causes of sleep disorders.

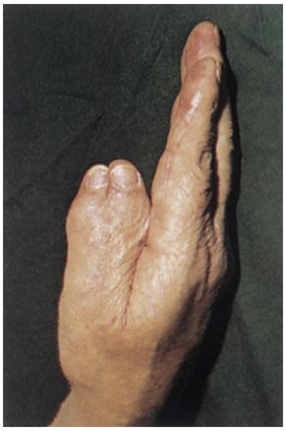
polysomy /pol′isō′mē/, the presence of more than two copies of a chromosome in an otherwise diploid somatic cell as the result of chromosomal nondisjunction during meiosis. The chromosome may be duplicated three (trisomy), four (tetrasomy), or more times. Males with Klinefelter's syndrome may have a genotype of XXY, XXXY, or XXXXY. Polysomic females with three, four, or five X chromosomes may have a higher frequency of mental retardation.

Polysporin, a trademark for an ophthalmic and topical fixed-combination antibiotic ointment containing two antibacterials **(polymyxin B sulfate** and **bacitracin).**

polysulfide polymer /pol′ēsul′fīd/, an elastomeric synthetic rubber used in dentistry as an impression material for fixed partial prosthodontic structures, inlays for single quadrants, and dental impressions. Also called *polysulfide rubber.*

polysynaptic /-sinap′tik/ [Gk, *polys,* many, *synaptein,* to join], pertaining to nerve cells that end in synapses.

polysyndactyly /-sindak′tilē/ [Gk, *polys,* many, *syn,* together, *daktylos,* finger or toe], multiple webbing or fusion between fingers or toes. Also called **synpolydactyly.**



Polysyndactyly *(Moll, 1997)*

polytene chromosome /pol′itēn/ [Gk, *polys* + *tainia,* band], an excessively large type of chromosome consisting of a large number of copies of the chromosome bundled side by side. Polytene chromosomes are produced by repeated rounds of DNA synthesis without mitosis and are bundles of unseparated chromonemata filaments found primarily in the salivary glands of certain insects. See also **giant chromosome.**

polythiazide /-thī·az′īd/, a thiazide diuretic.

■ INDICATIONS: It is prescribed as adjunctive therapy in the treatment of hypertension and edema.

■ CONTRAINDICATIONS: Anuria or known hypersensitivity to this drug, other thiazides, or sulfonamide derivatives prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypokalemia, hyperglycemia, hyperuricemia, and various hypersensitivity reactions.

polyunsaturated /-unsach′ərā′tid/ [Gk, *polys,* many; AS, *un,* not; L, *saturare,* to fill], pertaining to a chemical compound containing more than one double or triple bond that can be opened to accept more atoms into the molecule, thereby making the compound saturated. A polyunsaturated fatty acid is one in which there are two or more double bonds in the chain of carbon atoms that can be opened to accept hydrogen atoms.

polyunsaturated fatty acid. See **unsaturated fatty acid.**

polyuria /pol′ēyo͝or′ē·ə/ [Gk, *polys* + *ouron,* urine], the excretion of an abnormally large quantity of urine. Some causes of polyuria are diabetes insipidus, diabetes mellitus, use of diuretics, excessive fluid intake, and hypercalcemia.

polyvalent, denoting the capacity of an element to combine with two or more atoms.

polyvalent antiserum. See **antiserum.**

polyvalent vaccine /-vā′lənt/ [Gk, *polys,* many; L, *valere,* worth, *vaccinus,* cow], a vaccine prepared from several different antigens of a species. Also called **multivalent vaccine.**

Poly-Vi-Flor, a trademark for an oral fixed-combination pediatric drug containing several vitamins and sodium fluoride.

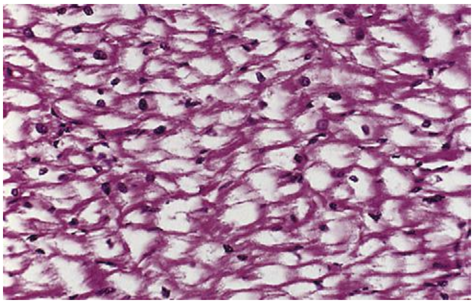
polyvinyl chloride (PVC) /-vī′nil/, a tasteless, odorless, clear hard resin with many industrial uses, including packaging, clothing, and insulation of pipes and wires. Workers in its manufacture are at risk primarily because of the toxicity of its parent compound, vinyl chloride. It releases hydrochloric acid when burned. Excessive inhalation of its dust can cause pneumoconiosis.

polyvinylidene fluoride (PVF$_2$) /-vīnil′idēn/, a commonly used piezoelectric material in a hydrophone. It is also used in imaging transducers.

Pomeroy technique, a method of tubal ligation in which a loop of fallopian tube is picked up and ligated at its base with an absorbable suture, about 5 cm from the uterine cornua, and the tied loop is then resected. Also called *Pomeroy operation*.

POMP /pomp/, an abbreviation for a combination drug regimen used in the treatment of cancer, containing three antineoplastics, *P*urinethol (mercaptopurine), *O*ncovin (vincristine sulfate), *m*ethotrexate, and *p*redniSONE (a glucocorticoid).

Pompe's disease [J.C. Pompe, twentieth-century Dutch physician; L, *dis,* opposite of; Fr, *aise,* ease], a rare genetic disorder that is a form of muscle glycogen storage disease, characterized by a generalized accumulation of glycogen resulting from a deficiency of acid maltase (alpha-1,4-glucosidase). It is usually fatal in infants, causing cardiac or respiratory failure. Children with Pompe's disease appear mentally retarded and hypotonic, seldom living beyond 20 years of age. In adults, muscle weakness is progressive, but the disease is not fatal. Also called **glycogen storage disease, type II.** See also **glycogen storage disease.**



Pompe's disease: glycogen in myocardial fibers
(Kumar et al, 2010/Courtesy Dr. Trace Worrell, Department of Pathology, University of Texas, Southwestern Medical Center, Dallas, Texas)

POMR, abbreviation for **problem-oriented medical record.**

pono-, prefix meaning "pain": *ponograph, ponopalmosis, ponophobia.*

ponos. See **kala-azar.**

pons /ponz/ *pl.* **pontes** [L, bridge], **1.** also called **bridge of Varolius.** a prominence on the ventral surface of the brainstem, between the medulla oblongata and the cerebral peduncles of the midbrain. The pons consists of white matter and a few nuclei and is divided into a ventral part and a dorsal part. The ventral part consists of transverse fibers separated by longitudinal bundles and small nuclei. The dorsal part comprises the tegmentum, which is a continuation of the reticular formation of the medulla containing the nucleus of the abducens nerve, the nucleus of the facial nerve, the motor nucleus of the trigeminal nerve, the sensory nuclei of the trigeminal nerve, the nucleus of the cochlear division of the eighth nerve, the superior olive, and the nuclei of the vestibular division of the eighth nerve. **2.** any slip of tissue connecting two parts of a structure or an organ of the body.—**pontine, pontile,** *adj,*

Ponstel, a trademark for an antiinflammatory and analgesic **(mefenamic acid).**

pont-, prefix meaning "bridge": *pontic, ponticulus, pontimeter.*

pontes. See **pons.**

Pontiac fever. See **Legionnaires' disease.**

pontic /pon′tik/ [L, *pons,* bridge], the suspended member of a removable partial denture or fixed bridge, such as an artificial tooth, usually occupying the space previously occupied by the natural tooth crown.

pontile, pontine. See **pons.**

pontine micturition center, a center in the pons that contributes to control of the bladder and inhibition of tension of the urethral sphincters.

pontine nucleus [L, *pons,* bridge, *nucleus,* nut kernel], nerve cells in the basilar part of the pons where impulses are relayed between the cerebrum and cerebellum.

pontine respiratory center. See **apneustic center.**

Pontocaine, a trademark for a local anesthetic **(tetracaine hydrochloride).**

PONV, abbreviation for **postoperative nausea and vomiting.**

pooled plasma [AS, *pol* + Gk, *plasma,* something formed], plasma pooled from many donors and used to prepare plasma protein derivatives. Source plasma is plasma collected specifically for the manufacture of derivatives; recovered plasma is plasma separated from whole blood donations.

poorly differentiated lymphocytic malignant lymphoma, a lymphoid neoplasm containing cells resembling lymphoblasts that have a fine nuclear structure and one or more nucleoli. Also called **lymphoblastic lymphoma, lymphoblastic lymphosarcoma, lymphoblastoma.**

popliteal /poplit′ē·əl, pop′litē′əl/ [L, *poples,* ham of the knee], pertaining to the area behind the knee.

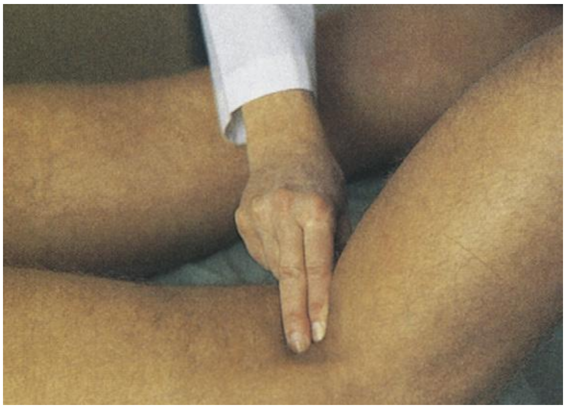
popliteal artery [L, *poples,* ham of the knee; Gk, *arteria,* airpipe], a continuation of the femoral artery, extending from the opening in the abductor magnus, passing through the popliteal fossa at the knee, dividing into 10 branches, and supplying various muscles of the thigh, leg, and foot. Its branches are the anterior tibial, posterior tibial, patellar rete, genicular articular, sural, medial superior genicular, lateral superior genicular, middle genicular, medial inferior genicular, and lateral inferior genicular.

popliteal fossa, the hollow at the posterior part of the knee.

popliteal node, a node in one of the groups of lymph glands in the leg. Approximately seven small popliteal nodes are embedded in the fat of the popliteal fossa at the back of the knee. Compare **anterior tibial node, inguinal node.**

popliteal pterygium syndrome, **1.** also called **popliteal web syndrome.** a congenital syndrome consisting chiefly of popliteal webs, cleft palate, lower lip pits, and dysplasia of the toenails. A wide variety of other abnormalities may be associated. **2.** also called **Fèvre-Languepin syndrome.** popliteal webbing associated with cleft lip and palate, fistula of the lower lip, syndactyly, nail dysplasia, and clubfoot.

popliteal pulse, the pulsation of the popliteal artery, behind the knee, best palpated with the patient lying prone with the knee flexed.



Assessment of the popliteal pulse *(Potter et al, 2011)*

popliteal web syndrome. See **popliteal pterygium syndrome** (def. 1).

population /pop′yəlā′shən/ [L, *populus,* the people], **1.** an interbreeding group of individuals characterized by genetic continuity through several generations. **2.** a group of individuals collectively occupying a particular geographic locale. **3.** any group that is distinguished by a particular trait or situation. **4.** any group from which samples may be measured for some variable characteristic for statistical purposes.

population at risk, a group of people who share a characteristic that causes each member to be susceptible to a particular event, such as nonimmunized children who are exposed to poliovirus or immunosuppressed people who are exposed to herpesvirus. Also called **vulnerable population.**

population genetics, a branch of genetics that applies mendelian inheritance to groups and studies the frequency of alleles and genotypes in breeding populations. See also **Hardy-Weinberg equilibrium principle.**

por-, poro-, prefix meaning "a cavity, opening, passage or pore": *porencephalia, porion, porotomy.*

poractant alfa, a lung surfactant extract.

■ INDICATION: It is used in the treatment (rescue) of respiratory distress syndrome in premature infants.

■ CONTRAINDICATION: None is currently known.

■ ADVERSE EFFECTS: Concurrent illnesses that have occurred during treatment with this drug include pulmonary air leaks, pulmonary interstitial emphysema, apnea, pulmonary hemorrhage, patent ductus arteriosus, intracranial hemorrhage, severe intracranial hemorrhage, necrotizing enterocolitis, posttreatment sepsis, and posttreatment infection. Adverse effects include bradycardia, oxygen desaturation, pallor, vasoconstriction, hypotension, and hypertension.

porcelain /por′sə·lən/, a white, translucent, dense ceramic material produced by fusing under high temperature a mixture of feldspar, kaolin, quartz, whiting, and other substances. See **dental porcelain.**

porcine /pôr′sīn/ [L, *porcinus,* pig-like], obtained from or related to hogs, such as porcine insulin.

porcine graft [L, *porcinus,* pig-like; Gk, *graphion,* plant stylus], a temporary biological heterograft made from the skin of a pig.

-pore, suffix meaning an "opening or passageway": *metapore, myelopore, neuropore.*

porfimer, a miscellaneous antineoplastic.

■ INDICATIONS: It is used to treat completely obstructing esophageal cancer and endobronchial non–small cell lung cancer.

■ CONTRAINDICATIONS: Factors that prohibit the use of this drug include porphyria, porphyrin allergy (porfimer), tracheoesophageal or bronchoesophageal fistula, and major blood vessels with eroding tumors.

■ ADVERSE EFFECTS: Life-threatening effects of this drug are cardiac failure, pleural effusion, and tracheoesophageal fistula. Other adverse effects are pneumonia, dyspnea, respiratory insufficiency, dehydration, weight decrease, anemia, photosensitivity reaction, urinary tract infection, and moniliasis. Common side effects include hypotension, hypertension, atrial fibrillation, tachycardia, abdominal pain, constipation, diarrhea, dyspepsia, dysphagia, eructation, esophageal edema and/or bleeding, hematemesis, melena, nausea, vomiting, anorexia, anxiety, confusion, and insomnia.

poriomania /pôr′ē·ōmā′nē·ə/, a tendency to leave home impulsively or to be a vagabond.

porion /por′ē·on/ [Gk. *poros,* passage], the most lateral point on the roof of the bony external acoustic meatus, vertically over the middle of the meatus. Also called **point Po.**

pork tapeworm. See ***Taenia solium.***

pork tapeworm infection [L, *porcus,* pig, hog (male); AS, *taeppe,* tape, *wyrm,* worm; L, *inficere,* to stain], an infection of the intestine or other tissues caused by adult and larval forms of the tapeworm ***Taenia solium.*** The pork tapeworm is unique in that it can use humans as both intermediate hosts for larvae and definitive hosts for the adult worm. Humans are usually infected with the adult worm after eating contaminated undercooked pork. The infection is rare in the United States but relatively common in South America, Asia, and Russia. See also **cysticercosis, tapeworm infection.**

poro-. See **por-.**

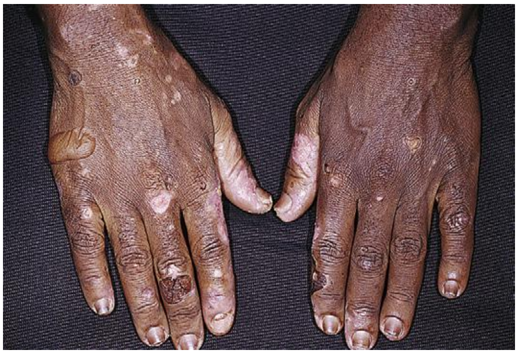
porosis /pərō′sis/ [Gk, *poros,* passage], a condition of thinning bone tissue, particularly its supporting connective tissue, as in osteoporosis.

porous /pôr′əs/ [Gk, *poros,* passage], pertaining to something with pores or openings.

porphobilinogen /pôr′fōbilin′əjən/, a chromogen substance that is an intermediate in the biosynthesis of heme and porphyrins. It appears in the urine of people with porphyria, representing an error of metabolism. See also **heme, porphyria.**

porphyria /pôrfir′ē·ə/ [Gk, *porphyros,* purple], a group of inherited disorders in which there is abnormally increased production of substances called porphyrins. Two major classifications of porphyria are **erythropoietic porphyria,** characterized by the production of large quantities of porphyrins in the blood-forming tissue of the bone marrow, and **hepatic porphyria,** in which large amounts of porphyrins are produced in the liver. Clinical signs common to both classifications of porphyria are photosensitivity, abdominal pain, and neuropathy. See also **acute intermittent porphyria, uroporphyria.**

porphyria cutanea tarda (PCT), the most common form of porphyria, characterized by cutaneous photosensitivity that causes scarring bullae, hyperpigmentation, facial hypertrichosis, and sometimes sclerodermatous thickenings and alopecia. It is frequently associated with alcohol abuse, liver disease, or hepatic siderosis. Urinary levels of uroporphyrin and coproporphyrin are increased, and activity of a specific enzyme involved in heme biosynthesis is decreased. The cause is debated, but two types are generally recognized: an autosomal-dominant (or familial) form in which activity of the affected enzyme is reduced to half normal in liver, erythrocytes, and fibroblasts, and a sporadic (but probably also familial) form in which the reduction is confined to the liver. Both types are believed to be heterozygous, with clinical expression occurring in adulthood, precipitated by disease or environmental factors. A more severe homozygous form begins in childhood and is called **hepatoerythropoietic porphyria.** See also **porphyria.**



Porphyria cutanea tarda *(Callen et al, 2000)*

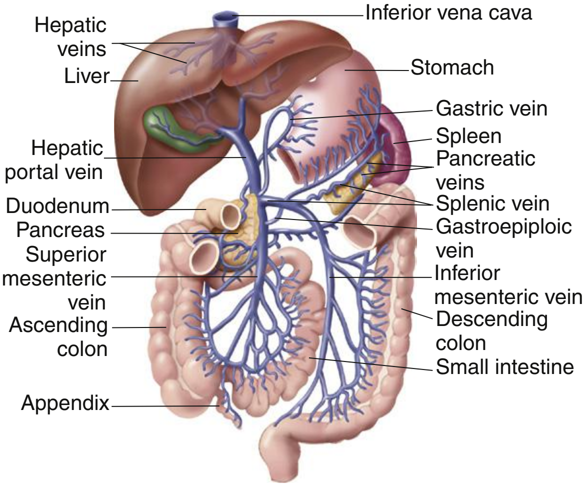
porphyrin /pôr′fərin/ [Gk, *porphyros,* purple], any iron- or magnesium-free pyrrole derivative occurring in many plant and animal tissues. Normal findings of porphyrins in urine are 50 to 300 mg/24 hours.

porphyrinogen /por′f-rin′o-jen/, the reduced form of a porphyrin. The porphyrinogens are the functional intermediates in the biosynthesis of heme and if, oxidized to their corresponding porphyrins, such as occurs in porphyrias, are irreversibly removed from the biosynthetic pathway and accumulate in tissue. Their nomenclature corresponds to that of the porphyrins.

porphyrins and porphobilinogens test, a quantitative analysis of urinary porphyrins and porphobilinogens to screen for porphyria.

portability /pôr′təbil′itē/ [L, *portare,* to carry], a property of computer software that permits its use in a variety of compatible operating systems.

portacaval shunt /pôr′təkā′vəl/ [L, *porta,* gateway, *cavus,* cavity; ME, *shunten*], a shunt created surgically to increase blood flow from the portal circulation by carrying it into the vena cava.



Portal circulation *(Patton and Thibodeau, 2010)*

Portagen, a trademark for a nutritional supplement containing protein, carbohydrate, and fat.

porta hepatis. See **portal fissure.**

portal /pôr′təl/ [L, *porta,* gateway], *n,* an entrance.

portal circulation [L, *porta,* gateway, *circulare,* to go around], the pathway of blood flow from the GI tract and spleen to the liver via the portal vein and its tributaries. Also called **hepatic portal circulation.**

portal fissure [L, *porta* + *fissura,* cleft], a fissure on the visceral surface of the liver along which the portal vein, the hepatic artery, and the hepatic ducts pass. Also called **porta hepatis.**

portal hypertension, an increased venous pressure in the portal circulation caused by compression or occlusion in the portal or hepatic vascular system. It results in splenomegaly, large collateral veins, ascites, and, in severe cases, systemic hypertension and esophageal varices. Portal hypertension is frequently associated with cirrhosis.

portal of entry, the route by which an infectious agent enters the body, such as through nonintact skin.

portal system, arrangement of blood vessels in which blood exiting one tissue is immediately carried to a second tissue before being returned to the heart and lungs for oxygenation and redistribution.

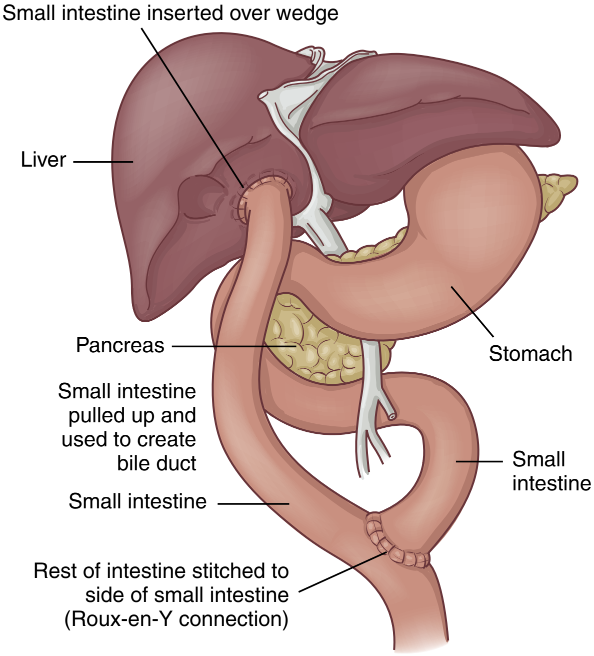
portal-systemic encephalopathy. See **hepatic coma.**

portal vein, a vein from the small intestine that ramifies in the liver and ends in capillary-like sinusoids that convey the blood to the inferior vena cava through the hepatic veins. The portal vein passes behind the duodenum and ascends through the lesser omentum to the porta hepatis, where it divides into the right and left branches. The vein is surrounded by the hepatic plexus of nerves and is accompanied by numerous lymphatic vessels, some lymph nodes, and corresponding branches of the hepatic artery. The right branch of the portal vein enters the right lobe of the liver, and the left branch enters the left lobe.

portal venous shunt. See **postcaval shunt.**

Porter-Silber reaction [Curt C. Porter, American biochemist, b. 1914; Robert H. Silber, American biochemist, b. 1915], a reaction, visible as a change in color to yellow, that indicates the amount of adrenal steroids (the 17-hydroxycorticosteroids) excreted per day in the urine. The test is used to evaluate adrenocortical function but is now largely supplanted by immunoassay techniques.

portoenterostomy /pôr′tō·en′təros′təmē/ [L, *porta* + Gk, *enteron,* bowel, *stoma,* mouth, *temnein,* to cut], construction of a bile drainage system with an intestinal conduit to correct biliary atresia. There are several procedural approaches, such as anastomosis of the jejunum by a Roux-en-Y loop to the portal fissure region to establish bile flow from the bile ducts to the intestine. The procedure is indicated in patients younger than 3 months of age. The operation is successful in most cases, but in a significant number of patients late mortality occurs because of chronic medical problems. Without the operation, biliary cirrhosis develops with an attendant early death. Also called **Kasai operation.**



Small intestine inserted over wedge
Liver
Pancreas
Stomach
Small intestine pulled up and used to create bile duct
Small intestine
Small intestine
Rest of intestine stitched to side of small intestine (Roux-en-Y connection)

Portoenterostomy *(McCance and Huether, 2010)*

Portuguese-Azorean disease. See **Machado-Joseph disease.**

Portuguese man-of-war /por′chəgēs/, any member of the genus ***Physalia,*** in the phylum Cnidaria. All species have a large purple air sac that allows them to float on the surface of the water, and from which many long tentacles of stinging polyps hang. The tentacles are equipped with nematocysts that are able to penetrate the skin of humans, causing intense pain. Paralysis can result from numerous stings.

port-wine stain. See **nevus flammeus.**

posaconazole, a systemic antifungal.

■ INDICATIONS: This drug is used for prevention of aspergillus, ***Candida*** infection, and oropharyngeal candidiasis in the immunocompromised.

■ CONTRAINDICATIONS: Fungal meningitis, onychomycosis or dermatomycosis in cardiac dysfunction, and hypersensitivity to this drug or other systemic antifungals or azoles prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include insomnia, fever, rigors, weakness, anxiety, hypertension, hypotension, tachycardia, anemia, cramps, abdominal pain, flatulence, gynecomastia, impotence, decreased libido, malaise, hypokalemia, and tinnitus. Life-threatening side effects include GI bleeding, hepatotoxicity, toxic epidermal necrolysis, and rhabdomyolysis. Common side effects include headache, dizziness, nausea, vomiting, anorexia, diarrhea, pruritus, edema, and fatigue.

position /pəzish′ən/ [L, *positio*], **1.** any one of many postures of the body, such as the anatomical position, lateral recumbent position, or semi-Fowler's position. See specific positions. **2.** (in obstetrics) the relationship of an arbitrarily chosen fetal reference point, such as the occiput, sacrum, chin, or scapula, on the presenting part of the fetus to its location in the maternal pelvis.

-position, suffix meaning the "putting or setting in place": *electrodeposition, juxtaposition, reposition.*

positional behavior /pəzish′ənəl/, the orientation of the body regions to claim a quantum of space. Positional behavior involves four body regions: head and neck, upper torso, pelvis and thighs, and lower legs and feet.

positional vertigo, a severe but brief episode of vertigo associated with a change of body position, as when a patient lies down. It may be caused by an injury or disease of the utricle. Also called **postural vertigo.** See also **cupulolithiasis.**

positioner /pə·zish′ənər/, a resilient rubbery and plastic removable appliance fitted over the occlusal surfaces of the teeth to obtain limited tooth movement and stabilization, usually at the end of orthodontic treatment.

positioning, a nursing intervention from the Nursing Interventions Classification (NIC) defined as deliberative placement of the patient or a body part to promote physiological and/or psychological well-being. See also **Nursing Interventions Classification.**

positioning: intraoperative, a nursing intervention from the Nursing Interventions Classification (NIC) defined as moving the patient or body part to promote surgical exposure while reducing the risk of discomfort and complications. See also **Nursing Interventions Classification.**

positioning: neurological, a nursing intervention from the Nursing Interventions Classification (NIC) defined as achievement of optimal, appropriate body alignment for the patient experiencing or at risk for spinal cord injury or vertebral irritability. See also **Nursing Interventions Classification.**

positioning: wheelchair, a nursing intervention from the Nursing Interventions Classification (NIC) defined as placement of a patient in a properly selected wheelchair to enhance comfort, promote skin integrity, and foster independence. See also **Nursing Interventions Classification.**

position sense, a variety of muscular senses by which the position or attitude of the body or its parts is perceived. Also called **posture sense.**

positive /poz′itiv/ [L, *positivus,*], **1.** (of a laboratory test result) indicating that a substance or a reaction is present. **2.** (of a sign) indicating on physical examination that a finding is present, often meaning that there is pathological change. **3.** (of a substance) tending to carry or carrying a positive chemical charge.

positive balance, a state in which the amount of water or an electrolyte excreted from the body is less than that ingested.

positive end-expiratory pressure (PEEP), positive airway pressure applied at the end of the exhalation phase during mechanical ventilation. Each successive breath begins from a new baseline. Air is delivered in cycles of constant pressure through the respiratory cycle. The patient is usually but not always intubated, and a ventilator cycles the air through an endotracheal tube. PEEP is used for the relief of respiratory distress secondary to prematurity, pancreatitis, shock, pulmonary edema, trauma, surgery, or other conditions in which spontaneous respiratory efforts are inadequate and arterial levels of oxygen are deficient. Close observation is necessary during PEEP therapy because excessive PEEP may decrease venous return to the heart. Blood gases and vital signs are monitored closely. If PEEP does not significantly improve the patient's condition, its level is increased or it may be discontinued. Compare **continuous positive airway pressure.**

positive feedback, **1.** (in physiology) an increase in function in response to a stimulus. For example, micturition increases after the flow of urine has started, and the uterus contracts more frequently and with greater strength after it has begun to contract in labor. **2.** *(informal)* an encouraging, favorable, or otherwise positive response from one person to what another person has communicated.

positive identification, the unconscious modeling of one's personality on that of another who is admired and esteemed. See also **identification.**

positive mask. See **reversal film.**

positive pressure, **1.** a greater-than-ambient atmospheric pressure. **2.** any technique in which compressed gas or air is delivered to the airways at greater-than-ambient pressure. Positive-pressure techniques in respiratory therapy require a flow-regulating device and a delivery system, such as a cannula, mouthpiece, endotracheal tube, or tracheostomy tube.

positive pressure breathing unit. See **IPPB unit.**

positive pressure ventilation (PPV), any of numerous types of mechanical ventilation in which gas is delivered into the airways and lungs under positive pressure, producing positive airway pressure during inspiration. It may be done via either an endotracheal tube or a nasal mask.

positive relationship, (in research) a direct relationship between two variables in which as one increases, the other can be expected to increase. Also called **direct relationship.** Compare **negative relationship.**

positive sequence, the sequence of the bases on the strand of a double-stranded nucleic acid that encodes the product. In DNA it is the strand that encodes the RNA, having thus the same base sequence except changing T for U in the RNA.

positive signs of pregnancy, three unmistakable signs of pregnancy: fetal heart tones, heard on auscultation; fetal skeleton, seen on x-ray film or ultrasonogram; and fetal parts, felt on palpation.

positive symptom, a symptom of the acute phase of schizophrenia. Compare **negative symptom.**

positron /pos′itron/, a positively charged particle emitted from neutron-deficient radioactive nuclei; the antiparticle of an electron.

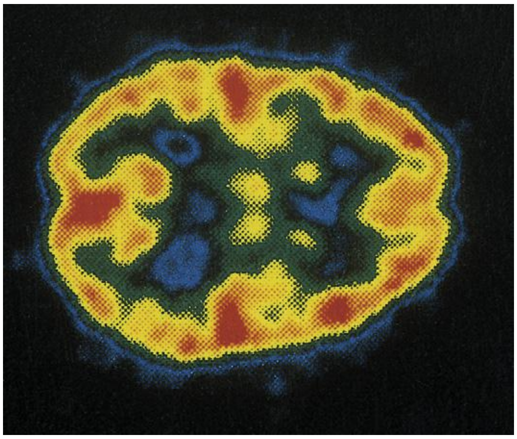


Image produced by a PET scan after a seizure
(Black and Hawks, 2005)

positron emission tomography (PET) [L, *positivus* + Gk, *elektron,* amber; L, *emittere,* to send out; Gk, *tome,* section, *graphein,* to record], a computerized radiographic technique that uses radioactive substances to examine the metabolic activity of various body structures. The patient either inhales or is injected with a metabolically important substance such as glucose, carrying a radioactive element that emits positively charged particles, or positrons. When the positrons combine with electrons normally found in the cells of the body, gamma rays are emitted. The electronic circuitry and computers of the PET device detect the gamma rays and construct color-coded images that indicate the intensity of metabolic activity throughout the organ involved. The radioactive isotopes used in PET are very short-lived, so that patients undergoing a PET scan are exposed to very small amounts of radiation. Researchers use PET to examine blood flow and the metabolism of the heart and blood vessels, to study and diagnose cancer, and to investigate the biochemical activity of the brain.

Posner-Schlossman syndrome. See **glaucomatocyclitic crisis.**

post. See **dowel.**

post-, prefix meaning "after or behind": *postabortal, postcerebellar, postdiastolic.*

postanesthesia care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as monitoring and management of the patient who has recently undergone general or regional anesthesia. See also **Nursing Interventions Classification.**

postanesthesia care unit (PACU), an area adjoining the operating room to which patients who have received sedative, general, and regional anesthetics are taken for nursing assessment and care while recovering from anesthesia. Vital signs, adequacy of ventilation, level of consciousness, surgical site, and levels of pain are carefully monitored as the patient recovers consciousness. The PACU has nursing staff with specific skills to care for patients, and a certified registered nurse anesthetist or anesthesiologist is available. Formerly called **recovery room.** See also **postoperative care.**

postaxial /pōst·ak′sē·əl/ [L, *post,* after; Gk, *axon,* axis], posterior to an axis. In anatomical usage, this refers to the medial (ulnar) aspect of the upper limb and the lateral (fibular) aspect of the lower limb.

postaxial acrofacial dysostosis. See **Miller's syndrome.**

postcaval shunt /-kā′vəl/ [L, *post,* after, *vena cava* + ME, *shunten*], any of several surgical anastomoses of the portal and systemic circulations to relieve symptoms of portal hypertension. Also called **portacaval shunt, portal venous shunt.**

postcentral gyrus /-sen′trəl/ [L, *post,* after; Gk, *kentron,* center, *gyros,* turn], a convolution of the brain immediately posterior to the central sulcus of the cerebrum. It is the location of the sensory strip for the contralateral side of the body.

postcoital /-kō′itəl/ [L, *post,* after, *coire,* to come together], after sexual intercourse.

postcoital contraceptive, a contraceptive that blocks or terminates pregnancy after sexual intercourse. Also called *emergency contraceptive*.

postcoital test, (for infertility) examination of secretions aspirated from the vaginal fornix and endocervical canal after coitus to determine the number and condition of spermatozoa present and the extent to which they have penetrated the cervical mucus. See also **Huhner test.**

postcommissurotomy syndrome /-kəmis′yərot′əmē/ [L, *post,* after, *commissura,* a union; Gk, *temnein,* to cut], a condition of unknown cause occurring within the first few weeks after cardiac valvular surgery, characterized by intermittent episodes of pain and fever, which may last weeks or months and then resolve spontaneously.

postconcussional syndrome /-kənkush′ənəl/ [L, *post* + *concussio,* shake violently], a condition that follows head trauma, characterized by dizziness, poor concentration, headache, hypersensitivity, and anxiety. It usually resolves itself without treatment. Also called **posttraumatic syndrome.**

postdate pregnancy /-dāt′/ [L, *post,* after, *data* + *praegnans,* bearing child], a pregnancy that lasts more than 42 weeks. Also called **postterm pregnancy.**

postdural puncture headache (PDPH). See **spinal headache.**

posterior /postir′ē·ər/ [L, behind], **1.** *adj,* in the back part of a structure, such as the dorsal surface of the human body. **2.** *n,* the back part of something. **3.** *adj,* toward the back. Compare **anterior.**

posterior Achilles bursitis, a painful heel condition caused by inflammation of the bursa between the Achilles tendon and the calcaneus. It is commonly associated with Haglund's deformity.

posterior antebrachial cutaneous nerve, a nerve that branches off from the radial nerve, innervates the skin of the dorsal aspect of the forearm, and has a general sensory modality.

posterior asynclitism. See **asynclitism.**

posterior atlantoaxial ligament, one of five ligaments connecting the atlas to the axis. It is broad, thin, and fixed to the inferior border of the anterior arch of the atlas and to the ventral surface of the body of the axis. Compare **anterior atlantoaxial ligament.**

posterior atlantooccipital membrane, one of a pair of thin, broad fibrous sheets that form part of the atlantooccipital joint between the atlas and the occipital bone and contain an opening for the vertebral artery and the suboccipital nerve. Also called *posterior atlantooccipital ligament*. Compare **anterior atlantooccipital membrane.**

posterior auricular artery, one of a pair of small branches from the external carotid arteries, dividing into auricular and occipital branches and supplying parts of the ear, scalp, and other structures in the head.

posterior circumflex humeral artery, an artery that originates from the third part of the axillary artery, leaves the axilla through the quadrangular space in the posterior wall, and enters the posterior scapular region where it supplies related muscles and the glenohumeral joint.

posterior column. See **posterior horn.**

posterior common ligament. See **posterior longitudinal ligament.**

posterior costotransverse ligament, one of the five ligaments of each costotransverse joint, comprising a fibrous band passing from the neck of each rib to the base of the vertebra above. Compare **superior costotransverse ligament.**

posterior drawer sign, an orthopedic test used to determine laxity of the posterior cruciate ligament of the knee. The patient is positioned with hips at 45 degrees and knees flexed at 90 degrees while the examiner stabilizes the foot and pushes the tibia backward. Also, with both the hips and knees flexed at 90 degrees, the examiner holds the heels together and observes the knees to compare the relative posterior sag of the tibia.

posterior ethmoidal artery, an artery that supplies the ethmoidal air cells and the nasal cavity.

posterior ethmoidal nerve, a nerve that supplies the posterior ethmoidal air cells and the sphenoid sinus.

posterior fontanel, a small triangular area between the occipital and parietal bones at the junction of the sagittal and lambdoidal sutures. See also **fontanel.**

posterior fossa, a depression on the posterior surface of the humerus, above the trochlea, that lodges the olecranon of the ulna when the elbow is extended.

posterior horn [L, behind, *cornu,* horn], the horn-shaped projection of gray matter in the posterior region of the spinal cord. It relays information related to touch and pressure from muscles and regulates precise movement and unconscious proprioception. Also called **dorsal column, dorsal horn, posterior column.**

posterior inferior cerebellar artery syndrome. See **Wallenberg's syndrome.**

posterior kidney, posterior segment of kidney; the renal segment located most posteriorly.

posterior ligament. See **rectovaginal ligament.**

posterior liver, a term used to refer to the posterior region that is not part of either the left part or the right part of the liver but is coextensive with the caudate lobe.

posterior longitudinal ligament, a thick strong ligament attached to the dorsal surfaces of the vertebral bodies, extending from the occipital bone to the coccyx. Also called **posterior common ligament.** Compare **anterior longitudinal ligament.**

posterior median fissure, a narrow groove in the closed part of the medulla oblongata.

posterior mediastinal node, a node in one of three groups of thoracic visceral nodes, connected to the part of the lymphatic system that serves the esophagus, pericardium, diaphragm, and convex surface of the liver. Most of the efferent vessels of the posterior mediastinal nodes end in the thoracic duct, but some join the tracheobronchial nodes. Compare **thoracic visceral node.**

posterior mediastinum, the irregularly shaped lower part of the mediastinum parallel with the vertebral column. It is bounded ventrally by the pericardium, inferiorly by the diaphragm, dorsally by the vertebral column from the fourth to the twelfth thoracic vertebra, and laterally by the mediastinal pleurae. It contains the bifurcation of the trachea, two primary bronchi, the esophagus, the thoracic duct, many large lymph nodes, and various vessels, such as the thoracic part of the aortic arch. Compare **anterior mediastinum, middle mediastinum, superior mediastinum.**

posterior nares, a pair of posterior internal openings in the nasal cavity connecting it with the nasopharynx and allowing the inhalation and exhalation of air. Each is an oval aperture that measures about 2.5 cm vertically and is about 1.5 cm in diameter. Also called **choanae.** Compare **anterior nares.**

posterior neuropore, the embryonic opening at the inferior end of the neural tube from neural canal to exterior. It closes at about the 25 somite stage, which indicates the end of horizon XII in the numeric anatomical charting of human embryonic development. Compare **anterior neuropore.** See also **horizon.**

posterior occlusion. See **distoclusion.**

posterior palatal seal area, the area of soft tissues along the junction of the hard and soft palates on which displacement, within the physiological tolerance of the tissues, can be applied by a maxillary full or partial denture to aid its retention. Also called *post dam*.

posterior parietal artery, an artery that originates at the terminal part of middle cerebral artery and serves the posterior parietal lobe of the brain.

posterior pituitary gland. See **neurohypophysis.**

posterior ramus, a branch of each spinal nerve. Collectively, the posterior rami innervate the back.

posterior rhizotomy [L, behind; Gk, *rhiza,* root, *temnein,* to cut], a surgical procedure for cutting the posterior, or sensory, nerve root to relieve intractable pain or to relieve spasms from neurological causes such as cerebral palsy.

posterior sagittal anorectoplasty, plastic surgery to create a functional anus and rectum in children with imperforate anus or other anorectal malformations. Also called *Peña procedure*.

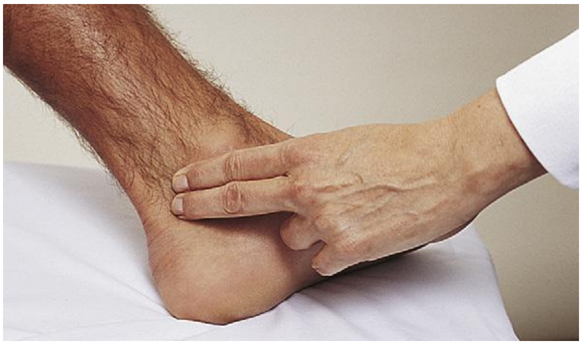
posterior spinal arteries, one of two arteries that originate in the cranial cavity, usually arising directly from a terminal branch of each vertebral artery, and descend along the spinal cord, each as two branches that bracket the posterolateral sulcus and the connection of posterior roots with the spinal cord. They are reinforced along their length by 8 to 10 segmental medullary arteries, the largest of which is the artery of Adamkiewicz.

posterior subcapsular cataract [L, *capsula* + Gk, *katarrhaktes,* waterfall], a visual opacity caused by a thickening of the epithelial cells lining the capsule. The condition is frequently the result of the aging process or a disease that involves surrounding eye tissues.

posterior temporal artery, the posterior temporal branch of the middle cerebral artery, originating in the middle cerebral artery and supplying the cortex of the posterior temporal lobe. It has no branches.

posterior tibial artery, one of the divisions of the popliteal artery, supplying various muscles of the lower leg, foot, and toes. Compare **anterior tibial artery.**

posterior tibialis pulse, the pulse of the posterior tibialis artery palpated on the medial aspect of the ankle, just posterior to the prominence of the malleolus.



Palpation of the posterior tibialis pulse

(Wilson and Giddens, 2009)

posterior tooth, any of the maxillary and mandibular premolars and molars of the primary or secondary dentition or of prostheses. Compare **anterior tooth.**

posterior uveitis, uveitis involving the posterior segment of the eye, including **choroiditis** and **chorioretinitis.**

posterior vaginal hernia. See **vaginal hernia.**

posterior vein of left ventricle, one of the five tributaries of the coronary sinus that drain blood from the capillary bed of the myocardium. It courses along the diaphragmatic surface of the left ventricle, accompanying the circumflex branch of the left coronary artery. In some individuals it ends in the great cardiac vein. Compare **great cardiac vein, middle cardiac vein, small cardiac vein.**

postero-, prefix meaning "posterior part": *posteroanterior, posteromedian, posterosuperior.*

posteroanterior (P-A, p-a) /pos′tərō·antir′ē·ər/ [L, *posterus,* coming after, *anterior,* before], the direction from back to front.

posteroexternal /pos′tər·ō·ek·ster′nəl/ [L, *posterus,* coming after, *externus,* outward], situated on the outer side of a posterior aspect.

posteroinferior /-infir′ē·ər/ [L, *posterus,* coming after, *inferior,* lower], pertaining to a position that is both lower and behind.

posterolateral /-lat′ərəl/ [L, *posterus,* coming after, *latus,* side], pertaining to a position behind and to the side.

posterolateral sulcus, a shallow depression on each side of the posterior surface of the spinal cord that marks where the posterior rootlets of the spinal nerve enter the cord.

posterolateral thoracotomy, a chest surgery technique in which an incision is made in the submammary fold, below the tip of the scapula. The incision is continued posteriorly along the course of the ribs and upward as far as the spine of the scapula. It requires division of the trapezius, rhomboideus, latissimus dorsi, and serratus anterior muscles. Compare **anterolateral thoracotomy, median sternotomy.**

posteromedial /pos′tər·ō·mē′dē·əl/ [L, *posterus,* coming after, *medius,* middle], situated toward the middle of the posterior surface.

posteromedial central arteries of posterior communicating artery, branches of the posterior communicating artery that supply the medial surface of the thalamus and the walls of the third ventricle.

posteroparietal /pos′tər·ō·pə·rī′ə·təl/ [L, *posterus,* coming after, *paries,* wall], situated at the posterior part of the parietal bone.

posterosuperior /pos′tər·ō·so͞o·pēr′ē·ər/ [L, *posterus,* coming after, *superior,* higher], situated posteriorly and superiorly.

postganglionic /-gang′glē·on′ik/ [L, *post,* after; Gk, *ganglion,* knot], distal to a ganglion.

postganglionic fiber, the axon of a nerve cell whose cell body is situated in a ganglion.

postganglionic neuron [L, *post,* after; Gk, *ganglion,* knot, *neuron,* nerve], a neuron that is distal to or beyond a ganglion.

posthepatic cirrhosis. See **postnecrotic cirrhosis.**

posthepatic jaundice /pōst′hepat′ik/ [L, *post,* after; Gk, *hepar,* liver; Fr, *jaune,* yellow], jaundice caused by obstruction of the bile ducts.

posthumous /pos′chəməs/ [L, *post,* after, *humare,* to bury], after a person's death.

posthypnotic suggestion /-hipnot′ik/ [L, *post,* after; Gk, *hypnos,* sleep; L, *suggerere,* to suggest], an action suggested to a hypnotized subject during a trance that the subject carries out on awakening from the trance. The action is in response to a cue, and the subject usually does not know why he or she is performing it.

postictal /pōst′iktəl/ [L, *post* + Gk, *ikteros,* jaundice], **1.** after a seizure. **2.** confused. —*postictus, n.*

postinfectious /-infek′shəs/ [L, *post* + *inficere,* to stain], after an infection.

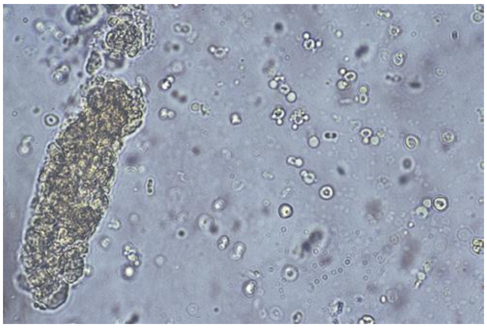
postinfectious encephalitis. See **encephalitis.**

postinfectious glomerulonephritis, the acute form of glomerulonephritis, which may follow 1 to 6 weeks after a streptococcal infection, most often in childhood. Characteristics of the disease are hematuria, oliguria, edema, and proteinuria, especially in the form of granular casts. There may be slight impairment of renal function in adults, but most patients recover fully in 1 to 3 months. There is no specific treatment for this form of glomerulonephritis. Restriction of dietary protein and the prescription of diuretics may be necessary until kidney function returns to normal. Also called **acute glomerulonephritis.** See also **chronic glomerulonephritis, subacute glomerulonephritis.**

■ OBSERVATIONS: Onset of symptoms occurs 1 to 6 weeks after a streptococcal infection. Symptoms include hypertension, headache, edema, oliguria, dark urine, reduced urine output, flank pain, weight gain, fever, chills, nausea, and vomiting; about half of cases are asymptomatic. Diagnosis is made through a series of lab tests. Hematuria (microscopic or gross), proteinuria, sediment, and RBC casts are seen on urinalysis. Blood chemistries reveal increased blood urea nitrogen, increased serum creatinine, increased serum lipids, and decreased serum albumin. ASO titers are positive. Complications include congestive heart failure, acute or chronic renal failure, and end-stage renal disease.

■ INTERVENTIONS: Treatment focuses on treating symptoms and preventing complications. Antihypertensives are administered for hypertension, diuretics are given for edema, and antiinfective drugs are administered if an infection is still present. Electrolytes are monitored and abnormalities corrected. Diet therapy focuses on restricted sodium, restricted potassium, and low protein to combat electrolyte abnormalities and uremia. Hemodialysis or peritoneal dialysis may be used to treat renal failure.

■ NURSING CONSIDERATIONS: Nursing management in acute care focuses on supportive measures. Bed rest, fluid, and electrolyte restrictions and dietary reduction of protein are necessary until signs of inflammation (e.g., proteinuria and hematuria) subside. Instruction centers on restrictions and proper administration of a full course of antibiotics. Prevention is also key and involves encouraging individuals to seek early diagnosis and treatment of sore throats and skin lesions, particularly in children.



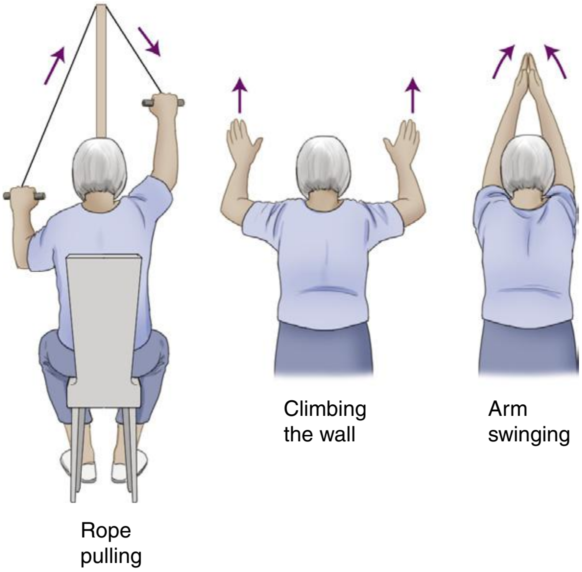
Postinfectious glomerulonephritis: red blood cell cast
(Campbell, Walsh, and Retik, 2002)

postinfectious psychosis [L, *post,* after, *inficere,* to stain; Gk, *psyche,* mind, *osis,* condition], psychotic behavior that follows a severe infection, such as pneumonia, scarlet fever, malaria, uremia, or typhoid fever. Also called **infectious-exhaustive syndrome.**

postlumbar puncture headache /-lum′bar/ [L, *post,* after, *lumbus,* loin, *punctura;* AS, *heafod* + *acan*], a headache that occurs within a few hours after a lumbar puncture and usually lasts 1 or 2 days to several weeks. It may be accompanied by nausea and vomiting and improves when the patient lies down.

postmastectomy exercises /-məstek′təmē/ [L, *post* + Gk, *mastos,* breast, *ektomē,* excision], exercises essential to the prevention of shortening of the muscles, prevention of contracture of the joints, and improvement in lymph and blood circulation after mastectomy.

■ METHOD: The woman is asked to flex and extend the fingers of the affected arm in the recovery room and to pronate and supinate the forearm immediately on return to her room after recovery from anesthesia and surgery. The postoperative mastectomy exercises are begun gradually at the surgeon's discretion. Brushing her teeth and hair is encouraged as effective exercise. Other exercises are usually taught, including four specific exercises: climbing the wall, arm swinging, rope pulling, and elbow spreading. They are performed as follows: *Climbing the wall:* The patient stands facing a wall, toes close to the wall. The elbows are bent, and the palms of the hands are placed on the wall at shoulder height. The hands are moved up the wall together until the woman feels pain or pulling on the incision, then returned to the starting position. *Arm swinging:* While standing, the patient bends forward from the waist, allowing both arms to relax and hang naturally. The arms are swung together from the shoulders from left to right and then in circles parallel to the floor, clockwise and counterclockwise. She straightens up slowly. *Rope pulling:* A rope is attached over a shower rod or a hook. Each end of the rope is grasped, and the patient alternately pulls each end, raising one arm after the other to the height at which incisional pain or pulling is felt. The rope is shortened until the affected arm is raised

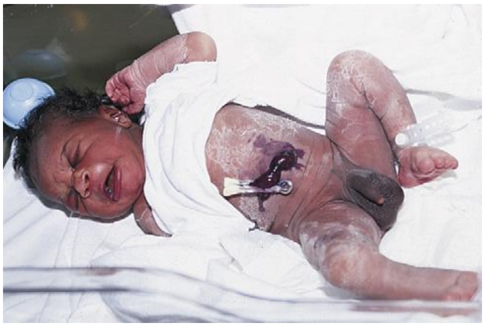


Postmastectomy exercises *(Lewis et al, 2011)* almost directly overhead. *Elbow spreading:* The hands are clasped behind the neck, and the elbows are slowly raised to chin level while the head is held erect. Gradually the elbows are spread apart to the point at which incisional pain or pulling is felt.

■ INTERVENTIONS: Specific exercises may be ordered. The patient is shown how to do them and is encouraged to continue them at home.

■ OUTCOME CRITERIA: With proper exercise, full range of motion returns; both arms can be extended fully and equally high over the head. The woman benefits from having something active to do to help herself during the difficult period of adjustment after mastectomy. Many activities of daily life provide good exercise, such as reaching high shelves, hanging clothes, and gardening.

postmature infant, an infant born after the end of the 42nd week (288 days) of gestation, bearing the physical signs of placental insufficiency. Characteristically the baby has dry, peeling skin; long fingernails and toenails; and folds of skin on the thighs and sometimes on the arms and buttocks. Hypoglycemia and hypokalemia are common. Postmature infants often look as if they have lost weight in utero. The newborn is fed early, and the calcium and potassium levels in the blood are monitored and corrected, if necessary, to prevent seizures and neurological damage. To prevent the syndrome, labor may be induced as gestation approaches 42 weeks. To anticipate the problems associated with the syndrome, the fetus and the mother may be electronically monitored through labor. Also called *postmature newborn,* **postterm infant.**



Dry skin of postmature infant

(Murray and McKinney, 2006)

postmaturity /-məcho͞o′ritē/ [L, *post* + *maturare,* to become ripe], **1.** overdevelopment or maturity. **2.** beyond the normal date for maturity, as in a postmature infant. See also **dysmaturity, postmature infant.** —*postmature, adj.*

postmenopausal /-men′əpô′səl/ [L, *post* + *men,* month; Gk, *pauein,* to cease], pertaining to the period of life after menopause.

postmenopausal hemorrhage, bleeding from the uterus after menopause.

postmenopausal vaginitis [L, *post,* after, *men,* month; Gk, *pauein,* to cease; L, *vagina,* sheath; Gk, *itis,* inflammation], an inflammation caused by degenerative changes in the vaginal mucosa after menopause. Also called **atrophic vaginitis.**

postmortem /môr′təm/ [L, *post* + *mors,* death], *adj,* after death. See **postmortem examination.**

postmortem care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing physical care of the body of an expired patient and support for the family viewing the body. See also **Nursing Interventions Classification.**

postmortem cesarean section [L, *post,* after, *mors,* death, *secare,* to cut, *sectio*], delivery of a fetus by incision into the uterus after death of a woman. Also called *postmortem delivery.*

postmortem examination [L, *post,* after, *mors,* death, *examinatio*], an examination of a body after death by a person trained in pathology. Also called **autopsy,** *(informal)* **postmortem.**

postmortem graft [L, *post,* after, *mors,* death; Gk, *graphion,* stylus], the transplanting of a cornea, artery, or other body part from a deceased person to repair a defect in a living body. Also called **cadaver graft.**

postmortem lividity, the black and blue discoloration of the skin of a cadaver, resulting from an accumulation of deoxygenated blood in subcutaneous vessels.

postmyocardial infarction syndrome /-mī·əkär′dē·əl/ [L, *post* + Gk, *mys,* muscle, *kardia,* heart; L, *infarcire,* to stuff], a condition that may occur days or weeks after an acute myocardial infarction. It is characterized by chest pain, fever, pericarditis with a friction rub, pleurisy, pleural effusion, joint pain, and elevated white blood cell count and sedimentation rate. It tends to recur and often provokes severe anxiety, depression, and fear that another heart attack is occurring. Treatment includes aspirin, reassurance, and a short course of corticosteroids. Nursing care includes close observation and emotional support, especially when debilitating anxiety and depression are present. Also called **Dressler's syndrome.**

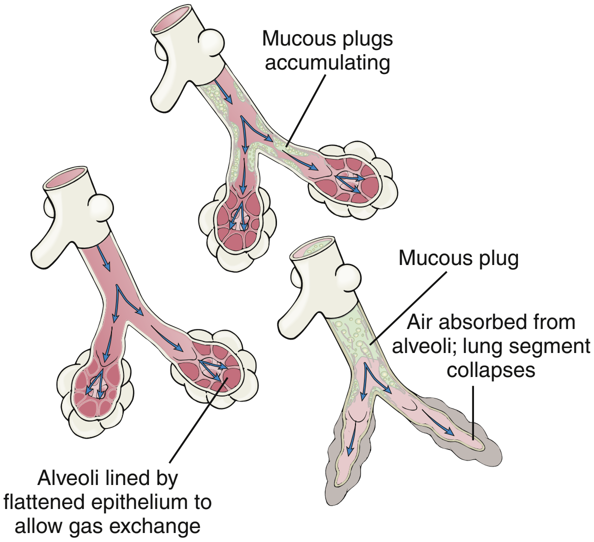
postnasal /-nā′zəl/ [L, *post,* after, *nasus,* nose], pertaining to the region posterior to the nasal cavity.

postnasal drip (PND) [L, *post* + *nasus,* nose; AS, *dryppan*], a drop-by-drop discharge of nasal mucus into the posterior pharynx caused by rhinitis, chronic sinusitis, or hypersecretion by the nasopharyngeal mucosa. It is often accompanied by a feeling of obstruction, an unpleasant taste, and fetid breath. Methods of treatment include the application of drops or sprays of phenylephrine or epHEDrine sulfate to constrict blood vessels and reduce hyperemia, sinus irrigation to improve drainage, and use of appropriate antibiotics. Therapy for allergies may be indicated in some cases, and surgery may be required if the nasal passages are obstructed by polyps or a deviated septum.

postnecrotic cirrhosis /-nekrot′ik/ [L, *post* + Gk, *nekros,* dead; *kirrhos,* yellowish, *osis,* condition], a nodular form of cirrhosis that may follow hepatitis or other inflammation of the liver. Also called **posthepatic cirrhosis.** See also **cirrhosis.**

postoperative (post-op) /-op′ərətiv′/ [L, *post* + *operari,* to work], pertaining to the period of time after surgery. It begins with the patient's emergence from anesthesia and continues through the time required for the acute effects of the anesthetic and surgical procedures to abate.

postoperative atelectasis, a form of atelectasis in which collapse of lung tissue is caused by the depressant effects of anesthetic drugs or the inability to breathe deeply or cough effectively because of pain. Deep breathing and coughing are encouraged at frequent postoperative intervals to prevent this condition.



Mucous plugs accumulating
Mucous plug
Air absorbed from alveoli; lung segment collapses
Alveoli lined by flattened epithelium to allow gas exchange

Postoperative atelectasis *(Lewis et al, 2011)*

postoperative bed, a surface prepared for a patient who is weak or unconscious, as when recovering from anesthesia. The bed is in the flat position. The bottom sheet may be covered with a cotton bath blanket that is tucked tightly beneath the mattress. The top linen is fan-folded to the far side of the bed and not tucked in. The bed is made in this way to simplify transferring a patient from a stretcher into the bed.

postoperative care, the management of a patient after surgery. See also **preoperative care.**

■ METHOD: Before the patient's discharge from the operating room to the postanesthesia care unit, the surgical drapes, ground plate, and restraints are removed and a sterile dressing may be applied to the incision. The patency and connections of all drainage tubes and the flow rate of parenteral infusions are checked. The patient's cleanliness and dryness are given attention, and the gown is changed, avoiding exposing the individual. The patient is transferred slowly and cautiously to a stretcher or bed, maintaining body alignment and protecting the limbs. When indicated, an oral or nasal airway is inserted or a previously inserted endotracheal tube is suctioned. Respiration may be assessed with a pulse oximeter; if respiration remains impaired, the anesthetist is notified. The blood pressure, pulse, and respirations are initially reported to the anesthetist and are then checked at least every 15 minutes or as ordered. At similar intervals the level of consciousness, reflexes, and movements of extremities are observed, and the incision, drainage tubes, and IV infusion site are inspected. Medication, blood or blood components, and oxygen are administered as ordered, and fluid intake and output are measured. Pain is controlled with analgesics. The patient is kept warm and dry and positioned for optimal ventilation and comfort. At the first sign of vomiting, the head or body is turned to one side and suction is applied to prevent aspiration. Oral hygiene is administered to keep the mouth and tongue moist. The chest is auscultated for breath sounds every 30 minutes, and the patient, when reactive, is helped to turn and deep breathe. The tympanic or axillary temperature is taken every 1 to 4 hours. When rested and able to move the extremities well, and after having exhibited stable vital signs, the patient may be transferred to the assigned room, if the drainage tubes are functioning, the dressings show no bleeding or excessive drainage, and the anesthesiologist approves the move. The family is informed of the patient's progress and expectations for the postoperative period. The airway patency; rate, depth, and character of respirations; pulse; blood pressure; temperature; skin color; level of consciousness; and condition of dressings and drainage tubes are assessed. If respirations are noisy, the patient is assisted in coughing. A rapid, weak, thready pulse may indicate increased bleeding and is reported, especially if other signs of impending shock, such as hypotension or changes in level of consciousness, are evident. The dressing is examined at frequent intervals, and excessive drainage is reported immediately. The side rails of the bed are raised for safety and the head is slightly elevated, unless contraindicated. A cardiac monitor may be connected. Parenteral fluids and pain medication are administered as ordered. Fluid intake and output are measured; range-of-motion exercises to extremities are performed, and ambulation, when ordered, is assisted.

■ INTERVENTIONS: The postanesthesia care nurse performs the immediate postoperative procedures, and the clinical unit nurse provides ongoing care, emotional support, and instructions for the patient and family. Special attention is given to preventing trauma postoperatively, as may occur when confused or elderly patients fall when getting out of bed.

■ OUTCOME CRITERIA: Meticulous postoperative care prevents falls, infections, and other complications and promotes the healing of the incision and restoration of the patient to health.

postoperative cholangiography, (in diagnostic radiology) a procedure for outlining the major bile ducts. A radiopaque contrast material is injected into the common bile duct via a T-tube inserted during surgery. It is usually performed after a cholecystectomy to discover any residual calculi. See also **cholangiography.**

postoperative ileus [L, *post* + *operari,* to work; Gk, *eilein,* to twist], an absence of normal intestinal function caused by a loss of peristaltic muscular action of the intestine after surgery.

postoperative nausea and vomiting (PONV), nausea and vomiting occurring after a surgical procedure.

postoperative paresthesia, prolonged dysfunction of a nerve after surgery typically due to a mechanical injury or prolonged duration of a local anesthetic.

postparalytic /-per′əlit′ik/ [L, *post* + Gk, *paralyein,* to be palsied], pertaining to the period after paralysis.

postpartal care[1] /-pär′təl/ [L, *post* + *partus,* birth], care of the mother and her newborn during the first few days of the puerperium. See also **antepartal care, intrapartal care, newborn intrapartal care.**

postpartal care[2]**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as monitoring and management of the patient who has recently given birth. See also **Nursing Interventions Classification.**

postpartum /pōstpär′təm/, after childbirth.

postpartum blues [L, *post,* after, *partus,* birth; ME, *bleu*], an emotional effect of childbirth experienced by mothers, consisting mainly of transient feelings of sadness for a period of about 72 hours. If the symptom persists for a longer period, the diagnosis of depression may apply. The condition may require psychotherapy, use of antidepressant medications, or both. It may occur more than once in the same person after subsequent pregnancies and may have serious consequences if untreated. See also **postpartum depression.**

postpartum depression [L, *post* + *partus* + *deprimere,* to press down], an abnormal psychiatric condition that occurs after childbirth, typically from 3 days to 6 weeks after birth. It is characterized by symptoms that range from mild "postpartum blues" to an intense suicidal depressive psychosis. Severe postpartum depression occurs approximately once in every 2000 to 3000 pregnancies. The cause is not proved; neurochemical and psychological influences have been implicated. Approximately one third of patients are found to have had some degree of psychiatric abnormality predating the pregnancy. The disorder recurs in subsequent pregnancies in 25% of cases. Some women at risk for postpartum depression may be identified during the prenatal period: those who have made no preparations for the expected baby, expressed unrealistic plans for postpartum work or travel, or denied the reality of the responsibilities of parenthood. Depending on the severity of the disorder, psychoactive medication or psychiatric hospitalization may be necessary.

Postpartum Depression Theory. See **Beck, Cheryl Tatano.**

postpartum hemorrhage [L, *post,* after, *partus,* birth; Gk, *haima,* blood, *rhegnynai,* to burst forth], excessive bleeding (a loss of more than 500 mL of blood) after childbirth.

postpartum iliofemoral thrombophlebitis [L, *post,* after, *parturs,* birth, *ilia,* flank, *femur,* thigh; Gk, *thrombos,* lump, *phleps,* vein, *itis,* inflammation], thrombophlebitis involving the iliofemoral artery after childbirth.

postpartum maternal health behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to promote health of a mother in the period following birth of an infant. See also **Nursing Outcomes Classification.**

postpartum pituitary necrosis [L, *post* + *partus* + *pituita,* phlegm; Gk, *nekros,* dead, *osis,* condition], an infarct of the pituitary resulting from hypovolemia and shock in the immediate postpartum period. The condition causes a state of hypopituitarism; lactation may not develop, pubic and axillary hair may be lost, and symptoms of hypoglycemia and amenorrhea are experienced. See also **Sheehan's syndrome.**

postpartum psychosis [L, *post,* after, *partus,* birth; Gk, *psyche,* mind], an episode of psychosis, which may be depressive, after childbirth. Because the condition usually develops in the month after childbirth, endocrinological factors are believed to be a cause.

postperfusion syndrome /-pərfyo͞o′zhən/ [L, *post* + *perfundere,* to pour over], a cytomegalovirus (CMV) infection occurring between 2 and 4 weeks after the transfusion of fresh blood containing CMV. It is characterized by prolonged fever, hepatitis, rash, atypical lymphocytosis, and occasionally jaundice. No specific treatment is available.

postpericardiotomy syndrome /pōst′perikär′dē·ot′əmē/ [L, *post* + Gk, *peri,* around, *kardia,* heart, *temnein,* to cut], a condition that sometimes occurs days or weeks after pericardiotomy, characterized by symptoms of pericarditis, often without any fever. It appears to be an autoimmune response to damaged cells of the myocardium and pericardium. See also **pericarditis.**

postpill amenorrhea /-pill′/ [L, *post* + *pilla,* ball; Gk, *a,* not, *men,* month, *rhoia,* flow], failure of normal menstrual cycles to resume within 3 months after discontinuation of oral contraception. The pathophysiological characteristics of this uncommon condition are poorly understood. Postpill amenorrhea is rarely permanent. See also **amenorrhea.**

postpoliomyelitis muscular atrophy (PPMA) /-pō′lē-ōmī′əlī′tis/ [L, *post,* after; Gk, *polios,* gray, *myelos,* marrow, *itis,* inflammation; L, *musculus* + Gk, *a,* not, *trophe,* nourishment], a recurrence of muscular weakness and other neuromuscular symptoms in people who recovered from acute paralytic polio many years earlier. The condition may or may not affect the same muscles that were damaged in the earlier polio attack.

postpolycythemic myeloid metaplasia /-pol′isīthē′mik/ [L, *post* + Gk, *polys,* many, *kytos,* cell, *haima,* blood, *myelos,* marrow, *eidos,* form, *meta,* with, *plassein,* to mold], a late developing anemia in polycythemia vera, caused by bone marrow fibrosis. The production of red blood cells occurs only in the liver and spleen. This condition is frequently complicated by leukemia, especially if the patient has been treated with ionizing radiation. See also **myelofibrosis, myeloid metaplasia** and **polycythemia.**

postprandial, after a meal.

postprandial glucose test, a blood test in which a meal acts as a glucose challenge to the body's metabolism. It is an easily performed screening test for diabetes mellitus. A 1-hour glucose screen, using a 50-g oral glucose load, is used to detect gestational diabetes mellitus.

postprandial pain [L, *post,* after, *prandium,* meal, *poena,* penalty], pain that occurs after a meal.

post procedure recovery, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which an individual returns to baseline function following a procedure(s) requiring anesthesia or sedation. See also **Nursing Outcomes Classification.**

postprocessing /-pros′əsing/, (in ultrasonics) manipulation and conditioning of signals and image data after they emerge from the scan converter and before they are displayed. Postprocessing is used to change the assignment of image brightness versus echo signal amplitude in memory.

postpuberal, postpubertal. See **postpuberty.**

postpubertal panhypopituitarism /-pyo͞o′bərtəl/ [L, *post* + *pubertas,* maturation; Gk, *pan,* all, *hypo,* below, *pituita,* phlegm], insufficiency of pituitary hormones, caused by pituitary necrosis resulting from a blood clot in the artery supplying the gland or trauma to the gland. The disorder is characterized initially by weakness, lethargy, loss of libido, intolerance to cold, and, in females by failure to lactate and amenorrhea. It leads eventually to loss of axillary and pubic hair, bradycardia, hypotension, premature wrinkling of the skin, and atrophy of the thyroid and adrenal glands. Treatment consists of the administration of thyroid hormone, corticosteroids, and sex hormones. Also called **hypophyseal cachexia, pituitary cachexia, Simmonds' disease.** Compare **prepubertal panhypopituitarism.**

postpuberty /-pyo͞o′bərtē/ [L, *post* + *pubertas,* maturation], a period of approximately 1 to 2 years after puberty during which skeletal growth slows and the physiological functions of the reproductive years are established. Also called **postpubescence. —postpuberal, postpubertal,** *postpubescent, adj.*

postrenal anuria /-rē′nəl/ [L, *post* + *renes,* kidney; Gk, *a* + *ouron,* not urine], cessation of urine production caused by obstruction of the ureters or urethra.

postresection filling. See **retrograde filling.**

poststeroid lobular panniculitis [L, *panniculus,* piece of cloth], subcutaneous nodules that may develop in a layer of fatty connective tissue in children 1 to 13 days after discontinuation of steroid therapy. The condition resolves spontaneously or without readministration of the medication. Compare **poststeroid panniculitis.**

poststeroid panniculitis /pos′təroid pənik′yəlī′tis/ [L, *panniculus,* piece of cloth], subcutaneous nodules that may develop in children after withdrawal of corticosteroid treatment for rheumatic fever or nephrotic syndrome.

The condition resolves spontaneously or with readministration of the medication. Compare **poststeroid lobular panniculitis.**

postsynaptic /-sinap′tik/ [L, *post* + Gk, *synaptein,* to join], **1.** situated after a synapse. **2.** occurring after a synapse has been crossed.

postterm infant. See **postmature infant.**

postterm pregnancy. See **postdate pregnancy.**

posttransfusion syndrome /-transfyo͞o′zhən/ [L, *post,* after, *transfundere,* to pour through; Gk, *syn,* together, *dromos,* course], a complex of adverse reactions that may accompany or follow IV administration of blood or blood components. Reactions may include hemolytic effects, headache and back pain, allergies to an unknown component in donor blood, circulatory overloading, effects of cold blood that chill the patient's cardiovascular system, and effects of microaggregates in stored blood.

posttransplant diabetes, glucose intolerance or overt hypoglycemia that first appears after an organ transplant. Some cases are steroid diabetes caused by use of steroid immunosuppressive agents.

posttraumatic /-trômat′ik/ [L, *post,* after, Gk, *trauma,* wounded], pertaining to any emotional, mental, or physiological consequences after a major illness or injury.

posttraumatic amnesia [L, *post* + Gk, *trauma,* wound], a period of amnesia between a brain injury resulting in memory loss and the point at which the functions concerned with memory are restored.

posttraumatic epilepsy. See **traumatic epilepsy.**

posttraumatic osteoporosis [L, *post,* after; Gk, *trauma,* wound, *osteon,* bone, *poros,* passage, *osis,* condition], a loss of bone density that develops after an injury or other severe health episode. It may occur as a result of disease.

posttraumatic spondylitis. See **Kümmell's disease.**

posttraumatic stress disorder (PTSD), a *DSM-IV* psychiatric disorder characterized by an acute emotional response to a traumatic event or situation involving severe environmental stress, such as a natural disaster, airplane crash, serious automobile accident, military combat, or physical torture.

posttraumatic syndrome. See **postconcussional syndrome.**

postulate /pos′chəlāt/ [L, *postulare,* to demand], a hypothesis that is offered as true without proof or as a basis for argument or debate.

postural albuminuria. See **orthostatic proteinuria.**

postural background movements /pos′chərəl/ [L, *ponere,* to place], the spontaneous body adjustments, requiring vestibular and proprioceptive integration, that maintain the center of gravity, keep the head and body in alignment, and stabilize body parts, such as the shoulder girdle when the hand reaches for a distant object.

postural drainage, the use of positioning to drain secretions from specific segments of the bronchi and the lungs into the trachea. Coughing usually expels secretions from the trachea. Also called **bronchial drainage.**

■ METHOD: Positions that promote drainage from the affected parts of the lungs are selected. Pillows and raised sections of the hospital bed are used to support or elevate parts of the body. The procedure is begun with the patient level, and the head is gradually lowered to a full Trendelenburg position. Inhalation through the nose and exhalation through the mouth are encouraged. Simultaneously the nurse or other health care provider may use cupping and vibration over the affected area of the lungs to dislodge and mobilize secretions. The person is then helped to a position conducive to coughing and is asked to breathe deeply at least three times and to cough at least twice. See also **cupping and vibrating.**

■ INTERVENTIONS: A patient who is dyspneic or who has hemoptysis or signs of cerebral hemorrhage, increased intracerebral pressure, or lung abscess is not placed in a head-down position without caution and a specific medical order. Suction is kept available in all cases in which the patient may not be able to expel the secretions that have drained into the trachea. The patient's tolerance for the procedure and the position is carefully observed. Fatigue is prevented.

■ OUTCOME CRITERIA: Effectiveness of the procedure depends on positioning that allows drainage by gravity and on liquefaction, ciliary action, and effective breathing. As the secretions are cleared, the patient becomes better able to breathe, is more comfortable, and may move about more freely; thus the respiratory passages may remain freer of obstructing secretions and resume their expected function. Also called **bronchial drainage.**

postural hypotension. See **orthostatic hypotension.**

postural mechanism, a term used to encompass muscle tone, postural tone, equilibrium, and righting responses, as well as protective extension reactions.

postural proteinuria. See **orthostatic proteinuria.**

postural reflex [L, *ponere,* to place, *reflectere,* to turn back], any of several reflexes associated with maintaining normal body posture.

postural vertigo. See **positional vertigo.**

posture /pos′chər/ [L, *ponere,* to place], the position of the body with respect to the surrounding space. A posture is determined and maintained by coordination of the various muscles that move the limbs, by proprioception, and by the sense of balance.

posture sense. See **position sense.**

postvaccinal encephalitis /-vak′sinəl/ [L, *post,* after, *vaccinus,* of a cow; Gk, *enkephalos,* brain, *itis,* inflammation], acute encephalitis after vaccination, especially with vaccinia (smallpox vaccine) or the Semple rabies vaccine.

postvaccinal encephalomyelitis [L, *post,* after, *vaccinus,* of a cow; Gk, *enkephalos,* brain, *myelos,* marrow, *itis,* inflammation], acute encephalomyelitis after vaccination.

postviral fatigue syndrome /-vīrəl/ [L, *post,* after, *virus,* poison, *fatigare,* to tire; Gk, *syn,* together, *dromos,* course], a condition after a viral infection of chronic muscle fatigue unrelieved by rest. Other symptoms may include visual and hearing difficulties, low-grade fever, stiff neck, urinary frequency, and insomnia. Also called **benign myalgic encephalomyelitis, Iceland disease, Royal Free disease.**

pot-, prefix meaning "related to drinking": *potable, potocytosis, potomania.*

potable water /pō′təbəl/ [L, *potare,* to drink], water that can be consumed without concern for adverse health effects. Potable water does not have to taste good. Likewise, water may be palatable but not necessarily safe to drink.

potassemia /pōt′əsē′meiə/ [D, *potasschen,* potash; Gk, *haima,* blood], an excess of potassium in the blood.

potassium (K) /pətas′ē·əm/ [D, *potasschen,* potash], an alkali metal element, the seventh most abundant element in the earth's crust. Its atomic number is 19; its atomic mass is 39.10. Potassium salts are necessary to the life of all plants and animals. Potassium in the body constitutes the predominant intracellular cation, helping to regulate neuromuscular excitability and muscle contraction. Sources of potassium in the diet are whole grains, meat, legumes, fruit, and vegetables. The average adequate daily intake for most adults is 2 to 4 g. Normal adult levels of blood potassium are 3.5 to 5 mEq/L or 3.5 to 5 mmol/L (SI units). Potassium is important in glycogen formation, protein synthesis, and correction

Positions for postural drainage

Lung segment	*Position of client*
Adult	
Bilateral	High-Fowler's position Apical segments Right upper lobe—anterior segment	Supine with head of bed elevated 15 to 30 degrees Left upper lobe—anterior segment	Supine with head elevated Right upper lobe—posterior segment	Side lying with right side of chest elevated on pillows Left upper lobe—posterior segment	Side lying with left side of chest elevated on pillows Right middle lobe—anterior segment	Three-fourths supine position with dependent lung in Trendelenburg's position Left lower lobe—lateral segment	Left lateral in Trendelenburg's position Right lower lobe—lateral segment	Right side-lying in Trendelenburg's position Right lower lobe—posterior segment	Prone in Trendelenburg's position with right side of thorax elevated Both lower lobes—posterior segment	Prone in Trendelenburg's position with abdomen and thorax elevated Child	
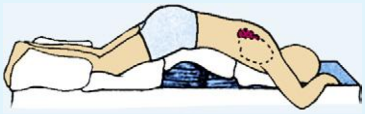
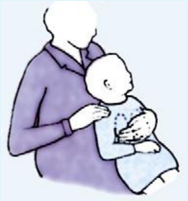
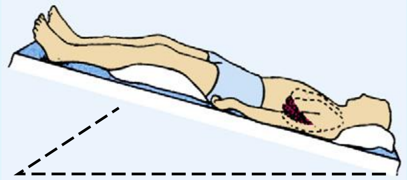
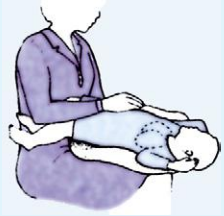
Bilateral—apical segments	Sitting on nurse's lap, leaning slightly forward, flexed over pillow 
Positions for postural drainage—cont'd

Lung segment	*Position of client*	*Lung segment*	*Position of client*
Right middle lobe—posterior segment	Prone with thorax and abdomen elevated	Bilateral—middle anterior segments	Sitting on nurse's lap, leaning against nurse
			




Both lower lobes—anterior segment	Supine in Trendelenburg's position	Bilateral lobes—anterior segments	Lying supine on nurse's lap, back supported with pillow
			





From Potter PA, Perry AG: *Fundamentals of nursing*, ed 8, St Louis, 2013, Mosby.

of imbalances of acid-base metabolism, especially in association with the action of sodium and hydrogen ions. Potassium salts are very important as therapeutic agents but are extremely dangerous if used improperly. The kidneys play an important role in controlling the secretion and absorption. Aldosterone stimulates sodium reabsorption and potassium secretion by the kidneys. The major extrarenal adaptation to this process involves the absorption of potassium by the body tissues, especially the tissues of the muscles and the liver. Potassium is most commonly depleted in the body by an increased rate of excretion by the kidneys or the GI tract. Increased renal excretion may be caused by diuretic therapy, large doses of anionic drugs, or renal disorders. Increased GI excretion of potassium may occur with the loss of GI fluid through vomiting, diarrhea, surgical drainage, or chronic use of laxatives. Potassium loss through the skin is rare but can result from perspiring during excessive exercise in a hot environment.

potassium and sodium phosphate, any of various preparations containing both sodium and potassium phosphate in some combination of the monobasic and dibasic salts of each. It is used as an electrolyte replenisher, urinary acidifier, and antiurolithic.

potassium channel blocking agent, any of a class of antiarrhythmic agents that inhibit the movement of potassium ions through potassium channels, thus prolonging repolarization of the cell membrane. Also called *potassium channel blocker.*

potassium chloride (KCl), a white crystalline salt used as a substitute for table salt in the diet of people with cardiovascular disorders, in administration of the potassium ion, and as a constituent of Ringer's solution.

■ INDICATIONS: It is prescribed in the treatment of hypokalemia resulting from a variety of causes and of digitalis intoxication.

■ CONTRAINDICATIONS: Hyperkalemia; concomitant use of spironolactone, amiloride, or triamterene; Addison's disease; renal impairment; or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are hyperkalemia and, when the drug is given orally, ulceration of the small bowel.

potassium hydroxide (KOH), a white, soluble, highly caustic compound. Occasionally used in solution as an escharotic for bites of rabid animals, KOH has many laboratory uses as an alkalinizing agent, including the preparation of clinical specimens for examination for fungi under the microscope.

potassium indoxyl sulfate. See **indican.**

potassium iodide, an expectorant.

■ INDICATIONS: It is prescribed in the treatment of chronic bronchitis, bronchiectasis, asthma, and other pulmonary disease with excess mucus formation and of various thyroid disorders.

■ CONTRAINDICATIONS: Acute bronchitis, known or suspected pregnancy, or known hypersensitivity to this drug or to any iodide prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypersensitivity, goiter, myxedema, GI disturbance, and skin lesions.

potassium penicillin V. See **penicillin V.**

potassium phosphates, a combination of monobasic and dibasic potassium phosphates used as an electrolyte replenisher.

potassium pump, a mechanism that involves energy-dependent pumping of potassium or the active transport of the potassium ion (K^+) across a biological membrane using the energy of K^+-activated adenosine triphosphatase. Also called **K^+ pump.** See also **calcium pump, sodium-potassium pump.**

potassium-sparing diuretic. See **diuretic.**

potency /pō′tənsē/ [L, *potentia*, power], **1.** (in embryology) the range of developmental possibilities of which an embryonic cell or part is capable, regardless of whether the stimulus for growth or differentiation is natural, artificial, or experimental. See also **competence,** def 1. **2.** a measure of the strength of the active chemical components contained in an herb or herbal preparation. Standardized products ensure the consumer of receiving a dosage containing a consistent potency. Compare **concentration.**

potent /pō′tənt/ [L, *potentia*, power], powerful or strong.

-potent, suffix meaning "powerful or able to do" something specified: *pluripotent, unipotent, viripotent*.

potential /pəten′shəl/ [L, *potentia*], an expression of the energy involved in transferring a unit of electric charge. The gradient or slope of a potential causes the charge to move. The movement of 1 coulomb of charge from a potential of V to a potential of V-1 volts requires 1 joule of energy.

potential abnormality of glucose tolerance, a classification that includes people who have never had abnormal glucose tolerance but who have an increased risk of diabetes or impaired glucose tolerance. Factors associated with an increased risk of type 1 diabetes mellitus include having circulating islet cell antibodies, being a monozygotic twin or sibling of a type 1 diabetes patient, and being the offspring of a type 1 diabetes patient. Factors associated with an increased risk of type 2 diabetes mellitus include being a first-degree relative of a type 2 diabetes patient (particularly in a family in which there are several generations with type 2 diabetes); giving birth to a neonate weighing more than 9 pounds (4.086 kilograms); being a member of a racial or ethnic group with a high prevalence of diabetes, such as some Native American groups; and being an obese adult. Also called *potential diabetes*. See also **diabetes mellitus.**

potential difference, the difference in electric potential between two points. It represents the work involved in the release of energy by the transfer of a unit quantity of electricity from one point to another.

potential energy [L, *potentia*, power; Gk, *energeia*], the energy contained in a body as a result of its position in space, internal structure, and stresses imposed on it. Also called **latent energy.**

potential life, a criterion used by the Centers for Disease Control and Prevention to gauge premature death rates. Among younger individuals, it is based on an assumption that the person would have lived to 65 years of age if life had not been interrupted by a particular disease or injury. The leading cause of loss of potential life in young people is accidents, followed by cancer and heart disease. For older people the system is based on years of potential life lost before 85 years of age, in which case cancer and heart disease rank first and second.

potential trauma, a change in tissue that may occur because of existing malocclusion or dental disharmony.

potentiate /pōten′shē·āt/, to increase the strength or degree of activity of something.

potentiation /pōten′shē·ā′shən/ [L, *potentia*], a synergistic action in which the effect of two drugs given simultaneously is greater than the sum of the effects of each drug given separately.

potentiometer /pōten′shē·om′ətər/ [L, *potentia* + Gk, *metron*, measure], a voltage-measuring device.

Potter-Bucky grid [Hollis E. Potter; Gustav Bucky; twentieth-century American radiologists; ME, *gredire*, grate], an x-ray grid that oscillates during the exposure of a radiographic film, blurring the grid lines. Also called **Potter-Bucky diaphragm.** See also **grid.**

Pott's disease. See **tuberculous spondylitis.**

Pott's fracture [Percival Pott, English physician, 1713–1788], a break in the fibula near the ankle, often accompanied by a break in the malleolus of the tibia or a rupture of the internal lateral ligament. Also called **Dupuytren's fracture.**

potty chair [AS, *pott* + ME, *chaire*], a small chair that has an open seat over a removable pot, used for the toilet training of young children.

pouch [OFr, *pouche*], any small saclike appendage or pocket, such as Rathke's pouch in the embryonic roof cavity. See also **cul-de-sac.**

pouch of Douglas. See **cul-de-sac of Douglas.**

poultice /pōl′tis/ [L, *puls*, porridge], **1.** a soft moist pulp spread between layers of gauze or cloth and applied hot to a surface to provide heat or to counter irritation. A kind of poultice is a **mustard plaster.** **2.** plant material (such as crushed fresh herbs) that has been wrapped in gauze or similar soft cloth, moistened, and applied topically.

pound (lb) [L, *pondus*, weight], a unit of measure equal to 16 ounces, avoirdupois; 0.45359 kg; 7000 grains.

***P. ovale*,** abbreviation for *Plasmodium ovale*.

poverty /pov′ərtē/ [L, *paupertas*], **1.** a lack of material wealth needed to maintain existence. **2.** a loss of emotional capacity to feel love or sympathy.

povidone /pō′vidōn/, a polymerized form of vinylpyrrolidone, a white hygroscopic powder readily soluble in water, used as a dispersing and suspending agent in drugs. It also has been used as a blood volume extender and, in a complex with iodine, as a topical antiseptic.

povidone-iodine /pō′vidōn ī′ədīn/, an antiseptic microbicide.

■ INDICATIONS: It is prescribed as a topical microbicide for disinfection of wounds, as a preoperative surgical scrub, for vaginal infections, and for antiseptic treatment of burns. A drop is also often placed into the eyes of neonates to prevent ophthalmia neonatorum.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to iodine prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are local skin irritation, redness, and swelling.

Powassan virus infection [Powassan, Ontario], an uncommon form of encephalitis caused by a tick-borne arbovirus found in eastern Canada and the northern United States.

powder, the dried product of an extraction process in which a substance is first mixed with a solvent such as alcohol or water. Then, the solvent is removed completely. The dry solid that remains either is already in powder form or may be ground into it.

power centric, the position of the mandible during a forceful bite.

power mode, a method of color flow processing and display in which the Doppler signal amplitude or the signal intensity, averaged over a small interval, is displayed rather than the average Doppler frequency. Velocity and flow direction are not displayed and artifacts do not affect the image.

power of attorney [Fr, *pouvoir* + OFr, *atorne*, legal agent], a document authorizing one person to take legal actions on behalf of another, to act as an agent for the grantor. The legality of a power of attorney may be challenged if the grantor can be found to have been mentally incompetent at the time the authority was granted.

power stroke, a working movement of a dental scaling instrument, used for splitting or dislodging calculus from the surface of a tooth or tooth root.

pox [ME, *pokkes,* pustules], **1.** any of several vesicular or pustular exanthematous diseases terminating in scars. **2.** the pitlike scars of smallpox or chicken pox. **3.** *archaic*. syphilis.

poxvirus /poksvī′rəs/ [ME, *pokkes* + L, *virus,* poison], a member of a family of viruses that includes the organisms that cause molluscum contagiosum, smallpox, and vaccinia.

PP, abbreviation for (Latin) *punctum proximum,* "near the point of accommodation."

PPD, abbreviation for **purified protein derivative.**

PPE, abbreviation for **personal protective equipment.**

PPLO, abbreviation for **pleuropneumonia-like organism.**

PPM, ppm, abbreviation for **parts per million.**

PPMA, abbreviation for **postpoliomyelitis muscular atrophy.**

PPNG, abbreviation for **penicillinase-producing** ***Neisseria gonorrhoeae.***

PPO, abbreviation for **preferred provider organization.**

PPS, abbreviation for **prospective payment system.**

PPV, abbreviation for **positive pressure ventilation.**

Pr, symbol for the element **praseodymium.**

PR, abbreviation for **prosthion.**

practical anatomy. See **applied anatomy.**

practical nurse. See **licensed practical nurse.**

practice guideline, a detailed description of a process of patient care management that will facilitate improvement or maintenance of health status or slow the decline in health status in certain chronic clinical conditions. The purpose of a practice guideline is to assist health care providers to identify preferred treatment by providing links among diagnoses, treatments, and outcomes and by describing alternatives available for each patient. Practice guidelines provide a basis for evaluation of care and allocation of resources. See also **clinical pathway.**

practice models /prak′tis/ [Gk, *praktikos,* practical], the patterns by which health care services are made available to people in different settings.

practice setting, the context or environment within which nursing care is given.

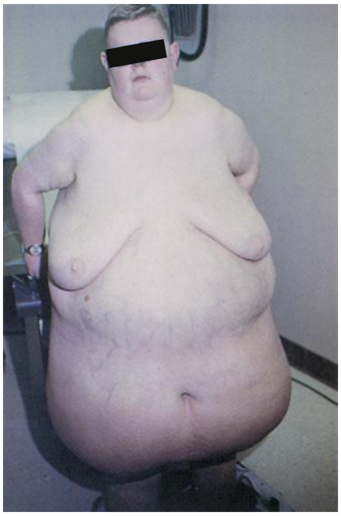
practice theory, (in nursing research) a theory that describes, explains, and prescribes nursing practice in general. It serves as the basis for specific items in the curriculum of nursing education and for the development of theories in the administration of nursing and nursing education.

practicing /prak′tising/, the second subphase of the separation-individuation phase in Mahler's system of preoedipal development, when the child is able to move away from the mother and return to her for emotional nurturing. The child may feel elation in response to this investigation of the environment and through practicing locomotor skills.

practicing medicine without a license, (in law) practicing activities defined under state law in the medical practice act without physician supervision, direction, or control.

practitioner /praktish′ənər/ [Gk, *praktikos*], a person qualified to practice in a special professional field, such as a nurse practitioner.

Prader-Willi syndrome /prä′dər wil′ē/ [A. Prader, twentieth-century Swiss physician; H. Willi; Gk, *syn,* together, *dromos,* course], a congenital metabolic condition characterized by hypotonia, hyperphagia, marked obesity, hypogonadism, and mental retardation. When diabetes mellitus occurs with the other symptoms, the condition is called **Royer's syndrome.** Administration of growth hormones may accelerate growth and improve strength. Testosterone may increase penis size, and puberty can be accomplished with hormone replacement. See also **Angelman's syndrome.**



Prader-Willi syndrome *(Morgan and Weinsier, 1998)*

prae-. See **pre-.**

praecox [L, premature], pertaining to something that occurred at an earlier stage of life or development.

praevia /prē′vē·ə/ [L], having occurred at an earlier time or in front of a place. Also called *praevius.*

-pragia, suffix meaning "quality of action": *bradypragia, dyspragia, tachypragia.*

pragmatic /pragmat′ik/, pertaining to a belief that ideas are valuable only in terms of their consequences.

pragmatism /prag′mətiz′əm/ [Gk, *pragma,* deed], a philosophy concerned with actual practice and practical results as opposed to theory and speculation.

pralidoxime chloride /pral′ədok′sēm/, a cholinesterase reactivator.

■ INDICATIONS: It is prescribed as an antidote for organophosphate poisoning and drug overdosage in the treatment of myasthenia gravis.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is contraindicated in poisoning by carbamate insecticides that react with pralidoxime.

■ ADVERSE EFFECTS: Among the most serious adverse effects are dizziness, tachycardia, hyperventilation, and muscle weakness. These reactions are most common when the drug is injected too rapidly.

-pramine, suffix for imipramine-type compounds.

pramipexole, an antiparkinson agent.

■ INDICATION: It is used to treat parkinsonism.

■ CONTRAINDICATION: Known hypersensitivity prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects are hemolytic anemia, leukopenia, and agranulocytosis. Other adverse effects include psychosis, hallucination, depression, dizziness, constipation, impotence, and blurred vision. Common side effects include agitation, insomnia, nausea, anorexia, and orthostatic hypotension.

pramlintide, an antidiabetic that modulates and slows stomach emptying, prevents postprandial rise in plasma glucagon, decreases appetite, and leads to decreased caloric intake and weight loss.

■ INDICATIONS: This drug is used as an adjunct to insulin therapy to treat uncontrolled type 1 or type 2 diabetes.

■ CONTRAINDICATIONS: Gastroparesis and known hypersensitivity to this drug or to metacresol prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include headache, fatigue, dizziness, nausea, vomiting, anorexia, abdominal pain, injection site reactions, hypoglycemia (while used with insulin), arthralgia, cough, pharyngitis, and systemic allergy.

Pramosone, a trademark for a fixed-combination topical drug containing a glucocorticoid (hydrocortisone acetate) and a topical anesthetic **(pramoxine hydrochloride)** used to treat perianal pain and swelling.

pramoxine hydrochloride /prəmok′sēn/, a local anesthetic for the relief of pain and itching associated with dermatoses, anogenital pruritus, hemorrhoids, anal fissure, and minor burns.

prandial /pran′dē·əl/ [L, *prandium,* meal], pertaining to a meal. The term is used in relation to timing, such as postprandial or preprandial. *—prandiality, n.*

praseodymium (Pr) /prā′sē·ōdīm′ē·əm/ [Gk, *prasaios,* light-green, *didymos,* twin], a rare earth metallic element. Its atomic number is 59, and its atomic mass is 140.91.

Prausnitz-Küstner test (PK test) /prous′nits kist′nər/ [Otto C. Prausnitz, German hygienist, 1876–1963; Heinz Küstner, German gynecologist, 1897–1963], a skin test formerly used to measure the presence of immunoglobulin E. An allergic response was transferred to a nonallergic person who acted as a surrogate to permit identification of the allergen. It is no longer used because of the high risk of transfer of hepatitis or blood-borne diseases such as acquired immunodeficiency syndrome. Also, serum IgE can now be measured by in vitro assays, such as the radioallergosorbent test and radioimmunosorbent test. Also called **passive transfer test.** Compare **patch test, radioallergosorbent test.** See also **anaphylaxis.**

pravastatin /prav′ahstat′in/, an antihyperlipidemic agent that acts by inhibiting cholesterol synthesis, used as the sodium salt in the treatment of hypercholesterolemia and other forms of dyslipidemia and to lower the risks associated with atherosclerosis and coronary heart disease. It is administered orally.

-praxia, suffix meaning "to achieve or to do (perform)": *dyspraxia, eupraxia, hypopraxia.*

praxis [Gk, action], **1.** a concept that deals with actions and overt behavior or the performance of an action to the exclusion of metaphysical thought. **2.** the ability to plan and then execute movement.

-praxis /prak′sis/, suffix meaning "to achieve, doing, an act, or treatment based on theory": *actinopraxis, echopraxis, parapraxis.*

prazepam /praz′əpam/, a benzodiazepine derivative used to treat anxiety.

■ INDICATIONS: It is not available in the United States, but it is prescribed elsewhere for the treatment of anxiety disorders or the short-term relief of symptoms of anxiety and has several unlabeled uses, including alcohol and opiate withdrawal, spasticity, and partial seizures.

■ CONTRAINDICATIONS: Acute narrow-angle glaucoma or known sensitivity to this drug or other benzodiazepines prohibits its use.

■ ADVERSE EFFECTS: Among the more serious, but rare, adverse effects are confusion, tremor, palpitations, and diaphoresis.

-prazole, suffix for antiulcerative benzimidazole derivatives.

prazosin hydrochloride /prä′zəsin/, an antihypertensive, peripherally acting alpha$_1$-adrenergic blocker.

■ INDICATIONS: It is prescribed to treat hypertension and to decrease afterload in congestive heart disease. Unlabeled uses include treatment of benign prostatic hyperplasia and Raynaud's phenomenon.

■ CONTRAINDICATIONS: Known hypersensitivity to this or similar drugs (e.g., terazosin, doxazosin) prohibits its use.

■ ADVERSE EFFECTS: The initial dose of the medication can cause a large drop in blood pressure and syncope, especially in patients who are volume depleted or are concurrently using beta blockers. Common ongoing adverse effects include tachycardia, palpations, orthostatic hypotension, fainting, dizziness, headache, drowsiness, urinary urgency, weakness, and nausea. Rarely cataracts have appeared or worsened with the use of prazosin.

PRE, abbreviation for **progressive resistance exercise.**

preadmission certification /prē′ədmish′ən/, a system whereby physicians are required to obtain advance approval for nonemergency admission of Medicare, Medicaid, and managed care patients to hospitals, as well as most third-party payers. The system is intended to determine whether the patient can be treated as an outpatient or in another, less expensive manner than hospitalization. Emergency admissions require post hoc approval. Also called **precertification.**

preagonal ascites /prē·ag′ənəl/ [L, *prae,* before; Gk, *agon,* struggle, *askos,* bag], a rapid accumulation of fluid within the peritoneal cavity, representing the transudation of serum from the circulatory system. Preagonal ascites immediately precedes death in some cases. See also **ascites.**

prealbumin test (PAB, TBPA), a blood, 24-hour urine, or cerebrospinal fluid analysis. It is useful as a marker of nutritional status and is a sensitive indicator of protein synthesis and catabolism. This test is done frequently on patients receiving total parenteral nutrition.

preanal /prē·ā′nəl/, located anterior to the anus.

preanesthetic medication. See **premedication.**

preaortic node /prē′ā·ôr′tik/ [L, *prae* + Gk, *aerein,* to raise; L, *nodus,* knot], a node in one of the three sets of lumbar lymph nodes that serve various abdominal viscera supplied by the celiac, superior mesenteric, and inferior mesenteric arteries. The preaortic nodes lie ventral to the aorta and are divided into the celiac nodes, superior mesenteric nodes, and inferior mesenteric nodes. Most of the efferent vessels from the preaortic nodes unite to form the lymphatic intestinal trunk that enters the cisterna chyli. Compare **lateral aortic node, retroaortic node.**

preauricular /prē′ôrik′yələr/, located anterior to the auricle of the ear.

precancerous /-kan′sərəs/ [L, *prae* + *cancer,* crab], pertaining to a stage of abnormal tissue growth that is likely to develop into a malignant tumor.

precancerous dermatitis. See **intraepidermal carcinoma.**

precautionary labels /prikô′shəner′ē/, information and identification that must be applied to the containers of all hazardous chemicals, including flammables, combustibles, corrosives, carcinogens, and potential carcinogens.

prececocolic fascia, an extension sometimes found in the parietal abdominal fascia, crossing anterior to the cecum adjacent to the ascending colon.

precedent /pres′ədənt/ [L, *praecedere,* to go before], a previously adjudged decision that serves as an authority in a similar case.

precentral gyrus /-sen′trəl/ [L, *prae* + Gk, *kentron,* center, *gyros,* turn], a convolution of the cerebral hemisphere immediately anterior to the central sulcus of the cerebrum in each hemisphere. It is the location of the motor strip that controls voluntary movements of the contralateral side of the body. Also called **anterior central gyrus.**

preceptor: employee, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting and supporting a new or transferred employee through a planned orientation to a specific clinical area. See also **Nursing Interventions Classification.**

preceptorship /-sep′tərship′/ [L, *prae* + *capere,* to take up], **1.** the position of teacher or instructor. **2.** a defined period of time in which two people (a nurse with a student nurse or an experienced nurse with a new graduate) work together so that the less experienced person can learn and apply knowledge and skills in the practice setting with the help of the more experienced person.

preceptor: student, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting and supporting learning experiences for a student. See also **Nursing Interventions Classification.**

precertification, authorization for a specific medical procedure before it is done or for admission to an institution for care. It is required for payment by most U.S. managed care organizations.

precession /-sesh′ən/ [L, *praecedere,* to go before], a comparatively slow gyration of the axis of a spinning body such that the axis traces out a cone, caused by the application of a torque. The magnetic moment of a nucleus with spin experiences such a torque when inclined at an angle to an applied magnetic field, resulting in precession at the Larmor frequency.

precipitant /-sip′ətənt/ [L, *praecipitare,* to cast down], a substance that causes another substance to settle, separate, or deposit from a solution, such as a reagent that causes certain metals to precipitate.

precipitate /prəsip′itāt, -it/ [L, *praecipitare,* to cast down], **1.** *v,* to cause a substance to separate or settle out of solution. **2.** *n,* a substance that has separated from or settled out of a solution. **3.** *adj,* occurring hastily or unexpectedly.

precipitate delivery /-sip′itit/, childbirth that occurs with such speed or in such a situation that the usual preparations cannot be made. See also **emergency childbirth.**

precipitating factor /-sip′itā′ting/, an element that causes or contributes to the occurrence of a disorder.

precipitation /-sip′itā′shən/ [L, *praecipitare,* to cast down], a process whereby solid particles are made to settle out of a solution so that they can be separated from other dissolved substances.

precipitin /prəsip′itin/ [L, *praecipitare* + Gk, *anti,* against; AS, *bodig,* body; Gk, *genein,* to produce], an antibody that causes the formation of an insoluble complex when combined with a specific soluble antigen. Compare **agglutinin.** See also **agglutination, antiglobulin.**

precision attachment /pri·sish′ən/ [L, *praecidere,* to cut short], a device using a close fitting male and female portion to adjoin fixed or removable partial dentures to the crown of an abutment tooth or a restoration. See also **precision rest, intracoronal retainer.** Also called *precision anchorage*.

precision rest /prisish′ən/ [L, *praecidere,* to cut short; AS, *rest*], a rigid denture support consisting of two tightly fitting parts, the insert of which rests firmly against the gingival part of the device.

preclinical /-klin′ikəl/ [L, *prae* + Gk, *kline,* bed], a stage in a disease when a specific diagnosis cannot be made because adequate signs and symptoms have not yet developed.

precocious /-kō′shəs/ [L, *praecoquere,* to mature early], pertaining to the early, often premature, development of physical or mental qualities.

precocious carrier. See **amebic carrier state.**

precocious dentition, an abnormal acceleration of the eruption of the primary or secondary teeth, usually associated with an endocrine imbalance, such as excess growth hormone or hyperthyroidism. Compare **retarded dentition.**

precocious puberty [L, *praecoquere,* to mature early, *pubertas*], abnormally early development of sexual maturity. It is usually marked by early breast development and ovulation in girls before 8 years of age and the production of mature sperm in boys before 10 years of age.

precognition /-kognish′ən/, the alleged intuitive foreknowledge of events. Compare **premonition.**

preconception counseling, a nursing intervention from the Nursing Interventions Classification (NIC) defined as screening and providing information and support to individuals of childbearing age before pregnancy to promote health and reduce risks. See also **Nursing Interventions Classification.**

preconscious /-kon′shəs/ [L, *prae,* before, *conscire,* to be aware], **1.** *adj,* before the development of self-consciousness and self-awareness. **2.** *n,* (in psychiatry) the mental function in which thoughts, ideas, emotions, or memories not in immediate awareness can be brought into the consciousness, usually through associations, without encountering any intrapsychic resistance or repression. **3.** *n,* the mental phenomena capable of being recalled, although not present in the conscious mind.

precordial. See **precordium.**

precordial lead. See **chest lead.**

precordial movement, any motion of the anterior wall of the thorax localized in the area over the heart. Variations of precordial movements include **apical impulse, left ventricular thrust,** and **right ventricular thrust.**

precordial pain [L, *prae,* before, *cor,* heart; *poena,* penalty], pain in the chest wall over the heart.

precordium /-kôr′dē·əm/ [L, *prae,* before, *cor,* heart], the part of the front of the chest wall that overlays the heart and the epigastrium.—**precordial,** *adj*.

Precose, a trademark for an antidiabetic agent **(acarbose).**

precursor /-kur′sər/ [L, *prae* + *currere,* to run], **1.** something preceding, or coming before, another. **2.** a prognostic characteristic or feature of a patient's health data, such as a radiographic or laboratory finding, that is associated with a higher or lower risk of death than the average.

precursor therapy, a type of treatment involving the use of nutrients that may influence neurological clinical conditions. An example is the use of choline, a B complex vitamin precursor of acetylcholine, in the treatment of tardive dyskinesia.

pred-, -pred, combining form for predniSONE or prednisoLONE derivatives.

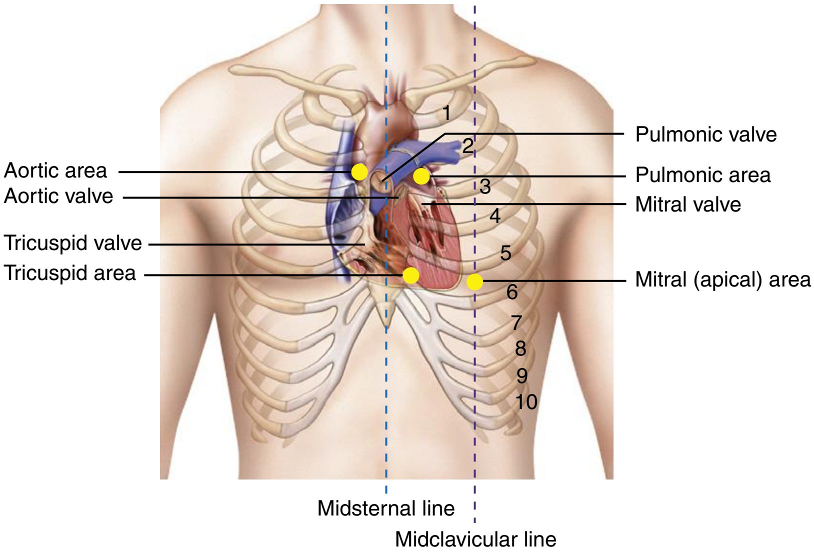
predeciduous dentition /-disid′yo͞o·əs/ [L, *prae* + *decidere,* to fall off], the epithelial structures in the mouth of the infant before the eruption of the primary teeth. See also **primary dentition, teething.**

prediabetes. See **potential abnormality of glucose tolerance, previous abnormality of glucose tolerance.**

prediastole /-dī·as′təlē/ [L, *prae,* before; Gk, *dia* + *stellein,* to set], the part of the cardiac cycle between late systole and early diastole.

prediastolic murmur /-dī·əstol′ik/ [L, *prae* + Gk, *dia* + *stellein,* to set; L, *murmur,* humming], a murmur heard during cardiac systole.

predictive hypothesis /-dik′tiv/ [L, *prae* + *dicere,* to say; Gk, foundation], (in research) a hypothesis that predicts the nature of a relationship among the variables to be studied. Also called **research hypothesis.** Compare **null hypothesis**.



Precordium *(Harkreader, Hogan, and Thobaben, 2007)*

predictive validity, validity of a test or a measurement tool that is established by demonstrating the ability of a test or measure to predict the results of an analysis of the same data made with another test instrument or measurement tool. See also **validity.**

predictor variable. See **independent variable.**

predisposing cause /-dispō′sing/ [L, *prae* + *disponere,* to arrange, *causa*], any condition that enhances the specific cause of a disease, such as susceptibility caused by hereditary or life-style factors.

predisposing factor [L, *prae* + *disponere,* to dispose], any conditioning factor that influences both the type and the amount of resources that the individual can elicit to cope with stress. It may be biological, psychological, genetic, or sociocultural.

predisposition /-dis′pəzish′ən/ [L, *prae* + *disponere,* to dispose], a state of being particularly susceptible.

prednicarbate /pred′n-kahr′bāt/, a synthetic corticosteroid used topically for the relief of inflammation and pruritus in certain dermatoses.

prednisoLONE /prednis′əlōn/, a glucocorticoid.

■ INDICATIONS: It is prescribed as treatment for inflammation of the skin, conjunctiva, and cornea and for immunosuppression.

■ CONTRAINDICATIONS: Fungal infections or known hypersensitivity to this drug prohibits its systemic use. Viral or fungal infections of the skin, impaired circulation, or known hypersensitivity to this drug prohibits its topical use.

■ ADVERSE EFFECTS: Among the more serious adverse effects to the systemic administration of this drug are GI, endocrine, neurological, fluid, and electrolyte disturbances. Skin reactions may result from topical administration of this drug.

predniSONE /pred′nisōn/, a glucocorticoid.

■ INDICATIONS: It is prescribed in the treatment of severe inflammation and for immunosuppression.

■ CONTRAINDICATIONS: Viral or fungal infections of the skin, impaired circulation, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects to the systemic administration of the drug are GI, endocrine, neurological, fluid, and electrolyte disturbances. Skin reactions may occur from topical administration of this drug.

predonated autologous blood, blood donated before surgery or another invasive procedure for use in a possible autologous transfusion.

preeclampsia /prē′iklamp′sē·ə/ [L, *prae* + Gk, *ek,* out, *lampein,* to flash], an abnormal condition of pregnancy characterized by the onset of acute hypertension after the 24th week of gestation. The classic triad of preeclampsia is hypertension, proteinuria, and edema. The cause of the disease remains unknown despite 100 years of research by thousands of investigators. It occurs in 5% to 7% of pregnancies, most often in primigravidas, and is more common in some areas of the world than others. The incidence is particularly high in the southeastern part of the United States. The incidence increases with increasing gestational age, and it is more common in cases of multiple gestation, hydatidiform mole, or hydramnios. A typical lesion in the kidneys, glomeruloendotheliosis, is pathognomonic. Termination of the pregnancy results in resolution of the signs and symptoms of the disease and in healing of the renal lesion. Preeclampsia is classified as mild or severe. Mild preeclampsia is diagnosed if one or more of the following signs develop after the 24th week of gestation: systolic blood pressure of 140 mm Hg or more or a rise of 30 mm Hg or more above the woman's usual systolic blood pressure; diastolic blood pressure of 90 mm Hg or more or a rise of 15 mm Hg or more above the woman's usual diastolic blood pressure; proteinuria; and edema. Severe preeclampsia is diagnosed if one or more of the following is present: systolic blood pressure of 160 mm Hg or more or a diastolic blood pressure of 110 mm Hg or more on two occasions 6 hours apart with the woman at bed rest; proteinuria of 5 g or more in 24 hours; oliguria of less than 400 mL in 24 hours; ocular or cerebro vascular disorders; and cyanosis or pulmonary edema. Preeclampsia commonly causes abnormal metabolic function, including negative nitrogen balance, increased central nervous system irritability, hyperactive reflexes, compromised renal function, hemoconcentration, and alterations of fluid and electrolyte balance. Complications include premature separation of the placenta, hypofibrinogenemia, hemolysis, cerebral hemorrhage, ophthalmological damage, pulmonary edema, hepatocellular changes, fetal malnutrition, and lowered birth weight. The most serious complication is eclampsia, which can result in maternal and fetal death. Healthy living conditions, including a diet high in protein, calories, and essential nutritional elements, and rest and exercise are associated with a decreased incidence of preeclampsia. Treatment includes rest, sedation, magnesium sulfate, and antihypertensives. Ultimately, if eclampsia threatens, delivery by induction of labor or cesarean section may be necessary. Formerly called **toxemia of pregnancy.** See also **eclampsia.**

preemie. See **premature infant.**

preexcitation /prē′eksitā′shən/ [L, *prae* + *excitare,* to arouse], activation of part of the ventricular myocardium earlier than would be expected if the activating impulses traveled only down the normal routes and had experienced a normal delay within the atrioventricular (AV) node. Preexcitation may be a result of either an AV accessory pathway (Wolff-Parkinson-White syndrome), which is reflected on the electrocardiogram by a short P-R interval and a broad QRS complex, or an excessively fast intranodal pathway (Lown-Ganong-Levine syndrome), which manifests with a short P-R interval and a normal QRS complex. The degree of preexcitation is determined by the speed at which the impulse traverses the atrial tissue and the accessory pathway or the AV node. See also **accessory pathway.**

preexisting condition /prē′iksis′ting/ [L, *prae* + *existere,* to have reality, *conditio*], any injury, disease, or disability that may have occurred at some time in the past and may predispose an individual to limited health in the future.

preferential anosmia /pref′əren′shəl/ [L, *praeferens,* being preferred; Gk, *a* + *osme,* not smell], the inability to smell certain odors. The condition is often caused by psychological factors concerning either a particular smell or the situation in which the smell occurs.

preferred provider organization (PPO) /-furd′/ [L, *praeferre,* to put before], an organization of physicians, hospitals, and pharmacists whose members discount their health care services to subscriber patients. A PPO may be organized by a group of physicians, an outside entrepreneur, an insurance company, or a company with a self-insurance plan. See also **health maintenance organization.**

preformation /-fôrmā′shən/ [L, *prae* + *formatio,* formation], an early theory in embryology in which the organism is contained in minute and complete form within the germ cell and after fertilization grows from microscopic to normal size. Compare **epigenesis.**

preformed water /-fôrmd′/ [L, *prae* + *forma,* form; AS, *waeter*], the water that is contained in foods.

prefrontal lobotomy /-frôn′təl/ [L, *prae* + *frons,* forehead; Gk, *lobos,* lobe, *temnein,* to cut], a surgical procedure in which connecting fibers between the prefrontal lobes of the brain and the thalamus are severed. An archaic technique, it is rarely used today but formerly was an accepted procedure for treating schizophrenic patients with uncontrollable, destructive behavior. After surgery patients were often apathetic, docile, and lacking social graces and decision-making abilities of even the simplest kind. If only the white fibers are severed, the procedure is called a **prefrontal leukotomy.**

preg, abbreviation for **pregnancy.**

pregabalin, an anticonvulsant.

■ INDICATIONS: This drug is used to treat neuropathic pain associated with diabetic peripheral neuropathy, partial-onset seizures, and postherpetic neuralgia.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. This drug should not be abruptly discontinued.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, fatigue, confusion, euphoria, incoordination, nervousness, neuropathy, tremor, vertigo, somnolence, ataxia, amnesia, abnormal thinking, dry mouth, blurred vision, nystagmus, amblyopia, constipation, flatulence, abdominal pain, weight gain, ecchymosis, back pain, pruritus, impotence, and dyspnea.

preganglionic neuron /-gang′glē·on′·ik/ [L, *prae* + Gk, *gagglion,* knot, *neurom,* nerve], a neuron whose axon terminates in contact with another nerve cell located in a peripheral ganglion.

Pregestimil, a trademark for a hypoallergenic nutritional supplement for infants.

pregnancy (preg) /preg′nənsē/ [L, *praegnans,* pregnant], the gestational process, comprising the growth and development within a woman of a new individual from conception through the embryonic and fetal periods to birth. Pregnancy lasts approximately 266 days (38 weeks) from the day of fertilization, but it is clinically considered to last 280 days (40 weeks; 10 lunar months; 9⅓ calendar months) from the first day of the last menstrual period. The expected date of delivery (EDD) is calculated on the latter basis even if a woman's periods are irregular. If a woman is certain that coitus occurred only once during the month of conception and if she knows the date on which coitus occurred, the EDD may be calculated as 266 days from that date. Pregnancy begins after coitus at or near the time of ovulation (usually about 14 days before a woman's next expected menstrual period). Of the millions of ejaculated sperm cells, thousands reach the female ovum in the outer end of the fallopian tube, but usually only one penetrates the egg for union of the male and female pronuclei and conception. The zygote, genetically a unique entity, begins cell division as it is transported to the uterine cavity, where it implants in the uterine wall. Maternal and embryological elements together form the beginnings of the placenta, which grows into the substance of the uterus. The placenta functions in maternal-fetal exchange of nutrients and waste products, although the maternal and fetal bloods do not normally mix. The conceptus is in some aspects like a foreign graft or transplant in the mother. Although an immune response is normally activated in the mother, all of her tissues and organs undergo change, many of them profound and some of them permanent.

■ PSYCHOLOGICAL CHANGES: The emotional experiences of pregnancy, as reported by pregnant women, are normal and healthy, but extraordinary. A pregnant woman is "herself," but in a very unfamiliar way. She has a sense of heightened function and expectancy. Being keenly aware of the rapid and inevitable changes her body is undergoing, she is more intensely interested in herself. Her concern for the perfection of her baby, her anticipation of the exertion of labor, and her contemplation of the new or expanded responsibilities of motherhood all serve to intensify her emotional tone.

■ CARDIOVASCULAR CHANGES: Cardiac output increases 30% to 50% in pregnancy. The increase begins at about the sixth week, reaches a maximum about the sixteenth week, declines slightly after the thirtieth week, and rapidly falls off after delivery. It returns to prepregnancy level about the sixth week after delivery. The stroke volume of the heart increases, and the pulse rate becomes more rapid: Normal pulse rate in pregnancy is approximately 80 to 90 beats/min. Blood

Pregnancy table for expected date of delivery

Find the date of the last menstrual period in the top line (light-face type) of the pair of lines.
The dark number (bold-face type) in the line below will be the expected day of delivery.

pressure may drop slightly after the twelfth week of gestation and return to its usual level after the twenty-sixth week. The circulation of blood to the pregnant uterus near term is about 1 L/min, requiring about 20% of the total cardiac output. Total blood volume also increases in pregnancy; plasma volume increases more than red cell volume, and this results in a drop in the hematocrit, caused by dilution. The number of white blood cells increases: The normal white blood cell count in pregnancy is often above 15,000/mL.

pregnancy epulis. See **gingival hormonal enlargement.**

pregnancy gingivitis, an enlargement or hyperplasia of the gingivae caused by plaque, poor oral hygiene, and hormonal imbalance during pregnancy. It is usually limited to the interdental papillae.

pregnancy-induced hypertension. See **gestational hypertension.**

pregnancy luteoma. See **luteoma.**

pregnancy rate, (in statistics) the ratio of pregnancies per 100 woman-years, calculated as the product of the number of pregnancies in the women observed multiplied by 12 (months), divided by the product of the number of women observed multiplied by the number of months observed. For example, if 50 women used one contraceptive method for 12 months and 5 of them became pregnant, the pregnancy rate would be 10 per 100 woman-years.

pregnancy termination care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of the physical and psychological needs of the woman undergoing a spontaneous or elective abortion. See also **Nursing Interventions Classification.**

pregnanediol /pregnān′dē·ol/, a crystalline, biologically inactive compound in the urine of women during pregnancy or during the secretory phase of the menstrual cycle. A dihydroxy derivative of the saturated steroid pregnane, pregnanediol is the end product of metabolism of progesterone in the urine.

pregnanediol test, an infrequently used 24-hour urine test that evaluates progesterone production by the ovaries and placenta. It is useful in documenting whether ovulation has occurred, and if so, when. The test is used primarily to monitor progesterone supplementation in patients with an inadequate luteal phase.

pregnant /preg′nənt/ [L, *praegnans*], gravid; with child.

prehensile /-hen′sil/ [L, *prehendre,* to seize], able to grasp.

prehension /-hen′shən/, the use of the hands and fingers to grasp, pick up objects, or pinch.

prehospital care, any initial medical care given an ill or injured patient by a paramedic or other person before the patient reaches the hospital emergency department.

preimplantation genetic diagnosis (PGD), in assisted reproductive technology, the determination of chromosomal abnormalities in the embryo before it is transferred to the uterus.

preinfarction angina /pre′infärc′shən/ [L, *prae* + *infarcire,* to stuff; *angina,* quinsy], angina pectoris before a myocardial infarction.

preinvasive carcinoma. See **carcinoma in situ.**

prekallikrein /prekal′ikre′in/, a plasma protein that is the proenzyme of plasma kallikrein. It is cleaved to its active enzyme form by activated coagulation factor XII.

preload /prē′lōd/ [L, *prae* + AS, *lad*], the stretch of ventricular muscle fibers at end diastole. It is reflected by the ventricular pressure and volume at that part of the cardiac cycle. Cardiac output increases with preload. Also called **preload filling pressure.**

preload filling pressure, the load on the ventricular muscle fibers at the end of diastole or just before contraction. The preload on the heart is estimated by the left ventricular filling pressure. Cardiac performance increases with preload.

premalignant fibroepithelioma /-məlig′nənt/ [L, *prae* + *malignus,* bad disposition, *fibra,* fiber; Gk, *epi,* above, *thele,* nipple, *oma,* tumor], an elevated white- or flesh-colored sessile neoplasm formed of interlacing ribbons of epithelial cells on a hyperplastic mesodermal stroma. The tumor occurs most often on the lower trunk of older people and may be found in association with or develop into superficial basal cell carcinoma.

Premarin, a trademark for conjugated estrogens.

Premarin with Methyltestosterone, a trademark for a fixed-combination hormonal drug containing **Premarin** and an androgen **(methyltestosterone).**

premarket approval (PMA) /-mar′kit/, permission given by the federal government to equipment manufacturers to sell their devices to the medical profession.

premature /-məcho͞or′/ [L, *praematurus,* too soon], **1.** not fully developed or mature. **2.** occurring before the appropriate or usual time. **—prematurity,** *n.*

premature alopecia [L, *praematurus,* too soon; Gk, *alopex,* fox mange], acquired baldness in a person who is not old.

premature atrial complex (PAC), an atrial depolarization that occurs earlier than expected. It is indicated electrocardiographically by an early P′ wave followed by a normal QRS complex. PACs may be the result of atrial enlargement or ischemia or may be caused by stress, caffeine, or nicotine. They may occur occasionally or in a regular pattern. Occasional PACs usually have no significance, but frequent PACs may lead to atrial fibrillation or to paroxysmal supraventricular tachycardia. Also called **atrial extrasystole,** *atrial premature beat,* **atrial premature complex.**

premature beat [L, *praematurus,* too soon; AS, *beatan*], an electrocardiogram deflection or complex that occurs earlier than expected in the ongoing rhythm pattern. Also called **premature complex, premature impulse.**

premature complex, any electrocardiogram deflection representing either the ventricles or atria that occurs early with respect to the dominant rhythm.

premature ejaculation, uncontrollable, untimely ejaculation of semen often caused by anxiety during sexual intercourse. Behavioral techniques can be learned by the man and his partner, or medication may be used to extend the length of time between erection and ejaculation. See also **ejaculation, erection.**

premature impulse. See **premature beat.**

premature infant, any neonate, regardless of birth weight, born before 37 weeks of gestation. Because exact gestational age is often difficult to determine, low birth weight is a significant criterion for identifying the high-risk infant with incomplete organ system development. Predisposing factors associated with prematurity include multiple pregnancy, toxemia, chronic disease, acute infection, sensitization to blood incompatibility, any severe trauma that may interfere with normal fetal development, substance abuse, and teenage pregnancy. In most instances the cause is unknown. The incidence of prematurity is highest among women from low socioeconomic circumstances, for whom poor nutrition and lack of prenatal medical care are often precipitating factors. The premature infant usually appears small and scrawny, with a large head in relation to body size, and weighs less than 2500 g. The skin is thin, smooth, shiny, and translucent, with the underlying vessels clearly visible. The arms and legs are extended, not flexed, as in the full-term infant. There is little subcutaneous fat, sparse hair, few creases on the soles and palms, and poorly developed ear cartilage. In boys the scrotum has few rugae, and the testes may be undescended; in girls the labia gape and the clitoris is prominent. Among the common problems of the premature infant are variations in thermoregulation, chilling, apnea, respiratory distress, sepsis, poor sucking and swallowing reflexes, small stomach capacity, lowered tolerance of the alimentary tract that may lead to necrotizing enterocolitis, immature renal function, hepatic dysfunction often associated with hyperbilirubinemia, incomplete enzyme systems, and susceptibility to various metabolic upsets, such as hypoglycemia, hyperglycemia, and hypocalcemia. The degree of complications and the rate of survival of premature infants are directly related to the state of physiological and anatomical maturity of the various organ systems at the time of birth, the condition of the infant other than prematurity, and the quality of postnatal care. With treatment in a neonatal intensive care unit, survival rates improve yearly. In increasing numbers of very small babies, development is normal, and those who do not have seizures or apneic spells in the first few days are unlikely to suffer neurological or physical sequelae of their prematurity. Of primary concern for the nurse caring for the premature infant are the stabilization of body temperature by maintaining a neutral thermal environment, the maintenance of respiration, the prevention of infection, the provision of adequate nutrition and hydration, and the conservation of energy. Important functions of the nurse are to involve the parents in the care of the infant, to explain therapeutic procedures, and to facilitate attachment between the infant and family. Also called *(informal)* **preemie, preterm infant.** Compare **postmature infant.**

Premature infant

(Eichenfield, Frieden, and Esterly, 2008/Courtesy Eric S. Patrick, MD)

premature labor. See **preterm labor.**

premature newborn, preterm newborn. See **premature infant.**

premature rupture of membranes, the spontaneous rupture of the amniotic sac before the onset of labor.

premature systole [L, *praematurus* + Gk, *systole,* contraction], a ventricular contraction that occurs too early as a result of a discharge of an ectopic focus in the atria, atrioventricular junction, or ventricle.

premature thelarche. See **thelarche.**

premature ventricular complex (PVC), a ventricular depolarization that occurs earlier than expected. It appears on the electrocardiogram as an early, wide QRS complex without a preceding related P wave. PVCs may be idiopathic or caused by stress, electrolyte imbalance, ischemia, hypoxemia, hypercapnia, ventricular enlargement, or a toxic reaction to drugs. They may occur occasionally, in a regular pattern, or as several in sequence. Occasional PVCs are not clinically significant in healthy individuals, but they may produce decreased cardiac output in people with heart disease. Frequent PVCs may be a precursor of ventricular tachycardia or fibrillation.

prematurity /-məcho͞o′ritē/ [L, *praematurus,* too soon], pertaining to an event that occurs before the usual or expected time, such as a premature birth.

premed /-med′/, abbreviation for *premedical student.*

premedication /-med′ikā′shən/ [L, *prae* + *medicare,* to heal], **1.** any sedative, tranquilizer, hypnotic, antinausea, or anticholinergic medication administered before anesthesia to relieve anxiety, prevent nausea, reduce oral secretions, and decrease pain. The choice of drug depends on such variables as the patient's age and physical condition and the specific operative procedure. **2.** the administration of such medications. *—premedicate, v.*

premenarchal /-mənär′kəl/ [L, *prae,* before, Gk, *men,* month; Gk, *archaios,* from the beginning], before the start of the first menstrual period.

premenopausal /-men′əpô′səl/ [L, *prae* + Gk, *men,* month; Gk, *pauein,* to cease], before the start of menopause.

premenstrual /-men′stro͞o·əl/ [L, *prae,* before, *menstrualis,* monthly], before the start of menstruation each month.

premenstrual dysphoric disorder (PMDD), a mental health condition in women that begins 1 or 2 weeks before menstrual flow. Symptoms include depression, tension, mood swings, irritability, decreased interest, difficulty in concentrating, fatigue, changes in appetite or sleep, physical symptoms, and a sense of being overwhelmed. The condition affects 3% of menstruating women, usually between 25 and 30 years of age. Compare **premenstrual syndrome.**

premenstrual syndrome (PMS, pms) [L, *prae* + *menstrualis,* monthly, *tendere,* to stretch], a syndrome of nervous tension, irritability, weight gain, edema, headache, mastalgia, dysphoria, sleep changes, and lack of coordination occurring during the last few days of the menstrual cycle before the onset of menstruation. Several theories attempt to explain the cause of the syndrome, including nutritional deficiency, stress, hormonal imbalance, and various emotional disorders.

premenstrual syndrome (PMS) management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the alleviation/attenuation of physical and/or behavioral symptoms occurring during the luteal phase of the menstrual cycle. See also **Nursing Interventions Classifications.**

premise /prem′is/ [L, *prae* + *mittere,* to send], a proposition that is presented as the basis of an argument and is usually established beforehand.

premolar /prēmō′lər/ [L, *prae* + *mola,* mill], one of eight teeth, four in each dental arch, located lateral and posterior to the canine teeth and anterior to the molars. They are smaller and shorter than the canine teeth. The crown of each premolar is compressed anteroposteriorly and surmounted by two cusps, and the neck is oval. The root is single and compressed in all premolars except the upper first, which usually has two roots. Usually an anterior and a posterior groove are also present. The upper premolars are larger than the lower premolars. Also called **bicuspid.** Compare **canine tooth, incisor, molar.**

premonition /-mənish′ən/, a sense of an impending event without prior knowledge of it.

premonitory /-mon′iter′ē/ [L, *prae* + *monere,* to warn], an early symptom or sign of a disease. The term is commonly used to describe minor symptoms that precede a major health problem.

premorbid personality /-môr′bid/, a personality characterized by early signs or symptoms of a mental disorder. The specific defects may indicate whether the condition will progress to schizophrenia, a bipolar disorder, or another type of condition.

prenatal /-nā′təl/ [L, *prae* + *natus,* birth], occurring or existing before birth, referring to both the care of the woman during pregnancy and the growth and development of the fetus. Also called **antenatal.** See also **antepartal care.**

prenatal care[1]**.** See **antepartal care.**

prenatal care[2]**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as monitoring and management of patient during pregnancy to prevent complications of pregnancy and promote a healthy outcome for both mother and infant. See also called **Nursing Interventions Classification.**

prenatal development, the entire process of growth, maturation, differentiation, and development that occurs between conception and birth. On approximately the 14th day before the next expected menstrual period ovulation usually occurs. If the egg is fertilized, it immediately begins the course to fetal maturity and birth. During the first 14 days the fertilized ovum undergoes cell division several times, becoming a morula and then a blastocyst that is able to implant in the uterine wall. From the beginning of the third to the end of the seventh week of embryonic development, implantation deepens and completes. Primitive uteroplacental circulation originates between the enlarging trophoblast and the maternal endometrial tissue of the uterus. The amniotic cavity appears as an opening between the inner cell mass and the invading trophoblast. A thin lining in the cavity becomes the amnion. At this point the embryo is a two-layered embryonic disk composed of an ectoderm and an endoderm. As the disk thickens in the middle, giving rise to the third cell layer, or mesoderm, the basic structural systems of the body begin to form. The neural tube develops as a precursor of the central nervous system in the midline of the cranial part of the ectoderm. Primitive blood vessels and blood cells, a heart tube, and umbilical vessels are formed and begin to function. Arm and leg buds may appear, and rudimentary gut, lungs, and kidneys form. By the fifth week the brain has begun to grow rapidly, the heart tube is divided into chambers, the palate and the upper lip are forming, and the urogenital system is developing. By the end of the seventh week all essential systems are present. The period from the eighth week to birth is called the **fetal stage.** From the 8th to the 10th week the fetus continues to grow and development is rapid. The head is almost half of its total length, and arms, legs, and face are clearly recognizable. The fetus floats in the amniotic fluid of the amniotic sac within the uterus; the umbilical vessels in the cord extend to a rapidly growing placenta. By the twelfth week the facial features are formed and the eyelids are present but not yet closed because they have not divided into upper and lower eyelids. The palate is fusing, a neck connects the large head and the body, and tooth buds and nailbeds have begun to form. Identification of the external genitalia is possible for the first time. From the13th to the 16th week the arms, legs, and trunk grow rapidly, and the fetus is active. Scalp hair develops. The skeleton of the fetus is calcified and may be seen on an x-ray film. A sonogram sometimes detects respiratory movements. Between the 17th and the 20th week of pregnancy the mother usually first feels the baby move. The fetus looks like a very small baby at this time. There are eyebrows and tiny nipples; during fetoscopic examination the fetus has been seen and photographed sucking its thumb and grasping its own umbilical cord. At the 24th week the external ears are smooth and soft and the skin is wrinkled and translucent. The body is covered with lanugo and vernix and weighs a little more than 1 pound. At 28 weeks subcutaneous fat begins to develop, fingernails and toenails are present, the eyelids are separate, the eyes may open, scalp hair is well developed, and in males the testes are at the internal inguinal ring or below. In a modern neonatal intensive care unit most of the babies born at 28 weeks survive. By the 32nd week the fetus weighs between 3 and 4 pounds. The hair is fine and woolly, the fingernails and toenails have grown to the tips of the fingers and toes, and there are one or two creases on the anterior part of the soles of the feet. The areolae of the breasts are visible but flat. In females the clitoris is prominent and the labia majora are small and separated. At 36 weeks the body and the limbs are fuller and more rounded, creases involve the anterior two thirds of the soles, and the skin is thicker and less translucent. As the fetus reaches term, between 38 and 42 weeks, the vernix decreases, and the ear cartilage is developed. In males the testes are in the scrotum. In females the labia majora meet in the midline and cover the labia minora and the clitoris. At 40 weeks the average fetus weighs 7¼ pounds and is between 19 and 22 inches long. Prenatal development may be adversely affected by several factors. Between 2 and 14 weeks of gestation, ionizing radiation and some drugs may have profound effects on morphological and functional development. During the first 10 days of development, any damage usually kills the conceptus. Various viruses, malnutrition, trauma, or maternal disease may also affect the morphological development of a rapidly differentiating structure or organ during the embryological or early fetal stage. After 14 weeks, when all of the organs, systems, and body parts have formed, any adverse effects are largely functional; major morphological damage does not occur.

prenatal diagnosis, any of various diagnostic techniques to determine whether a developing fetus is affected with a genetic disorder or other abnormality. Such procedures as radiographic examination and ultrasound scanning can be used to follow fetal growth and detect structural abnormalities; amniocentesis enables fetal cells to be obtained from the amniotic fluid for culture and biochemical assay for detection of metabolic disorders and chromosomal analysis; fetoscopy enables fetal blood to be withdrawn from a blood vessel of the placenta and examined for disorders such as thalassemia, sickle cell anemia, and Duchenne's muscular dystrophy. If any of the test results are positive and the child is likely to be born with a severe defect or disease, the parents need support and advice from genetic counselors on whether to terminate the pregnancy. If the parents decide to have the baby, the nurse can help educate them about the specific disorder and prepare them for the special care required of a handicapped or genetically defective child. Also called **antenatal diagnosis.** See also **chorionic villus sampling, genetic counseling, genetic screening.**

prenatal health behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to promote a healthy pregnancy and a healthy newborn. See also **Nursing Outcomes Classification.**

prenatal surgery, any surgical procedure that is performed on a fetus. The technique has been used to correct hydrocephalus, urinary tract obstructions, and many other conditions.

Timetable of prenatal development, cont'd *(Moore and Persaud, 2008)*

preoccupation /prē·ok′yəpā′shən/, a state of being self-absorbed or engrossed in one's own thoughts to a degree that hinders effective contact with or relationship to external reality.

pre-op /prē·op′/, abbreviation for **preoperative.**

preoperational thought phase /prē·op′ərā′shənəl/ [L, *prae* + *operari,* to work; AS, *thot* + Gk, *phainein,* to show], a Piagetian phase of child development, during the period of 2 to 7 years of age, when the child focuses on the use of language as a tool to meet his or her needs.

preoperative (pre-op) /prē·op′ərətiv′/ [L, *prae* + *operari,* to work], pertaining to the period before a surgical procedure. Commonly the preoperative period begins with the first preparation of the patient for surgery, such as when the surgery is scheduled. Within 1 week, the preoperative patient has relevant studies, labs, x-ray, and a history and physical examination. It ends with the induction of anesthesia in the operating suite.

preoperative care, the preparation and management of a patient before surgery. The patient's nothing-by-mouth (NPO) status, nutritional state, medical and surgical history, allergies, current medication, physical handicaps, signs of infection, and elimination habits are recorded. The patient's understanding of the operative, preoperative, and postoperative procedures; the patient's ability to verbalize anxieties; and the family's knowledge of the planned surgery are ascertained and education provided. The accuracy of patient's signed informed consent is verified, requests in the physician's preoperative orders are fulfilled, and the patient's identification bands and blood type are checked. Vital signs are recorded, and any abnormalities of the electrocardiogram, chest x-ray, or laboratory tests are reported to the surgeon and anesthesiologist. If needed, the number of matched blood units required to be held for a possible blood transfusion is determined. When ordered, an enema is given, a bowel preparation is completed, a nasogastric tube or indwelling catheter is inserted, and parenteral fluids are administered. If preoperative sedation is administered, the side rails of the bed are raised. Before transfer to the operating room with the completed chart, the patient voids, and any dentures, contact lenses, jewelry, and valuables are removed for safekeeping.

■ INTERVENTIONS: The nurse performs and explains the preoperative procedures; reinforces the physician's explanation of the operation; provides instruction and emotional support; answers the patient's questions as honestly as possible, avoiding standard cliches in responding to any anxiety; and reassures the patient that medication will be available to relieve postoperative pain. Depending on the surgical procedure, the nurse shows the patient how to turn, cough, deep breathe, and support the incision during coughing. Instructions on leg exercises are also given. The nurse informs the patient and the patient's family about the postoperative period in the postanesthesia care unit or the intensive care unit, if indicated.

■ OUTCOME CRITERIA: The patient who is carefully prepared for an operation, psychologically and physically, experiences less anxiety and is more likely to make an uneventful recovery.

preoperative coordination, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating preadmission diagnostic testing and preparation of the surgical patient. See also **Nursing Interventions Classification.**

prep, **1.** abbreviation for *prepare.* **2.** abbreviation for *preparation*, particularly when referring to preparation for surgery.

preparatory prosthesis /prep′ərətôr′ē/, a temporary artificial limb that is fitted to the stump soon after amputation. It permits ambulation and biomechanical adaptation during the first several weeks after surgery. A rigid removable dressing is usually applied, which allows for inspection of the stump for signs of hemorrhage or tissue deterioration before a permanent or definitive prosthesis is fitted. Also called **temporary prosthesis.**

preparatory sensory information, a nursing intervention from the Nursing Interventions Classification (NIC) defined as describing in concrete and objective terms the typical sensory experiences and events associated with an upcoming stressful health care procedure/treatment. See also **Nursing Interventions Classification.**

prepared childbirth. See **natural childbirth.**

preparedness /prepār′ed-nes/, the state of being ready beforehand for a given event.

prepared tooth cavity /priperd′/ [L, *praeparare,* to make ready, *cavum,* cavity], a tooth space that has been carved or shaped with a compressed-air dental handpiece and other hand instruments to receive and retain a restoration. Also called **cavity prep.**

prepartal /prepahr′tal/. See **antepartal.**

prepartum /-pär′təm/, before childbirth.

prepatellar /-pətel′ər/ [L, *prae,* before, *patella,* small dish], pertaining to the area in front of the patella.

prepatellar bursa [L, *prae* + *patella,* small dish; Gk, *byrsa,* wineskin], a bursa between the tendon of the quadriceps muscle group and the lower part of the femur continuous with the cavity of the knee joint.

prepatellar bursitis [L, *prae,* before, *patella* + Gk, *byrsa,* wineskin, *itis,* inflammation], an inflammation of the bursa in front of the patella and beneath the skin over the site.

prepayment /-pā′mənt/ [L, *prae* + *pacere,* to pacify], the payment in advance for health care services by subscribers to a third-party insurance program.

preperitoneal hernia, an interstitial hernia located between the parietal peritoneum and the transversalis fascia.

pre-, prae-, prefix meaning "before or in front of": *preataxic, precritical, pregenital.*

preprandial /-pran′dē·əl/ [L, *prae* + *prandium,* meal], before a meal.

pre procedure readiness, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the readiness of a patient to safely undergo a procedure requiring anesthesia or sedation. See also **Nursing Outcomes Classification.**

preprocessing /prēpros′əsing/, (in ultrasonics) conditioning and manipulation of echo signals before their storage in the scan memory.

prepuberal, prepubertal. See **prepuberty.**

prepubertal panhypopituitarism /-pyo͞o′bərtəl/ [L, *prae,* + *pubertas,* maturity; Gk, *pan,* all, *hypo,* under, *pituita,* phlegm], insufficiency of pituitary hormones, caused by damage to the gland usually associated with a suprasellar cyst or craniopharyngioma occurring in childhood. The disorder is characterized by dwarfism with normal body proportions; subnormal sexual development; impaired thyroid and adrenal function; and yellow, wrinkled skin. Diabetes insipidus is frequently present, and there may be bitemporal hemianopia or complete blindness, but the patient's mentality is usually normal. Radiographic pictures show delayed fusion of the epiphyses and suprasellar calcification, and the sella turcica is often destroyed. The condition is treated with cortisone, thyroid and gonadotrophic hormones, and, if available, human growth hormone.

prepuberty /-pyo͞o′bərtē/ [L, *prae* + *pubertas,* maturity], the period immediately before puberty, lasting approximately 2 years. It is characterized by preliminary physical changes, such as accelerated growth and appearance of secondary sex characteristics, that lead to sexual maturity. **—prepuberal, prepubertal,** *adj.*

prepubescence /prē′pyo͞obes′əns/, the state of being prepubertal. **—prepubescent,** *adj.*

prepuce /prē′pyo͞os/ [L, *praeputium,* foreskin], a fold of skin that forms a retractable cover, such as the foreskin of the penis or the fold around the clitoris. *—prepucial,* **preputial,** *adj.*

preputial /prē·pyo͞o′shəl/, pertaining to the prepuce.

prerenal /-rē′nəl/ [L, *prae,* before, *ren,* kidney], **1.** pertaining to the area in front of the kidney. **2.** pertaining to events occurring before reaching the kidney.

prerenal anuria [L, *prae* + *renes,* kidneys; Gk, *a* + *ouron,* not urine], cessation of urine production that results when the blood pressure in the kidney is too low to maintain glomerular filtration pressure.

prerenal uremia [L, *prae,* before, *ren,* kidney; Gk, *ouron,* urine, *haima,* blood], a condition of kidney failure in which the primary cause may be outside the kidney, as in congestive heart failure or some severe cases of alkalosis.

presacral fascia, a layer of parietal pelvic fascia between the sacrum and the rectum in which the superior and inferior hypogastric plexuses are imbedded.

presacral space, a subdivision of the extraperitoneal space found between the urinary bladder and the sacrum.

presby-, prefix meaning "aging or being elderly": *presbyacusia, presbyatrics, presbyopia.*

presbycardia /prez′bēkär′dē·ə/ [Gk, *presbys,* old man, *kardia,* heart], an abnormal cardiac condition that especially affects elderly individuals and may be associated with heart failure in the presence of other complications, such as heart disease, fever, anemia, mild hyperthyroidism, and excess fluid administration. Presbycardia may be associated with decreased myocardial elasticity and mild fibrotic changes of the heart valves, but the basis for these changes and the associated pigmentation of the heart is not known.

presbycusis /-ko͞o′sis/ [Gk, *presbys* + *akousis,* hearing], hearing loss associated with aging. It usually involves both a loss of hearing sensitivity and a reduction in the clarity of speech.

presbyopia /prez′bē·ō′pē·ə/ [Gk, *presbys* + *ops,* eye], a refractive condition in which the accommodative ability of the eye cannot meet the accommodative demand for near work. It results from a loss of elasticity of the lens of the eye. The condition commonly develops with advancing age, with the first symptoms appearing about age 40. Compare **visual accommodation. —presbyopic,** *adj.*

presbyopic /prez′bē·op′ik/ [Gk, *presbys,* old man, *ops,* eye], pertaining to a decrease in accommodation of the lens as one grows older and resulting in a shift toward hyperopia or farsightedness.

preschizophrenic state /prēskit′səfren′ik, prē′-/ [L, *prae* + Gk, *schizein,* to split, *phren,* mind], a period before psychosis is evident when the patient deviates from normal behavior but does not demonstrate psychotic symptoms of delusions, hallucinations, or stupor.

prescreen /-skrēn/ [L, *prae* + ME, *scren*], **1.** *v,* to evaluate a person or a group of people to identify those who are at greater risk of development of a specific condition in order to select those who are in particular need of special diagnostic procedures or health care. **2.** *n, (informal)* a rapid, superficial examination of a person who does not appear to be acutely ill. It may include taking a medical history.

prescribe /priskrīb′/ [L, *prae* + *scribere,* to write], **1.** to write an order for a drug, treatment, or procedure. **2.** to recommend or encourage a course of action.

prescription /priskrip′shən/, an order for medication, therapy, or therapeutic device given by a properly authorized person, which ultimately goes to a person properly authorized to dispense or perform the order. A prescription is usually in written form; can be emailed from a secure encrypted computer system, written, phoned, or faxed; and includes the patient's name and address, the date, the ℞ symbol (superscription), the medication prescribed (inscription), directions to the pharmacist or other dispenser (subscription), the acceptability of dispensing a generic, directions to the patient that must appear on the label, prescriber's signature, and in some instances, an identifying number.

prescription drug [L, prae + *scribere* + Fr, *drogue*], a drug that can be dispensed to the public only with an order given by a properly authorized person. The designation of a medication as a prescription drug is made by the U.S. Food and Drug Administration.

prescriptive intervention mode /priskrip′tiv/ [L, *praescriptus,* prescribed, *intervenire,* to come between, *modus,* measure], a therapeutic situation in which the health professional tells the patient explicitly how to solve a problem so that less collaboration between the consultant and patient is needed.

prescriptive theory, a theory that comprises a description of a specific activity, a statement of the goal of the activity, and an analysis of the elements of the activity, which together constitute a prescription for reaching the goal.

presence^{1} /prez′əns/, a mode of being available in a situation with the wholeness of one's individual being; a gift of self that can be given freely, invoked, or evoked.

presence^{2}, a nursing intervention from the Nursing Interventions Classification (NIC) defined as being with another, both physically and psychologically, during times of need. See also **Nursing Interventions Classification.**

presenile /-sē′nīl/ [L, *prae,* before, *senex,* aged], pertaining to a condition in which a person manifests signs of aging in early or middle life.

presenile dementia, dementia occurring in younger persons, usually in persons age 65 or younger. Because most cases are the result of Alzheimer's disease, the term is sometimes used to denote the early onset form of *dementia of the Alzheimer type;* it has also been used more generally to denote **Alzheimer's disease.**

presentation. See **fetal presentation.**

presentation of the cord. See **funic presentation.**

present health [L, *praesentare,* to show; AS, *haelth*], (in a health history) a succinct chronological account of any recent changes in the health of the patient and of the circumstances or symptoms that prompted the person to seek health care.

presenting part /prəsen′ting/ [L, *praesentare* + *pars,* part], the part of the fetus that lies closest to the internal os of the cervix.

presenting symptom. See **symptom.**

preservative /prisur′vətiv/ [L, *praeservare,* to keep], a chemical or other agent that reduces the rate of decomposition of a substance.

presomite embryo /prēsō′mīt/ [L, *prae* + Gk, *soma,* body, *en,* in, *bryein,* to grow], an embryo in any stage of development before the appearance of the first pair of somites (segments), which in humans usually occurs around 19 to 21 days after fertilization of the ovum.

-pressin, suffix for vasoconstrictors, particularly vasopressin derivatives.

pressor /pres′ər/ [L, *premere,* to press], describing a substance that tends to cause a rise in blood pressure.

pressoreceptor. See **baroreceptor.**

pressure acupuncture, a system of acupuncture involving the application of pressure, such as by the tip of a finger, to certain specified points of the body. See also **acupuncture.**

pressure area, an oral area that is subject to excessive displacement of soft tissue by a prosthesis.

pressure control ventilation, positive pressure ventilation in which breaths are augmented by air at a rate and fixed amount of pressure, with tidal volume not being fixed. It is used particularly for patients with acute respiratory distress syndrome.

pressure cycling, the delivery of gas under positive pressure during inspiration until an adjustable, preselected pressure has been reached.

pressure diuresis, increased urinary excretion of water when there is an increase of arterial pressure, a compensatory mechanism to maintain blood pressure within the normal range.

pressure dressing, a bandage or cloth material firmly applied to exert pressure to stop bleeding, prevent edema, and provide support for varicose veins. It also is commonly used in the treatment of burns and after skin grafting.

Pressure dressing *(Sanders et al, 2012)*

pressure edema, **1.** edema of the lower extremities caused by pressure of a pregnant uterus against the large veins of the area. **2.** edema of the fetal scalp after cephalic presentation.

pressure management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as minimizing pressure to body parts. See also **Nursing Interventions Classification.**

pressure natriuresis, increased urinary excretion of sodium along with water when there is an increase of arterial pressure, a compensatory mechanism to maintain blood pressure within the normal range.

pressure necrosis. See **pressure ulcer.**

pressure *(P)* /presh′ər/ [L, *premere,* to press], a force, or stress, applied to a surface by a fluid or an object, usually measured in units of mass per unit of area, such as pounds per square inch. Other units are mm Hg, bar, atm.

pressure point, **1.** a point over an artery where the pulse may be felt. Pressure on the point may be helpful in stopping the flow of blood from a wound distal to it. **2.** a site that is extremely sensitive to pressure, such as the phrenic pressure point along the phrenic nerve between the sternocleidomastoid and the scalenus anticus on the right side. Pressure at this site may be symptomatic of gallbladder dysfunction.

pressure-sensitive adhesive (PSA), a transdermal drug-delivery device that uses polymers that are permanently tacky at room temperature and adhere to the skin when slight pressure is applied.

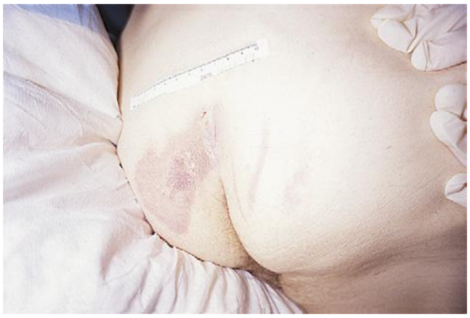
pressure sore. See **pressure ulcer.**

pressure support ventilation (PSV), the augmentation of spontaneous breathing effort with a specific amount of positive airway pressure. The patient initiates the inspiratory flow and sets his or her own respiration rate and tidal volume. PSV can be used to decrease the work of breathing in a patient being weaned from mechanical ventilation.

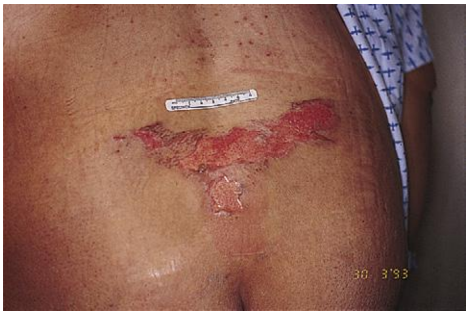
pressure transducer, an electronic device that converts pressure (such as blood pressure) into electrical signals that can be recorded graphically and monitored.

pressure trigger, a trigger for initiating assisted ventilation, consisting of a mechanism for measuring pressure and starting assisted ventilation when pressure reaches a given level.

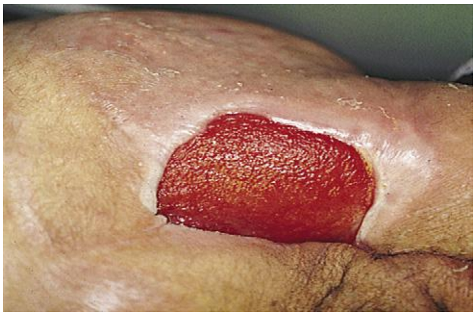
pressure ulcer, an inflammation, sore, or ulcer in the skin over a bony prominence, most frequently the sacrum, elbows, heels, outer ankles, inner knees, hips, shoulder blades, and occipital bone of high-risk patients, especially those who are obese, elderly, or suffering from chronic diseases, infections, injuries, or a poor nutritional state. It results from ischemic hypoxia of the tissues caused by prolonged pressure on them. Pressure ulcers are most often seen in aged, debilitated, immobilized, or cachectic patients. The sores are graded by stages of severity. Prevention of pressure ulcers is a cardinal aspect of nursing care. Treatment specific to the location and the extent of the condition is planned. Also called **bedsore, decubitus ulcer, pressure necrosis, pressure sore.**



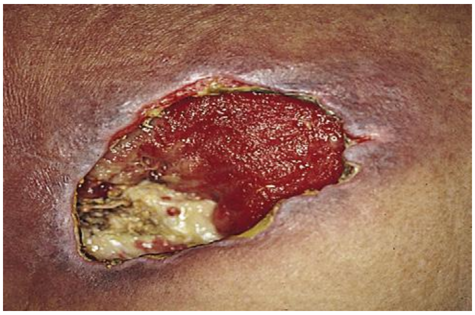
Stage I pressure ulcer *(Perry, Potter, and Elkin, 2012/Courtesy Laurel Wiersma, RN, MSN, CNS, Barnes-Jewish Hospital)*



Stage II pressure ulcer *(Perry, Potter, and Elkin, 2012/Courtesy Laurel Wiersma, RN, MSN, CNS, Barnes-Jewish Hospital)*



Stage III pressure ulcer *(Perry, Potter, and Elkin, 2012/Courtesy Laurel Wiersma, RN, MSN, CNS, Barnes-Jewish Hospital)*



Stage IV pressure ulcer *(Perry, Potter, and Elkin, 2012/Courtesy Laurel Wiersma, RN, MSN, CNS, Barnes-Jewish Hospital)*

pressure ulcer care[1], the management and prevention of pressure ulcers. Also called **decubitus ulcer care.**

■ METHOD: Prevention of pressure ulcers begins with an understanding of proper body positioning, the importance of turning and repositioning, and the need for suitable support surfaces for sleeping and sitting. Support surfaces include overlays, mattress replacements, specialty beds, and special chair cushions. "Donut" rings should not be used to relieve pressure because they reduce blood supply. Bedfast patients should be repositioned at least every 2 hours, and chairfast patients should be repositioned every 15 minutes. Bed linen should be kept dry and wrinkle free. To avoid shear, a sheet or mechanical lift is used to move a patient. Skin should be inspected at least once daily for redness or discoloration, and each time the patient is repositioned the bony areas should be inspected. Dark skin will not show redness; close observation is needed to detect changes in color. A prophylactic measure is daily skin care, in which all areas are washed, rinsed, and dried thoroughly, and lotion is gently applied to bony prominences. The perineal and perianal areas are washed with mild soap and warm water after defecation and urination. A high protein diet with vitamin and mineral supplements is usually required. One method of classifying pressure ulcers is staging. If necrotic material exists in the ulcer, staging is not possible until it has been removed. Necrotic material can be eschar or slough. Topical wound management involves debridement, wound cleansing, the application of dressings, and possibly adjunct therapy (electrical stimulation, hyperbaric oxygen, ultrasound). Clinical Practice Guidelines for Treatment of Pressure Ulcers may be obtained from the U.S. Department of Health and Human Services, Agency for Health Care Policy and Research. Normal saline is recommended for cleaning most pressure ulcers. An ideal dressing for a pressure ulcer should protect the wound and provide ideal hydration. The pressure ulcer wound bed should be moist. Devices such as heat lamps and hair dryers should not be used. Dead space within a wound should be eliminated by loosely filling all cavities with dressing materials.

■ INTERVENTIONS: The nurse plays a major role in the prevention of pressure ulcers and in their treatment if they occur, turning the patient at frequent intervals, applying the ordered medications and dressings to the lesions, avoiding rubbing in the administration of daily skin care, and encouraging good nutrition. The nurse conducts active or passive exercises with massage to the patient's extremities and, when indicated, prepares for debridement of advanced ulcers.

■ OUTCOME CRITERIA: Pressure ulcers are often resistant to treatment, and large areas of ulceration can be life-threatening and costly, especially in a debilitated patient. Prompt and continued care of early lesions can prevent invasion of underlying tissue and promote healing. The nurse may elicit the cooperation and participation of the patient in a nursing care plan that includes all preventive measures. The importance of frequent change of position, pressure, friction, moisture, shear, and good nutrition is emphasized.

pressure ulcer care[2], a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of healing in pressure ulcers. See also **Nursing Interventions Classification.**

pressure ulcer prevention, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the prevention of pressure ulcers for an individual at high risk for developing them. See also **Nursing Interventions Classification.**

pressure ventilator, a mechanical ventilator in which gas delivery is limited by a predetermined pressure.

presternal region, the region of the thorax overlying the sternum, bounded laterally by the pectoral regions.

presumptive signs /prē-sump′tiv/ [L, *praesumere,* to take beforehand, *signum,* mark], manifestations that indicate a pregnancy, although they are not necessarily positive. Presumptive signs may include cessation of menses and morning sickness. See also **Chadwick's sign.**

preswing stance stage /prē′swing/ [L, *prae* + AS, *swingan,* to fling; L, *stare,* to stand; OFr, *estage,* stage], one of the five stages in the stance phase of walking or gait, a brief transitional period of double-limb support during which one leg is rapidly relieved of body-bearing weight and prepared for the swing forward. The type of preswing used by an individual is a factor in the diagnosis of many abnormal orthopedic conditions. Compare **initial contact stance stage, loading response stance stage, midstance, terminal stance.** See also **swing phase of gait.**

presymptomatic disease /-simp′təmat′ik/ [L, *prae* + Gk, *symptoma,* a happening], an early stage of disease when physiological changes have begun but no signs or symptoms are observed.

presynaptic /-sinap′tik/ [L, *prae* + *synaptein,* to join], **1.** situated near or before a synapse. **2.** before a synapse is crossed.

presystole /-sis′təlē/ [L, *prae,* before; Gk, *systole,* contraction], the interval in the cardiac cycle immediately before systole. **—presystolic,** *adj.*

presystolic /-sistol′ik/ [L, *prae* + Gk, *systole,* contraction], pertaining to the period before systole.

presystolic murmur (psm) [L, *prae,* before; Gk, *systole,* contraction; L, *murmur,* humming], a heart murmur heard immediately before systole in cases of mitral valve stenosis.

preterm /prēturm′/ [L, *prae,* before; Gk, *terma,* limit], **1.** *n,* events before a specific date. **2.** *adj,* pertaining to a shorter than normal period of gestation.

preterm birth, any birth that occurs before the thirty-seventh week of gestation. See also **premature infant.**

preterm contractions, irregular tightening of the pregnant uterus that begins in the first trimester and increases in frequency, duration, and intensity as pregnancy progresses. Contractility of uterine muscle increases in pregnancy. Near term, strong preterm contractions are often difficult to distinguish from the contractions of true labor. Also called **Braxton Hicks contractions, false labor.**

preterm infant. See **premature infant.**

preterm infant organization, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as extrauterine integration of physiological and behavioral function by the infant born at 24 to 37 (term) weeks of gestation. See also **Nursing Outcomes Classification.**

preterm labor, labor that occurs earlier in pregnancy than normal, either before the fetus has reached a weight of 2000 to 2500 g or before the 37th or 38th week of gestation. No single measure of fetal weight or gestational age is used universally to designate preterm birth; local or institutional policy dictates which of several standards is applied. Prematurity is a concomitant of 75% of births that result in neonatal mortality. It may occur spontaneously, or it may be iatrogenic. The incidence of preterm labor increases in inverse proportion to maternal age, weight, and socioeconomic status. Incidence is higher for African-American women, women who have not had adequate prenatal care or have an abnormal obstetric history, and women who smoke or whose diet is deficient in protein or calories. Predisposing conditions include maternal infection, low weight gain, uterine bleeding, multiple gestation, polyhydramnios, uterine abnormalities, incompetent cervix, premature rupture of membranes, and intrauterine fetal growth retardation. The cause of preterm labor is poorly understood; in some cases there may be several contributing causes. In some pregnancies preterm labor may be homeostatic, resulting in the best possible outcome under the particular abnormal conditions. If preterm labor itself constitutes a threat to the fetus, the outcome of pregnancy may be improved if labor can be inhibited. Determining accurately which pregnancies are likely to benefit from the inhibition of labor and which are not is difficult. Medications used to stop labor are not always effective. Misdiagnosis of gestational age and fetal condition may lead to induction of labor that is inadvertently premature; preterm babies whose birth has been brought about inappropriately early account for 15% of admissions to newborn intensive care nurseries. Also called **premature labor.** See also **small for gestational age infant.**

pretibial /prētib′ē·əl/ [L, *prae* + *tibia,* shinbone], pertaining to the area of the leg in front of the tibia.

pretibial fever, an acute infection caused by *Leptospira autumnalis*. It is characterized by headache, chills, fever, enlarged spleen, myalgia, low white blood cell count, and rash on the anterior surface of the legs. Also called **Fort Bragg fever.**

pretrial discovery. See **discovery.**

prevalence /prev′ələns/ [L, *praevalentia,* a powerful force], (in epidemiology) the number of all new and old cases of a disease or occurrences of an event during a particular period. Prevalence is expressed as a ratio in which the number of events is the numerator and the population at risk is the denominator. See also **rate.** *—prevalent, adj.*

prevention /-ven′shən/ [L, *praevenire,* to anticipate], (in nursing care) actions directed to preventing illness and promoting health to reduce the need for secondary or tertiary health care. Prevention includes such nursing actions as assessment, including disease risk; application of prescribed measures, such as immunization; health teaching; early diagnosis and treatment; and recognition of disability limitations and rehabilitation potential. In acute care nursing many interventions are simultaneously therapeutic and preventive.

preventive /-ven′tiv/ [L, *praevenire,* to anticipate], pertaining to hindering the occurrence of an illness or decreasing the incidence of a disease.

preventive care, a pattern of nursing and medical care that focuses on disease prevention and health maintenance. It includes early diagnosis of disease, discovery and identification of people at risk of development of specific problems, counseling, and other necessary intervention to avert a health problem. Screening tests, health education, and immunization programs are common examples of preventive care.

preventive dentistry [L, *praevenire,* to anticipate, *dens,* tooth], the science of the care required to prevent disease of the teeth and supporting structures. There are three levels of preventive dentistry: the use of a topical fluoride gel to prevent caries is an example of primary prevention, a dental restoration is an example of secondary prevention, and a fixed bridge is an example of tertiary prevention.

preventive health care. See **preventive care.**

preventive medicine [L, *praevenire,* to anticipate, *medicina*], the branch of medicine that is concerned with the prevention of disease and methods for increasing the power of the patient and community to resist disease and prolong life.

preventive nursing [L, *praevenire,* to anticipate, *nutrix,* nurse], the branch of nursing concerned with general health promotion, teaching of early recognition and treatment of disease, encouragement of life-style modification, and prevention of further deterioration of the disabled.

preventive psychiatry, the use of theoretic knowledge and skills to plan and implement programs designed to achieve primary, secondary, and tertiary prevention of the onset of psychiatric disorders.

preventive treatment, a procedure, measure, substance, or program designed to prevent a disease from occurring or a mild disorder from becoming more severe. Various diseases are prevented by immunizations with vaccines, antiseptic measures, the avoidance of smoking, regular exercise, prudent diet, adequate rest, correction of congenital anomalies, and screening programs for the detection of preclinical signs of disorders. Also called **prophylactic treatment.**

prevertebral ganglia, collections of postganglionic sympathetic neuronal cell bodies in recognizable aggregations along the abdominal prevertebral plexus. They include the celiac, superior mesenteric, aorticorenal, and inferior mesenteric ganglia and play a critical role in the innervations of the abdominal viscera.

previa. See **placenta previa.**

previllous embryo /prēvil′əs/ [L, *prae* + *villus,* hairy; Gk, *en,* in, *bryein,* to grow], an embryo of a placental mammal at any stage before the development of the chorionic villi, which in humans occurs between the first and second months after fertilization.

previous abnormality of glucose tolerance /prē′vē·əs/, an obsolete classification that includes people who previously had diabetes mellitus or impaired glucose tolerance but whose fasting and postprandial plasma glucose levels have returned to normal. Included in this category were people who had gestational diabetes but whose plasma level returned to normal after parturition and obese people whose plasma glucose level returned to normal after they lost weight. Formerly called **latent diabetes.** See also **diabetes mellitus.**

previtamin. See **provitamin.**

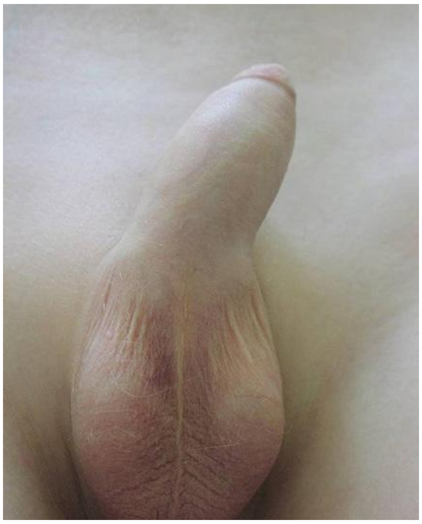
prevocational evaluation /-vōkā′shənəl/, an evaluation of the abilities and limitations of a patient undergoing rehabilitation for a disabling disorder. The goal is to find eventual employment in a sheltered workshop or in the general community. The evaluation usually leads to selective placement of the patient in an appropriate business or industry.

prevocational training, a rehabilitation program designed to prepare a patient for the performance of useful paid work in a sheltered setting or community. It may involve training in basic work skills and counseling as required for a typical employment setting.

Prezista, a trademark for **darunavir.**

PRF, abbreviation for **pulse repetition frequency.**

priapism /prī′əpiz′əm/ [Gk, *priapos,* phallus], an abnormal condition of prolonged or constant penile erection, often painful and seldom associated with sexual arousal. It may result from localized infection, a lesion in the penis or the central nervous system, or the use of medications or recreational drugs such as cocaine. It sometimes occurs in men who have acute leukemia or sickle cell anemia.



Priapism *(Kiss et al, 2007)*

priapitis /prī′əpī′tis/, inflammation of the penis.

priapus. See **penis.**

prickle cell layer. See **stratum spinosum.**

prickly heat. See **miliaria.**

-pride, suffix for sulpiride derivatives.

-pril, suffix for captopril-type antihypertensive agents.

prilocaine hydrochloride /pril′ōkān/, a local anesthetic agent of the amide family, used for nerve block, epidural, and regional anesthesia. It is not used for spinal or topical anesthesia. Prilocaine hydrochloride is about half as toxic as lidocaine but, because methemoglobinemia is a possible reaction to its administration, is not used for patients with hypoxic conditions of any kind.

prim-, primi-, prefix meaning "first": *primerite, primigravida, primitiae.*

-prim, suffix for trimethoprim-type antibacterials.

prima facie rights /prī′mə fā′shē·ə/, rights on the surface, or face, that may be overridden by stronger conflicting rights or by other values.

primal scream therapy /prī′məl/, a nonmainstream form of psychotherapy developed by Arthur Janov that focuses on repressed pain of infancy or childhood. The goal of the therapy is to enable the patient to surrender his or her anxiety defenses and "become real."

primaquine phosphate /prī′məkwin/, an antimalarial.

■ INDICATIONS: It is prescribed in the treatment of malaria and prevention of relapse during recovery from the disease; it eradicates the tissue schizonts of *Plasmodium vivax* and *P. ovale* infections.

■ CONTRAINDICATIONS: Lupus erythematosus, rheumatoid arthritis, concomitant use of bone marrow depressants or hemolytic drugs, or known hypersensitivity to this drug prohibits its use. It must be used with caution in patients with glucose-6-phosphate dehydrogenase deficiency.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hemolytic anemia, agranulocytosis, and abdominal distress.

primary /prī′mərē/ [L, *primus,* first], **1.** first in order of time, place, development, or importance. **2.** not derived from any other source or cause, specifically the original condition or set of symptoms in disease processes, such as a primary infection or a primary tumor. **3.** (in chemistry) referring to the first and simplest compound in a related series, formed by the substitution of one of two or more atoms or of a group in a molecule, such as in amine or carboxyl radicals. Compare **secondary, tertiary.**

primary abscess [L, *primus* + *abscedere,* to go away], an abscess that develops at the original point of infection by a pus-producing microorganism.

primary afferent fiber. See **gamma efferent fiber.**

primary alveolar hypoventilation. See **Ondine's curse.**

primary amebic meningoencephalitis, a rare and often fatal acute, febrile, purulent meningoencephalitis caused by usually free-living soil and water amebas of the genera ***Naegleria*** and ***Acanthamoeba.*** Infection caused by *Naegleria* is generally seen in young persons who swim or bathe in contaminated freshwater, the pathogens gaining access to the central nervous system by penetrating the nasal mucosa and cribriform plate and then following the olfactory bulbs and nerves to the brain and meninges. By contrast, *Acanthamoeba* infections tend to be more benign, are more often seen in older or immunocompromised persons, and are sometimes associated with spontaneous recovery; the mode of transmission of these infections is not known, but hematogenous spread from amebic infection at distant sites has been reported.

primary amenorrhea. See **amenorrhea.**

primary amputation, amputation performed after severe trauma, after the patient has recovered from shock and before infection occurs. Compare **secondary amputation.**

primary amyloidosis. See **amyloidosis.**

primary apnea, a self-limited condition characterized by an absence of respiration. It may follow a blow to the head and is common immediately after birth in the newborn who breathes spontaneously when the carbon dioxide level in the circulation reaches a certain value. Reflexes are present and the heart is beating, but the skin may be pale or blue and muscle tone is diminished. No treatment is necessary, but careful observation, maintenance of body temperature, and oral pharyngeal aspiration are usually performed. Within seconds the newborn usually begins breathing, becomes pinker, moves the arms and legs, and cries. Compare **periodic apnea of the newborn, secondary apnea.**

primary atelectasis, failure of the lungs to expand fully at birth, most commonly seen in premature infants or those narcotized by maternal anesthesia. The infant is usually cared for in an incubator in which the temperature and humidity may be closely monitored. Nursing care includes changing the infant's position frequently to assist respiration, suctioning to remove bronchial secretions, and feeding very slowly to prevent abdominal distension.

primary atypical pneumonia. See **mycoplasma pneumonia.**

primary bilateral micronodular hyperplasia. See **micronodular adrenal disease.**

primary biliary cirrhosis, a chronic inflammatory condition of the liver. It is characterized by generalized pruritus; enlargement and hardening of the liver; weight loss; and diarrhea with pale, bulky stools. Petechiae, epistaxis, or hemorrhage resulting from hypoprothrombinemia may also be evident. Pathological fractures and collapsed vertebrae may develop as the result of the associated malabsorption of vitamin D and calcium. Xanthomas commonly develop when the serum cholesterol level exceeds 450 mg/dL. The cause of primary biliary cirrhosis is unknown, although it is associated with autoimmune disorders. The condition most often affects women 40 to 60 years of age. The diagnosis is confirmed by liver biopsy and cholangiography. Antibody is nearly always present. Jaundice, dark urine, pale stools, and cutaneous xanthosis may occur in the later stages of this disease. Treatment commonly includes the administration of fat-soluble vitamins A, D, E, and K to prevent and correct deficiencies caused by malabsorption. Life expectancy is about 5 years for symptomatic patients after the onset of jaundice. Compare **secondary biliary cirrhosis.**

primary bronchial buds, two outgrowths from the respiratory diverticulum, which ultimately become the right and left primary bronchi and also give rise to the secondary bronchial buds.

primary bronchus, one of the two main air passages that branch from the trachea and convey air to the lungs as part of the respiratory system. The right primary bronchus enters the right lung nearly opposite the fifth thoracic vertebra. The left primary bronchus divides into bronchi for the superior and anterior lobes of the lung. The bronchi, like the trachea, are composed of rings of hyaline cartilage, fibrous tissue, mucous membrane, and glands. The right primary bronchus has a more direct extension of the trachea than the left. Hence foreign objects entering the trachea usually drop into the right bronchus rather than the left. See also **bronchial tree.**

primary carcinoma, a neoplasm at the site of origin.

primary care, the first contact in a given episode of illness that leads to a decision regarding a course of action to resolve the health problem.

primary care case management (PCCM), (in the United States) a situation in which primary care receives concurrent utilization management review, and discharge planning is used to minimize resource consumption while maintaining quality of care.

primary care physician (PCP, P.C.P.) [L, *primus* + ME, *caru,* sorrow; Gk, *physikos,* natural], a physician who usually is the first health professional to examine a patient and who recommends secondary care physicians, medical or surgical specialists with expertise in the patient's specific health problem, if further treatment is needed.

primary caries. See **dental caries.**

primary cell, an irreversible (nonrechargeable) electromotive force cell.

primary cell culture, a cell line derived directly from the parent tissue. Cells in primary culture have the same karyotype and chromosome number as those in the original tissue.

primary colors, a small number of fundamental colors. In visual science these are red, green, and blue, the colors specifically picked up by the retinal cones. Mixtures of varying proportions of the primary colors will yield white light in addition to the 150 discriminable hues of normal human vision. In painting and printing, the primary colors are red, blue, and yellow. When combined properly, these colors yield black and all other visible hues. See also **prismatic colors.**

primary constriction. See **centromere.**

primary curvature of vertebral column, a dorsally convex part of the spinal (vertebral) column.

primary cutaneous melanoma, a malignant neoplasm on the skin at the site of origin.

primary dementia. See **Alzheimer's disease.**

primary dental caries, dental caries developing in a tooth that was previously unaffected. Compare **secondary dental caries.**

primary dentition, the set of 20 teeth that appears normally during infancy, consisting of four incisors, two canines, and four molars in each jaw. The teeth start developing at about the sixth week of fetal life as a thickening of the epithelium along the line of the future jaw. During the seventh week the epithelium splits longitudinally into labial and lingual strands. The former becomes the labiodental lamina, and the latter forms the dental lamina, which develops 10 enlargements in each jaw. The enlargements appear at about the ninth week and correspond to the future teeth. In most individuals, the first tooth erupts through the gum about 6 months after birth. Thereafter one or more teeth erupt about every month until all 20 have appeared. The primary teeth are usually shed between the ages of 6 and 13 years, although the timing varies greatly from person to person. Also called **deciduous dentition, first dentition, primary teeth.** Compare **secondary dentition.** See also **predeciduous dentition, teething, tooth.**

primary dermatitis [L, *primus* + Gk, *derma,* skin, *itis,* inflammation], skin eruption caused by a substance that can produce cell damage on initial contact, as opposed to that which develops as a sensitivity reaction to an allergen.

primary distal RTA. See **distal renal tubular acidosis.**

primary drive. See **drive.**

primary dysmenorrhea. See **dysmenorrhea.**

primary effusion lymphoma, a B cell lymphoma associated with human herpesvirus 8 infection, characterized by the occurrence of lymphomatous effusions in body cavities without the presence of a solid tumor.

primary endometriosis [L, *primus* + Gk, *endon,* within, *metra,* womb, *osis,* condition], an ingrowth of the muscle walls of the uterus by the mucous membrane lining of the organ. Also called **adenomyosis, endometriosis interna.**

primary fissure, a fissure that marks the division of the anterior and posterior lobes of the cerebellum.

primary gain, a benefit, primarily relief from emotional conflict and freedom from anxiety, attained through the use of a defense mechanism or other psychological process. Compare **secondary gain.**

primary gangrene [L, *primus* + Gk, *gangraina*], a form of gangrene that occurs without preceding inflammation.

primary health care, a basic level of health care that includes programs directed at the promotion of health, early diagnosis of disease or disability, and prevention of disease. Primary health care is provided in an ambulatory facility to limited numbers of people, often those living in a particular geographic area. It includes continuing health care, as provided by a family nurse practitioner.

primary hemorrhage [L, *primus* + Gk, *haima,* blood, *rhegnynei,* to burst forth], a hemorrhage immediately after an injury.

primary host. See **definitive host.**

primary hypertension. See **essential hypertension.**

primary intention. See **intention.**

primary iritis [L, *primus* + Gk, *iris,* rainbow, *itis,* inflammation], an inflammation of the iris that results from a source within the body, such as a systemic disease. Also called **endogenous iritis.**

primary lateral sclerosis, a slowly progressing degenerative brain disease characterized by weakness, spasticity, hyperreflexia, and a positive Babinski sign. It involves neurons of the motor cortex but not the brainstem or spinal cord neurons. Also called **spastic primary paraplegia.**

primary lesion [L, *primus* + *laesio,* hurting], a sore or wound that develops at the point of inoculation of the disease, usually referring to a syphilis chancre. Also called **initial lesion.**

primary myelofibrosis, chronic, eventually fatal myeloproliferative neoplasm in which normal bone marrow hematopoietic tissue is replaced by reticulin fibers and blood cell production moves to other organs, called myeloid metaplasia. The peripheral blood film presents all stages of myelocytic and erythrocytic maturation and teardrop-shaped red blood cells called dacryocytes.

primary nurse, a nurse who is responsible for the planning, implementation, and evaluation of the nursing care of one or more clients 24 hours a day for the duration of the hospital stay. See also **primary nursing.**

primary nursing, a system for the distribution of nursing care in which care of one patient is managed for the entire 24-hour day by one nurse who directs and coordinates nurses and other personnel; schedules all tests, procedures, and daily activities for that patient; and cares for that patient personally when on duty. In acute care the primary care nurse may be responsible for only one patient; in intermediate care the primary care nurse may be responsible for three or more patients. Nurse midwives and other nurse practitioners practice primary nursing. Some advantages are continuity of care for the patient; accountability of the nurse for that care; patient-centered care that is comprehensive, individualized, and coordinated; and the professional satisfaction of the nurse. Compare **team nursing.**

primary oocyte, an oocyte that has begun but not completed the first maturation division. It is derived from an oogonium by differentiation near the time of birth.

primary organizer, the part of the dorsal lip of the blastopore that is self-differentiating and induces the formation of the neural plate that gives rise to the main axis of the embryo.

primary palate, a shelf formed from the medial nasal process of an embryo that separates the primitive nasal cavity from the oral cavity.

primary physician, **1.** the physician who usually takes care of a patient. **2.** the physician who first sees a patient for the care of a given health problem. **3.** a family practice physician or general practitioner. See also **family medicine.**

primary pneumonic plague. See **pneumonic plague.**

primary polycythemia. See **polycythemia rubra vera.**

primary prevention, a program of activities directed at improving general well-being while also involving specific protection for selected diseases, such as immunization against measles.

primary processes, (in psychoanalytic theory) unconscious processes, originating in the id, that obey laws different from those of the ego. These processes occur in the least disguised form in infancy and in the dreams of the adult.

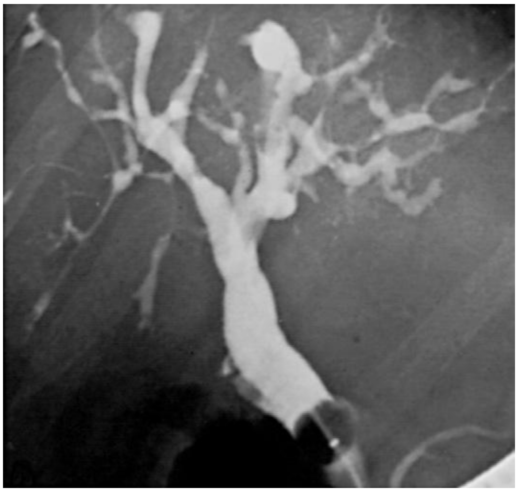
primary progressive aphasia, a speech disorder seen with certain degenerative brain diseases, consisting of deterioration of speech and language ability over a period of years without significant loss of memory or ability to understand language.

primary progressive apraxia of speech, a speech disorder similar to primary progressive aphasia except that a prominent feature is the inability of the patient to produce the sequence of muscle movements necessary to produce understandable speech, although comprehension of speech remains intact. See also **primary progressive aphasia.**

primary proximal RTA. See **proximal renal tubular acidosis.**

primary relationships, relationships with intimates, close friends, and family.

primary sclerosing cholangitis, a progressive chronic fibrosing inflammation of the bile ducts of unknown cause, occurring most commonly in young men and frequently in association with chronic ulcerative colitis. It also occurs as a complication of HIV infection. See also **AIDS cholangiopathy.**



Primary sclerosing cholangitis
(Feldman, Friedman, and Brandt, 2010)

primary sensation, a feeling or impression resulting directly from a particular stimulus. See also **sensation,** def. 1.

primary sequestrum, a piece of dead bone that completely separates from sound bone during the process of necrosis. Compare **secondary sequestrum.**

primary sex character, an inherited trait directly concerned with the reproductive function of the primary sex organs of the individual.

primary shock, a state of physical collapse comparable to fainting. It may be the result of slight pain, such as that produced by venipuncture, or may be caused by fright. Primary shock is usually mild, self-limited, and of short duration. Severe injury may prolong and merge primary shock with secondary shock. Compare **hemorrhagic shock.**

primary sterility [L, *primus* + *sterilis,* barren], the inability to produce offspring caused by a functional failure of the ovaries or the testes.

primary symptoms. See **symptom.**

primary syphilis. See **syphilis.**

primary teeth. See **primary dentition.**

primary triad, in A.T. Beck's theory of depression, the three major cognitive patterns that force the individual to view self, environment, and future in a negative manner.

primary tuberculosis, the childhood form of tuberculosis, most commonly occurring in the lungs, the posterior pharynx, or, rarely, the skin. Infants lack resistance to the disease and are readily infected and especially vulnerable to rapid and extensive spread of infection through the body. In childhood the disease is usually brief and benign, characterized by regional lymphadenopathy, calcification of the tubercles, and residual immunity. The disease may reactivate later in life. The tuberculin test result will be positive for life. See also **tuberculosis.**

primate /prī′māt, prī′mit/ [L, *primus,* first], a member of the order of mammals that includes lemurs, monkeys, apes, and humans. Most primates have large brains, stereoscopic vision, and hands and feet developed for grasping.

Primaxin, a trademark for a broad-spectrum parenteral antibiotic **(imipenem-cilastatin sodium).**

prime mover /prīm/ [L, *primus* + *movere,* to move], a muscle that acts directly to produce a desired movement amid other muscles acting simultaneously to produce the same movement indirectly. Most movements of the body require the combined action of numerous muscles. Compare **antagonist, fixation muscle, synergist.**

primer /prī′mər/, **1.** a short piece of DNA or RNA complementary to a given DNA sequence that acts as a point at which replication can proceed, as in a polymerase chain reaction. **2.** a molecule, such as a small polymer, that induces the synthesis of a larger molecule.

primidone /prī′mədōn/, an anticonvulsant.

■ INDICATIONS: It is prescribed in the treatment of seizure disorders, including tonic-clonic, psychomotor, and focal epilepsy-like seizures, and has an unlabeled use for treating familial (essential) tremor.

■ CONTRAINDICATIONS: Porphyria, pregnancy, or known hypersensitivity to this drug or to phenobarbital, a metabolite of primidone, prohibits its use. The drug must be used with caution in those having renal, hepatic, or pulmonary insufficiency.

■ ADVERSE EFFECTS: The most serious adverse effect, seen on rare occasions, is megaloblastic anemia. Drowsiness, ataxia, and dizziness are common. Drug dependency and other adverse effects of phenobarbital may occur.

primigravida /prim′igrav′idə/ [L, *primus* + *gravidus,* pregnancy], a woman pregnant for the first time. Also called **gravida.** Compare **multigravida, primipara.** —*primigravid, adj.*

primipara /primip′ərə/ *pl.* **primiparae** [L, *primus* + *parere,* to bear], a woman who has given birth to one viable infant, indicated by the notation *para 1* on the patient's chart. Compare **multipara, nullipara, primigravida.**

primiparity /prim′iper′itē/ [L, *primus* + *parere,* to bear], the condition of having borne one child.

primiparous /primip′ərəs/ [L, *primus* + *parere,* to bear], pertaining to a woman who has borne one child.

primitive /prim′itiv/ [L, *primivus*], **1.** undeveloped; undifferentiated; rudimentary; showing little or no evolution. **2.** embryonic; formed early in the course of development; existing in an early or simple form. Compare **definitive.**

primitive fold. See **primitive ridge.**

primitive groove, a furrow in the posterior region of the embryonic (primordial) disk. It indicates the cephalocaudal axis that results from the active involution of cells forming the primitive streak.

primitive gut. See **archenteron.**

primitive heart tube, the primordium of the heart, formed by fusion of the two lateral endocardial tubes.

primitive line. See **primitive streak.**

primitive node, a knoblike accumulation of cells at the cephalic end of the primitive streak in the early stages of embryonic development in humans and higher animals. It consists of mesoderm cells that give rise to the notochord, and it corresponds to the dorsal lip of the blastopore in lower animals. Also called **Hensen's knot, Hensen's node.**

primitive pit, a minute indentation at the anterior end of the primitive groove in the early developing embryo. It lies posterior to the primitive node and probably functions as an opening into the notochordal canal in humans and higher animals and into the neurenteric canal in lower animals.

primitive reflex, any reflex normal in an infant or fetus. Its presence in an adult usually indicates serious neurological disease, such as dementia. Some kinds of primitive reflexes are **grasp reflex, Moro reflex,** and **sucking reflex.**

primitive ridge, a ridge that bounds the primitive groove in the early stages of embryonic development. Also called **primitive fold.** See also **primitive streak.**

primitive streak, a dense area on the central posterior region of the embryonic disk. It is formed by the morphogenetic movement of a rapidly proliferating mass of cells that spreads between the ectoderm and endoderm, giving rise to the mesoderm layer. This seamlike elongation indicates the cephalocaudal axis along which the embryo develops, and it corresponds to the blastopore of lower animal groups. Also called **primitive line.**

primordia. See **primordium.**

primordial /prīmôr′dē·əl/ [L, *primordium,* origin], **1.** characteristic of the most undeveloped or earliest state, specifically those cells or tissues that are formed in the early stages of embryonic development. **2.** first or original; primitive.

primordial cyst, one of three kinds of follicular cysts, consisting of an epithelium-lined sac that contains fluid and appears radiographically as a light area in the affected jaw. It develops from a dental enamel organ before the formation of hard tissue. See **odontogenic keratocyst.**

primordial dwarf, a person of extremely short stature who is otherwise perfectly formed, with the usual proportions of body parts and normal mental and sexual development. The condition may be genetically related, involving some defect in the ability to use growth hormone, or it may occur sporadically within a particular population. Also called **hypoplastic dwarf, normal dwarf, physiological dwarf, pure dwarf, true dwarf.** See also **pituitary dwarf, pygmy.**

primordial germ cell, any of the large spheric diploid cells that are formed in the early stages of embryonic development and are precursors of the oogonia and spermatogonia. They are formed outside the gonads and migrate to the embryonic ovaries and testes for maturation. See also **oogenesis, spermatogenesis.**

primordial image, (in analytic psychology) the archetype or original parent, representing the source of all life. It occurs in the memory as a stage preceding the differentiation of the actual mother and father. See also **collective unconscious.**

primordial oocyte, an oocyte very early in its development.

primordial sex cords. See **gonadal cords.**

primordium /prīmôr′dē·əm/ *pl.* **primordia** [L, origin], the first recognizable stage in the embryonic development and differentiation of a particular organ, tissue, or structure. Also called **anlage, rudiment.**

principal /prin′sipəl/ [L, *principalis,* first in rank], first in authority or importance.

principal cell. See **chief cell.**

Principen, a trademark for an antibacterial **(ampicillin).**

principle /prin′sipəl/ [L, *principium,* foundation], **1.** a general truth or established rule of action. **2.** a prime source or element from which anything proceeds. **3.** a law on which others are founded or from which others are derived.

principle of infinitesimal dose, one of the fundamental principles of homeopathy, stating that the more a remedy is diluted (even to the point that none of the medicinal substance is likely to be present), the more powerful and longer lasting will be its effect.

principles of instrumentation, six rules for the use of mirrors and other hand-driven and motor-driven devices in dentistry and dental hygiene: (1) grasp, (2) fulcrum, (3) insertion, (4) adaptation and angulation, (5) activation (lateral pressure and working stroke), and (6) rest.

Prinivil, a trademark for an angiotensin-converting enzyme inhibitor used for hypertension (lisinopril).

P-R interval, the interval from the beginning of the P wave to the beginning of the QRS complex on an electrocardiogram. It represents the atrioventricular conduction time, which normally is between 0.12 and 0.20 second.

printout, a printed copy of information produced by a computer's printer.

Prinzmetal's angina [Myron Prinzmetal, American cardiologist, 1908–1994], chest pain caused by reversible, severe coronary artery spasm. It is associated with S-T segment elevation that reverts to normal within minutes. The S-T segment elevation indicates total occlusion of the epicardial coronary artery. Also called **variant angina.**

prion /prī′on/, one of several kinds of proteinaceous particles believed to be responsible for transmissible neurodegenerative diseases, including scrapie in sheep and kuru and Creutzfeldt-Jakob disease in humans. Because prions lack detectable nucleic acid, they are not inactivated by the usual procedures for destroying viruses. They also do not trigger an immune response.

prion disease, any of a group of fatal degenerative diseases of the nervous system caused by abnormalities in the metabolism of prion protein. These diseases are unique in that they may be transmitted genetically as an autosomal-dominant trait or by infection with abnormal forms of the protein (prions). Inherited forms result from mutations in the gene that codes for prion protein; such mutations may occur sporadically. Hereditary forms include some forms of Creutzfeldt-Jakob disease, Gerstmann-Sträussler syndrome, and fatal familial insomnia. Infectious forms of the disease result from ingestion of infected tissue or the introduction of infected tissue into the body (kuru and some forms of Creutzfeldt-Jakob disease). The latter has occasionally occurred during surgical procedures. It has also occurred as the result of injection of human growth hormone prepared from infected pituitary glands. Prion diseases also occur in animals. Also called **subacute spongiform encephalopathy, transmissible neurodegenerative disease, transmissible spongiform encephalopathy**.

priority /prī·ôr′itē/ [L, *prius,* previously], actions established in order of importance or urgency to the welfare or purposes of the organization, patient, or other person at a given time.

Priscoline, a trademark for a peripheral vasodilator **(tolazoline hydrochloride).**

prism /priz′əm/ [Gk, *prisma,* that which is seen through], **1.** a solid of glass, plastic, or a similar substance with a triangular or polygonal cross section, which splits up a ray of light into its constituent colors and turns or deflects light rays toward its base. Prisms are used to correct deviations of the eyes because they alter the apparent situation of objects. **2.** enamel prism, or calcified rods, surrounded by organic prism cuticle joined together to form tooth enamel. **3.** an adverse prism or verger prism used to test and train ocular muscles.

prismatic colors /prizmat′ik/, the seven rainbow hues (red, orange, yellow, green, blue, indigo, and violet) produced from white light when it is reduced to its component wavelengths by the dispersion effect of a prism.

privacy /prī′vəsē/, a culturally specific concept defining the degree of one's personal responsibility to others in regulating behavior that is regarded as intrusive. Some privacy-regulating mechanisms are physical barriers (closed doors or drawn curtains, such as around a hospital bed) and interpersonal types (lowered voices or cessation of smoking).

Privacy curtains help ensure patient's privacy

(Sorrentino, 2008)

private duty nurse /prī′vit/, a nurse who may work in an institution, caring for a patient on a fee-for-service basis. The private duty nurse is not a member of the institution staff. Private duty care also occurs in the home.

private practice, the work of a professional health care provider who is independent of economic or policy control by professional peers except for licensing and other legal restrictions.

-privia, suffix meaning a "(specified) condition of loss or deprivation": *calciprivia, hormonoprivia, paraprivia.*

privileged communication /priv′ilijd/, a legal term used in court-related proceedings concerning the right to reveal information that belongs to the person who spoke. It may prevent the listener from disclosing the information without the permission of the speaker. Privileged communication may exist between a patient and a health professional only if the law specifically establishes it.

privileges /priv′ilij′əs/ [L, *privilegium,* private law], authority granted to a physician or dentist by a hospital governing board to provide patient care in the hospital. Clinical privileges are limited by the individual's professional license, experience, and competence. Emergency privileges may be granted by a hospital governing board or chief executive officer in an emergency and without regard to the physician's or dentist's regular service assignment or status. Temporary privileges may be granted a physician or dentist to provide health care to patients for a limited period or to a specific patient.

Privine, a trademark for an alpha-1 adrenergic agonist **(naphazoline hydrochloride).**

PRK, abbreviation for **photorefractive keratectomy.**

PRL, abbreviation for **prolactin.**

prn, p.r.n., (in prescriptions) abbreviation for *pro re nata,* a Latin phrase meaning "as needed." The administration times are determined by the patient's needs.

Pro, abbreviation for **proline.**

pro-, prefix meaning "first, or in front of": *procallus, procheilon, progravid.*

proaccelerin. See **factor V.**

probability /prob′əbil′itē/ [L, *probabilitas*], **1.** a measure of the likelihood that something will occur. **2.** a mathematic ratio of the number of times something will occur to the total number of possible occurrences.

probable signs /prob′əbəl/ [L, *probabalis,* credible, *signum,* mark], clinical signs that there is a definite likelihood of pregnancy. Examples include enlargement of the abdomen, Goodell's sign, Hegar's sign, Braxton Hicks' sign, and positive hormonal test results. Compare **presumptive signs.**

proband. See **propositus.**

Pro-Banthine, a trademark for an anticholinergic **(propantheline bromide).**

probe, **1.** any device used to explore an opening such as a sinus or wound. Common types of probes include a probe with a blunt leading end, a drum probe with a sounding device for the detection of metallic foreign particles, and an eyed probe with a small opening at one end for introducing a guiding thread along a fistula. **2.** any device or agent, such as a radioactively tagged isotope or a molecular deoxyribonucleic acid fragment probe, inserted into a medium to obtain information about a structure or substance. **3.** a Doppler probe used to detect blood flow in a vessel. **4.** the act of exploring or investigating an action or unfamiliar matter.

probenecid /prōben′əsid/, a uricosuric and adjunct to antibiotics.

■ INDICATIONS: It is prescribed in the treatment of gout and as an adjunct to prolong the activity of penicillin or cephalosporins in some infections, such as gonorrhea.

■ CONTRAINDICATIONS: Uric acid kidney stones, blood dyscrasias, or known hypersensitivity to this drug prohibits its use. It is not initiated during an acute attack of gout but is continued if an attack occurs during treatment. It is not given to children less than 2 years of age. Concomitant administration of salicylates decreases the effect of probenecid.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are hemolytic anemia, GI disturbances, headache, urinary frequency, and minor allergic reactions. It is involved in many drug interactions, particularly with salicylate drugs.

problem /prob′ləm/ [Gk, *proballein,* to throw forward], any health care condition that requires diagnostic, therapeutic, or educational action. It also refers, in nursing, to any unmet or partially met basic human need.

problem-based learning, an instructional strategy designed to develop critical thinking skills through the presentation of real-life clinical situations assessed and explored by students working in collaborative groups with faculty, other clinician experts, and their peer group.

problem-oriented medical record (POMR), a method of recording data about the health status of a patient in a problem-solving system. The POMR preserves the data in an easily accessible way that encourages ongoing assessment and revision of the health care plan by all members of the health care team. The particular format of the system used varies from setting to setting, but the components of the method are similar. A data base is collected before beginning the process of identifying the patient's problems. The data base consists of all information available that contributes to this end, such as that collected in an interview with the patient and family or others, that from a health assessment or physical examination of the patient, and that from various laboratory and radiological tests. It is recommended that the data base be as complete as possible, limited only by potential hazard, pain or discomfort to the patient, or excessive assumed expense of the diagnostic procedure. The interview, augmented by prior records, provides the patient's history, including the reason for contact; an identifying statement that is a descriptive profile of the person; a family illness history; a history of the current illness; a history of past illness; an account of the patient's current health practices; and a review of systems. The physical examination or health assessment makes up the second major part of the data base. The extent and depth of the examination vary from setting to setting and depend on the services offered and the condition of the patient. The next section of the POMR is the master problem list. The formulation of the problems on the list is similar to the assessment phase of the nursing process. Each problem as identified represents a conclusion or a decision resulting from examination, investigation, and analysis of the data base. A problem is defined as anything that causes concern to the patient or to the caregiver, including physical abnormalities, psychological disturbance, and socioeconomic problems. The master problem list usually includes active, inactive, temporary, and potential problems. The list serves as an index to the rest of the record and is arranged in five columns: a chronological list of problems, the date of each problem's onset, the action taken, the outcome (often its resolution), and the date of the outcome. Problems may be added, and intervention or plans for intervention may be changed; thus the status of each problem is available for the information of all members of the various professions involved in caring for the patient. The third major section of the POMR is the initial plan, in which each separate problem is named and described, usually on the progress note in a SOAP format: *S,* subjective data from the patient's point of view; *O,* the objective data acquired by inspection, percussion, auscultation, and palpation and from laboratory and radiological tests; *A,* assessment of the problem that is an analysis of the subjective and objective data; and *P,* the plan, including further diagnostic work, therapy, and education or counseling. After an initial plan for each problem is formulated and recorded, the problems are followed in the progress notes by narrative notes in the SOAP format or by flow sheets showing the significant data in a tabular manner. A discharge summary is formulated and written, relating the overall assessment of progress during treatment and the plans for follow-up or referral. The summary allows a review of all the problems initially identified and encourages continuity of care for the patient.

problem-solving approach to patient-centered care, (in nursing) a conceptual framework that incorporates the overt physical needs of a patient with covert psychological, emotional, and social needs. It provides a model for caring for the whole person as an individual, not as an example of a disease or a medical diagnosis. Nursing is defined within this model as a problem-solving process. The patient is viewed as a person who is in an impaired state, less than usually able to perform self-care activities. Nursing problems are conditions experienced by the patient or the patient's family for which the nurse may provide professional service. The nurse makes a nursing diagnosis that identifies the impaired state and determines the care needed to augment the patient's ability to perform self-care. The requirements for care are classified in four levels: care given to sustain life is sustenal care; care given to assist the patient in self-care is remedial care; care that helps the patient develop new skills and goals in self-care is restorative care; and care given to guide the patient to a level of self-help beyond the normal level is preventive care. The approach identifies 21 nursing problems and sorts them into four groups: problems relating to comfort, hygiene, and safety; physiological balance; psychological and social factors; and sociological and community factors. See also **nursing care plan.**

problem-solving interview. See **interview.**

procainamide hydrochloride /prōkān′əmīd/, an antiarrhythmic agent.

■ INDICATIONS: It is prescribed in the treatment of a variety of cardiac arrhythmias, including premature ventricular contractions, ventricular tachycardia, and atrial fibrillation.

■ CONTRAINDICATIONS: Myasthenia gravis, heart block, or known hypersensitivity to this drug, to procaine, or to related local anesthetics prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI disturbances, hypersensitivity reactions, agranulocytosis, and a syndrome resembling lupus erythematosus.

procaine hydrochloride /prō′kān/, a local anesthetic of the ester family.

■ INDICATIONS: It is administered for local anesthesia by infiltration and injection and for caudal, epidural, and other regional anesthetic procedures. It is not used for topical anesthesia.

■ CONTRAINDICATIONS: Known hypersensitivity to anesthetics of the ester group prohibits its use. It is not injected into inflamed or infected tissue, and large doses are not given to patients with heart block.

■ ADVERSE EFFECTS: Among the most serious adverse effects are potentially serious neurological and cardiovascular reactions that result from inadvertent intravascular administration. Allergic reactions also may occur.

procarbazine hydrochloride /prōkär′bəzēn/, an antineoplastic.

■ INDICATIONS: It is prescribed in the treatment of a variety of neoplasms, including Hodgkin's disease, lymphomas, brain tumors, and lung cancer.

■ CONTRAINDICATIONS: Bone marrow depression or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are bone marrow depression and GI disturbances, particularly nausea and vomiting.

Procardia, a trademark for a calcium channel blocker **(NIFEdipine).**

procaryocyte. See **prokaryocyte.**

procaryon. See **prokaryon.**

procaryosis. See **prokaryosis.**

Procaryotae /prōker′ē·ō′tē/, (in bacteriology) a kingdom of bacteria, viruses, and blue-green algae that includes all microorganisms in which the nucleoplasm has no basic protein and is not surrounded by a nuclear membrane. The kingdom has two divisions: Cyanobacteria, which includes the blue-green bacteria, and bacteria. Also called **Monera.** See also **procaryocyte.**

procaryote. See **prokaryote.**

procedure /prəsē′jər/ [L, *procedere,* to proceed], the sequence of steps to be followed in establishing some course of action.

procercoid /prōsur′koid/, the first stage in the life cycle of certain tapeworms that develop from the coracidium stage of *Diphyllobothrium latum*. The tapeworm develops in the body of the first intermediate host, either a crustacean or a copepod of the genus *Diaptomus*.

procerus /prəsir′əs/ [L, stretched], one of three muscles of the nose. It is a small pyramidal muscle that arises from the fascia of the nasal bone and the lateral nasal cartilage and inserts into the skin over the lower part of the forehead between the eyebrows. It is innervated by buccal branches of the facial nerve. The procerus functions to draw down the eyebrows and wrinkle the nose. Compare **depressor septi, nasalis.**

process /pros′əs/ [L, *processus*], **1.** *n*, a series of related events that follow in sequence from a particular state or condition to a conclusion or resolution. **2.** *n*, a natural growth that projects from a bone or other part. **3.** *v*, to put through a particular series of interdependent steps, as in preparing a chemical compound.

process criteria, standards identified by the American Nurses Association that focus on nursing activities for implementing the standards of each specialty practice area.

processor. See **central processing unit.**

process recording, (in nursing education) a system used for teaching nursing students to understand and analyze verbal and nonverbal interaction. The conversation between nurse and patient is written on special forms or in a special format. The student nurse is instructed to record observations, perceptions, thoughts, and feelings, as well as conversations. The student also is asked to analyze his or her communication, determining and naming both therapeutic and nontherapeutic techniques used within an interaction. The process recording is then studied by the nursing instructor to discover patterns of difficulty in communicating with the patient and to help the student nurse identify them.

processus vaginalis peritonei /prəses′əs/ [L, *processus,* process, *vagina,* sheath; Gk, *peri,* around, *teinein,* to stretch], a diverticulum of the peritoneal membrane that during embryonic development extends through the inguinal canal. In males it descends into the scrotum to form the processus vaginalis testis; in females it is usually completely obliterated. Also called **Nuck's canal, Nuck's diverticulum.**

prochlorperazine /-klôrper′əzēn/, a phenothiazine antipsychotic and antiemetic.

■ INDICATIONS: It is prescribed in the treatment of psychotic disorders, and it may be used in the control of nausea and vomiting.

■ CONTRAINDICATIONS: Parkinson's disease, the concurrent administration of central nervous system depressants, liver or renal dysfunction, severe hypotension, or known hypersensitivity to any phenothiazine prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, liver toxicity, extrapyramidal reactions, blood dyscrasias, and hypersensitivity reactions.

prochlorperazine maleate. See **prochlorperazine.**

prochromosome. See **karyosome.**

procidentia /-siden′shə/ [L, *procidere,* to fall forward], the prolapse of an organ. The term is usually applied to a prolapsed uterus.

procoagulant /-kō·ag′yələnt/, an inactive coagulation protein that becomes activated during the coagulation process to form a serine protease or cofactor and produce a fibrin clot. Prothrombin is an example.

proconvertin. See **factor VII.**

procreate /prō′krē·āt/ [L, *procreare,* to create], to produce offspring.

procreation /-krē·ā′shən/ [L, *procreare,* to create], the entire reproductive process of producing offspring. **—procreate,** *v.*

proct-. See **procto-.**

proctalgia /proktal′jə/ [Gk, *proktos,* anus, *algos,* pain], a neurological pain in the anus or lower rectum.

proctalgia fugax [Gk, *proktos* + *algos,* pain; L, *fugax,* fleeting], periodic pain in the anus, possibly muscular in origin, that follows a pattern and is sometimes relieved by food and drink.

-proctia, suffix meaning "anus or rectum": *ankyloproctia, cacoproctia, coloproctia*.

proctitis /proktī′tis/ [Gk, *proktos,* anus, *itis*], inflammation of the rectum and anus caused by infection, trauma, drugs, allergy, or radiation injury. Acute or chronic, it is accompanied by rectal discomfort and the repeated urge to pass feces and inability to do so. Pus, blood, or mucus may be present in the stools, and tenesmus may occur. Also called **rectitis.**

procto, prefix meaning "anus or rectum": *proctocele, proctorrhea, proctoscopy*.

proctocele. See **rectocele.**

proctocolectomy /prok′tōkəlek′təmē/, a surgical procedure in which the anus, rectum, and colon are removed. An ileostomy is created for the removal of digestive tract wastes. The procedure treats severe, intractable ulcerative colitis or Crohn's disease. See also **ileoanal anastomosis.**

Proctocort, a trademark for an anorectal preparation containing a glucocorticoid **(hydrocortisone).**

proctodeum /proktō′dē·əm/ *pl. proctodea* [Gk, *proktos* + *hodiaos,* a route], a depression of the ectoderm, behind the urorectal septum of the developing embryo, that forms the anus and anal canal when the cloacal membrane ruptures. Also spelled *proctodaeum* (*pl. proctodaea*). Compare **stomodeum.** *—proctodaeal, proctodeal, adj.*

proctodynia /-din′ē·ə/ [Gk, *proktos* + *odyne,* pain], pain in or around the anus.

proctologist /proktol′əjist/, a physician who specializes in proctology.

proctology /proktol′əjē/ [Gk, *proktos* + *logos,* science], the branch of medicine concerned with treating disorders of the colon, rectum, and anus.

proctoplasty /prok′təplas′tē/ [Gk, *proktos,* anus, *plassein,* to mold], a plastic surgery procedure performed on the anus and rectum.

proctoscope /prok′təskōp′/ [Gk, *proktos* + *skopein,* to look], an instrument used to examine the rectum and the distal part of the colon. It consists of a light mounted on a tube or speculum. Compare **sigmoidoscope.**

proctoscopy /proktos′kəpē/, the examination of the rectum with an endoscope inserted through the anus.

proctosigmoidoscopy /prok′tōsig′moidos′kəpē/ [Gk, *proktos* + *sigmoid* + *skopein,* to view], the use of a sigmoidoscope to examine the internal lumen of the rectum and pelvic colon.

procumbency /prōkum′bensē/ [L, *procumbere,* to lean forward], excessive inclination of the incisor teeth toward the lips.

procyclidine hydrochloride /prōsī′klədēn/, an anticholinergic.

■ INDICATIONS: It is prescribed in the treatment of parkinsonism and drug-induced extrapyramidal dysfunction and controls sialorrhea resulting from neuroleptic medication.

■ CONTRAINDICATIONS: Narrow-angle glaucoma, asthma, obstruction of the genitourinary or GI tract, severe ulcerative colitis, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are confusion, disorientation, blurred vision, central nervous system effects, tachycardia, dry mouth, decreased sweating, and hypersensitivity reactions.

prodromal /-drō′məl/ [Gk, *pro,* before, *dromos,* course], pertaining to early symptoms that may mark the onset of a disease.

prodromal labor [Gk, *prodromos,* running before; L, *labor,* work], the early period in parturition before uterine contractions become forceful and frequent enough to result in progressive dilation of the uterine cervix.

prodromal myopia, an optical condition in which the ability to do close work without eyeglasses returns, but usually as a symptom of developing cataracts. Also called **myopic shift.**

prodromal phase, a clear deterioration in function before the active phase of a mental disturbance. It is not caused by a disorder in mood or a psychoactive substance and includes some residual phase symptoms.

prodromal rash, a rash that precedes a potentially more serious skin eruption caused by an infectious disease.

prodromal symptom [Gk, *pro* + *dromos,* course, *symptoma,* that which happens], a symptom that may be the first indication of the onset of a disease.

prodrome /prō′drōm/ [Gk, *prodromos,* running before], **1.** an early sign of a developing condition or disease. **2.** the earliest phase of a developing condition or disease. Many infectious diseases such as chickenpox or measles are most contagious during the prodromal period. **—prodromal,** *adj.*

prodrug /prō′drug/, an inactive or partially active drug that is metabolically changed in the body to an active drug.

product evaluation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as determining the effectiveness of new products or equipment. See also **Nursing Interventions Classification.**

product evaluation committee /prod′əkt/, a hospital committee composed of medical, nursing, purchasing, and administrative staff members whose purpose is to evaluate healthcare-related products and advise on their procurement. Also called **new product evaluation committee.**

productive cough /prəduk′tiv/ [L, *producere* + AS, *cohhetan,* to cough], a sudden, noisy expulsion of air from the lungs that effectively removes sputum from the respiratory tract and helps clear the airways, permitting air to reach the alveoli. Coughing is stimulated by irritation or inflammation of the respiratory tract, which is caused most frequently by infection or sinus drainage secondary to rhinitis. Deep breathing, with contraction of the diaphragm and intercostal muscles and forceful exhalation, promotes productive coughing in patients with respiratory infections. Mucolytic agents liquefy mucus in the respiratory tract so that it can be raised and expectorated more easily. Atropine and other anticholinergic drugs decrease pulmonary secretions. Also called **moist cough, wet cough.** See also **nonproductive cough.**

-profen, suffix for ibuprofen-type antiinflammatory or analgesic substances.

Profenal, a trademark for an oral nonsteroidal antiinflammatory analgesic **(suprofen).**

professional corporation (PC) /prəfesh′ənəl/ [L, *professio,* profession], a corporation formed according to the law of a particular state for the purpose of delivering a professional service. In some states corporations may not practice law, medicine, surgery, or dentistry; in some states nurses may form or be partners in a professional corporation. According to the laws of the various states, professional corporations may offer legal and tax benefits to the members of the corporation.

professional liability, the legal obligation of health care professionals or their insurers to compensate patients for injury or suffering caused by acts of omission or commission by the professionals. Professional liability is a better characterization of the responsibility of all professionals to their patients than is the concept of malpractice, but the idea of professional liability is central to malpractice.

professional network, (in psychiatric nursing) the network of professional resources available to support the psychiatric outpatient in the community. The network may include a therapist, hospital day treatment program, social work agency, and other agencies.

professional organization, an organization whose members share a professional status, created to deal with issues of concern to the professional group or groups involved.

Professional Standards Review Organization (PSRO), an organization formed under the U.S. Social Security Act Amendments of 1972 to review the services provided under Medicare, Medicaid, and Maternal Child Health programs. Review is conducted by physicians to ascertain the need for the program and to ensure that it is carried out in accord with certain criteria, norms, and standards and, in institutional situations, in a proper setting. The PSRO requires that regional organizations be formed to conduct these reviews throughout the nation.

profibrinolysin. See **fibrinogen.**

profile /prō′fīl/ [L, *profilare,* to outline], a short sketch, diagram, or summary relating to a person or thing.

profunda /prōfun′də/ [L, *profundus,* deep], pertaining to structures, mainly blood vessels, that are deeply embedded in tissues.

profunda femoris artery. See **deep artery of the thigh.**

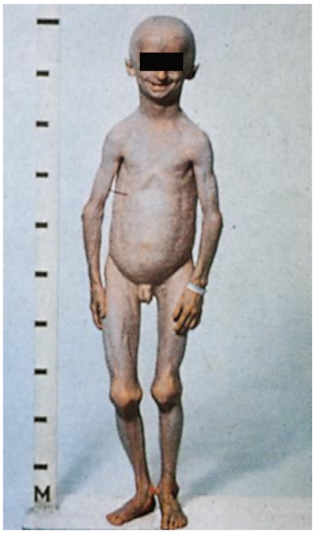
profuse sweat /prəfyo͞os′/ [L, *profundere,* to pour out; AS, *swaetan*], excessive perspiration. Also called **diaphoresis.**

progenital herpes, herpes genitalis.

progenitive /-jen′itiv/ [Gk, *pro,* before, *genein,* to produce], capable of producing offspring; reproductive.

progenitor /-jen′itər/ [Gk, *pro* + *genein*], **1.** a parent or ancestor. **2.** someone or something that begets or creates.

progeny /proj′ənē/ [L, *progenies*], **1.** offspring; an individual or organism resulting from a particular mating. **2.** the descendants of a known or common ancestor.



[redacted]

Progeria *(Patton and Thibodeau, 2010)*

progeria /prōjir′ē·ə/ [Gk, *pro* + *geras,* old age], an abnormal congenital condition characterized by premature aging, appearance in childhood of gray hair and wrinkled skin, small stature, absence of pubic and facial hair, and posture and habitus of an aged person. Death usually occurs before 20 years of age. Also called **Hutchinson-Gelford syndrome.** Compare **infantilism.**

progestagen. See **progestogen.**

progestagen-only contraceptive, an oral contraceptive consisting only of a small dose of a progestational agent to be taken every day.

progestational /prō′jestā′shənəl/ [Gk, *pro* + L, *gestare,* to bear], pertaining to a drug with effects similar to those of progesterone, the hormone produced by the corpus luteum and adrenal cortex during the luteal phase of the menstrual cycle that prepares the uterus for reception of the fertilized ovum. Natural and synthetic preparations of progesterone and its derivative medroxyPROGESTERone acetate are used in the treatment of secondary amenorrhea and abnormal uterine bleeding. Progestational compounds, such as norethindrone and norgestrel, are constituents of oral contraceptives. The use of progestins to prevent habitual or threatened abortion is no longer recommended.

progestational agent [L, *pro* + *gestare,* to bear, *agere,* to do], any chemical having the same action as progesterone produced by the corpus luteum and the placenta.

progestational phase. See **secretory phase.**

progesterone /prəjes′tərōn/, a natural progestational hormone.

■ INDICATIONS: It is used to prevent endometrial hyperplasia in nonhysterectomized, postmenopausal women who are receiving conjugated estrogen tablets; to treat dysfunctional uterine bleeding caused by hormonal imbalances; as a contraceptive in intrauterine devices; and in intravaginal gel for women using assisted reproductive technology.

■ CONTRAINDICATIONS: Thrombophlebitis, liver dysfunction, breast cancer, undiagnosed uterine bleeding, pregnancy, previous stroke, or hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are pain at the site of injection, breast pain, dizziness, headache, fatigue, emotional lability, abdominal pain, muscle weakness, catabolic effects, and electrolyte disturbances.

progesterone assay, a blood test that is useful in documenting whether ovulation has occurred and, if so, when. This information may be used to help women with difficulty becoming pregnant. Repeated assays may also be used to monitor the status of the placenta in high-risk pregnancy and progesterone supplementation in patients with an inadequate luteal phase.

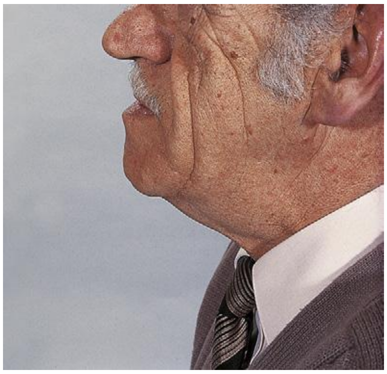
progesterone receptor assay, a tumor-specimen analysis used primarily to determine the prognosis and treatment of breast cancer.

progestin /-jes′tin/, **1.** progesterone. **2.** any of a group of hormones, natural or synthetic, secreted by the corpus luteum, placenta, or adrenal cortex that have a progesterone-like effect on the uterine endometrial lining to prepare it for implantation of the blastocyst.

progestogen /-jes′təjən/, any natural or synthetic progestational hormone. Also spelled **progestagen.** Also called **progestin.**

proglottid /prōglot′id/ [Gk, *pro* + *glossa,* tongue], a sexual segment of an adult tapeworm, containing both male and female reproductive organs. Each mature segment is shed and produces additional tapeworms.

prognathism /prog′nəthiz′əm/ [Gk, *pro* + *gnathos,* jaw], an abnormal facial configuration in which one or both jaws project forward. It may be real or imaginary, depending on anatomical and developmental factors. Real prognathism may exist when both the mandible and the maxilla increase in length or when the maxillary length is normal and the mandibular length increases excessively. Imaginary prognathism may exist when the maxilla is underdeveloped and the mandibular length is normal. *—prognathic, adj.*



Prognathism *(Belchetz and Hammond, 2003)*

prognosis /prognō′sis/ [Gk, *pro* + *gnosis,* knowledge], a prediction of the probable outcome of a disease based on the condition of the person and the usual course of the disease as observed in similar situations.

prognostic /prognos′tik/ [Gk, *pro* + *gnosis,* knowledge], pertaining to signs and symptoms that may indicate the outcome of an illness or injury.

prognosticate /prognos′tikāt/ [Gk, *pro,* before, *gnosis,* knowledge], to forecast or predict from facts, present indications, or signs, such as the course a disease may take and the final outcome.

prognostic indicators, factors, such as staging, tumor type, and laboratory studies, that may indicate treatment effectiveness and outcomes.

Prograf, a trademark for an immunosuppressive drug **(tacrolimus).**

program /prō′grəm/ [Gk, *pro* + *gramma,* record], a sequence of instructions, written in a computer programming language, that controls the functions of a computer.

program development, a nursing intervention from the Nursing Interventions Classification (NIC) defined as planning, implementing, and evaluating a coordinated set of activities designed to enhance wellness or to prevent, reduce, or eliminate one or more health problems for a group or community. See also **Nursing Interventions Classification.**

program documentation. See **documentation.**

programmable pacemaker /-gram′əbəl/ [Gk, *pro* + *graphein,* to record; L, *passus,* step; ME, *maken*], an electronic pacemaker with multiple settings that can be changed after implantation.

programmed aging theory, **1.** a theory of aging that states that life expectancy is predetermined and timed for individual species, with cells programmed to divide a certain number of times. Functional changes in the cells cause aging of the cells and thus the organism. **2.** any of various theories of aging based on timed functional changes. See **theories of aging.**

programmed pacing, control of the heart rate by a programmable pacemaker. See also **pacing.**

programmer /prō′grəmər/, a person skilled in writing or coding computer programs.

programming language. See **language.**

Program of All-inclusive Care of the Elderly (PACE) /pās/, a U.S. federally supported program of comprehensive care with a primary objective of keeping clients in the community as long as medically, socially, and financially possible. It uses a team approach in which professionals assess client needs, develop a care plan, integrate primary care and other services, and arrange for implementation of services. PACE is sponsored by one or more facilities and community groups and receives funds from Medicare, Medicaid, and private donations. A forerunner of PACE is the San Francisco On Lok program, which provides comprehensive adult day care, custodial or personal care, drug treatment, dentistry, and housekeeping for older persons who have a level of impairment that usually requires admission to a nursing facility.

progravid /-grav′id/ [L, *pro* + *gravid,* pregnant], before pregnancy.

progression /-gresh′ən/, a carcinogenic process whereby cells genetically altered by initiators undergo a second (nongenetic) cell expansion that allows uncontrollable growth.

progressive /-gres′iv/ [L, *progredi,* to advance], describing the course of a disease or condition in which the characteristic signs and symptoms become more prominent and severe, such as progressive muscular atrophy.

progressive assistive exercise, an exercise designed to improve the strength of a muscle group progressively by gradually decreasing assistance required of a therapist for an active motion, thereby increasing the patient's active effort. See also **progressive resistance exercise.**

progressive bulbar paralysis [L, *progredi,* to advance, *bulbus,* swollen root; Gk, *paralyein,* to be palsied], a motor neuron disease characterized by weakness of the laryngeal, pharyngeal, tongue, and facial muscles. The patient experiences progressive dysarthria and dysphagia. Also called **association paralysis, Duchenne's paralysis.**

progressive familial intrahepatic cholestasis, an autosomal-recessive type of intrahepatic cholestasis of hepatocellular origin. Affected children often develop cirrhosis by age 10 and die during adolescence. At least three different genetic defects cause varieties of the disease. Also called **Byler's disease.**

progressive histoplasmosis. See **histoplasmosis.**

progressive interstitial hypertrophic neuropathy. See **Déjérine-Sottas disease.**

progressive muscle relaxation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating the tensing and releasing of successive muscle groups while attending to the resulting differences in sensation. See also **Nursing Interventions Classification.**

progressive myonecrosis. See **myonecrosis.**

progressive myopia [L, *progredi* + Gk, *myops,* nearsighted], a condition in which myopia increases, continuing into adulthood.

progressive ophthalmoplegia [L, *progredi*], a form of ocular muscle paralysis that usually begins with ptosis and gradually involves all of the extraocular muscles.

progressive osseous heteroplasia. See **osteodermia.**

progressive ossifying myositis. See **myositis ossificans progressiva.**

progressive patient care, a system of care in which patients are placed in units on the basis of their needs for care as determined by the degree of illness rather than on the basis of a medical specialty. The usual levels or stages of progressive patient care are intensive care, intermediate care, and minimal care.

progressive relaxation, a technique for combating tension and anxiety by systematically tensing and relaxing muscle groups.

progressive resistance exercise (PRE), a method of increasing the strength of a weak or injured muscle by gradually increasing the resistance against which the muscle works, such as by using graduated weights. Also called **graduated resistance exercise.** See also **active resistance exercise, Delorme technique, progressive assistive exercise.**

progressive scan mode, a method of cathode ray tube scanning in which all of the lines are scanned successively (in interlaced scanning, the odd lines are scanned first and then the even lines).

progressive spinal muscular atrophy of infants. See **Werdnig-Hoffmann disease.**

progressive subcortical encephalopathy. See **Schilder's disease.**

progressive supranuclear palsy [L, *supra,* above, *nucleus,* nut kernel; Gk, *paralyein*], a rare progressive neurological disorder of unknown cause occurring in middle age, more often in men. It is characterized by paralysis of eye muscles, ataxia, neck and trunk rigidity, pseudobulbar palsy, and parkinsonian facies. Dementia and inappropriate emotional responses also are common. Treatment usually includes the antiparkinsonian drug levodopa for control of extrapyramidal symptoms. Also called **Steele-Richardson-Olszewski syndrome.** See also **Parkinson's disease.**

progressive systemic sclerosis. See **scleroderma.**

progress notes [L, *progredi* + *nota,* mark], (in the patient record) notes made by a nurse, physician, social worker, physical therapist, and other health care professionals that describe the patient's condition and the treatment given or planned. Progress notes may follow the problem-oriented medical record format. The physician's progress notes usually focus on the medical or therapeutic aspects of the patient's condition and care. The nurse's progress notes, although recording the medical conditions of the patient, usually focus on the objectives stated in the nursing care plan. These objectives may include responses to prescribed treatments, the ability to perform activities of daily living, and acceptance or understanding of a particular condition or treatment. Progress notes in an in-hospital setting are recorded daily; those in a clinic or office setting are usually preceded by an episodic or interval history and are recorded as accounts of each visit.

proguanil /progwahn′il/, an antimalarial agent administered orally as the hydrochloride salt. Its use in the United States is limited because of the development of drug-resistant malarial parasites.

proinsulin /prō·in′s(y)əlin/ [L, *pro* + *insula,* island], a single-chain peptide molecule that is a precursor of insulin.

projectile vomiting /-jek′til/, expulsive vomiting that is extremely forceful, with vomitus expelled some distance.

projection /-jek′shən/ [L, *projectio,* thrown forward], **1.** a protuberance; anything that thrusts or juts outward. **2.** the act of perceiving an idea or thought as an objective reality. **3.** (in psychology) an unconscious defense mechanism by which an individual attributes his or her own unacceptable traits, ideas, or impulses to another. It is noted in some stages of schizophrenia.

projection reconstruction imaging, the techniques used in magnetic resonance (MR) imaging to obtain a cross-sectional image of an object. Such an image is computer-reconstructed from a series of MR profiles recorded all around an object by rotating the gradient field superimposed on the static magnetic field.

projective test /-jek′tiv/ [L, *projectio,* thrown forward], a kind of diagnostic, psychological, or personality test that uses unstructured or ambiguous stimuli, such as inkblots, a series of pictures, abstract patterns, or incomplete sentences, to elicit responses that reflect a projection of various aspects of the individual's personality. See also **Rorschach test.**

prokaryocyte /prōker′ē·əsīt′/ [Gk, *protos,* first, *karyon,* nut, *kytos,* cell], a cell without a true nucleus and with nuclear material scattered throughout the cytoplasm. Prokaryocytic organisms **(Procaryotae)** include bacteria, viruses, mycoplasmas, actinomycetes, and blue-green algae. Also spelled **procaryocyte.** Compare **eukaryocyte.**

prokaryon /prōker′ē·on/ [Gk, *protos* + *karyon,* nut], a region within a bacterial cell that contains most of the bacterial DNA. It is not separated from the rest of the cell by a membrane. Also spelled **procaryon.** Compare **eukaryon.**

prokaryosis /-ker′ē·ō′sis/ [Gk, *protos* + *karyon* + *osis,* condition], the condition of having a prokaryon. Also spelled **procaryosis.** Compare **eukaryosis.**

prokaryote /prōker′ē·ōt/ [Gk, *protos* + *karyon*], a unicellular organism that does not contain a true nucleus surrounded by a double membrane; a bacterium. Division usually occurs through simple fission. Also spelled **procaryote.** Compare **eukaryote** —*prokaryotic, adj.*

prokaryotic cell, a cell without a true nucleus. See also **cell.**

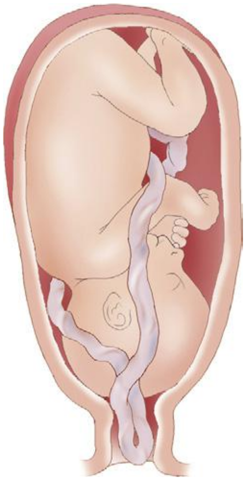
prokinetic /pro′kinet′ik/, stimulating movement or motility, such as a drug that promotes GI motility.

prolactin (PRL) /prōlak′tin/ [Gk, *pro,* before, *lac,* milk], a hormone produced and secreted into the bloodstream by the anterior pituitary gland. Prolactin stimulates the development and growth of the mammary glands after the glands have been prepared by estrogen, progesterone, thyroxine, insulin, growth hormone, glucocorticoids, and human placental lactogen. After parturition, prolactin, together with glucocorticoids, is essential for the initiation and maintenance of milk production. Prolactin synthesis and release from the pituitary are mediated by the central nervous system in response to suckling by the infant. When suckling or its mechanical equivalent ceases, prolactin secretion slows and milk production ceases. Prolactin has no known function in human males. Prolactin is similar to growth hormone in its chemical structure. Prolactin excess is seen with prolactin-secreting pituitary tumors in both sexes. Also called **lactogenic hormone.**

prolactin levels test, a blood test that is helpful for monitoring the disease activity of pituitary adenomas.

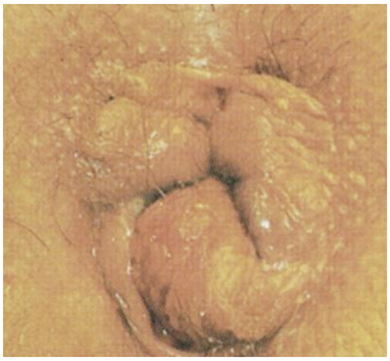
prolapse /prō′laps, prōlaps′/ [L, *prolapsus,* falling], the dropping, falling, sinking, or sliding of an organ from its normal position or location in the body, such as a prolapsed uterus or rectum.

prolapsed cord /prōlapst/, an umbilical cord that protrudes beside or ahead of the presenting part of the fetus.



Prolapsed cord *(McSwain, 2003)*

prolapsed hemorrhoid [L, *prolapsus,* falling; Gk, *haimorrhois,* a vein that loses blood], an internal hemorrhoid that protrudes through the anal orifice.



Prolapsed hemorrhoids *(Seidel et al, 2011/Courtesy Gershon Efron, MD, Sinai Hospital of Baltimore)*

prolapsed ureterocele, an intravesical ureterocele that extends beyond the bladder neck down into the urethra, usually seen in females.

prolapse of anus [L, *prolapsus,* falling, *anus*], the protrusion of the mucous membrane of the anus through the external sphincter.

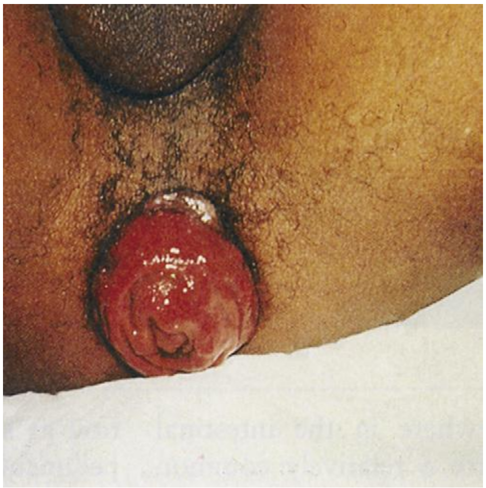
prolapse of rectum [L, *prolapsus,* falling, *rectus,* straight], a protrusion of the mucous membrane of the lower part of the rectum through the anal orifice.

prolapse of uterus [L, *prolapsus,* falling, *uterus,* womb], the descent of the uterine cervix into the vagina, partly into the vagina, or outside the vagina.

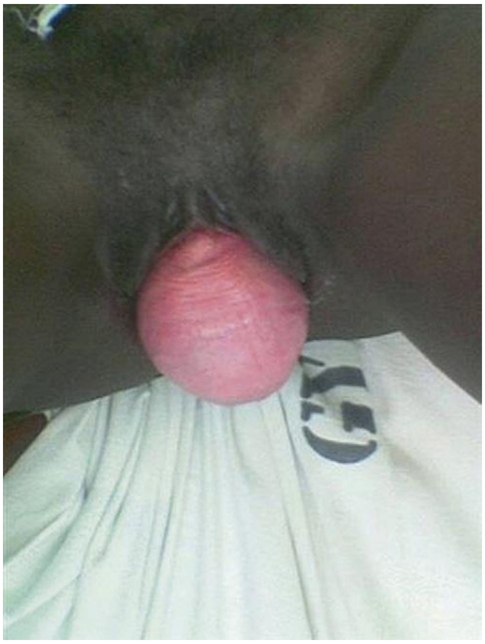
Prolastin, a trademark for alpha$_1$-antitrypsin (alpha$_1$-proteinase inhibitor, human).

proliferate /-lif′ərāt/ [L, *proles,* offspring, *ferre,* to bear], to grow by multiplication of cells, parts, or organisms.

proliferation /-lif′ərā′shən/ [L, *proles,* offspring, *ferre,* to bear], the reproduction or multiplication of similar forms. The term is usually applied to increases of cells or cysts. —**proliferate,** *v., proliferative,* **prolific,** *adj.*



Prolapse of the rectum
(Seidel et al, 2003/Courtesy Gershon Efron, MD, Sinai Hospital of Baltimore)



Uterine prolapse
(Dim et al, 2008)

proliferation inhibiting factor, a lymphokine that restricts cell division in tissue cultures.

proliferative-follicular phase. See **proliferative phase.**

proliferative glomerulonephritis, any of various types of glomerulonephritis accompanied by proliferation of endothelial or mesangial cells in the glomeruli, including acute, diffuse, membranoproliferative, mesangial proliferative, and rapidly progressive glomerulonephritis.

proliferative phase /-lif′ərətiv/, the phase of the menstrual cycle after menstruation. Under the influence of follicle-stimulating hormone from the pituitary, the ovary produces increasing amounts of estrogen, causing the lining of the uterus to become dense and richly vascular. The phase is terminated by rupture of a mature follicle and subsequent ovulation. Also called **proliferative-follicular phase.** Compare **menstrual phase, secretory phase.**

prolific /lif′ik/ [L, *proles*, offspring, *ferre*, to bear], highly productive.

proline (Pro) /prō′lēn/, a nonessential amino acid found in many proteins of the body, particularly collagen. See also **amino acid, protein.**

prolonged gestation /-longd′/ [L, *prolongare*, to lengthen, *gestare*, to bear], a pregnancy that lasts longer than the usual period of 41 weeks.

prolonged release [Gk, *pro*, before, *longus*, long], a term applied to a drug that is designed to deliver a dose of a medication over an extended period. The most common device for this purpose is a soft, soluble capsule containing minute pellets of the drug for release at different rates in the GI tract, depending on the thickness and nature of the oil, fat, wax, or resin coating on the pellets. Another system consists of a porous plastic carrier impregnated with the drug and a surfactant to facilitate the entry of GI fluids that slowly leach out of the drug. Ion exchange resins that bind to drugs and liquids containing suspensions of slow-release drug granules are also used to provide medication over an extended period. Various mechanisms and vehicles have also been developed to prolong the release of drugs after injection. Also called **timed release.**

Proloprim, a trademark for an antibacterial **(trimethoprim).**

PROM, abbreviation for **passive range of motion.**

promastigote /prōmas′tigōt/, the flagellate stage of a trypanosome. It is found in the insect intermediate host or in culture.

promethazine hydrochloride /-meth′əzēn/, a phenothiazine antiemetic, antihistamine, and sedative.

■ INDICATIONS: It is prescribed in the treatment of motion sickness, nausea, rhinitis, itching, and skin rash and as an adjunct to anesthesia and pain control.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to other phenothiazines or severe central nervous system depression or coma prohibits its use.

■ ADVERSE EFFECTS: Drowsiness, hypotension, and dry mouth are the most common adverse effects.

promethium (Pm) /-mē′thē·əm/ [L, *Prometheus*, mythic character who gave fire to humans], a radioactive rare earth metallic element. Its atomic number is 61; its atomic mass is 145.

prominence /prom′inəns/ [L, *prominentia*, sticking out], any protuberance or projection of a structural feature.

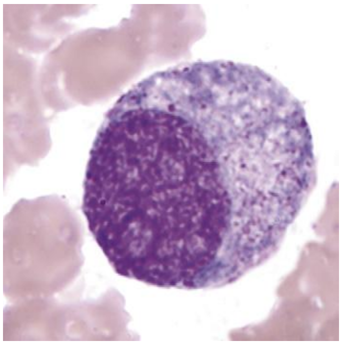
promontory of the sacrum /prom′əntôr′ē/ [L, *promontorium*, headland], the superior projecting part of the sacrum at its junction with the L5 vertebra.

promoter /-mō′tər/ [L, *promovere*, to move forward], **1.** a DNA sequence that initiates transcription of the genetic code. **2.** a cocarcinogen that encourages cells altered by initiators to reproduce more rapidly than normal, increasing the probability of malignant transformation. Examples include chlorophenothane (DDT), phenobarbital, saccharin, sunlight, and some chemicals in cigarette smoke. The effects of promoters are sometimes reversible.

prompted voiding, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of urinary continence through the use of timed verbal toileting reminders and positive social feedback for successful toileting. See also **Nursing Interventions Classification.**

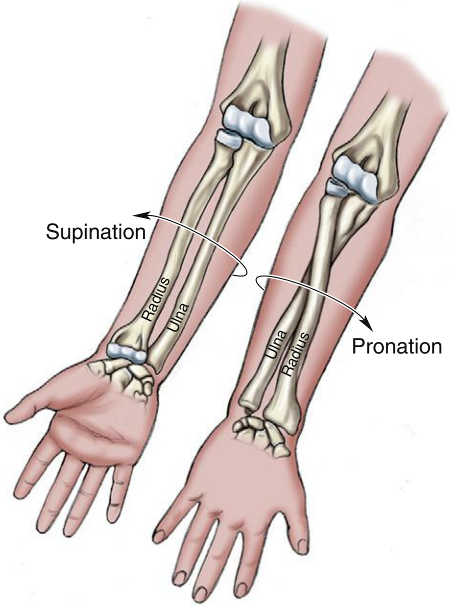
prompt insulin zinc suspension [L, *promptus*, ready], a fast-acting noncrystalline semilente insulin prescribed in the treatment of diabetes mellitus when a prompt, intense, and short-acting response is desired. It is only slightly slower acting than insulin injection. See also **short-acting insulin.**

promyelocyte /prōmī′ələsīt′/, precursor in the bone marrow myelocytic series that is intermediate in development between a myeloblast and a myelocyte. The cytoplasm contains prominent primary granules. Appears in peripheral blood in acute promyelocytic leukemia.



Promyelocyte *(Carr and Rodak, 2008)*

pronation /prōnā′shən/ [L, *pronare*, to bend forward], **1.** assumption of a prone position, one in which the ventral surface of the body faces downward. **2.** (of the arm) the rotation of the forearm so that the palm of the hand faces downward or backward. **3.** (of the foot) the lowering of the medial edge of the foot by turning it outward and through abduction in the tarsal and metatarsal joints. **—pronate,** *v.*



Pronation *(Herlihy, 2011)*

pronator quadratus /prōnā′tər/, a muscle of the forearm. It originates on the distal fourth of the anterior surface and border of the ulna and inserts onto the distal fourth of the anterior surface of the radius. It functions to pronate the forearm and hand.

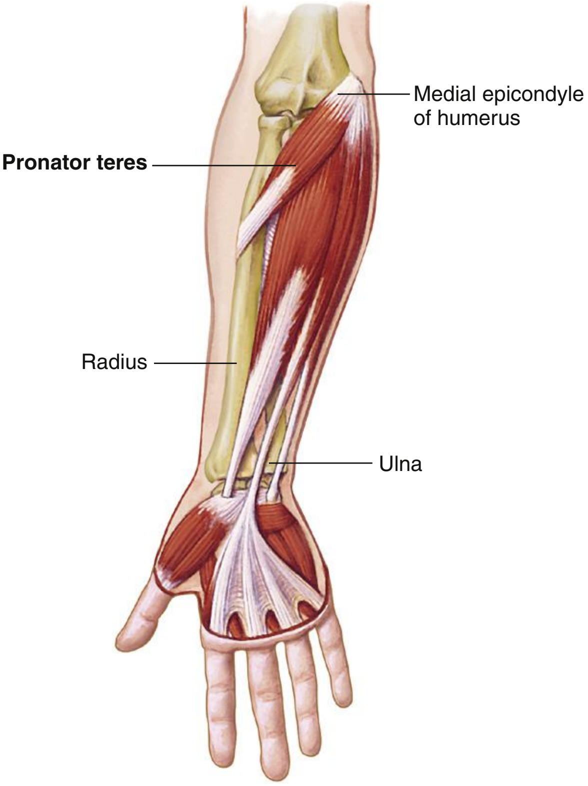
pronator reflex [L, *pronare* + *reflectere,* to bend back], a reflex elicited by holding the patient's hand vertically and tapping the distal end of the radius or ulna, resulting in pronation of the forearm. Hyperactivity of the reflex may be seen with lesions of the pyramidal system above the level of the sixth cervical nerve root. Also called **ulnar reflex.**

pronator syndrome [L, *pronare,* to bend forward; Gk, *syn,* together, *dromos,* course], the compression of the median nerve in the forearm between the two heads of the pronator teres muscle.

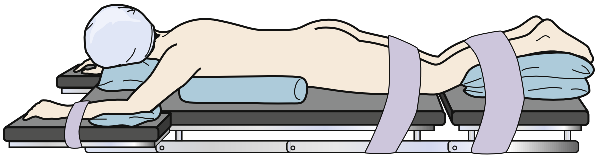
pronator teres /ter′əs/, a superficial muscle of the forearm, arising from a humeral and an ulnar head and ending in a flat tendon that inserts into the radius. It functions to pronate the hand. Compare **flexor carpi radialis, flexor carpi ulnaris, flexor digitorum superficialis, palmaris longus.**

prone /prōn/ [L, *pronare,* to bend forward], **1.** having a tendency or inclination. **2.** (of the body) being in horizontal position when lying face downward. Also called **ventral recumbent.** Compare **supine.**

proneness profile /prōn′nəs/ [L, *pronare,* to bend forward, *profilare,* to outline], a screening process that evaluates the probability of developmental problems in the early years of a child's life. Screening ideally begins during prenatal care and continues after birth. Several of the variables in the proneness profile that appear to be significant in selecting the infants who are at risk are the indicators of perinatal health of the mother and infant, especially complications of pregnancy, delivery, the neonatal period, and the puerperium; characteristics of the mother, especially her temperament, educational level, perception of the life situation, and perception of the infant; characteristics of the infant, including alertness, activity pattern, and responsiveness; and behaviors of the infant and caregiver as they interact. The proneness profile is followed by a developmental profile that assesses the current status of the infant and caregiver. Three areas to be considered are characteristics of the infant, including adaptation and response to the environment, the ability to give interpretable cues, and the developmental progress as compared with established norms; characteristics of the caregiver, including adaptation to the new infant, sensitivity to cues from the infant, and techniques for relieving distress; and the healthful quality of the environment, including health, safety, comfort, and stimulation.



Pronator teres *(Patton and Thibodeau, 2010)*



Prone position *(Phillips, 2012)*

prone-on-elbows, a body position in which the person rests the upper part of the body on the elbows while lying face down. The position is used as an initial rehabilitation exercise in training a person with a cerebellar dysfunction to achieve various goals. In this position, the person can practice weight shifting through the hips to a quadruped position without the risk of falling from a standing position.

pronephric. See **pronephros.**

pronephric duct /-nef′rik/ [Gk, *pro,* before, *nephros,* kidney; L, *ducere,* to lead], one of the paired ducts that connect the tubules of each of the pronephros with the cloaca in the early developing vertebrate embryo. They later become the functional mesonephric ducts. Also called **archinephric canal, archinephric duct.**

pronephric tubule, any of the segmentally arranged excretory units of the pronephros in the early developing vertebrate embryo. The tubules open into the pronephric duct and communicate with the coelom through a nephrostoma. In humans and the higher vertebrates, the tubules are present only in vestigial form; in lower animals they are functional.

pronephros /-nef′rəs/ *pl.* *pronephroi* [Gk, *pro* + *nephros,* kidney], the earliest and simplest kind of excretory organ in the developing vertebrate embryo. In humans and other mammals the structure is nonfunctional. Also called **archinephron, head kidney,** *pronephron* (*pl. pronephra*). See also **mesonephros, metanephros. —pronephric,** *adj.*

prone posture [L, *pronare,* to bend forward, *ponere,* to place], a posture assumed by lying flat with the face forward in response to certain disorders of the spine or viscera.

pronucleus /-no͞o′klē·əs/ *pl.* *pronuclei* [Gk, *pro* + L, *nucleus,* nut kernel], the nucleus of an ovum or a spermatozoon after fertilization but before fusion of the chromosomes to form the nucleus of the zygote. Each pronucleus contains the haploid number of chromosomes, is larger than the normal nucleus, and is diffuse in appearance. The pronucleus of the ovum is formed only after it has completed its second meiotic division and the second polar body has formed, which occur after the spermatozoon has penetrated. It then loses its nuclear envelope, releasing the chromosomes so that synapsis with the chromosomes of the male pronucleus, which is contained in the head of the spermatozoon, can occur. Also called **germinal nucleus, germ nucleus.** See also **oogenesis, spermatogenesis.**

propagation /prop′əgā′shən/ [L, *propagare,* to generate], the process of increasing or causing to increase.

propanoic acid. See **propionic acid.**

2-propanol. See **isopropyl alcohol.**

2-propanone. See **acetone.**

propantheline bromide /-pan′thəlēn/, an anticholinergic/antispasmodic.

■ INDICATIONS: It is prescribed as an adjunct in peptic ulcer therapy, irritable bowel syndrome, and pancreatitis and for spasm of the ureters or urinary bladder.

■ CONTRAINDICATIONS: Narrow-angle glaucoma, asthma, obstruction of the genitourinary or GI tract, severe ulcerative colitis, megacolon, myasthenia gravis, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blurred vision, central nervous system effects, tachycardia, dry mouth, decreased sweating, and hypersensitivity reactions.

proparacaine hydrochloride /prōper′əkān/, a rapid-acting topical anesthetic of the amide family. Also called **proxymetacaine.**

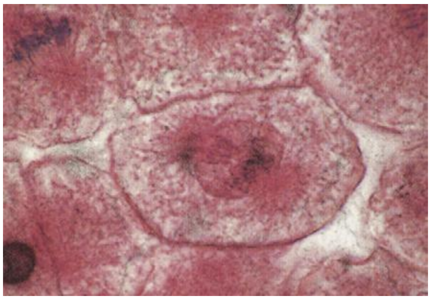
■ INDICATIONS: It is used for tonometry, gonioscopy, removal of foreign objects from the eye, and other minor ophthalmological procedures and preoperatively for major eye surgery. One drop gives 15 minutes of optic anesthesia.

■ CONTRAINDICATIONS: Proparacaine hydrochloride is not administered to individuals with cardiac disease, hyperthyroidism, or multiple allergies. People given the drug should be warned not to touch their eyes until the anesthetic has worn off.

■ ADVERSE EFFECTS: Adverse optic effects may occur with proparacaine, but systemic reactions are rare. Prolonged use may injure the eye.

properidin system. See **alternative pathway of complement activation.**

prophase /prō′fāz/ [Gk, *pro* + *phasis,* appearance], the first of four stages of nuclear division in mitosis and in each of the two divisions of meiosis. In mitosis the chromosomes progressively shorten and thicken to form individually recognizable elongated double structures composed of two chromatids held together by a centromere. The nucleolus and nuclear membrane disappear, the spindle and polar bodies are formed, and the chromosomes begin to migrate toward the midplane of the developing spindle. In the first meiotic division, prophase is complex and subdivided into five stages: leptotene, zygotene, pachytene, diplotene, and diakinesis. In the second meiotic division the same processes occur as in mitotic prophase. See also **anaphase, interphase, meiosis, metaphase, mitosis, telophase.**



Prophase *(© Ed Reschke; used with permission)*

prophylactic /prō′filak′tik/ [Gk, *prophylax,* advance guard], **1.** *adj,* preventing the spread of disease. **2.** *n,* an agent that prevents the spread of disease. **3.** *n,* a popular name for **condom.** —*prophylactically, adv.*

prophylactic forceps. See **low forceps.**

prophylactic odontomy, the surgical removal of harmful pits and fissures in the posterior primary and secondary molars to prevent the formation of caries in those areas.

prophylactic treatment. See **preventive treatment.**

prophylaxis /prō′filak′sis/ [Gk, *prophylax,* advance guard], prevention of or protection against disease, often involving the use of a biological, chemical, or mechanical agent to destroy or prevent the entry of infectious organisms. —**prophylactic,** *adj.*

Propionibacterium /prō′pē·on′ēbaktir′ē·əm/ [Gk, *pro* + *pion,* fat, *bakterion,* small rod], a genus of nonmotile, anaerobic, gram-positive bacteria found on the skin of humans, in the intestinal tract of humans and animals, and in dairy products. ***Propionibacterium acnes*** is common in acne pustules. Formerly called *Corynebacterium acnes.*

propionic acid /prō′pē·on′ik/, an aliphatic carboxylic acid that is a chemical component of sweat. It can be formed by fermentation of sugars by several species of bacteria. Also called **propanoic acid.**

propionicacidemia /prō′pē·on′ikas′idē′mē·ə/ [Gk, *pro* + *pion,* fat; L, *acidus,* sour; Gk, *haima,* blood], a rare inherited metabolic defect caused by the failure of the body to metabolize the amino acids threonine, isoleucine, and methionine, characterized by lethargy and mental and physical retardation. Acidosis results from the accumulation of propionic acid in the body. A diet low in these amino acids is difficult to achieve but is the only treatment. —*propionicacidemic, adj.*

propionic fermentation [Gk, *pro* + *pion* + L, *fermentare,* to cause to ferment], the production of propionic acid by the action of certain bacteria on sugars or lactic acid.

Proplex T, a trademark for human clotting factor IX.

propofol /pro′pah-fol/, a short-acting sedative and hypnotic used as a general anesthetic and adjunct to anesthesia, administered intravenously.

proportional /prəpôr′shənəl/, pertaining to the relationship between two quantities when a fractional variation of one is always accompanied by the same fractional change in the other.

proportional gas detector, a device for measuring alpha and beta forms of radioactivity.

proportional mortality [L, *pro* + *portio,* part, *mortalis,* subject to death], a statistical method of relating the number of deaths from a particular condition to all deaths within the same population group for the same period.

proposition /prop′əzish′ən/ [L, *proponere,* to place forward], **1.** *n,* a statement of a truth to be demonstrated or an operation to be performed. **2.** *v,* to bring forward or offer for consideration, acceptance, or adoption.

propositus /prōpoz′itəs/ [L, *proponere,* to place forward], a person from whom a genealogical lineage is traced, as is done to discover the pattern of inheritance of a familial disease or a physical trait. Also called **proband.**

propoxyphene hydrochloride, an analgesic.

■ INDICATION: It is prescribed for the relief of mild to moderate pain.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or known narcotic addiction prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are respiratory depression, paradoxical excitement, and convulsions.

propranolol hydrochloride /-pran′əlol/, a nonselective beta-adrenergic receptor blocking agent.

■ INDICATIONS: It is prescribed in the treatment of hypertension, angina pectoris, catecholamine-induced cardiac arrhythmias, pheochromocytoma, essential tremor, and migraine headache and for various unlabeled uses such as treatment of anxiety and aggressive behavior.

■ CONTRAINDICATIONS: Asthma, COPD, pulmonary edema, bradycardia, second or third degree heart block, congestive heart failure unless secondary to a tachyarrhythmia treatable with beta-blockers, pregnancy (especially second and third trimester), or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are heart failure, heart block, increased airway resistance, augmentation of hypoglycemic response, GI disturbances, and hypersensitivity reactions. Withdrawal syndrome has been observed in some patients.

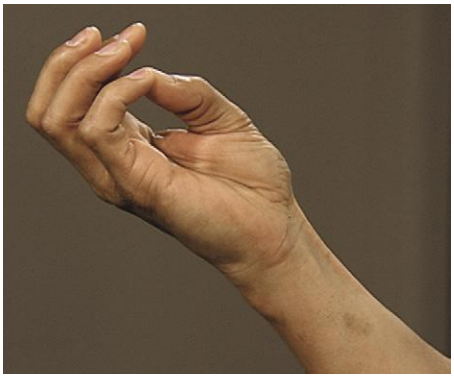
proprietary /-prī′əter′ē/ [L, *proprietas,* property], **1.** pertaining to an institution or other organization that is operated for profit. **2.** pertaining to a product, such as a drug or device, that is made for profit.

proprietary drug. See **patent medicine, proprietary medicine.**

proprietary hospital, a hospital operated as a profit-making organization. Many proprietary hospitals are owned by physicians who operate them primarily for their own patients but also accept patients from other physicians. Some proprietary hospitals are owned by investor groups or large corporations.

proprietary medicine, any pharmaceutic preparation or medicinal substance that is protected from commercial competition because its ingredients or method of manufacture is kept secret or is protected by trademark or copyright.

proprioception /prō′prē·əsep′shən/ [L, *proprius,* one's own, *capere,* to take], sensation pertaining to stimuli originating from within the body related to spatial position and muscular activity or to the sensory receptors that they activate. Compare **exteroceptive, interoceptive.** See also **autotopagnosia.**



Assessment of proprioception *(Seidel et al, 2011)*

proprioceptive /prō′prē·əsep′tiv/ [L, *proprius,* one's own, *capere,* to take], pertaining to the sensations of body movements and awareness of posture, enabling the body to orient itself in space without visual clues.

proprioceptive feedback, muscle-joint input that provides information regarding position in space and/or in relation to objects.

proprioceptive impulse, a nerve impulse that originates with a sensory ending in muscle, joint, or tendon. Such impulses provide information to the central nervous system about the relative position of body parts.

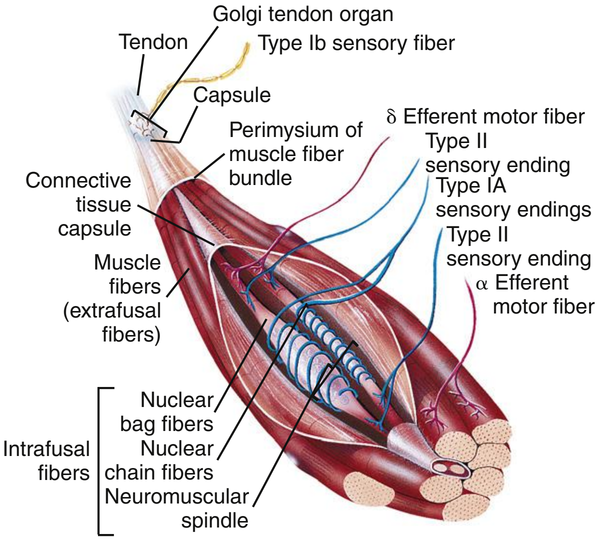
proprioceptive neuromuscular facilitation (PNF), an activity, such as a therapeutic technique, that helps initiate a proprioceptive response in a person. An example is a slow rocking movement that relaxes an anxious person by stimulating vestibular and proprioceptive nerve receptors. Techniques are used to facilitate total body responses or selective postural extensors.

proprioceptive receptor. See **proprioceptor.**

proprioceptive reflex [L, *proprius* + *capere,* to take, *reflectere,* to bend back], any reflex initiated by stimulation of proprioceptors, such as the increase in respiratory rate and volume induced by impulses arising from muscles and joints during exercise.

proprioceptive sensation [L, *proprius* + *capere* + *sentire,* to feel], the feeling of body movement and position, including motion of the arms and legs, resulting from stimuli received by special sense organs in the muscles, tendons, joints, and inner ear. The stimuli may be produced by changes in muscle tension or stretching and reaction to the pull of gravity on the body.

proprioceptor /prō′prē·əsep′tər/ [L, *proprius* + *capere*], any sensory nerve ending, such as those located in muscles, tendons, joints, and the vestibular apparatus, that responds to stimuli originating from within the body related to movement and spatial position. Also called **proprioceptive receptor.** Compare **exteroceptor, interoceptor.** See also **mechanoreceptor.**

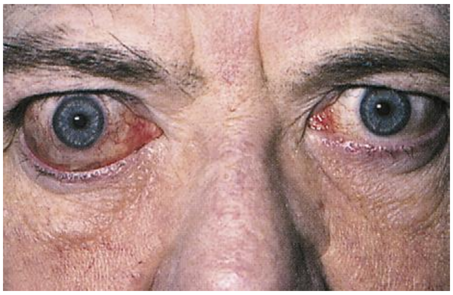


Proprioceptor *(Patton and Thibodeau, 2010)*

proptosis /proptō′sis/ [L, *pro* + *ptosis,* falling], a bulging, protrusion, or forward displacement of a body organ or area.

propulsion /-pul′shən/ [L, *propellere,* to drive forward], **1.** the process of pushing forward. **2.** the tendency of some patients, particularly those afflicted with nervous disorders, to push or fall forward while walking as their center of gravity is displaced.

propylene glycol ($CH_3CHOHCH_2OH$) /prop′ilēn/, a colorless viscous liquid used as a solvent in the preparation



Proptosis of the right eye *(Kanski and Nischal, 1999)*

of certain medications. It also inhibits the growth of fungi and microorganisms and is used commercially as an antifreeze.

propylformic acid. See **butyric acid.**

propylthiouracil /prō′pilthī′əyo͞or′əsil/, an inhibitor of thyroid hormone biosynthesis.

■ INDICATIONS: It is prescribed in treatment of hyperthyroidism and thyrotoxic crisis and in preparation for thyroidectomy.

■ CONTRAINDICATIONS: Mental depression, cold intolerance, or known hypersensitivity to this drug prohibits its use. Caution is recommended in pregnancy, in patients older than 40 years of age (can cause hypoprothrombinemia and bleeding), and in use in combination with other drugs that can cause agranulocytosis.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI distress, pruritus, and rashes. Rarely blood dyscrasia occurs.

pro re nata. See **prn.**

prorenin /prōren′in/, the inactive precursor of renin, stored in the juxtaglomerular cells of the kidney and activated by cleavage to renin. Also called *big renin*.

pros-. See **proso-.**

proscribe /prōskrīb′/, to forbid. —*proscriptive, adj.*

prosector /-sek′tər/ [L, *prosecare*, to cut off], a person who, under the supervision of a pathologist, performs gross dissections and prepares autopsy specimens for pathological examination.

prosencephalon /pros′ensef′əlon/ [Gk, *pro* + *enkephalon*, brain], the anterior primitive cerebral vesicle, comprising the diencephalon and telencephalon. Also called **forebrain.** Compare **mesencephalon.** —*prosencephalic, adj.*

proso-, pros-, prefix meaning "forward, or anterior": *prosocoele, prosodemic, prosogaster.*

Pro Sobee, a trademark for a commercial milk-substitute formula that is prepared from a soy isolate base and is lactose free. It is prescribed for infants with galactosemia and people with lactose intolerance. It is supplemented with other nutrients, is fortified with vitamins and minerals, and is available in both powder and liquid forms. See also **Nutramigen.**

prosopalgia. See **trigeminal neuralgia.**

-prosopia, suffix meaning "(condition of the) face": *ateloprosopia, lipoprosopia, schizoprosopia.*

prosopo-, prefix meaning "face": *prosopoanoschisis, prosopodiplegia, prosoponeuralgia.*

prosopopilary virilism /pros′əpōpī′lərē/, a heavy growth of facial hair.

prosopospasm /pros′əpōspaz′əm/ [Gk, *prosopon*, face, *spasmos*], a spasm of the facial muscles, such as may occur in tetanus.

prosoposternodidymus /pros′əpōstur′nədid′əməs/ [Gk, *prosopon*, face, *sternon*, chest, *didymos*, twin], a fetus consisting of conjoined twins united laterally from the head through the sternum.

prosopothoracopagus /pros′əpōthôr′əkop′əgəs/ [Gk, *prosopon* + *thorax*, chest, *pagos*, fixed], conjoined symmetric twins who are united laterally in the frontal plane from the thorax through most of the head region.

prospective medicine /-spek′tiv/ [L, *proscipere*, to look forward, *medicina*, art of healing], the early identification of pathological or potentially pathological processes and the prescription of intervention to stop them.

prospective payment system (PPS), a payment mechanism for reimbursing hospitals for inpatient health care services in which a predetermined rate is set for treatment of specific illnesses. The system was originally developed by the U.S. federal government for use in treatment of Medicare recipients. See also **diagnosis-related group.**

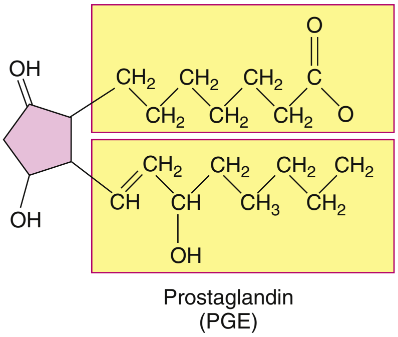
prospective reimbursement, a method of payment to an agency for health care services to be delivered that is based on predictions of what the agency's costs will be for the coming year.

prospective study, an analytic study designed to determine the relationship between a condition and a characteristic shared by some members of a group. The population selected is healthy at the beginning of the study. Some of the members of the group share a particular characteristic, such as cigarette smoking. The researcher follows the population group over a period of time, noting the rate at which a condition, such as lung cancer, occurs in the smokers and in the nonsmokers. A prospective study may involve many variables or only two; it may seek to demonstrate a relationship that is an association or one that is causal. Prospective studies produce a direct measure of risk called the **relative risk.** Compare **retrospective study.**

prost-, -prost, combining form for prostaglandin derivatives.

prostacyclin (PGI_2) /pros′təsī′klin/, a prostaglandin. It is a biologically active product of arachidonic acid metabolism in human vascular walls and a potent inhibitor of platelet aggregation. It inhibits the vasoconstrictor effect of angiotensin and stimulates renin release and has been used to treat pulmonary hypertension.

prostaglandin (PG) /pros′təglan′din/ [Gk, *prostates*, standing before; L, *glans*, acorn], one of several potent unsaturated fatty acids that act in exceedingly low concentrations on local target organs. Prostaglandins are produced in small amounts and have a large array of significant effects. Those given in tablets or in solutions for oral or IV use effect changes in vasomotor tone, capillary permeability, smooth



Prostaglandin E *(Patton and Thibodeau, 2010)* muscle tone, aggregation of platelets, endocrine and exocrine functions, and the autonomic and central nervous systems. Some of the pharmacological uses of the prostaglandins are termination of pregnancy and treatment of asthma and gastric hyperacidity.

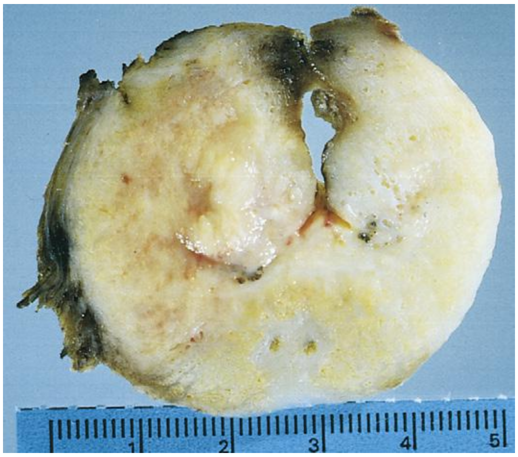
prostaglandin endoperoxide synthase /pros′tah·glan′din en′doperok′sīd sin′thās/, an enzyme of the oxidoreductase class that has both cyclooxygenase and peroxidase activities, which together catalyze part of the synthesis of prostaglandins and thromboxanes from arachidonic acid.

prostaglandin inhibitor, an agent that prevents the production of prostaglandins. An example is a nonsteroidal anti-inflammatory drug.

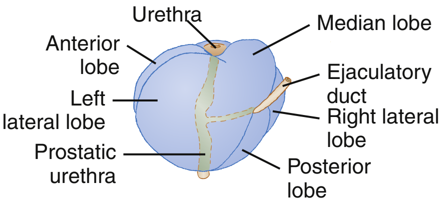
prostanoic acid /pros′tənō′ik/, a 20-carbon aliphatic carboxylic acid that is the basic framework for prostaglandin molecules, which differ according to the location of hydroxyl and keto substitutions at various positions along the molecule.

prostate /pros′tāt/ [Gk, *prostates,* standing before], a gland in men that surrounds the neck of the bladder and the proximal part of the urethra and produces a fluid that becomes part of semen. A firm structure normally about the size of a chestnut, the prostate is located in the pelvic cavity, below the inferior part of the symphysis pubis and ventral to the rectum, through which it can be felt, especially when it is enlarged. A depression on its cranial border accommodates the entry of the two ejaculatory ducts from the seminal vesicles. The prostate is composed of glandular and muscular tissue and contracts during ejaculation of seminal fluid. The prostatic secretion contains alkaline phosphatase, citric acid, prostate-specific antigen, and various proteolytic enzymes. **—prostatic,** *adj.*

prostate cancer, the most common invasive cancer among American males, rarely occurring before the age of 39 and most often affecting men between the ages of 60 and 79. Ninety-five percent are adenocarcinomas; the remaining types are transitional cell carcinoma, squamous cell carcinoma, sarcoma, and ductal carcinoma. The cause is unknown, but it is believed to be hormone-related. The disease may cause no direct symptoms but can be detected in the course of diagnosing bladder or ureteral obstruction, hematuria, or pyuria. The cancer can spread to cause bone pain in the pelvis, ribs, or vertebrae. It is commonly detected by prostate-specific antigen testing and digital rectal examination, with confirmation by core-needle biopsy. Treatment is by surgery, radiation therapy, or hormones, depending on the age of the patient, extent of disease, and other individual factors. Nursing interventions focus on health teaching about the chosen intervention and education regarding community resources such as support groups.

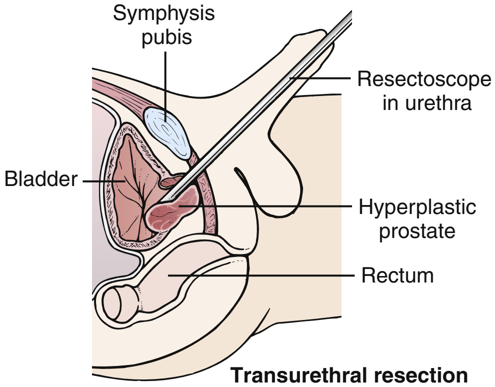


Prostate cancer *(Kumar, Cotran, and Robbins, 2003)*

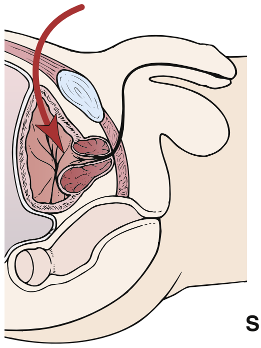


Prostate gland *(Black and Hawks, 2009)*

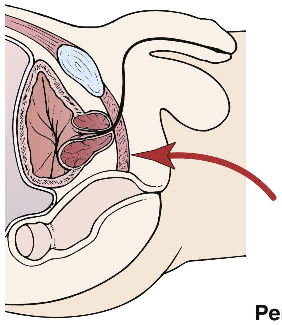
prostatectomy /pros′tətek′təmē/ [Gk, *prostates* + *ektomē,* excision], surgical removal of a part of the prostate gland, such as that performed for benign prostatic hypertrophy, or



Transurethral resection



Suprapubic



Perineal

Prostatectomy *(Lewis et al, 2007)*

the total excision of the gland, as performed for malignancy. Type and crossmatching of blood are done to prepare for possible transfusion. In the transurethral approach, the most common approach, a resectoscope is inserted into the urethra, and through it shavings of prostatic tissue are cut off at the bladder opening. The perineal approach is used for biopsy when early cancer is suspected or for the removal of calculi. In the suprapubic approach a large catheter is positioned into the bladder through the abdomen. Wound drains are placed in both the perineal and the suprapubic approaches. After surgery hematuria is expected for several days. Bleeding may be controlled by increasing the pressure at the balloon end of the urethral catheter. If arterial the bleeding is bright red with clots and increased viscosity and may lead to hemorrhagic shock, requiring transfusion and surgical intervention. The bladder catheter is connected to a closed system of irrigation with drainage. Meticulous aseptic technique is required to prevent infection when tending catheters, tubings, and collection bags, as well as when changing the dressing. Catheter patency is ensured, as well as care to prevent blockage or kinking of the drainage tubes. Accidental removal or dislodging of catheters is prevented. Bladder spasm may occur if a catheter becomes blocked or result from the irritation of the balloon of the catheter in the bladder. Antispasmodic drugs may prevent spasm but are not given in severe cardiac disease or if glaucoma is present. The nurse also assesses the patient's ability to void in adequate amounts when the urethral catheter is removed. Complications of prostatectomy include urethral stricture, especially with the transurethral approach; urinary incontinence; and impotence, especially with the perineal approach.

prostate-specific antigen (PSA), a protein produced by the prostate that may be present at elevated levels in patients with cancer or other disease of the prostate.

prostate-specific antigen (PSA) test, a blood test used to detect prostatic cancer and to monitor the patient's response to therapy. The PSA velocity monitors the change in PSA with time, and the percent-free PSA is assessed as an independent predictor of prostate cancer risk. Currently, PSA is considered the most sensitive tumor marker for this type of cancer.

prostatic /prostat′ik/, pertaining to the prostate.

prostatic calculus [Gk, *prostates,* standing before; L, *calculus,* pebble], a solid calcification formed in the prostate. Typically small and multiple, prostatic calculi are often the product of chronic prostatitis and are usually composed of calcium carbonate and/or calcium phosphate. They are not clinically significant and do not require treatment.

prostatic catheter, a catheter that is approximately 16 inches (41 cm) long and has an angled tip. It is used in male urinary bladder catheterization to bypass an enlarged prostate gland obstructing the urethra. Also called **Coudé catheter.**

prostatic ductule /duk′tyo͞ol/ [Gk, *prostates* + L, *ductulus,* little duct], any of 12 to 20 tiny excretory tubes that convey the alkaline secretion of the prostate and open into the floor of the prostatic part of the urethra. The ductules are joined together by areolar tissue, supported by extensions of the fibrous capsule of the prostate and its muscular stroma, and wrapped in a delicate network of capillaries.

prostatic fascia, a condensation of fascia around the anterior and lateral region of the prostate that contains and surrounds the prostatic plexus of veins and is continuous posteriorly with the rectovesical septum, which separates the posterior surface of the prostate and the base of the bladder from the rectum.

prostatic fluid, the secretion of the prostate gland, which contributes to formation of the semen.

prostatic hypertrophy. See **benign prostatic hyperplasia, prostatomegaly.**

prostatic syncope [Gk, *prostates,* standing before, *syn,* together, *koptein,* to cut], a temporary loss of consciousness caused by restricted cerebral blood flow that may occur during a digital rectal examination of the prostate.

prostatic urethral polyps, presence of numerous polyps in the prostatic urethra, sometimes causing obstruction, seen in male children as a developmental anomaly and in older males in some inflammatory reactions.

prostatic utricle, the part of the urethra in men that forms a cul-de-sac about 6 mm long behind the middle lobe of the prostate. It is composed of fibrous tissue, muscular fibers, and mucous membrane. Numerous small glands open on its inner surface. It is homologous with the uterus in women. Also called **uterus masculinius.** See also **prostate.**

prostatism /pros′tətiz′əm/ [Gk, *prostates,* standing before], an abnormal condition of the prostate, particularly an enlargement of the gland resulting in obstructed urinary flow.

prostatitis /pros′tətī′tis/ [Gk, *prostates* + *itis,* inflammation], an inflammation of the prostate gland, usually the result of infection. The patient complains of burning, urinary frequency, and urgency. **Acute prostatitis** is a sudden, severe inflammation of the prostate, whereas **chronic prostatitis** is a persistent inflammation of the prostate characterized by dull, aching pain in the lower back or perineal area and dysuria; other symptoms may include fever and discharge from the penis. Treatment consists of antibiotics, sitz baths, bed rest, and fluids. Also called **chronic bacterial prostatitis.** Compare **benign prostatic hyperplasia.**

prostatomegaly /pros′tətōmeg′əlē/ [Gk, *prostates* + *megas,* large], hypertrophy, or enlargement, of the prostate.

prosthesis /prosthē′sis/ *pl. prostheses* [Gk, addition], **1.** an artificial replacement for a missing body part, such as an artificial limb or total joint replacement. **2.** a device designed

Myoelectric prosthesis *(Courtesy Otto Bock)* and applied to improve function, such as a hearing aid. See also **maxillofacial prosthesis, Starr-Edwards prosthesis.** *—prosthetic, adj.*

prosthesis care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as care of a removable appliance worn by a patient and the prevention of complications associated with its use. See also **Nursing Interventions Classification.**

prosthetic heart valve /prosthet′ik/ [Gk, *prosthesis,* addition; AS, *hoerte* + L, *valva,* door, leaf], an artificial heart valve.

prosthetic restoration. See **restoration.**

prosthetics /prosthet′iks/ [Gk, *prosthesis,* addition], the design, construction, and attachment of artificial limbs or other systems to assume the function of missing body parts. See also **orthotics.**

prosthetist /pros′thətist/, a person who fabricates and fits artificial limbs and similar devices prescribed by a physician. A certified prosthetist is one who has successfully completed the examination of the American Orthotic and Prosthetic Association.

prosthion (PR) /pros′thē·on/ [Gk, *prosthios,* foremost], the point of the maxillary alveolar process that projects most anteriorly in the midline of the maxilla, used for measuring upper facial height and determining the gnathic index.

prosthodontics /pros′thədon′tiks/ [Gk, *prosthesis* + *odous,* tooth], a branch of dentistry devoted to the construction of artificial appliances that replace missing teeth or restore parts of the face.

Prostigmin, a trademark for a cholinergic **(neostigmine bromide).**

Prostin VR Pediatric, a trademark for a proprietary form of prostaglandin **(alprostadil).**

prostration /prostrā′shən/ [L, *prosternere,* to throw down], **1.** a condition of extreme exhaustion and inability to exert oneself further, as in heat prostration or nervous prostration. **2.** lying face down in front of something or someone to show reverence. *—prostrate, adj.*

prot-. See **proto-.**

protactinium (Pa) /-taktin′ē·əm/ [Gk, *protos,* first, *aktis,* ray], a radioactive element. Its atomic number is 91, and its atomic mass is 231.04. Its decay products are actinium and an alpha particle. See also **actinium.**

protamine sulfate /prō′təmēn/, a heparin antagonist derived from fish sperm.

■ INDICATION: It is prescribed to diminish or reverse the anticoagulant effect of heparin, particularly in cases of heparin overdosage.

■ CONTRAINDICATIONS: Pregnancy, allergy to fish, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, dyspnea, and bradycardia. Dosage greater than needed to neutralize heparin causes the toxic and anticoagulant effects of protamine.

protamine zinc insulin (PZI) suspension, a long-acting insulin that is absorbed slowly at a steady rate and is used to maintain baseline levels of insulin. Combination therapy with regular insulin may be necessary for adequate control.

protanopia /-tənō′pē·ə/, a form of color blindness in which the person is unable to distinguish shades of red. Also called **red blindness.**

protaxic mode of experience /-tak′sik/, (in psychology), a type of primitive experience characterized by sensations, feelings, and fragmented images of short duration that are not logically connected.

protease /prō′tē·ās/, an enzyme that is a catalyst in the breakdown of peptide bonds that join the amino acids in a protein. See also **proteolysis.**

protease inhibitor, a substance that blocks activity of endopeptidase (protease), such as in a virus. See also **HIV protease inhibitor.**

protectin /protek′tin/, a membrane-bound protein, CD59, that protects normal bystander cells from lysis after complement activation in nearby bacteria or immune complexes.

protective /-tek′tiv/ [L, *protegere,* to cover], guarding another person from danger or injury and providing a safe environment.

protective apron. See **lead apron.**

protective isolation [L, *protegere,* to cover in front; It, *isolare,* detached], **1.** the practice of confining a patient with a virulent infectious disease in a separate area so that contact with other people can be minimized. **2.** the practice of placing a highly susceptible person, such as an immunodeficient patient, in a separate area where the risk of contact with pathogenic microorganisms can be controlled.

protein /prō′tē·in, prō′tēn/ [Gk, *proteios,* first rank], any of a large group of naturally occurring complex organic nitrogenous compounds. Each is composed of large combinations of amino acids (usually 50 or more) containing the elements carbon, hydrogen, nitrogen, oxygen, and occasionally sulfur, phosphorus, iron, iodine, or other essential constituents of living cells. Twenty-two amino acids have been identified as vital for proper growth, development, and maintenance of health. The body can synthesize 13 of these, the nonessential amino acids, whereas the remaining 9 must be obtained from dietary sources and are termed *essential*. Protein is the major source of building material for muscles, blood, skin, hair, nails, and the internal organs. It is necessary for the formation of many hormones, enzymes, and antibodies and may act as a source of energy. Rich dietary sources are meat, poultry, fish, eggs, milk, and cheese, which are classified as complete proteins because they contain the nine essential amino acids. Nuts and legumes, including navy beans, chickpeas, soybeans, and split peas, are also good sources but are incomplete proteins because they do not contain all the essential amino acids in adequate amounts. Protein deficiency causes abnormal growth and tissue development in children, leading to kwashiorkor, whereas in adults it results in lack of vigor and stamina, weakness, mental depression, poor resistance to infection, impaired healing of wounds, and slow recovery from disease. Excessive intake of protein may in some conditions result in fluid imbalance.

protein antibiotic. See **bacteriocin.**

proteinase /prō′tē·inās/ [Gk, *proteios,* first rank, *ase,* enzyme suffix], a proteolytic enzyme that splits protein molecules at central linkages. Also called **tryptase.**

protein C, plasma coagulation control protein that, when activated, inactivates coagulation factors Va and VIIIa.

protein calorie malnutrition. See **protein-energy malnutrition.**

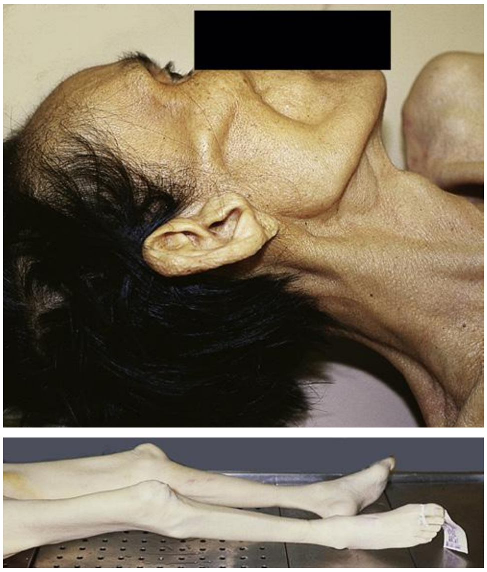
protein catabolic rate (PCR), a calculation derived by multiplying 6.25 times the amount of nitrogen in grams excreted in the urine over a given time period, which represents the amount of protein catabolized by the body in excess of protein synthesis. In a healthy steady state of nitrogen balance, it approximates the amount of protein in the diet.

protein C–protein S test, a blood test performed to determine the activity of proteins C and S. Deficient activity of one or both of these proteins is associated with liver disease, severe malnutrition, hypercoagulability, autoimmune diseases, and intervascular thrombosis.

protein/creatinine ratio, the ratio of protein to creatinine in the urine, calculated as a measure of proteinuria.

proteinemia /prō′tē·inē′mē·ə/ [Gk, *proteios,* first rank, *haima,* blood], an excessive level of protein in the blood. Also called **hyperproteinemia.**

protein-energy malnutrition (PEM), a wasting condition resulting from a diet inadequate in either protein or energy (calories) or both. These inadequacies are major problems for children in developing countries. Also called **energy-protein malnutrition, protein-calorie malnutrition.** See also **kwashiorkor, marasmic kwashiorkor, marasmus.**



[redacted]

Protein-energy malnutrition *(Finkbeiner, Ursell, and Davis, 2009)*

protein hydrolysate injection, a fluid and nutrient replenisher.

■ INDICATIONS: It is prescribed to correct a negative nitrogen balance and to provide parenteral nutrition in other clinical situations.

■ CONTRAINDICATIONS: Renal failure, anuria, severe liver disease, hepatic coma, or known hypersensitivity to one or more of the amino acids prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, abdominal pain, convulsions, phlebitis, thrombosis, and edema.

protein kinase (PKA), a protein that catalyzes the transfer of a phosphate group from adenosine triphosphate to produce a phosphoprotein.

protein metabolism, the processes whereby protein foods are used by the body to make tissue proteins, together with the processes of breakdown of tissue proteins in the production of energy. Food proteins are first broken down into amino acids, then absorbed into the bloodstream, and finally used in body cells to form new proteins. Amino acids in excess of the body's needs may be converted by liver enzymes into keto acids and urea. The keto acids may be used as sources of energy via the citric acid cycle, or they may be converted into glucose or fat for storage. Urea is excreted in urine and sweat. Growth hormone, insulin, and androgens stimulate protein formation, and adrenal cortical hormones tend to cause breakdown of body proteins. Diseases affecting protein metabolism include homocystinuria, liver disease, maple sugar urine disease, and phenylketonuria.

protein sensitization [Gk, *proteios,* first rank; L, *sentire,* to feel], a reaction that follows parenteral introduction of a foreign protein into the body. Symptoms of varying severity, including serum sickness, occur when the same foreign protein is reintroduced into the body at a later date.

protein truncation test, a method for detection of one or more translation termination mutations in a gene that cause a truncated, usually inactive, protein to be synthesized. The appropriate genomic DNA or mRNA is isolated, amplified by polymerase chain reaction, and used as a template for in vitro transcription and translation. The size of the resulting protein is compared with that of a wild type protein by means of SDS-polyacrylamide gel electrophoresis.

proteinuria /prō′tēnyŏŏr′ē·ə/ [Gk, *proteios* + *ouron,* urine], the presence in the urine of abnormally large quantities of protein, usually albumin. Healthy adults excrete less than 250 mg of protein per day. Persistent proteinuria is usually a sign of renal disease or renal complications of another disease, such as hypertension or heart failure. However, proteinuria can result from heavy exercise or fever. Also called **albuminuria.**

proteo-, prefix meaning "protein": *proteocrasis, proteolysis, proteopepsis.*

proteolipid /prō′tē·ōlip′id/ [Gk, *proteios* + *lipos,* fat], a type of lipoprotein in which lipid material forms more than half of the molecule. It is insoluble in water and occurs primarily in the brain.

proteolysis /prō′tē·ol′isis/ [Gk, *proteios* + *lysis,* loosening], a process in which water added to the peptide bonds of proteins breaks down the protein molecule into simpler substances. Numerous enzymes may catalyze this process. The action of mineral acids and heat also may induce proteolysis. **—proteolytic,** *adj.*

Proteus /prō′tē·əs/ [Gk, *Proteus,* mythic god who changed shapes], a genus of motile, gram-negative bacilli often associated with nosocomial infections, normally found in feces, water, and soil. *Proteus* may cause urinary tract infections, pyelonephritis, wound infections, diarrhea, bacteremia, and endotoxic shock. Some species are sensitive to penicillin; most respond to the aminoglycoside antibiotics and cephalosporins.

Proteus mirabilis, a species of anaerobic, motile, rod-shaped bacteria found in putrid meat, abscesses, and fecal material. It is a leading cause of urinary tract infections.

Proteus morganii, a species of bacteria associated with infectious diarrhea in infants.

Proteus syndrome /prō′tē·us/, a rare congenital disorder with highly variable manifestations, including partial gigantism of the hands and feet with hypertrophy of the palms and soles, nevi, hemihypertrophy, subcutaneous tumors, macrocephaly and other skull abnormalities, and abdominal or pelvic lipomatosis. The cause is unknown, although a genetic origin, possibly of autosomal-dominant transmission, has been conjectured. Although symptoms can be treated, there is no known cure.

Proteus vulgaris, a species of bacteria that is a frequent cause of urinary tract infections. The bacteria are found in feces, water, and soil.

prothrombin, a plasma protein that is converted to the active form, factor IIa, or thrombin, when cleaved by factor Xa bound to factor Va. Thrombin then cleaves fibrinogen to fibrin, which forms the fibrin clot. Also called **factor II.**

prothrombin complex concentrate (PCC). See **factor IX complex.**

prothrombinemia /-ē′mē·ə/ [L, *pro,* before; Gk, *thrombos,* lump, *haima,* blood], the presence of prothrombin in the blood.

prothrombin time (PT), a one-stage test for detecting certain plasma coagulation defects caused by a deficiency of factors V, VII, or X. Thromboplastin and calcium are added to a sample of the patient's plasma and simultaneously to a sample from a normal control. The amount of time required for clot formation in both samples is observed. Thrombin is formed from prothrombin in the presence of adequate calcium, thromboplastin, and the essential tissue coagulation factors. A prolonged PT therefore indicates deficiency in one of the factors, as in liver disease, vitamin K deficiency, or anticoagulation therapy with the drug warfarin sodium. Normal findings of prothrombin time are 11 to 12.5 sec. Compare **International Normalized Ratio** and **partial thromboplastin time.** See also **blood clotting.**

protist, a member of the kingdom Protista, which includes eukaryotic, mostly unicellular organisms with animal-like (protozoa), plantlike (algae), or funguslike (slime molds) modes of nutrition.

protium (^{1}H) /prō′tēəm/, ordinary, or light, hydrogen, as opposed to **deuterium** (^{2}H) or **tritium** (^{3}H).

proto-, prot-, prefix meaning "first": *protoblast, protopathic, prototoxin.*

protocol /prō′təkôl/ [Gk, *protos,* first, *kolla,* glued page], a written plan specifying the procedures to be followed in giving a particular examination, conducting research, or providing care for a particular condition. See also **standing orders.**

proton /prō′ton/ [Gk, *protos,* first], a positively charged particle that is a fundamental component of the nucleus of all atoms. The number of protons in the nucleus of an atom equals the atomic number of the element. Compare **electron, neutron.** See also **atomic mass.**

proton density, a measure of proton concentration, or the number of atomic nuclei per given volume. It is one of the major determinants of magnetic resonance signal strength in hydrogen imaging.

proton pump inhibitor, an agent that inhibits gastric acid secretion by blocking the action of hydrogen ions, potassium ions, and adenosine triphosphatase at the secretory surface of gastric parietal cells. Also called **gastric acid pump inhibitor.**

Protopam Chloride, a trademark for a cholinesterase reactivator **(pralidoxime chloride).**

protopathic sensibility /prō′təpath′ik/, pertaining to the somatic sensations of fast localized pain; slow, poorly localized pain; and temperature.

protoplasm. See **cytoplasm.**

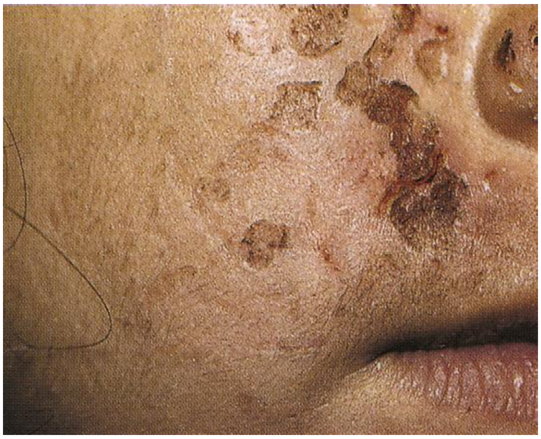
protoplasmic /-plaz′mik/ [Gk, *protos,* first, *plasma,* something formed], pertaining to or composed of protoplasm, the substance of which animal and vegetable cells are formed.

protoplast /prō′təplast/ [Gk, *protos* + *plassein,* to mold], **1.** (in biology) the protoplasm of a cell without its containing membrane. **2.** a first entity or an original. *—protoplastic, adj.*

protoporphyria /prō′tōpôrfir′ē·ə/ [Gk, *protos* + *porphyros,* purple, *haima,* blood], increased levels of protoporphyrin in the blood and feces.

protoporphyrin /prō′tōpôr′firin/ [Gk, *protos* + *porphyros*], a kind of porphyrin that combines with iron and protein to form various important organic molecules, including catalase, hemoglobin, and myoglobin. See also **heme.**

protostoma. See **blastopore.**



Erythropoietic protoporphyria
(Weston, Lane, and Morelli, 2007)

prototaxic mode /prōtətak′sik/ [Gk, *protos* + *taxis,* arrangement, *modus,* measure], a stage in infancy, according to H.S. Sullivan's theory, characterized by a lack of differentiation between the self and the environment.

prototype /prō′tətīp/ [Gk, *protos,* first, *typos,* mark], the primary or original form of an object or organism.

protozoal infection /-zō′əl/, any disease caused by single-celled organisms of the subkingdom Protozoa. Some kinds of protozoal infections are **amebic dysentery, malaria, schistosomiasis, trichomoniasis,** and **trypanosomiasis.**

protozoan /-zō′ən/ [Gk, *protos,* first, *zoon,* animal], pertaining to or caused by protozoa.

protozoon /prō′təzō′ən/ *pl.* **protozoa** [Gk, *protos* + *zoon,* animal], a unicellular protist that ingests food. Protozoa include free-living forms, such as amebas and paramecia, as well as parasites. Approximately 30 protozoa are pathogenic to humans, including ***Plasmodium,*** which causes malaria, and ***Trypanosoma,*** which causes sleeping sickness. See also **mastigophora.** *—protozoal,* **protozoan,** *adj.*

protracted dose /prōtrak′tid/ [L, *pro,* before, *trahere,* to draw, *dosis,* something given], a low amount of therapeutic radiation delivered continuously over a relatively long period.

protriptyline hydrochloride /-trip′tilēn/, a tricyclic antidepressant.

■ INDICATIONS: It is prescribed in the treatment of endogenous depression marked by withdrawal and anergy.

■ CONTRAINDICATIONS: Concomitant administration of monoamine oxidase inhibitors, recent myocardial infarction, or known hypersensitivity to any tricyclic medication prohibits its use. It is used with caution when anticholinergics are contraindicated, in seizure disorders, and in cardiovascular disease.

■ ADVERSE EFFECTS: Among the more serious adverse effects are sedation and anticholinergic side effects. A variety of GI, cardiovascular, and neurological reactions may occur. It interacts with many other drugs.

Protropin, a trademark for a synthetic human growth hormone **(somatrem).**

protrusio bulbi. See **exophthalmia.**

protrusion /-tro͞o′zhən/ [L, *protrudere,* to push forward], a state or condition of being forward or projecting.

protrusive incisal guide angle /-tro͞o′siv/, the inclination of the incisal guide of a dental articulator in the sagittal plane.

protrypsin. See **trypsinogen.**

protuberance /-t(y)o͞o′bərəns/ [L, *pro* + *tuberare,* to swell], an anatomical landmark that appears as a blunt projection, eminence, or swelling, such as the chin, buttock, or bulge of the frontal bone above the eyebrow.

proud flesh [AS, *prud* + *flaesc*], excessive granulation tissue. See also **cicatrix, keloid, scar.**

Proventil, a trademark for a bronchodilator **(albuterol).**

Provera, a trademark for a progestin **(medroxyPROGESTERone acetate).**

provider, a hospital, clinic, health care professional, or group of health care professionals who provide a service to patients.

Provincial/Territorial Nurses Association (PTNA), an association of Canadian nurses organized at the provincial or territorial level. The Canadian Nurses' Association is a federation of the 11 PTNAs.

provirus /-vī′rəs/, a stage of viral replication in which the viral genetic information has been integrated into the genome of the host cell. It may be activated spontaneously or by a specific stimulus to direct the cell to produce new virions to progress to a complete virus.

provitamin /prōvī′təmin/, a precursor of a vitamin; a substance found in certain foods that in the body may be converted into a vitamin. Also called **previtamin.**

provocative diagnosis /-vok′ətiv/ [L, *provocare,* to call forth; Gk, *dia,* through, *gnosis,* knowledge], a diagnosis in which the identity and cause of an illness are discovered by inducing an episode of the condition. For example, in immunology an allergen causing an allergic response is shown to be a causative factor in the patient's allergic condition.

prox, abbreviation for **proximal.**

proxemics /proksē′miks/ [L, *proximus,* nearest], the study of spatial distances between people and their effect on interpersonal behavior, especially in relation to population density, placement of people within an area, territoriality, personal space, and the opportunity for privacy.

proximal (prox) /prok′siməl/ [L, *proximus*], nearer to a point of reference or attachment, usually the trunk of the body, than other parts of the body. Proximal interphalangeal joints are those closest to the hand or the surface of a tooth in relation to the abutting tooth nearer or farther from the anteroposterior median plane. Compare **distal.**

proximal cavity, a cavity that occurs on the mesial or distal surface of a tooth.

proximal contact [L, *proximus,* nearest, *contingere,* to touch], contact between the distal surface of one tooth and the mesial surface of an adjacent tooth.

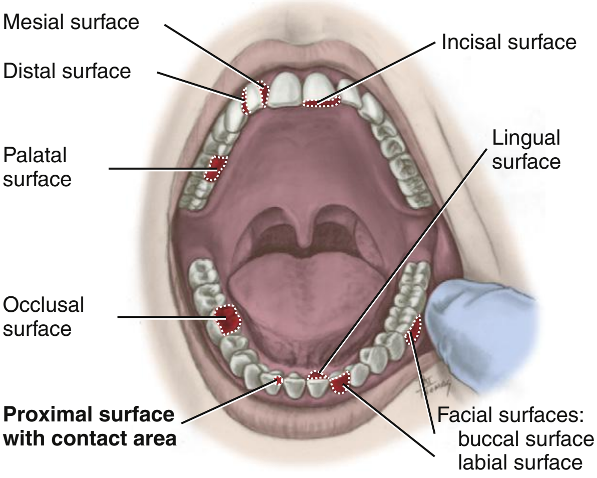
proximal contour, the shape or form of the mesial or the distal surface of a tooth.

proximal dental caries, decay that may occur in the mesial or distal surface of a tooth.

proximal part of prostatic urethra, the first portion of the prostatic urethra, up to and including the seminal colliculus.

proximal radioulnar articulation, the pivot joint between the circumference of the head of the radius and the ring formed by the radial notch of the ulna and the annular ligament. The joint allows the rotary movements of the head of the radius in pronation and supination. Also called **superior radioulnar joint.** Compare **distal radioulnar articulation.**

proximal renal tubular acidosis (RTA), an abnormal condition characterized by excessive acid accumulation and bicarbonate excretion. It is caused by the defective reabsorption of bicarbonate in the proximal tubules of the kidney and the resulting flow of excessive bicarbonate into the distal tubules, which normally secrete hydrogen ions. This disruption impedes the formation of titratable acids and ammonium for excretion and ultimately leads to metabolic acidosis. Treatment is the same as for renal tubular acidosis. In **primary proximal RTA** the defective reabsorption of bicarbonate is the sole causative factor. In **secondary proximal RTA** the resorptive defect is one of several causative factors and may result from tubular cell damage produced by various disorders, such as Fanconi's syndrome. Compare **distal renal tubular acidosis.**



Proximal surface of the tooth
(Bath-Balogh and Fehrenbach, 2011)

proximate /prok′simit/ [L, *proximus,* nearest], the nearest to a point of origin or attachment.

proximate cause [L, *proximus,* nearest], a legal concept of cause-and-effect relationships in determining, for example, whether an injury would have resulted from a particular cause.

proximity principle /proksim′itē/ [L, *proximus* + *principium,* origin], a rule that when two or more objects are close to each other, they may be seen as a perceptual unit.

proximo-, prefix meaning "near or opposite of distal, central, or a point of attachment": *proximal, proximity, proximolabial*.

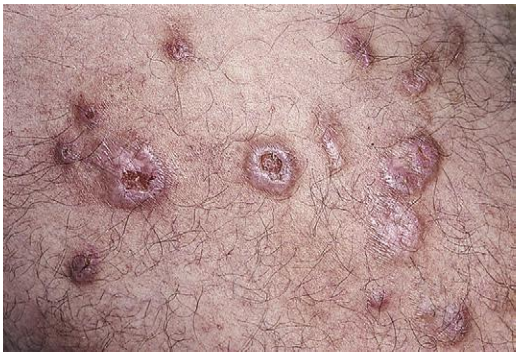
proxymetacaine. See **proparacaine hydrochloride.**

Prozac, a trademark for an oral antidepressant **(fluoxetine hydrochloride).**

PrP, abbreviation for *prion protein,* a viruslike infectious agent associated with Creutzfeldt-Jakob disease.

prune-belly syndrome, a syndrome, occurring almost exclusively in males, in which the lower part of the rectus abdominis muscle and the lower and medial parts of the oblique muscles are absent, the bladder and ureters are usually greatly dilated, the kidneys are small and dysplastic with hydronephrosis, and the testes are undescended. The abdomen is protruding and thin-walled with wrinkled skin, giving the syndrome its name.

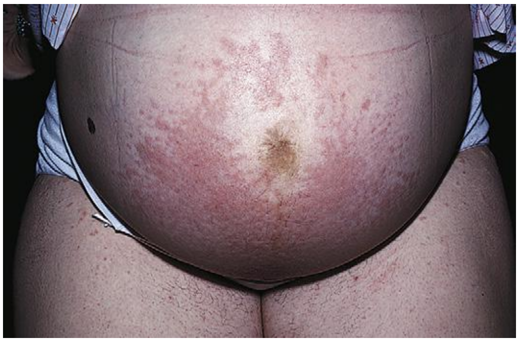
prurigo /pro͝orī′gō/ [L, an itch], any of a group of chronic inflammatory conditions of the skin characterized by severe itching and multiple dome-shaped small papules capped by tiny vesicles. As a result of repeated scratching, crusting and lichenification may occur. Some causes of prurigo are allergies, drugs, endocrine abnormalities, malignancies, and parasites. Specific treatment depends on the cause. Symptomatic therapy is the same as for pruritus. A mild form of the disease is called *prurigo mitis,* a more severe form, *prurigo agria* or *prurigo ferox*. See also **pruritus.** —*pruriginous, adj.*



Nodular prurigo *(Callen et al, 2000)*

pruritic. See **pruritus.**

pruritic urticarial papules and plaques of pregnancy (PUPPP) /pro͝orit′ik/, small, semisolid, intensely itching blisters that may appear on the abdomen of a pregnant woman and spread peripherally. They begin in the third trimester and resolve spontaneously after delivery.



Pruritic urticarial papules and plaques of pregnancy *(Callen et al, 2000)*

pruritus /pro͝orī′təs/ [L, *prurire,* to itch], the symptom of itching, an uncomfortable sensation leading to the urge to scratch. Scratching may result in secondary infection. Some causes of pruritus are allergy, infection, jaundice, chronic renal disease, lymphoma, and skin irritation. Treatment is best directed at the cause. Symptomatic relief may be obtained with antihistamines, starch baths, topical corticosteroids, cool water, or alcohol applications. —**pruritic,** *adj.*

pruritus ani, a common chronic condition of itching of the skin around the anus. Some causes are candidal infection, contact dermatitis, external hemorrhoids, pinworms, psoriasis, and psychogenic illness. Treatment is best directed at the specific cause. However, symptomatic relief may be obtained with careful cleansing, soothing creams or lotions, topical corticosteroids, antihistamines, and tranquilizers.

pruritus management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preventing and treating itching. See also **Nursing Interventions Classification.**

pruritus vulvae, itching of the external genitalia of a female. The condition may become chronic and result in lichenification, atrophy, and occasionally malignancy. Some causes of pruritus vulvae are contact dermatitis, lichen sclerosus et atrophicus, psychogenic pruritus, trichomoniasis, and vaginal candidiasis. Treatment of the condition depends on its cause.

Prussian blue /prush′ən/ [Prussia, Germany; ME, *blew*], a chemical stain used on microscopic preparations. It demonstrates the presence of copper by developing a bright blue color.

ps, abbreviation for **picosecond.**

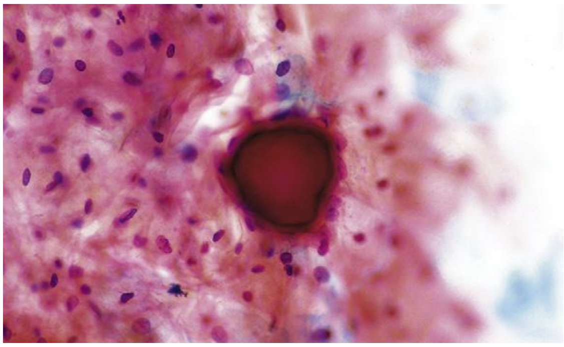
PSA, **1.** abbreviation for **pressure-sensitive adhesive.** **2.** abbreviation for **prostate-specific antigen.**

P sac, abbreviation for *pericardial cavity.*

psammo-, prefix meaning "sand or sandlike material": *psammocarcinoma, psammoma, psammosarcoma.*

psammoma /samō′mə/ *pl.* **psammomas, psammomata** [Gk, *psammos,* sand, *oma,* tumor], a neoplasm containing small calcified granules (psammoma bodies) that occurs in the meninges, choroid plexus, pineal body, and ovaries. Also called **sand tumor.**

psammoma body, a round layered mass of calcareous material occurring in benign and malignant epithelial and connective tissue neoplasms and in some chronically inflamed tissue.



Psammoma body *(McKee, 1997)*

psammomas, psammomata. See **psammoma.**

-pselaphesia, -pselaphesis, suffix meaning "(condition of the) tactile sense": *apselaphesia, hyperpselaphesia, hypopselaphesia.*

pseud-. See **pseudo-.**

pseudarthritis /so͞o′därthrī′tis/ [Gk, *pseudes,* false, *arthron,* joint, *itis,* inflammation], musculoskeletal pain that does not involve the joints.

pseudesthesia /so͞o′desthē′zhə/ [Gk, *pseudes,* false, *aisthesis,* feeling], a sensation experienced without an external stimulus or a sensation that does not correspond to the causative stimulus, such as phantom limb pain occurring after an amputation.

pseudo-, pseud-, prefix meaning "false": *pseudoangina, pseudocyst, pseudorubella.*

pseudoacanthosis nigricans /-ak′ənthō′sis/, a condition of pigmented velvety thickening of the flexural skin, often with skin tags. It occurs most commonly in obese persons with dark complexions or in persons with endocrine disorders and is secondary to maceration of the skin from sweating. Compare **acanthosis nigricans.**

pseudoactinomycosis. See **paraactinomycosis.**

pseudoagraphia /so͞o′dō·ə·graf′ē·ə/ [Gk, *pseudes,* false + *a, graphein,* not to write], a type of dysgraphia in which the patient can copy writing but cannot write to express ideas. Also called **echographia.**

pseudoainhum /so͞o′do·īn′yoom/, ringlike constrictions around the digits, limbs, or trunk, occurring both congenitally and in association with a wide variety of hereditary and nonhereditary disorders. The most severe cases of congenital pseudoainhum result in autoamputation in utero.

pseudoallele /-əlēl′/ [Gk, *pseudes* + *allelon,* of one another], one of two or more closely linked genes on a chromosome that appear to function as a single allelic pair but occupy distinct, nearly corresponding loci on homologous chromosomes. Such gene pairs produce a mutant effect in the diploid state when located on homologous chromosomes but are capable of being separated by crossing over during meiosis to produce a wild-type effect when recombined on either of the homologues. *—pseudoallelic, adj., pseudoallelism, n.*

pseudoaneurysm /-an′yəriz′əm/, **1.** a dilation of an artery caused by damage to one or more layers of the artery as a result of arterial trauma or rupture of a true aneurysm. **2.** a tortuosity of a blood vessel or cavity resulting from a herniated infarction. Also called **pulsatile hematoma.**

pseudoankylosis /-ang′kilō′sis/ [Gk, *pseudes,* false, *ankylosis,* joint stiffness], fixation of a joint caused by inflexibility of body structures outside the joint.

pseudoanodontia /-an′ōdon′shə/, an absence of teeth caused by failure of the teeth to erupt.

pseudoanorexia /-an′ərek′sē·ə/ [Gk, *pseudes* + *a* + *orexis,* without appetite], a condition in which an individual eats secretly while claiming a lack of appetite and inability to eat. Also called **false anorexia.** Compare **anorexia.**

pseudoarthrosis. See **false joint.**

pseudoataxia /-ətak′sē·ə/ [Gk, *pseudes,* false, *ataxia,* without order], a loss of control over voluntary movements that does not involve an organic lesion.

pseudobulbar paralysis /-bul′bər/ [Gk, *pseudes,* false; L, *bulbus,* swollen root, *paralyein,* to be palsied], a condition resembling progressive bulbar paralysis, with dysarthria and dysphagia, but in which weakness of the bulbar muscles is of the upper motor neuron type. It may result from multiple bilateral infarcts of the cerebral cortex.

pseudocephalocele /-sef′əlōsēl′/, a noncongenital cerebral hernia resulting from a skull injury or disease.

pseudochancre /-shang′kər/, an indurated genital sore resembling or simulating a chancre.

pseudocholinesterase. See **cholinesterase.**

pseudochondroplasia /-əkon′drōplā′zhə/, a hereditary condition resembling achondroplasia but developing after birth.

pseudochylous ascites /-kī′ləs/ [Gk, *pseudes* + *chylos,* juice, *askos,* bag], the abnormal accumulation in the peritoneal cavity of a milky fluid that resembles chyle. The turbidity of the fluid is caused by cellular debris in the fluid. Pseudochylous ascites is indicative of an abdominal tumor or infection. Compare **chylous ascites.** See also **ascites.**

pseudoclaudication /-klô′dikā′shən/, painful cramps that are not caused by peripheral artery disease but rather by spinal, neurological, or orthopedic disorders, such as spinal stenosis, diabetic neuropathy, or arthritis.

pseudocoxalgia. See **Perthes disease.**

pseudocyesis /-sī·ē′sis/ [Gk, *pseudes* + *kyesis,* pregnancy], a condition in which a woman believes that she is pregnant when she is not. Certain signs and symptoms suggest pregnancy, such as the absence of the menses, although conception has not occurred and therefore there is no embryonic development. The condition may be psychogenic in origin or caused by a tumor or endocrine dysfunction. Also called **false pregnancy, pseudopregnancy, spurious pregnancy.**

pseudocyst /so͞o′dəsist/ [Gk, *pseudes* + *kystis,* bag], a space or cavity containing gas or liquid but without a lining membrane. Pseudocysts commonly occur after pancreatitis when digestive juices break through the normal ducts of the pancreas and collect in spaces lined by fibroblasts and surfaces of adjacent organs. Symptoms are caused by displacement of abdominal structures or fluid or by atelectasis at the base of the left lung. Ultrasound and computed tomography are useful in diagnosis; surgical drainage is the best therapy. Also called **adventitious cyst, false cyst.** See also **pancreatitis.**

pseudodementia /-dimen′shə/, a syndrome that mimics dementia. It needs to be differentiated from depression.

pseudoephedrine hydrochloride /-ef′ədrēn/, an adrenergic agonist that acts as a vasoconstrictor and decongestant. Also called *pseudoephedrine sulfate.*

■ INDICATION: It is prescribed for the relief of nasal congestion.

■ CONTRAINDICATIONS: Known hypersensitivity to sympathomimetic drugs prohibits its use. Interaction with monoamine oxidase inhibitors may cause hypertensive crisis. It is prescribed with caution in patients who have hypertension, glaucoma, heart disease, diabetes, or urinary retention.

■ ADVERSE EFFECTS: Among the more serious adverse effects are central nervous system stimulation, headache, tachycardia, and increased blood pressure.

pseudoepitheliomatous keratotic and micaceous balanitis, rare, white, plaquelike, hyperkeratotic lesion of the glans penis that may be premalignant and progress to a verrucous type of carcinoma.

pseudofracture /-frak′chər/ [Gk, *pseudes,* false; L, *fractura*], radiological evidence of a thickened periosteum and new bone formation over what looks like an incomplete fracture.

pseudogene /so͞o′dōjēn′/ [Gk, *pseudes* + *genein,* to produce], a DNA sequence that resembles a gene and may be derived from one but lacks a genetic function.

pseudoglandular period, the period or phase of prenatal lung development lasting from about the 6th to 16th week, and followed by the canalicular period. Repeated branching of bronchi and bronchioles takes place to form primordial conductive airways, and the lungs resemble exocrine glands. Fetuses delivered during this phase are not viable because the lungs are not capable of respiration until the 24th to 26th week. Also called **pseudoglandular phase.**

pseudoglottis. See **neoglottis.**

pseudogout. See **chondrocalcinosis.**

pseudo-Graefe's sign, slow descent of the upper lid on looking down, and quick ascent on looking up. It is seen in conditions other than Graves' disease.

pseudogynecomastia /-gī′nəcōmas′tē·ə/, enlarged breasts in a male caused by fat accumulation.

pseudohallucination. See **phantom vision.**

pseudohermaphrodism. See **pseudohermaphroditism.**

pseudohermaphrodite /-hərmaf′redīt/ [Gk, *pseudes,* false, *Hermaphroditos,* son of Hermes and Aphrodite], a person who has either male or female gonads but external genitalia of the opposite sex, or both.

pseudohermaphroditism /-hərmaf′rəditiz′əm/ [Gk, *pseudes* + *Hermaphroditos,* son of Hermes and Aphrodite], a condition in which a person exhibits the somatic characteristics of both sexes though possessing the physical characteristics of either males (testes) or females (ovaries). Also spelled **pseudohermaphrodism.** See also **ambiguous genitalia, feminization,** def. 2, **hermaphroditism.** —*pseudohermaphroditic, adj.*

pseudo-Hurler polydystrophy, a disorder similar to but milder than **I cell disease** and thought to result from the same enzyme deficiency but to a lesser extent.

pseudohyperkalemia /-hī′pərkəlē′mē·ə/, a laboratory artifact indicating an elevated blood potassium level caused by potassium released in vitro from cells in the blood sample.

pseudohyperparathyroidism /-hī′pərper′əthī′roidiz′əm/, signs of hypercalcemia in a cancer patent in the absence of primary hyperparathyroidism or skeletal metastases.

pseudohypertension /-hī′pərten′shən/, a blood pressure reading that erroneously appears elevated as a result of arterial compliance. The condition occurs most often in elderly patients.

pseudohypertrophic muscular dystrophy. See **Duchenne's muscular dystrophy.**

pseudohypertrophy /-hīpur′trəfē/, abnormal enlargement of an organ or body structure caused by an overgrowth of fatty and fibrous tissues.

pseudohypoaldosteronism /-hī′pōaldos′tərōn′izəm/, **1.** a hereditary disorder of infancy characterized by severe salt and water depletion and other signs of aldosterone deficiency, even though normal or elevated amounts of aldosterone are secreted. Causes include aldosterone receptor defects and renal dysfunction. Some affected infants outgrow the need for dietary salt supplements in early childhood. **2.** the endocrine abnormality associated with sodium-losing nephropathy, usually resulting from chronic pyelonephritis, seen primarily in adults. See also **Gordon's syndrome.**

pseudohyponatremia /-hī′pōnātrē′mē·ə/, a decreased sodium concentration that does not correspond to a true hypotonic disorder. It may result instead from volume displacement by massive hyperlipidemia or hyperproteinemia.

pseudohypoparathyroidism /-hī′pōper′əthī′roidiz′əm/, a condition of end-organ resistance characterized by hypocalcemia, growth failure, and skeletal abnormalities such as short fingers. Also called **Albright's hereditary osteodystrophy.**

pseudoileus /so͞o′dō·il′ē·əs/, **1.** a condition resembling an intestinal obstruction caused by paralysis of a part of the bowel wall. **2.** an adynamic bowel obstruction.

pseudoisochromatic /so͞o′dō·ī′sōkrōmat′ik/, pertaining to visual test materials in which dots that differ in color appear to be a similar color to a person with color blindness. See also **Ishihara color test.**

pseudojaundice /-jôn′dis/ [Gk, *pseudes* + Fr, *jaune,* yellow], a yellow discoloration of the skin that is not caused by hyperbilirubinemia. The excessive ingestion of carotene results in a form of pseudojaundice.

pseudolymphoma /-limfō′mə/, a benign disorder of lymphoid cells or histiocytes that produces clinical features of a malignant lymphoma.

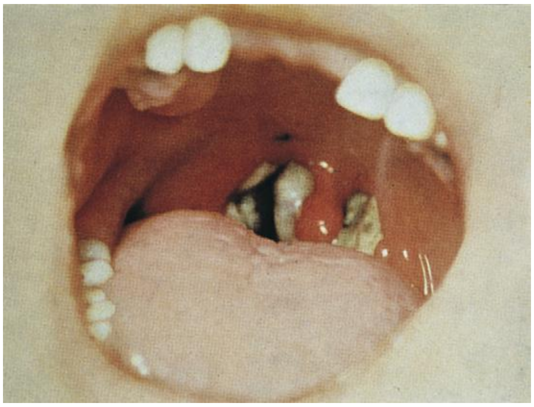
pseudolysogeny /-līsoj′ənē/, a condition in which a bacteriophage is carried in a culture of a bacterial strain by infecting susceptible variants of the strain.

pseudomamma /-mam′ə/, a glandular structure resembling a nipple or mammary gland, sometimes found in a dermoid ovarian cyst.

pseudomania /-mā′nē·ə/, **1.** a condition in which a person claims to have committed crimes of which he or she is really innocent. **2.** a deliberately pretended condition of mental illness.

pseudomegacolon /-meg′əkō′lon/, a dilation of the colon in an adult patient.

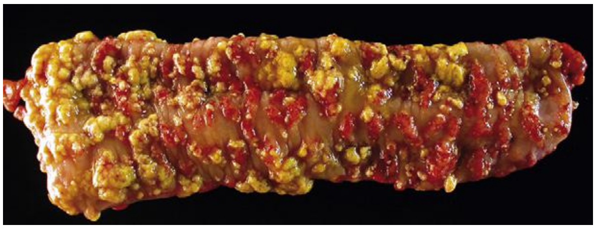
pseudomembrane /-mem′brān/ [Gk, *pseudes,* false; L, *membrana*], a membrane consisting of coagulated fibrin, bacteria, and leukocytes that forms in the throats of diphtheria patients.



Diphtheria pseudomembrane
(Cohen, Powderly, and Opal, 2010)

pseudomembranous /-mem′brənəs/, describing a false membrane, as occurs in diphtheria.

pseudomembranous colitis /-mem′brənəs/ [Gk, *pseudes* + L, *membrana,* thin skin], a diarrheal disease frequently found in hospitalized patients who have received antibiotics that caused overgrowth of the anaerobic spore-forming toxin ***Clostridium difficile.*** Patients have profuse watery diarrhea, fever, and cramping and are found to have exudates of the colon on endoscopy. Diagnosis is made by identifying the offending toxin in the stool of the affected patient. Antidiarrheals are strictly contraindicated because a life-threatening dilation of the bowel called toxic megacolon may result. The bacterium is passed from patient to patient by health care workers who fail to wash their hands adequately. Strict isolation of infected stools is necessary to prevent outbreaks of epidemics. Treatment with oral vancomycin or parenteral metronidazole usually will result in abatement of symptoms within 3 to 5 days. In mild to moderate cases, supportive therapy alone is required.



Pseudomembranous colitis *(Kumar et al, 2007)*

pseudomembranous enterocolitis. See **necrotizing enterocolitis.**

pseudomembranous stomatitis, a severe inflammation of the mouth that produces a membranelike exudate. The inflammation may be caused by various bacteria or by chemical irritants. It may produce dysphagia, pain, fever, and swelling of the lymph glands, or it may remain localized and mild.

pseudomenstruation /-men′stro͞o·ā′shən/, bleeding from the uterus that resembles menstruation but is not associated with the usual changes in endometrial tissues.

pseudomnesia /so͞o′dōmnē′zhə/, a memory aberration in which a client claims to remember events that actually have not taken place.

pseudomonad /so͞o′dōmō′nad, so͞odom′ənad/, a bacterium of the genus *Pseudomonas*.

Pseudomonas /so͞odom′ənas/ [Gk, *pseudes* + *monas*, unit], a genus of gram-negative bacteria isolated from wounds, burns, and infections of the urinary tract that includes several free-living species in soil and water and some opportunistic pathogens, such as *Pseudomonas aeruginosa*. Pseudomonads are notable for their fluorescent pigments and their resistance to disinfectants and antibiotics.

Pseudomonas aeruginosa [Gk, *pseudes*, false, *monas*, unity], a species of gram-negative, nonspore-forming, motile bacteria that may cause various human diseases ranging from purulent meningitis to nosocomial infected wounds. Also called ***Pseudomonas pyocyanea***.

Pseudomonas maltophilia. See ***Xanthomonas maltophilia***.

Pseudomonas pyocyanea. See ***Pseudomonas aeruginosa***.

pseudomutuality /-mo͞o′tyo͞o·al′itē/ [Gk, *pseudes* + L, *mutuus*, reciprocal], (in psychotherapy) an atmosphere maintained by family members in which surface harmony and a high degree of agreement with one another hide deep and destructive intrapsychic and interpersonal conflicts. The family acts as if it is close and happy when in fact it is not.

pseudomyopia /-mī·ō′pē·ə/, overaccommodation during distance viewing that results in distance blur.

pseudomyxoma /-miksō′mə/, a mucus-rich tumor.

pseudomyxoma peritonei, the presence in the peritoneal cavity of mucoid matter from a ruptured ovarian cyst or a ruptured mucocele of the appendix.

pseudonystagmus. See **end-positional nystagmus.**

pseudopapilledema /-pap′ilēdē′mə/, a congenitally swollen optic disc that resembles papilledema but with no retinal hemorrhages or exudates or any systemic signs of increased intraocular pressure.

pseudoparalysis /-pəral′isis/, a condition in which a person appears to be unable to move the arms or legs but has no “true” paralysis. In infants, the condition may be caused by pain in joints resulting from a disease such as rickets or scurvy.

pseudoparaplegia /-per′əplē′jə/, a form of psychogenic paralysis.

pseudoparesis /-pərē′sis/, a form of psychogenic paralysis.

pseudopelade /-pelād′, -pē′lād/, a scarring type of alopecia, preceded by folliculitis, in which one or more areas of baldness may appear and spread to become joined, forming an area of smooth fingerlike projections that are slightly depressed in the skin.

pseudopericarditis /-per′ikärdī′tis/, an auscultation sound resembling a friction rub when the diaphragm of a stethoscope is over the apex beat. It is actually caused by the movement of tissue in the intercostal space.

pseudophakia /-fā′kē·ə/, artificial lens implantation after cataract surgery.

pseudophakodonesis /-fā′kōdənē′sis/, excessive movement by an intraocular lens implant.

Pseudophyllidea /-filid′ē·ə/, an order of tapeworms with an aquatic life cycle. The scolex usually has two opposing sucking organs.

pseudopod /so͞o′dəpod/ [Gk, *pseudes*, false, *pous*, foot], a temporary cytoplasmic process of an ameba that can be extended to propel the organism or to engulf food. Also called *pseudopodium*.

pseudopolyp /-pol′ip/, a projecting mass of granulation tissue that may develop in ulcerative colitis and become covered by regenerating epithelium.

pseudopregnancy. See **pseudocyesis.**

pseudoprognathism /-prog′nəthiz′əm/, a condition in which the mandible is forced forward from its normal position by an occlusal disorder.

pseudopseudohypoparathyroidism /so͞o′dōso͞o′dōhī′pōpar′əthī′roidizəm/, an incomplete form of pseudohypoparathyroidism characterized by the same constitutional features but by normal levels of calcium and phosphorus in the serum. See also **pseudohypoparathyroidism.**

pseudopsychosis /-sīkō′sis/, a condition such as malingering that may resemble a true mental and behavioral disorder.

pseudopterygium /so͞o′dopterij′ē·əm/, a fold of conjunctiva that has become attached to the cornea after an injury or disease.

pseudoptosis /so͞o′doptō′sis/, an abnormally small palpebral fissure.

pseudopuberty /-p(y)o͞o′bərtē/, the appearance of somatic and functional changes in an individual before the chronological age of puberty.

pseudorabies. See **infectious bulbar paralysis.**

pseudoretinitis pigmentosa /-ret′inī′tis/, a pigmentary mottling of the retina that may follow an eye injury.

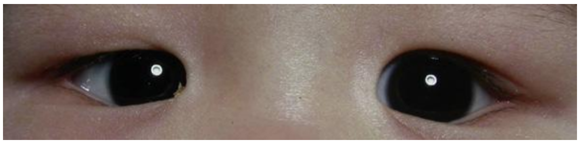
pseudorubella. See **roseola infantum.**

pseudosarcoma /-särkō′mə/, a spindle cell epithelioma on skin that has been exposed to irradiation.

pseudosclerema. See **adiponecrosis subcutanea neonatorum.**

pseudosmallpox. See **alastrim.**

pseudostrabismus /-strəbiz′məs/, an appearance of strabismus caused by an epicanthal fold of skin, which narrows the visible width of the sclera medial to the iris.



Pseudostrabismus caused by a flat nasal bridge, wide epicanthal folds, and closely placed eyes
(Courtesy David Taylor)

pseudostratified /-stra′tifīd/ [Gk, *pseudes*, false, *stratum*, cover], pertaining to a type of layered epithelium in which the nuclei of adjacent cells are at different levels.

pseudotabes /-tā′bēz/, any neuropathy with symptoms like those of tabes dorsalis.

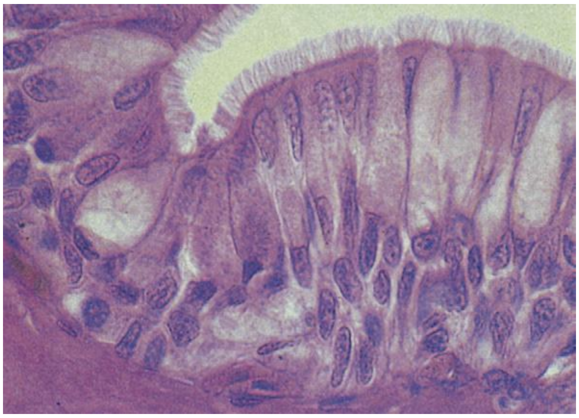
pseudotruncus arteriosus /-trung′kəs/, a condition in which blood is carried to the pulmonary arteries by collateral vessels.

pseudotubercle /-t(y)o͞o′bərkəl/, a nodule that resembles a tuberculosis granule but is caused by a microorganism other than *Mycobacterium tuberculosis*.

pseudotuberculosis /-t(y)o͞obur′kyəlō′sis/, a pulmonary condition with symptoms resembling those of tuberculosis but not caused by *Mycobacterium tuberculosis*.

pseudotumor /-t(y)o͞o′mər/ [Gk, *pseudes* + L, *tumor*, swelling], a false tumor.

pseudotumor cerebri, a condition characterized by increased intracranial pressure, headache, blurring of the optic disc margins, vomiting, and papilledema without neurological signs, except palsy of the sixth cranial nerve.



Pseudostratified columnar epithelium
(© Ed Reschke; used with permission)

Also called **benign intracranial hypertension, meningeal hydrops.**

pseudovariola. See **alastrim.**

pseudovitamin /-vī′təmin/, a substance that has a chemical structure similar to that of a vitamin but lacks the physiological effects.

pseudoxanthoma elasticum. See **Grönblad-Strandberg syndrome.**

psi /sī/, Ψ, ψ, the twenty-third letter of the Greek alphabet.

p.s.i., abbreviation for *pounds per square inch.*

psia, abbreviation for *pounds per square inch, absolute.*

psig, abbreviation for *pounds per square inch, gauge.*

psilocin /sī′ləsin/, one of several indole-derived psychomimetic drugs. It is related chemically to psilocybin.

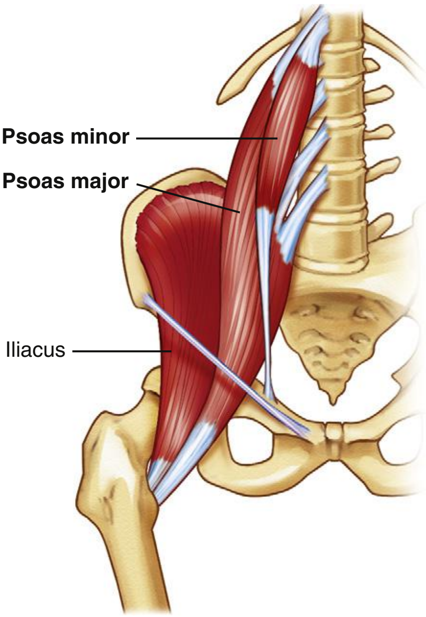
psilocybin /sī′lōsī′bin, -sib′in/, a psychedelic drug and an active ingredient of various Mexican hallucinogenic mushrooms of the genus *Psilocybe mexicana.* It can produce altered states of mood and consciousness and has no acceptable medical use in the United States. Psilocybin is controlled under Schedule I of the Controlled Substances Act of 1970, which bans the prescription of psilocybin and numerous other drugs and allows their procurement and use only for special research projects authorized by the Drug Enforcement Administration of the U.S. Department of Justice.

psittacosis /sit′əkō′sis/ [Gk, *psittakos,* parrot], an infectious illness caused by the bacterium *Chlamydia psittaci,* characterized by respiratory pneumonia-like symptoms and transmitted to humans inhaling dried secretions from infected birds, especially pet birds and poultry. The clinical manifestations of the disease are extremely variable and resemble those of a great number of infectious diseases, but fever, cough, anorexia, and severe headache are almost always present. All chlamydiae are difficult to isolate and culture, but a history of exposure to birds is highly suggestive. A demonstrated rise in antibody titer confirms a diagnosis. Tetracycline is usually used to treat psittacosis and is continued for 10 to 14 days after the fever subsides. Isolation is advised. Also called **ornithosis, parrot fever.** See also ***Chlamydia.***

psm, abbreviation for **presystolic murmur.**

psoas major /sō′əs/ [Gk, *psoa,* loin], a long muscle originating from the transverse processes of the lumbar vertebrae and the fibrocartilages and sides of the vertebral bodies of the lower thoracic vertebrae and the lumbar vertebrae. It joins the iliacus to form the iliopsoas deep in the pelvis as it passes under the inguinal ligament and inserts in the lesser trochanter. It acts to flex and rotate the thigh and to flex and laterally bend the spine. Compare **psoas minor.**

psoas minor, a long, slender muscle of the pelvis, ventral to the psoas major. Many individuals do not have this muscle. The psoas minor functions to flex the spine. Compare **psoas major.**



Psoas major and minor

psoas part of iliopsoas fascia, the part of the fascia that invests the psoas major muscle.

psomophagia /sō′mōfā′jē·ə/, the swallowing of food that has not been chewed properly.

psor-, prefix meaning "itching": *psora, psorocomium, psorous.*

psoralen-type photosensitizer /sôr′ələn/, any one chemical compound that contains photosensitizing psoralen and reacts on exposure to ultraviolet light to increase the melanin in the skin. Naturally occurring psoralen photosynthesizers, such as 5- and 8-methoxypsoralen, are found in buttercups, carrot greens, celery, clover, cockleburs, dill, figs, limes, parsley, and meadow grass. Some psoralen-type photosensitizers produced as pharmaceutics are methoxsalen and trioxsalen; both are used to enhance skin pigmentation or tanning in the treatment of skin diseases, such as psoriasis and vitiligo. Such drugs are carefully administered to prevent oversensitization of the skin and other complications. Psoralen-type photosensitizers are also used in the manufacture of some perfumes, colognes, and pomades. Such chemicals cause unique skin reactions, such as berlock dermatitis, in some individuals. Oil of bergamot, extracted from the peels of small oranges grown in southern France and Italy, is a photosensitizing psoralen used as a tea flavoring and in perfumes.

psorelcosis /sôr′əlkō′sis/, an ulceration of the skin caused by scabies.

psorenteritis /sôr′enterī′tis/, an inflammation of the intestines.

psoriasis /sərī′əsis/ [Gk, itch], a chronic skin disorder characterized by circumscribed red patches covered by thick, dry silvery adherent scales. Exacerbations and remissions are typical. Subcategories of psoriasis include **guttate psoriasis, pustular psoriasis,** and universe psoriasis. See also **psoriatic arthritis. —psoriatic** /sôr'ē·at'ik/, *adj.*

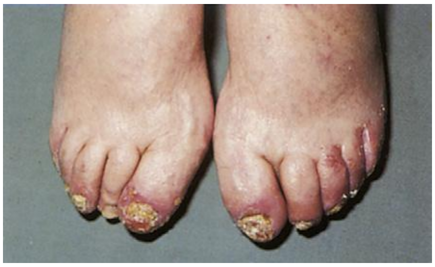
■ OBSERVATIONS: The onset of symptoms is gradual, and the disorder is characterized by periods of chronic exacerbation and remission. The scalp, elbows, knees, back, and buttocks are the most common sites. The nails, eyebrows, axillae, and anal and genital regions may also be affected. The lesions are well-defined, dry, nonpruritic papules or plaques overlaid with shiny silver scales, and they heal without scarring. The skin may be reddened and hot to touch. Affected nails are pitted, discolored, thickened, and crumbly. Diagnosis is based on evaluation of characteristic lesions. Common complications include psoriatic arthritis and exfoliative psoriatic dermatitis, which can lead to crippling and general debility.

■ INTERVENTIONS: Limited disease is treated with topical corticosteroids. Calcipotriene, tar products and other keratolytics are used in lotion, cream, ointment, or shampoo form to treat lesions. Lubricants are used to soften skin. Exposure to sunlight and short-wave or long-wave ultraviolet light therapy may be useful to treat generalized disease. Antineoplastic agents such as methotrexate may used for severe recalcitrant disease.

■ NURSING CONSIDERATIONS: Psoriasis is often more emotionally disabling than physically harmful. Nursing focus is on helping the individual adapt to the chronic relapsing nature of the disease. These individuals are at increased risk for alterations in body image and should be referred for counseling if body image is affected. Support groups and stress-reduction programs can be helpful. Instruction is needed to prevent mechanical injury to skin, and to reinforce the fact that lesions are not communicable.

psoriasis universalis [Gk, *psoriasis,* itch; L, *universus,* on the whole], a severe attack of psoriasis in which most or all of the skin is involved.

psoriatic arthritis /sôr′e·at′ik/, a form of arthritis associated with psoriatic lesions of the skin and nails, particularly at the distal interphalangeal joints of the fingers and toes.



Psoriatic arthritis *(Moll, 1997)*

PSRO, abbreviation for **Professional Standards Review Organization.**

PSS, abbreviation for **progressive systemic sclerosis.** See **scleroderma.**

PSSO, **1.** abbreviation for *peer specialist second opinion.* **2.** abbreviation for *physician support services organization.*

PSV, abbreviation for **pressure support ventilation.**

PSW, abbreviation for **psychiatric social worker.**

psych, abbreviation for **psychology.**

psych-. See **psycho-.**

psychalgia. See **psychic pain.**

psychataxia /sī′kətak′sē·ə/, a condition of mental confusion and inability to concentrate or fix attention.

psyche /sī′kē/ [Gk, mind], **1.** the aspect of one's mental faculty that encompasses the conscious and unconscious processes. **2.** the vital mental or spiritual entity of the individual as opposed to the body or soma. **3.** (in psychoanalysis) the total components of the id, ego, and superego, including all conscious and unconscious aspects. Compare **soma.**

psychedelic /sī′kədel′ik/ [coined in 1956 by Humphry Osmond from Gk, *psyche* + *deloun,* to reveal], **1.** describing a mental state characterized by altered sensory perception and hallucination accompanied by euphoria or fear, usually caused by the deliberate ingestion of drugs or other substances known to produce this effect. **2.** describing any drug or substance that causes this state, such as mescaline or psilocybin.

psychiatric /sī′kē·at′rik/ [Gk, *psyche,* mind, *iatreia,* treatment], pertaining to psychiatry.

psychiatric consultation liaison nurse (PCLN), an advanced practice nurse with a master's degree in psychiatric nursing. The practice focuses on emotional, spiritual, developmental, cognitive, and behavioral responses of patients with actual or potential physical dysfunction.

psychiatric disorder. See **mental disorder.**

psychiatric emergency service [Gk, *psyche* + *iatreia,* treatment], a hospital service that provides immediate initial evaluation and treatment to mentally ill patients on a 24-hour-a-day basis.

psychiatric foster care, a service for discharged psychiatric patients who receive observation and care in an approved foster home.

psychiatric home care, a service whereby a discharged psychiatric patient is provided observation and care in his or her place of residence. Many state laws require that the client be homebound.

psychiatric hospital, a health care facility providing inpatient and outpatient therapeutic services to clients with behavioral or emotional illnesses.

psychiatric inpatient unit, a hospital ward or similar area used for the treatment of inpatients who require psychiatric care.

psychiatric nurse practitioner, a nurse practitioner who, by advanced study and clinical practice, such as in a master's program in psychiatric nursing, has gained expert knowledge in the care and prevention of mental disorders. See also **psychiatric nursing.**

psychiatric nursing, the branch of nursing concerned with the prevention, care, and cure of mental disorders and their sequelae. It uses theories of human behavior as its scientific framework and requires the use of the self as its art or expression in nursing practice. Some of the activities of the psychiatric nurse include providing a safe therapeutic milieu; working with patients or clients on the real day-to-day problems they face; identifying and caring for the physical aspects of the patient's problems, including drug therapy reactions; assuming the role of social agent or parent for the patient in various recreational, occupational, and social situations; conducting psychotherapy; and providing leadership and clinical assistance for other nurses and health care workers. Psychiatric nurses work in many settings; their responsibilities vary with the setting and with the level of expertise, experience, and training of the individual nurse. Also called **mental health nursing.**

psychiatric social worker (PSW), a social worker who specializes in or works exclusively with the mentally ill.

psychiatrist /sīkī′ətrist/ [Gk, *psyche,* mind, *iatreia,* treatment], a physician with additional medical training and experience in the diagnosis, prevention, and treatment of mental disorders.

psychiatry /sīkī′ətrē/ [Gk, *psyche* + *iatreia,* treatment], the branch of medical science that deals with the causes, treatment, and prevention of mental, emotional, and behavioral disorders. Some kinds of psychiatry are **community psychiatry, descriptive psychiatry, dynamic psychiatry, existential psychiatry, forensic psychiatry,** and **orthopsychiatry. —psychiatric,** *adj.*

psychic /sī′kik/ [Gk, *psyche,* mind], a practitioner of the systematic study of parapsychology, a category of alleged psychological phenomena that cannot be explained by scientific thinking.

-psychic, suffix meaning "relation between mind and body": *allopsychic, biopsychic, physiopsychic.*

psychic blindness [Gk, *psyche,* mind; AS, *blind*], a somatoform disorder that is manifested by the total or partial loss of vision in eyes that are organically normal. Despite the symptoms claimed, the patient usually reacts to light and avoids objects that might cause injury. The condition is frequently the result of an inner conflict or psychological stress, such as an unconscious effort to avoid a threatening or guilt-inducing situation. See also **conversion disorder.**

psychic contagion. See **psychic infection.**

psychic energy, mental energy such as thinking, perceiving, and remembering. See also **libido.**

psychic impotence [Gk, *psyche,* mind; L, *in* + *potentia,* power], a functional disorder of the male who is unable to perform sexual intercourse despite normal genitalia and sexual desire. The term generally applies to an inability to achieve and maintain an erection, but the disorder may be manifested in other forms, such as premature ejaculation or the need for certain conditions.

psychic infection [Gk, *psyche* + L, *inficere,* to stain], the spread of psychic effects or influences on others on a small scale, as in folie à deux, or on a large scale, as in the dance and witch manias of the Middle Ages or the spread of hysteria or panic in a crowd. Also called **psychic contagion.** See also **sympathy.**

psychic pain [Gk, *psyche,* mind; L, *poena,* penalty], a functional pain that, in the absence of any organic cause, is usually associated with feelings of acute anxiety. In some cases, the person may experience hallucinations or obsessions. Also called **psychalgia.**

psychic suicide, the termination of one's own life without the use of physical means or agents, such as by an older person, widowed after many years of marriage, who becomes sufficiently depressed to lose "the will to live."

psychic trauma, an emotional shock or injury or a distressful situation that produces a lasting impression, especially on the subconscious mind. Some causes of psychic trauma may include abuse or neglect in childhood, rape, and loss of a loved one. Psychotherapeutic sessions in which the injured person can ventilate feelings can help alleviate psychic trauma.

psychoacoustics /sī′kō·əko͞os′tiks/, the branch of science concerned with the physical features of sound as it relates to the psychological and physiological aspects of the sense of hearing in the unimpaired ear.

psychoactive /sī′kō·ak′tiv/ [Gk, *psyche,* mind; L, *activus*], pertaining to a drug or other agent that affects such normal mental functioning as mood, behavior, or thinking processes, such as stimulants, sedatives, or hallucinogens.

psychoanalysis /sī′kō·ənal′isis/ [Gk, *psyche* + *analyein,* to separate parts], a branch of psychiatry founded by Sigmund Freud, devoted to the study of the psychology of human development and behavior. From its systematized method for investigating the processes of the mind evolved a system of psychotherapy based on the concepts of a dynamic unconscious. By using such techniques as free association, dream interpretation, and analysis of defense mechanisms, emotions and behavior are traced to the influence of repressed instinctual drives in the unconscious. Treatment consists of helping the individual become aware of the existence of repressed emotional conflicts, analyzing their origin and through the process of insight bringing them into the consciousness so that irrational and maladaptive behavior can be altered. See also **psychosexual development.**

psychoanalyst /sī′kō·an′əlist/, a psychotherapist, usually a psychiatrist, who has had special training in psychoanalysis and who applies the techniques of psychoanalytic theory.

psychoanalytic /sī′kō·an′əlit′ik/, **1.** pertaining to psychoanalysis. **2.** using the techniques or principles of psychoanalysis, e.g., the study of the unconscious processes, in an attempt to examine causality.

psychobiology /-bī′ol′əjē/ [Gk, *psyche* + *bios,* life, *logos,* science], **1.** the study of biochemical foundations of thought, mood, emotion, affect, and behavior. **2.** personality development and functioning in terms of the interaction of the body and the mind. **3.** a school of psychiatric thought introduced by Adolf Meyer that stresses total life experience, including biological, emotional, and sociocultural factors, in assessing the psychological makeup or mental status of an individual. *—psychobiological, adj.*

psychocatharsis. See **catharsis.**

psychodiagnosis /-dī′agnō′sis/ [Gk, *psyche,* mind, *dia* + *gnosis,* knowledge], the study of a personality through observations of behavior and mannerisms combined with various tests.

psychodrama /-dram′ə/, a form of group psychotherapy, originated by J.L. Moreno, in which people act out their emotional problems through improvisational dramatizations.

psychodynamics /-dīnam′iks/ [Gk, *psyche* + *dynamis,* power], the study of the forces that motivate behavior. It may include the influence of past experiences on present behavior and the influence of mental and emotional forces on development and behavior.

psychoendocrinology /sī′kō·en′dōkrinol′əjē/, the study of the relationship between endocrinology and psychology.

psychoesthesia, a sensation of cold perceived although the body is warm.

psychogalvanic /-galvan′ik/, pertaining to the effects of psychological influences on the electrical properties of skin.

psychogender /-jen′dər/, the psychological sex as expressed in gender attitudes of a person as distinguished from biological or somatic sex.

psychogenesis /sī′kōjen′əsis/ [Gk, *psyche* + *genesis,* origin], **1.** the development of the mind or of a mental function or process. **2.** the development or production of a physical symptom or disease having a mental or psychic origin rather than an organic cause. **3.** the development of emotional states, either normal or abnormal, from the interaction of conscious and unconscious psychological forces. Compare **somatogenesis.**

psychogenic /sī′kōjen′ik/ [Gk, *psyche* + *genein,* to produce], **1.** originating within the mind. **2.** referring to any physical symptom, disease process, or emotional state that is of psychological rather than physical origin. Also **psychogenetic.** See also **psychosomatic.**

psychogenic pain [Gk, *psyche,* mind; L, *poena,* penalty], a functional pain that does not have any known organic cause.

psychogenic pain disorder, a *DSM-IV* psychiatric disorder characterized by persistent pain for which there is no apparent organic cause. The condition is often accompanied by other sensory or motor dysfunction, such as paresthesia or muscle spasm. The cause may be one or many unresolved needs or conflicts.

psychogenic polydipsia. See **compulsive polydipsia.**

psychogenic vomiting, vomiting that is stimulated by anxiety and emotional distress.

psychogeusic /-jo͞o′sik/, pertaining to the psychological influences on taste.

psychograph /si′kōgraf/, **1.** a chart for recording graphically the personality traits of an individual. **2.** a written description of the mental functioning of an individual.

psychokinesia /sī′kōkinē′zhə, -kīnē′zhə/ [Gk, *psyche* + *kinesis,* motion], impulsive behavior resulting from deficient or defective inhibitions without benefit of processing between the stimulus and the response.

psychokinesis (PK) /sī′kōkinē′sis, -kīnē′sis/ [Gk, *psyche* + *kinesis,* motion], the alleged direct influence of the mind or will on matter to produce motion in objects without the intervention of the physical senses or a physical force.

psychokinetics /sī′kōkinet′iks, -kīnet′iks/, the study of psychokinesis.

psycholinguistics /-ling·gwis′tiks/, the study of language as a form of behavior, including language development, speech, and personality.

psychological miscarriage, an absence or deficiency of a mother's love for her infant or absence of mother-child bonding.

psychological test [Gk, *psyche* + *logos,* science; L, *testum,* crucible], any of a group of standardized tests designed to measure or ascertain such characteristics of an individual as intellectual capacity, motivation, perception, role behavior, values, level of anxiety or depression, coping mechanisms, and general personality integration. Compare **achievement test, aptitude test, intelligence test, personality test.**

psychologist /sīkol′əjist/, a person who specializes in the study of the structure and function of the brain and related mental processes of animals and humans. A clinical psychologist is one who is qualified by graduate study in psychology and training in clinical psychology and who provides testing and counseling services to patients with mental and emotional disorders.

psychology (psych) /sīkol′əjē/ [Gk, *psyche* + *logos,* science], **1.** the study of behavior and of the functions and processes of the mind, especially as related to the social and physical environment. **2.** a profession that involves the practical applications of knowledge, skills, and techniques in the understanding of, prevention of, or solution to individual or social problems, especially in regard to the interaction between the individual and the physical and social environment. **3.** the mental, motivational, and behavioral characteristics and attitudes of an individual or group of individuals. Kinds of psychology include **analytic psychology,** *animal psychology,* **behaviorism, clinical psychology, cognitive psychology, educational psychology, experimental psychology, humanistic psychology,** *phenomenology,* and **social psychology. —psychologic,** *psychological, adj.*

psychometrician /sī′kōmətrish′ən/ [Gk, *psyche,* mind, *metron,* measure], a specialist who performs quantitative estimation or measurement of personality and intelligence. The testing is not treatment oriented.

psychometrics /sī′kōmet′riks/ [Gk, *psyche* + *metron,* measure], the development, administration, or interpretation of psychological and intelligence tests. Also called *psychometry.*

psychomotor /-mō′tər/ [Gk, *psyche* + L, *motare,* to move about], pertaining to or causing voluntary movements usually associated with neural activity.

psychomotor and physical development of infants, a branch of pediatric psychiatry that is concerned with the development of skills requiring coordination of sensory processes and motor activities, including infant reflexes, developmental timetables, and emotional and behavioral disorders.

psychomotor development, the progressive attainment by the child of skills that involve both mental and muscular activity, such as the ability of the infant to turn over, sit, or crawl at will and of the toddler to walk, talk, control bladder and bowel functions, and begin solving cognitive problems. The mean chronological ages at which certain psychomotor skills are attained by most children follow.

12 weeks	Looks at own hand
20 weeks	Able to grasp objects voluntarily
24 weeks	Able to roll from back to front at will
11 months	Creeps with abdomen off the floor and imitates speech sounds
15 months	Able to walk without help
24 months	Has a vocabulary of 300 or more words and uses pronouns
30 months	Able to jump with both feet
3 years	Able to ride a tricycle and to feed self well
4 years	Able to hop and skip on one foot, catch and throw a ball; is independent, boasts, tattles, and shows off
5 years	Able to tie shoelaces and cut with scissors, tries to please, interested in facts about world, gets along more easily with parents

psychomotor domain, the area of observable performance of skills that require some degree of neuromuscular coordination.

psychomotor energy, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the personal drive and energy to maintain activities of daily living, nutrition, and personal safety. See also **Nursing Outcomes Classification.**

psychomotor epilepsy. See **psychomotor seizure.**

psychomotor learning, the acquisition of ability to perform motor skills.

psychomotor retardation, a generalized slowing of motor activity related to a state of severe depression or dementia.

psychomotor seizure, a temporary impairment of consciousness characterized by psychic symptoms, loss of judgment, automatic behavior, and abnormal acts. It is often associated with temporal lobe disease. No apparent convulsions occur, but there may be loss of consciousness or amnesia for the episode. During the seizure the individual may appear drowsy, intoxicated, or violent and may commit asocial acts or crimes, but normal activities, such as driving a car, typing, or eating, may continue at an automatic level. Psychic symptoms, including visual and auditory hallucinations, a sense of unreality, and déjà vu, may be present and may be accompanied by visceral symptoms, such as chest pain, transient respiratory arrest, tachycardia, and GI discomfort, and by abnormal sensations of smell and taste. Also called **psychomotor epilepsy.**

psychoneuroimmunology /-no͝or′ō·imyo͞onol′əjē/, a discipline that studies the relationships between psychological states and the immune response.

psychoneurosis. See **neurosis.**

psychoneurotic. See **neurotic.**

psychoneurotic disorder. See **neurosis.**

psychooncology /sī′kō·ongkol′əjē/, the psychological effects of cancer, particularly the psychosocial needs of the patient and the patient's family.

psychopath /sī′kōpath/ [Gk, *psyche* + *pathos,* disease], a person who has an antisocial personality disorder. Also called **sociopath.** See also **antisocial personality, antisocial personality disorder. —psychopathic,** *adj.*

psychopathia. See **psychopathy.**

psychopathia sexualis /sī′kōpā′thē·ə sek′sho͞o·al′is/ [Gk, *psyche* + *pathos,* disease; L, *sexus,* male or female], a mental disease characterized by sexual perversion.

psychopathic. See **psychopath.**

psychopathic personality. See **antisocial personality.**

psychopathologist /-pəthol′əjist/, one who specializes in the study and treatment of mental disorders. See also **psychiatrist.**

psychopathology /-pəthol′əjē/, **1.** the study of the causes, processes, and manifestations of mental disorders. **2.** the behavioral manifestation of any mental disorder. See also **psychiatry.**

psychopathy /sīkōp′əthē/, any disease of the mind, congenital or acquired, not necessarily associated with subnormal intelligence. Also called **psychopathia.**

psychopharmaceutical /-fär′məso͞o′tikəl/, a drug used in the treatment of mental health disorders.

psychopharmacology /-fär′məkol′əjē/ [Gk, *psyche* + *pharmakon,* drug, *logos,* science], **1.** the scientific study of the effects of drugs on behavior and normal and abnormal mental functions. **2.** the use of these drugs in the treatment of mental illness.

psychophylaxis. See **mental hygiene.**

psychophysical /-fiz′ikəl/, pertaining to the psychosocial and physical aspects of a client's health and illness.

psychophysical preparation for childbirth, a program that prepares women for giving birth by teaching them the physiological characteristics of the process, exercises to improve muscle tone and physical stamina, and various techniques of breathing and relaxation to promote control and comfort during labor and delivery. There are several methods of psychophysical preparation for childbirth. Among the goals of all of the methods are a decrease in the mother's fear and pain, a decrease in or elimination of the use of analgesia and anesthesia in childbirth, and an increase in the mother's participation and cooperation, resulting in a reduced need for obstetric intervention. Methods of psychophysical preparation for childbirth include the **Bradley method, Lamaze method, Leboyer method,** and **Read method.**

psychophysics /-fiz′iks/ [Gk, *psyche* + *physikos,* natural], the branch of psychology concerned with the relationships between physical stimuli and sensory responses.

psychophysiological /-fiz′ē·əloj′ik/ [Gk, *psyche* + *physikos,* natural], pertaining to physical symptoms, usually under the control of the autonomic nervous system, with emotional origins and involving a single organ system; psychosomatic.

psychophysiological disorder, any of a large group of mental disorders that is characterized by the dysfunction of an organ or organ system controlled by the autonomic nervous system and that may be caused or aggravated by emotional factors. The disorders are named and classified according to the organ system involved, such as cardiovascular, respiratory, musculoskeletal, and GI. Also called **psychosomatic illness, psychosomatic reaction.**

psychophysiology /-fiz′ē·ol′əjē/, **1.** the study of physiology as it relates to various aspects of psychological or behavioral function. See also **psychophysiological disorder.** **2.** the study of mental activity by physical examination and observation.

psychoprophylactic preparation for childbirth /-prō′filak′tik/, a system of prenatal education for giving birth using the Lamaze method of natural childbirth. See also **psychophysical preparation for childbirth.**

psychoprophylaxis /-prō′filak′sis/, a type of psychotherapy that is directed to prevention of emotional disorders. For example, it is used in the preparation for childbirth to reduce a woman's anxiety about pain and birth of a normal child.

psycho-, psych-, prefix meaning "the mind": *psychoauditory, psychodynamics, psychedelic.*

psychorelaxation /-ri′laksā′shən/, the systematic desensitization to stress and anxiety by the practice of general body relaxation.

psychosensory /-sen′sərē/, pertaining to the perception and interpretation of sensory stimuli.

psychoses. See **psychosis.**

psychosexual /-sek′sho͞o·əl/ [Gk, *psyche* + L, *sexus,* male or female], pertaining to the psychological and emotional aspects of sex. See also **psychosexual development, sexual disorder. —psychosexuality,** *n.*

psychosexual development, (in psychoanalysis) the emergence of the personality through a series of stages from infancy to adulthood. Each stage is relatively fixed in time and characterized by a dominant mode of achieving libidinal pleasure through the interaction of the person's biological drives and the environmental restraints. The stages of psychosocial development, as developed by Sigmund Freud, are the **oral stage, anal stage, phallic stage, latency stage,** and **genital stage.**

psychosexual disorder. See **sexual disorder.**

psychosexual dysfunction. See **sexual disorder.**

psychosexuality. See **psychosexual.**

psychosis /sīkō′sis/ *pl.* **psychoses** [Gk, *psyche* + *osis,* condition], any major mental disorder of organic or emotional origin characterized by a gross impairment in reality testing, in which the individual incorrectly evaluates the accuracy of his or her perceptions and thoughts and makes incorrect references about external reality, even in the face of contrary evidence. It is often characterized by regressive behavior, inappropriate mood and affect, and diminished impulse control. Symptoms of psychoses include hallucinations and delusions. See also **acute psychosis, ambulatory schizophrenia. —psychotic,** *adj.*

-psychosis, suffix meaning a "serious mental disorder": *autopsychosis, encephalopsychosis, pharmacopsychosis.*

psychosocial /-sō′shəl/ [Gk, *psyche* + L, *socialis,* partners], pertaining to a combination of psychological and social factors.

psychosocial adjustment: life change, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the adaptive psychosocial response of an individual to a significant life change. See also **Nursing Outcomes Classification.**

psychosocial assessment, an evaluation of a person's mental health, social status, and functional capacity within the community, generally conducted by psychiatric social workers.

psychosocial development, (in child development) a description devised by Erik Erikson of the normal serial development of trust (birth to 12 months), autonomy (1 to 2 years), initiative (3 to 5 years), industry, identity (12 to 18 years), intimacy, generativity, and ego integrity (60s and above). The development begins in infancy and progresses as the infantile ego interacts with the environment. For the child to reach a new stage successfully, the tasks of the preceding one should be fully mastered.

psychosomatic /sī′kōsəmat′ik/ [Gk, *psyche* + *soma,* body], **1.** pertaining to psychosomatic medicine. **2.** relating to, characterized by, or resulting from the interaction of the mind or psyche and the body. **3.** relating to the expression of an emotional conflict through physical symptoms. See also **conversion disorder, psychogenic, psychophysiological disorder.**

psychosomatic approach, the interdisciplinary or holistic study of physical and mental disease from a biological, psychosocial, and sociocultural point of view.

psychosomatic illness. See **psychophysiological disorder.**

psychosomatic medicine, the branch of medicine concerned with the interrelationships between mental and emotional reactions and somatic processes, in particular the manner in which intrapsychic conflicts influence physical symptoms. It maintains that the body and mind are one inseparable entity and that both physiological and psychological techniques should be applied in the study and treatment of illness. Also called **psychosomatics.**

psychosomatic pain [Gk, *psyche,* mind, *soma,* body; L, *poena,* penalty], pain that is caused in part by psychological factors.

psychosomatic reaction. See **psychophysiological disorder.**

psychosomatics. See **psychosomatic medicine.**

psychosomatogenic /-sōmat′əjen′ik/, pertaining to factors that cause or lead to the development of psychophysiological coping measures as learned responses to stressors.

psychostimulant /-stim′yələnt/, an agent that increases psychomotor activity in most patients. It improves concentration and impulse control in attention deficit hyperactivity disorder.

psychosurgery /-sur′jərē/ [Gk, *psyche* + *cheirourgia*], surgical interruption of certain nerve pathways in the brain, performed to treat selected cases of chronic unremitting anxiety, agitation, or obsessional neuroses. Modern psychotherapeutic drugs have replaced psychosurgery in most cases. Psychosurgery is performed when the condition is severe and when alternative treatments, such as psychotherapy, drugs, and electroshock, have proved ineffective. The procedure may be a limited prefrontal lobotomy, in which connecting fibers in the frontal region are cut, or a modified bifrontal tractotomy, in which nerve tracts of the brainstem are severed. Light general anesthesia is given. Postoperative nursing care includes observation for signs of leakage of cerebrospinal fluid. A marked alteration of personality is unavoidable. Various cognitive and affective functions also are affected, depending on the location of the induced lesion, the extent of destruction of nerve tissue, and the age, sex, and condition of the patient.

psychosynthesis /-sin′thəsis/, a form of psychotherapy that focuses on three levels of the unconscious—lower, middle, and higher unconscious, or superconscious. The goal of the treatment is the re-creation or integration of the personality.

psychotherapeutic drugs /-ther′əp(y)o͞o′tik/ [Gk, *psyche,* mind, *therapeutike,* medical practice; Fr, *drogue*], drugs that are prescribed for their effects in relieving symptoms of anxiety, depression, or other mental disorders.

psychotherapeutics /-tiks/ [Gk, *psyche* + *therapeia,* treatment], the treatment of mental disorders by means of psychotherapy.

psychotherapist /-ther′əpist/, one who practices psychotherapy, including psychiatrists, licensed psychologists, psychiatric nurses, psychiatric social workers, and individuals trained in counseling. The specific requirements for education and training differ markedly in content, breadth, and duration, depending on the form of psychotherapy practiced. Licensing procedures and definitions of practice vary from state to state. Compare **psychoanalyst.**

psychotherapy /-ther′əpē/ [Gk, *psyche* + *therapeia,* treatment], any of a large number of related methods of treating mental and emotional disorders by psychological techniques rather than by physical means.

psychotic /sīkot′ik/ [Gk, *psyche* + *osis,* condition], **1.** *adj,* pertaining to psychosis. **2.** *n,* a person exhibiting the characteristics of a psychosis. **3.** *adj,* not in contact with reality.

psychotic disorder. See **psychosis.**

psychotic insight, a stage in the development of a psychosis that follows an initial experience of confusion, bizarreness, and apprehension, characterized by an insight that enables the patient to interpret the external world in terms of a delusional system of thinking. With the new insight, the factors that had previously been confusing become a part of the systematized pattern of the delusion, which, although irrational to an observer, is perceived by the patient as the attainment of exceptionally lucid thinking.

psychotic reaction. See **psychosis.**

psychotogenic /sīkot′əjen′ik/, pertaining to an agent that is capable of inducing symptoms of psychosis.

psychotomimetic /sīkot′ōmimet′ik/, a drug or other substance whose effects mimic the symptoms of psychosis, such as hallucinations.

psychotropic /-trop′ik/ [Gk, *psyche* + *trepein,* to turn], exerting an effect on the mind or modifying mental activity, as in psychotropic medications.

psychotropic drugs, drugs that affect the psychic functions, behavior, or experience of a person using them.

psychro-, prefix meaning "cold": *psychrometer, psychrophilic, psychrophore.*

psychroesthesia /si′krō·esthē′zhə/, **1.** a chill. **2.** a sensation of cold although the body is warm.

psychrometer /sīkrom′ətər/, an instrument for calculating the degree of humidity in the atmosphere by comparing the temperatures of two thermometers, one with a wet bulb, one dry. The difference in temperature between the two thermometers indicates the relative humidity.

psychrometry /sīkrom′ətrē/, the calculation of relative humidity and water vapor pressure from psychrometer data and barometric pressure.

psychrophore /sī′krəfôr′/, a double-lumen catheter through which cold water is circulated.

psyllium husk, the cleaned, dried seed coat from the seeds of *Plantago* species, used as a bulk-forming laxative.

psyllium seed. See **plantago seed.**

pt, abbreviation for *pint.*

Pt, symbol for the element **platinum.**

PT, **1.** abbreviation for **physical therapist.** **2.** abbreviation for **physical therapy.** **3.** abbreviation for **prothrombin time.**

pt., **1.** abbreviation for *pint.* **2.** abbreviation for **patient.**

PTA, **1.** abbreviation for **percutaneous transluminal angioplasty.** **2.** abbreviation for **plasma thromboplastin antecedent.** **3.** abbreviation for **physical therapy assistant.**

PTB, abbreviation for *patellar-tendon bearing*. See **patellar-tendon bearing prosthesis.**

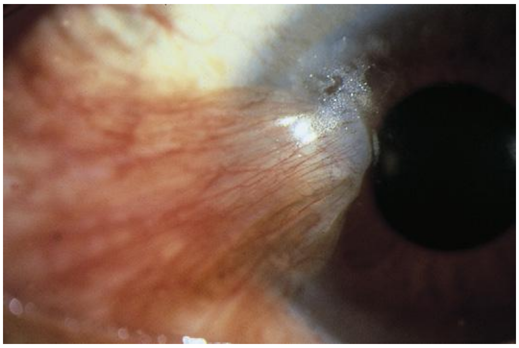
PTB/SC, abbreviation for **patellar-tendon bearing supracondylar socket.**

PTCA, abbreviation for **percutaneous transluminal coronary angioplasty.**

pterion /tir′ē·on/, a point near the sphenoid fontanel of the skull, at the junction of the greater wing of the sphenoid, squamous, temporal, frontal, and parietal bones. It also intersects the course of the anterior division of the middle meningeal artery.

pteroylglutamic acid. See **folic acid.**

pterygium /tərij′ē·əm/ [Gk, *pterygion*, wing], a thick triangular patch of pale hypertrophied tissue that extends medially from the nasal border of the cornea to the inner canthus of the eye.



Pterygium *(Swartz, 2009/Courtesy Ben Serar, MA, CRA)*

-pterygium, suffix meaning a "(specified) abnormality of the conjunctiva": *loxopterygium, pimelopterygium, symblepharopterygium*.

pterygium colli. See **webbed neck.**

pterygium syndrome. See **multiple pterygium syndrome.**

pterygoid /ter′igoid/ [Gk, *pteryx*, wing, *eidos*, form], pertaining to a winglike structure.

pterygoideus lateralis. See **external pterygoid muscle.**

pterygoideus medialis. See **internal pterygoid muscle.**

pterygoid fossa, a depression that separates the medial and lateral plates of each pterygoid process.

pterygoid hamulus, a hooklike projection at the inferior end of each medial plate of the pterygoid process.

pterygoid plexus, one of a pair of extensive networks of veins between the temporalis and the pterygoideus lateralis muscles, extending between surrounding structures in the infratemporal fossa. It communicates with the facial vein through the deep facial and angular veins. Compare **maxillary vein.**

pterygoid process [Gk, *pteryx*, wing, *eidos*, form; L, *processus*], any one of the paired processes of the sphenoid bone.

pterygomandibular /ter′igōmandib′yələr/ [Gk, *pteryx*, wing, *eidos*, form; L, *mandere*, to chew], pertaining to the pterygoid process and the mandible.

pterygomandibular raphe, a tendinous band between the pterygoid hamulus superiorly and the mandible inferiorly. It is the point of attachment for the buccinators and superior pharyngeal constrictor muscles.

pterygomaxillary /-mak′siler′ē/ [Gk, *pteryx*, wing, *eidos*, form; L, *maxilla*, jaw], pertaining to the sphenoid bone and the maxilla.

pterygomaxillary notch, a fissure at the junction of the maxilla and the pterygoid process of the sphenoid bone. Also called **hamular notch.**

pterygopalatine fossa, a space shaped like a teardrop between the bones on the lateral side of the skull immediately posterior to the maxilla. It is a major site of distribution for the maxillary nerve and for the terminal part of the maxillary artery.

PTH, abbreviation for **parathyroid hormone.**

Pthirus pubis. See **crab louse.**

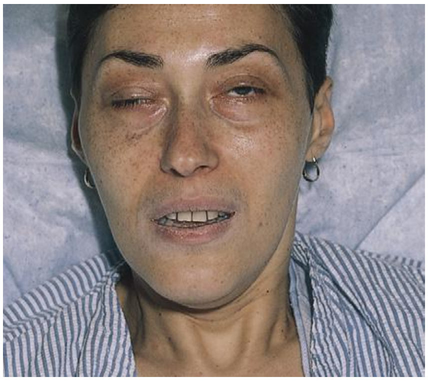
PTNA, abbreviation for **Provincial/Territorial Nurses Association.**

ptoma-, prefix meaning "corpse": *ptomaine, ptomatopsia, ptomatopsy*.

ptomaine /tō′mān/ [Gk, *ptoma*, corpse], an imprecise term introduced in the 19th century to identify a group of nitrogenous substances found in putrefied proteins. Because injection of the substances produced toxic reactions, the ptomaines were once regarded as poisonous. Later studies showed that the same substances were produced by the normal digestion of proteins in the human intestine without toxic effects.

ptomainemia /tō′mānē′mē·ə/, a condition caused by the presence of a ptomaine, a potentially toxic amine, in the blood.

ptosis /tō′sis/ [Gk, falling], an abnormal condition of one or both upper eyelids in which the eyelid droops because of a congenital or acquired weakness of the levator muscle or paralysis of the third cranial nerve. The condition may be treated surgically by shortening the levator muscle. **—ptotic,** *adj*.



Ptosis *(Swartz, 2009)*

-ptosis, suffix meaning a "falling, dropping, or prolapse of an organ": *esophagoptosis, hepatoptosis, uvulaptosis*.

ptotic. See **ptosis.**

ptotic kidney /tot′ik/, a kidney that is abnormally situated in the pelvis, usually over the sacral promontory behind the peritoneum. The condition may be either congenital or secondary to trauma. It is usually asymptomatic, but during pregnancy the flow of urine from a ptotic kidney may be obstructed.

PTSD, abbreviation for **posttraumatic stress disorder.**

PTT, abbreviation for **partial thromboplastin time.**

ptyalin /tī′əlin/ [Gk, *ptyalon*, spittle], a starch-digesting enzyme present in saliva. It hydrolyzes starch and glycogen. Its optimal pH is 6.9. Also called **amylase.**

ptyalism /tī′əliz′əm/ [Gk, *ptyalon*, spittle], excessive salivation, such as sometimes occurs in the early months of pregnancy. It is also a clinical sign of mercury poisoning. Also called **hyperptyalism.** See also **sialorrhea.**

ptyalo-, prefix meaning “saliva”: *ptyalocele, ptyalogenic, ptyalography.*

ptyocrinous /tī·ok′rinəs/, pertaining to the secretion of the contents of a unicellular gland in the form of extruded granules.

p-type semiconductor. See **semiconductor.**

-ptysis, suffix meaning a “spitting of matter”: *albuminoptysis, hemoptysis, plasmoptysis.*

Pu, symbol for the element **plutonium.**

pub-, pubo-, prefix meaning “grown up or adult”: *puberal, puberty, pubescence.*

pubarche /pyo͞obär′kē, pyo͞o′bärkē/ [L, *puber,* ripe, *arch,* beginning], onset of puberty. It is marked by the beginning of the development of secondary sexual characteristics.

pubertal /p(y)o͞o′bərtəl/ [L, *pubertas,* age of maturity], pertaining to puberty.

puberty /p(y)o͞o′bərtē/ [L, *pubertas,* age of maturity], the period of life at which the ability to reproduce begins. It is a stage of development when genitalia reach maturity and secondary sex characteristics appear. The onset normally occurs in females between 9 and 13 years of age with the development of breasts and menarche. In males, puberty usually occurs between 12 and 14 years of age and is characterized by the ejaculation of sperm.

puberulic acid /pyo͞ober′yo͝olik/, an antibiotic isolated from the mold *Penicillium puberulum* that prevents the replication of gram-positive bacteria.

pubes. See **pubis.**

pubescent /p(y)o͞obes′ənt/ [L, *pubescere,* to reach puberty], pertaining to the beginning of puberty.

pubescent uterus [L, *pubescere,* to reach puberty, *uterus,* womb], a uterus in which the cervix and body remain of equal length, the premenstruation state, in adult life.

pubic /p(y)o͞o′bik/ [L, *pubis*], pertaining to or involving the region of the pubic symphysis.

-pubic, suffix meaning “the frontal part of the pelvis”: *iliopubic, retropubic, vesicopubic.*

pubic bone. See **pubis.**

pubic dislocation. See **dislocation of the hip.**

pubic hair /p(y)o͞o′bik/ [L, *pubis* + AS, *haer*], hair of the pubic region.

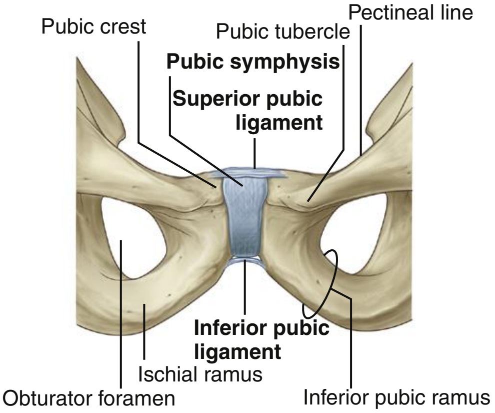
pubic ligament, either of the two ligaments, superior and inferior, associated with the pubic symphysis.

pubic region [L, *pubes,* signs of maturity, *regio,* territory], the most inferior part of the abdomen in the lower zone between the right and left inguinal regions and below the umbilical region. Also called **hypogastric region, hypogastrium.** See also **abdominal regions.**

pubic symphysis, the slightly movable interpubic joint of the pelvis, consisting of two pubic bones separated by a disk of fibrocartilage and connected by two ligaments. Also called **symphysis pubis.**

pubiotomy /p(y)o͞o′bi·ot′əmē/, the separation of the pubic bone, performed to increase the capacity of the pelvis to permit passage of a fetus. Also called **pelviotomy.**

pubis /pyo͞o′bis/ *pl.* **pubes** [L, *pubes*], one of a pair of pubic bones that join at the pubic symphysis and, with the ischium and the ilium, form the hip bone. The pubis forms one fifth of the acetabulum and is divisible into the body, the superior ramus, and the inferior ramus. The external surface of the pubis serves as the origin of the adductor longus, the obturator externus, the adductor brevis, and the proximal part of the gracilis. The internal surface of the pubis forms part of the anterior wall of the pelvis, giving origin to the levator ani and the obturator internus. The pubic crest affords attachment to the rectus abdominis, the pyramidalis, and the inguinal falx. The lateral part of the superior ramus of the pubis presents the superior, the inferior, and the dorsal surfaces. The superior surface presents the iliopectineal line. The inferior ramus gives origin to the gracilis, a part of the obturator externus, the adductor brevis, the adductor magnus, the obturator internus, and the constrictor urethrae. Compare **ilium, ischium.**



Pubic symphysis *(Drake, Vogl, and Mitchell, 2010)*

public health [L, *publicus,* of the people; AS, *haelth*], a field of medicine that deals with the physical and mental health of the community, particularly in such areas as water supply, waste disposal, air pollution, and food safety. In the United States there are more than 3000 state, county, or city public health agencies. The U.S. Public Health Service was organized in 1798 to provide hospital care for American merchant seamen. Subsequent legislation has expanded the role of the federal agency to include such services as the Food and Drug Administration; the National Library of Medicine; health care for Native Americans and Alaska Natives; protection against impure and unsafe foods, drugs, cosmetics, and medical devices; control of alcohol and drug abuse; and protection against unsafe radiation-producing projects.

public health dentistry. See **dental public health.**

public health nursing, a field of nursing that is concerned with the health needs of the community as a whole. Public health nurses may work with families in the home, in schools, at the workplace, in government agencies, and at major health facilities. A home care nursing service is provided by nurses who have special education in public health and are employed by such voluntary agencies as the Visiting Nurses Association or Visiting Nurse Service, or Victorian Order of Nurses for Canada. Public health nurses enter practice through a baccalaureate program accredited in the United States by the National League for Nursing accrediting commission or the American Association of Colleges of Nursing, which prepares them to work as generalists. Additional recognition is offered through a certification program sponsored by the Division of Community Health Nursing of the American Nurses Association.

public sector, (in health care) typically, government at the federal, state, provincial, and local levels. It may refer to other community organizations and lobbying groups.

publish or perish [L, *publicare,* to make public, *perire,* to come to naught], *(informal)* a practice followed in many academic institutions in which a contract for employment is renewed only if a candidate has demonstrated scholarship by having work published in a book or in a reputable refereed professional or scientific journal. This work is required in addition to whatever obligations for teaching or professional practice are entailed in the position.

pubo-. See **pub-.**

pubocapsular /p(y)o͞o′bōkap′sələr/, pertaining to the pubis and articular capsule of the hip joint.

pubocervical ligament, a condensation of fascia that extends from the cervix to the anterior pelvic wall. It is thought to help stabilize the uterus in the pelvic cavity. See also **cardinal ligament, levator ani, uterosacral ligament.**

pubococcygeal /p(y)o͞o′bōkoksij′ē·əl/ [L, *pubis* + Gk, *kokkyx,* cuckoo's beak], pertaining to the pubis and the coccyx.

pubococcygeus exercises /pyo͞o′bōkoksij′ē·əs/ [L, *pubes* + Gk, *kokkyx,* cuckoo's beak; L, *exercere,* to make strong], a regimen of isometric exercises in which a woman executes a series of voluntary contractions of the muscles of her pelvic diaphragm and perineum in an effort to increase the contractility of her vaginal introitus or to improve retention of urine. Also called **Kegel exercises.**

■ METHOD: The exercise involves the familiar muscular squeezing action that is required to stop the urinary stream while voiding; that action is performed in an intensive, repetitive, and systematic way throughout each day.

■ INTERVENTIONS: The woman is instructed in how to duplicate the squeezing, pulling-up action. A woman whose muscles are particularly attenuated may have difficulty understanding or feeling the muscular action involved. It is often helpful for her to be told that the action is exactly the same as that required to stop the flow of urine. When the woman can effect the contraction required, she is asked to hold the contraction for 6 to 10 seconds, allowing the muscles to relax completely between contractions. She is then advised to perform 10 to 15 repetitions of the contraction in a series and to repeat the series three to four times each day. She is further advised that the physiological nature of muscular exercise is such that weakened muscles may gain strength during the early phases of an exercise program and that, with diligence, she can expect to notice significant improvement in control that will continue as she maintains the regimen of exercise.

■ OUTCOME CRITERIA: Laxity and weakness of the pubococcygeus muscles, often a result of childbirth, may predispose certain women to looseness of the vaginal introitus and to stress incontinence. These problems may be ameliorated as the strength and tone of the muscles are increased through exercise. The rapidity with which a woman can, during voiding, close off the urinary stream is taken as a measure of the strength and tone of her pubococcygeus muscles. Ideally she should be able to perform the action completely and almost instantly.

pubofemoral ligament, a triangular ligament anteroinferior to the hip joint. Its base is attached medially to the iliopubic eminence, adjacent bone, and obturator membrane.

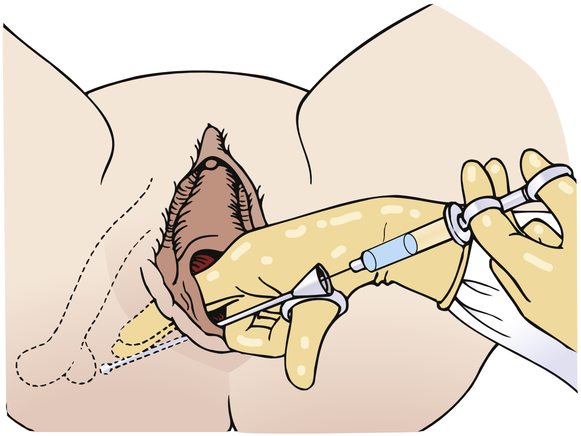
puboprostatic /p(y)o͞o′bōprostat′ik/, relating to the pubis and prostate gland.

pubovaginal sling, a support constructed of rectoabdominal fascia or synthetic mesh used to stabilize the bladder in treatment of stress incontinence.

pudenda, pudendal. See **pudendum.**

pudendal /pu-den′dal/, pertaining to or supplying the pudendum, such as pudendal nerves or a pudendal block.

pudendal block /p(y)o͞oden′təl/ [L, *pudendus,* shameful; Fr, *bloc,* lump], a form of regional anesthetic block administered to provide anesthesia of the perineum, which is particularly useful during the expulsive second stage of labor. The pudendal nerves are anesthetized by the injection of a local anesthetic near the trunk of each nerve as it passes over the sacrospinous ligament, just below the ischial spine. A 10-mL syringe, a long needle, and a guide are used in the procedure. The injection is most easily performed transvaginally. Pudendal block anesthetizes the perineum, vulva, and perirectal area without affecting the muscular contractions of the uterus. When the block is properly administered, the risk is minimal. Today's OB anesthesia is most often epidural analgesia.



Pudendal block *(Lowdermilk et al, 2012)*

pudendal canal. See **Alcock's canal.**

pudendal nerve, one of the branches of the pudendal plexus that arises from the second, third, and fourth sacral nerves; passes between the piriformis and coccygeus; and leaves the pelvis through the greater sciatic foramen. It divides into five branches supplying the external genital structures and the pelvic region. The branches of the pudendal nerve are the inferior rectal nerve, perineal nerve, and dorsal nerve of the penis or of the clitoris. See also **pudendal plexus.**

pudendal plexus, a network of motor and sensory nerves formed by the anterior branches of the second and the third and all of the fourth sacral nerves. It is often considered part of the sacral plexus. The pudendal plexus lies in the posterior hollow of the pelvis. The branches of the plexus are the visceral branches, the muscular branches, and the pudendal nerve. The visceral branches arise from the second, third, and fourth sacral nerves and supply the bladder, prostate, seminal vesicles, uterus, external genitalia, and some of the intestinal tract. The muscular branches arise from the fourth and sometimes the third and fifth sacral nerves and supply the levator ani, sphincter ani, and coccygeus. Compare **lumbar plexus, sacral plexus.** See also **pudendal nerve.**

pudendum /p(y)o͞oden′dəm/ *pl.* **pudenda** [L, *pudendus,* shameful], the external genitalia, especially of women. In a woman it comprises the mons veneris, the labia majora, the labia minora, the vestibule of the vagina, and the vestibular glands. In a man it comprises the penis, scrotum, and testes. **—pudendal,** *adj.*

puer-, prefix meaning "child": *puericulture, puerilism, puerperium, puerperal.*

puericulture /pyo͝o′ərikul′chər/ [L, *pueri,* children, *colere,* to cultivate], the rearing and training of children. **—puericulturist,** *n.*

puerile /pyo͝o′əril, -īl/ [L, *puerilis,* childish], pertaining to children or childhood; juvenile. **—puerility,** *n.*

puerilism /pyo͞o′əriliz′əm/ [L, *puerilis*, childish], childishness, particularly when manifested in an older adult.

puerility. See **puerile.**

puerpera /pyo͞o·er′pərə/ [L, *puerpus*, childbirth], a woman who has just given birth.

puerperal /pyo͞o·er′pərəl/ [L, *puerpus*, childbirth], **1.** pertaining to the period immediately after childbirth. **2.** pertaining to a woman (a puerpera) who has just given birth to an infant.

puerperal eclampsia [L, *puerpus*, childbirth; Gk, *ek*, out, *lampein*, to flash], a condition of coma and convulsive seizures occurring after childbirth. It is associated with hypertension, edema, and proteinuria. See also **puerperal fever.**

puerperal fever, a syndrome associated with systemic bacterial infection and septicemia that occurs after childbirth, usually as a result of unsterile obstetric technique. It is characterized by endometritis, fever, tachycardia, uterine tenderness, and foul lochia. If it is untreated, prostration, renal failure, bacteremic shock, and death may occur. The causative organism is most often one of the hemolytic streptococci. Puerperal fever was little known before hospital childbirth became common, early in the nineteenth century; then it became an endemic and frequently epidemic scourge that resulted in the deaths of many thousands of mothers and infants. Maternal mortality rates of 20% and higher were common in parts of the world where childbirth occurred in hospitals. Ignaz Philipp Semmelweis, in Vienna, noted that women attended by midwives were much less likely to contract the disease than those attended by physicians and medical students. Midwives did not perform frequent vaginal examinations during labor and did not participate in autopsies. Although the germ theory of disease had not yet been elaborated, Semmelweis deduced that the causative agent of the disease was being transmitted by doctors and students from the infected cadavers in the autopsy room to women in labor on the maternity wards. After institution of a policy requiring that the hands and instruments of obstetric attendants be disinfected, the maternal mortality rate in his clinic dropped dramatically. His work was widely ignored or discredited for almost half a century because physicians were unwilling to believe that they were the agents of transmission. Late in the nineteenth century, after Pasteur's discovery of microbes, Semmelweis was posthumously vindicated. Sterile techniques were gradually instituted, but not until the fourth decade of the twentieth century did puerperal fever cease to be the leading cause of maternal death. Postpartum uterine infection is common but is effectively treated with massive parenteral doses of antibiotics before it becomes a systemic illness. Also called **childbed fever, puerperal sepsis.**

puerperal mania, a rare acute mood disorder that sometimes occurs in women after childbirth, characterized by a severe manic reaction. Compare **postpartum depression, postpartum psychosis.** See also **mania.**

puerperal mastitis [L, *puerpus*, childbirth; Gk, *mastos*, breast, *itis*, inflammation], a form of acute mastitis in a nursing mother.

puerperal metritis. See **puerperal fever.**

puerperal phlebitis [L, *puerpus*, childbirth; Gk, *phleps*, vein, *itis*, inflammation], an inflammation that begins in a uterine vein after childbirth and spreads to other veins, particularly the iliac and femoral veins.

puerperal psychosis. See **postpartum psychosis.**

puerperal sepsis, an infection acquired during the puerperium.

puerperium /pyo͞o′ərpir′ē·əm/ [L, *puerperus*], the time after childbirth, lasting approximately 6 weeks, during which the anatomical and physiological changes brought about by pregnancy resolve and a woman adjusts to the new or expanded responsibilities of motherhood and nonpregnant life.

PUFA, abbreviation for **polyunsaturated fatty acid.** See **unsaturated fatty acid.**

puff [ME *puf*], a short, soft, blowing sound heard on auscultation.

puffer fish /puf′er fish/, any of several species of marine fish of genera *Fugu, Sphaeroides, Tetraodon,* and others, which when disturbed can inflate themselves to a spherical shape. Their flesh contains tetrodotoxin and can cause fatal tetrodotoxism.

Pulex /pyo͞o′leks/ [L, flea], a genus of fleas, some species of which transmit arthropod-borne infections, such as plague and epidemic typhus.

pulmo-, pulmon-, prefix meaning "the lungs": *pulmogram, pulmolith, pulmometer.*

pulmoaortic /po͝ol′mō·ā·ôr′tik/, pertaining to the lungs and aorta.

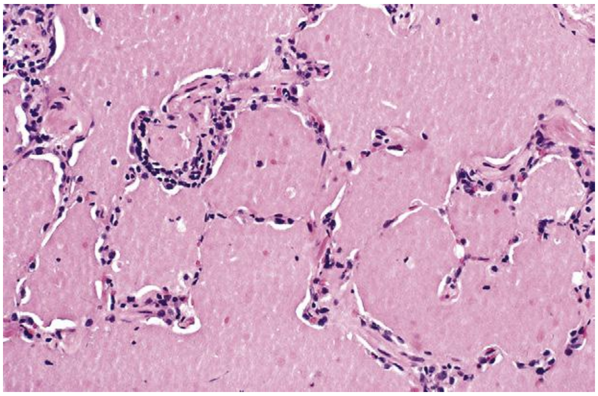
pulmon-. See **pulmo-.**

pulmonary /po͝ol′məner′ē/ [L, *pulmo*, lungs], pertaining to the lungs or the respiratory system. Also **pulmonic.**

pulmonary acid aspiration syndrome. See **Mendelson's syndrome.**

pulmonary agents. See **choking/lung/pulmonary agents.**

pulmonary alveolar proteinosis [L, *pulmoneus*, lungs, *alveolus*, little hollow; Gk, *proteios*, first rank, *osis*, condition], a condition in which the air sacs of the lungs become filled with protein and lipids, progressing to respiratory failure. The cause is unknown.



Pulmonary alveolar proteinosis

(Kumar et al, 2010)

pulmonary alveolus. See **alveolus.**

pulmonary angiography [L, *pulmoneus*, lungs; Gk, *angeion*, vessel, *graphein*, to record], the radiographic examination of the blood vessels of the lungs after the injection of radiopaque contrast medium into the pulmonary circulation. It is used to detect pulmonary emboli.

pulmonary anthrax. See **woolsorter's disease.**

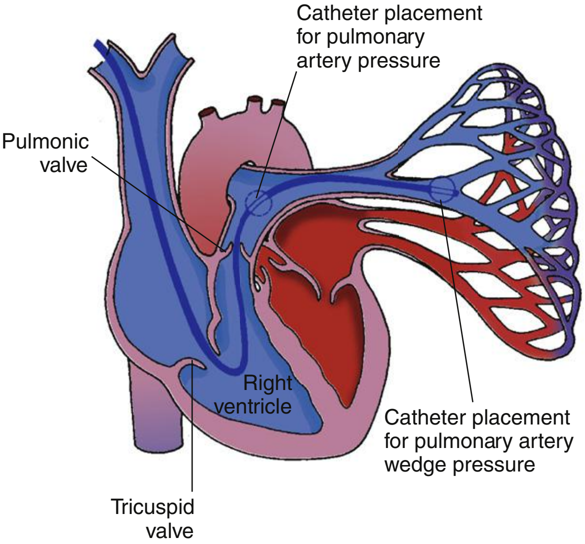
pulmonary arteriolar resistance (PAR), pressure loss per unit of blood flow from the pulmonary artery to a pulmonary vein.

pulmonary artery (PA) [L, *pulmoneus*, lungs; Gk, *arteria*, airpipe], one of two arteries, the left one supplying the left lung and the right one supplying the right lung. The lobar branches are named according to the lobe they supply, such as apical *(ramus apicalis)*.

pulmonary artery catheter [L, *pulmoneus,* lungs; Gk, *arteria* + *katheter,* a thing lowered], any of various cardiac catheters for measuring pulmonary arterial pressures, introduced into the venous system through a large vein and guided by blood flow into the superior vena cava, the right atrium and ventricle, and the pulmonary artery.

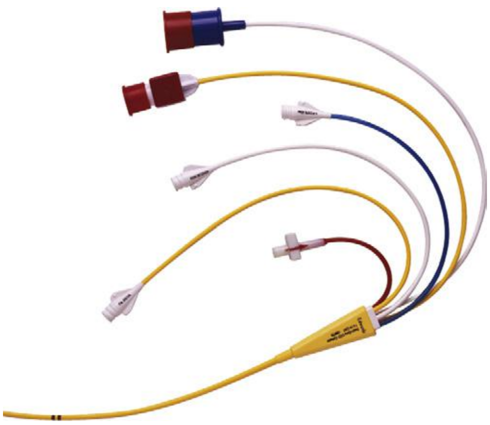
pulmonary artery wedge pressure. See **pulmonary wedge pressure.**

pulmonary atresia [L, *pulmoneus,* lungs; Gk, *a* + *tresis,* without perforation], a congenital heart defect of the right ventricular outflow tract. One form consists of an intact ventricular septum with an interatrial communication and a persistent patent ductus arteriosus. A more extreme form is the four-defect **tetralogy of Fallot.**



Catheter placement for pulmonary artery pressure
Pulmonic valve
Right ventricle
Catheter placement for pulmonary artery wedge pressure
Tricuspid valve

Placement of pulmonary artery catheter
(Ignatavicius and Workman, 2010)



Pulmonary artery catheter
(Courtesy Edwards Critical Care Division, Baxter Healthcare Corporation)

pulmonary atrium, any of the spaces at the end of an alveolar duct into which alveoli open.

pulmonary candidiasis [L, *pulmones,* lungs; L, *candidus,* white + Gk, *-iasis,* disease suffix], a type of fungal pneumonia caused by infection with *Candida* species, seen especially in immunocompromised patients or those with malignancies. Also called ***Candida* pneumonia.**

pulmonary capillary wedge pressure. See **pulmonary wedge pressure.**

pulmonary carcinosis. See **alveolar cell carcinoma.**

pulmonary circulation [L, *pulmoneus,* lungs, *circulare*], the blood flow through the network of vessels between the heart and the lungs for the oxygenation of blood and removal of carbon dioxide. Also called **lesser circulation.**

pulmonary compliance. See **compliance,** def. 2.

pulmonary congestion [L, *pulmoneus,* lungs, *congerere,* to heap together], an excessive accumulation of fluid in the lungs, usually associated with either an inflammation or congestive heart failure.

pulmonary disease, any abnormal condition of the respiratory system, characterized by cough, chest pain, dyspnea, hemoptysis, sputum production, stridor, or adventitious sounds. Less common symptoms include anxiety, arm and shoulder pain, tenderness in the calf of the leg, erythema nodosum, swelling of the face, headache, hoarseness, joint pain, and somnolence. Diagnostic procedures for pulmonary diseases include bronchoscopy; cytological, serological, and biochemical examination of bronchial secretions; laryngoscopy; pulmonary function tests; and radiography. Obstructive respiratory disease is the result of a reduction of airway size that impedes air flow. The obstruction may result from bronchospasm, edema of the bronchial mucosa, or excessive bronchial secretions. Obstructive disease is characterized by reduced expiratory flow rates and increased total lung capacity. Acute obstructive respiratory diseases include asthma, bronchitis, and bronchiectasis; chronic obstructive diseases include emphysema, chronic bronchitis, or combined emphysema and chronic bronchitis. Patients with obstructive diseases may have acute respiratory failure from any respiratory stress, such as infections or general anesthesia. Restrictive respiratory disease is caused by conditions that limit lung expansion, such as fibrothorax, obesity, a neuromuscular disorder, kyphosis, scoliosis, spondylitis, or surgical removal of lung tissue. Pregnancy causes a self-limiting restrictive disease in the third trimester. Characteristics of restrictive respiratory disease are decreased forced expired vital capacity and total lung capacity, with increased work of breathing and inefficient exchange of gases. Acute restrictive conditions are the most common pulmonary cause of acute respiratory failure. Infectious diseases include pneumonia and tuberculosis.

pulmonary dysmaturity syndrome, a respiratory disorder of premature infants in which the lungs contain focal emphysematous blebs and thickened alveolar walls. The infants commonly die of hypoxia.

pulmonary edema, the accumulation of extravascular fluid in lung tissues and alveoli, caused most commonly by congestive heart failure. Serous fluid is pushed through the pulmonary capillaries into alveoli and quickly enters bronchioles and bronchi. The condition also may occur in barbiturate and opiate poisoning, diffuse infections, hemorrhagic pancreatitis, and renal failure and after a stroke, skull fracture, near-drowning, inhalation of irritating gases, and rapid administration of whole blood, plasma, serum albumin, or IV fluids. See also **pleural effusion.**

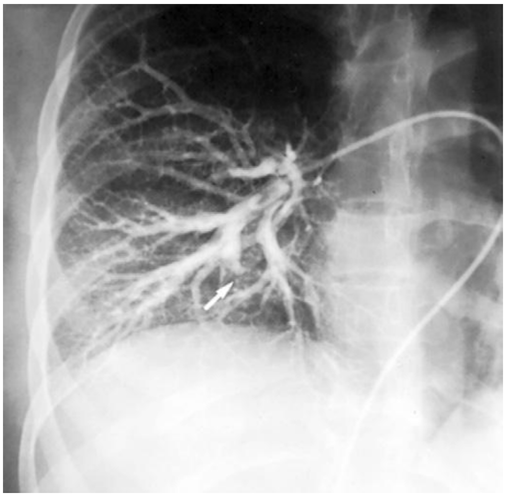
■ OBSERVATIONS: Signs and symptoms of pulmonary edema include tachypnea; labored, shallow respirations;

restlessness; apprehensiveness; air hunger; cyanosis; and blood-tinged or frothy pink sputum. The peripheral and neck veins are usually engorged, blood pressure and heart rate are increased, and the pulse may be full and pounding or weak and thready. There may be edema of the extremities, adventitious breath sounds in the lungs, respiratory acidosis, and profuse diaphoresis.

■ INTERVENTIONS: Acute pulmonary edema is an emergency condition requiring prompt treatment. The patient is given oxygen and placed in bed in a high Fowler's position, and IV morphine sulfate is usually administered immediately to relieve pain, to quiet breathing, and to allay apprehension. Morphine also acts as a pulmonary vasodilator. A cardiotonic, such as digitalis or DOBUTamine, and a fast-acting diuretic, such as furosemide or bumetanide, may be given. Oxygen may be ordered. While the patient is acutely ill, the blood pressure, respiration, apical pulse, and breath sounds are checked frequently or continually monitored. Parenteral fluids, if indicated, are infused slowly in limited quantities; a low-sodium diet is served; and the patient's intake and output of fluids are measured. The patient is weighed daily, and any sudden weight gain is noted and reported.

■ NURSING CONSIDERATIONS: The nurse provides continued care and emotional support and directs the patient to exercise to tolerance with frequent rest periods, to report any symptoms, to avoid smoking, and to follow the regimen ordered for medication, diet, and return checkups.

pulmonary embolism (PE), the blockage of a pulmonary artery by fat, air, tumor tissue, or a thrombus that usually arises from a peripheral vein (most frequently one of the deep veins of the legs). Predisposing factors include an alteration of blood constituents with increased coagulation, damage to blood vessel walls, and stagnation or immobilization, especially when associated with pregnancy and childbirth, congestive heart failure, polycythemia, or surgery. Pulmonary embolism is difficult to distinguish from myocardial infarction and pneumonia. It is characterized by dyspnea, anxiety, sudden chest pain, shock, and cyanosis. Pulmonary infarction, which often occurs within 24 hours after the formation of a pulmonary embolus, is further characterized by pleural effusion, hemoptysis, leukocytosis, fever, tachycardia, atrial arrhythmias, and striking distension of the neck veins. Analysis of blood gases reveals arterial hypoxia and hypocapnia. Pulmonary embolism is detected by chest radiographic films, pulmonary angiography, and radioscanning of the lung fields. Two thirds of patients with a massive pulmonary embolus die within 2 hours. Initial resuscitative measures include external cardiac massage, oxygen, vasopressor drugs, embolectomy, and correction of acidosis. The formation of further emboli is prevented by the use of anticoagulants, sometimes the use of streptokinase or urokinase, and also surgical intervention. Ambulation, exercise, and use of sequential compression devices on the lower extremities also are recommended for prevention. A vena cava filter may be inserted if pulmonary emboli recur.



Pulmonary embolism *(Black and Hawks, 2009)*

pulmonary emphysema, a chronic obstructive disease of the lungs, marked by an overdistension of the alveoli and destruction of the supporting alveolar structure. See also **emphysema.**

pulmonary fibrosis. See **fibrosis of the lungs.**

pulmonary function laboratory, an area of a hospital or other health facility used for examination and evaluation of patients' respiratory function.

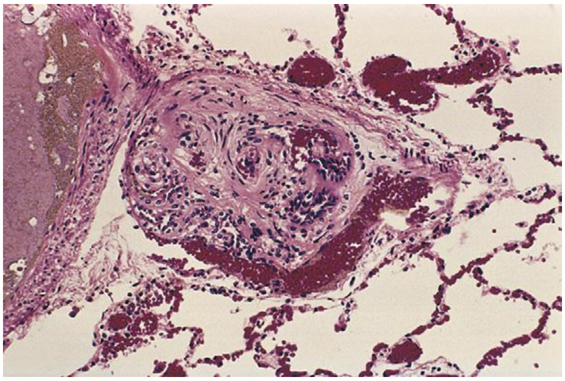
pulmonary function test (PFT), a procedure for determining the capacity of the lungs to exchange oxygen and carbon dioxide efficiently. There are two general kinds of respiratory function tests. One measures ventilation, or the ability of the bellows action of the chest and lungs to move gas in and out of alveoli; the other kind measures the diffusion of gas across the alveolar capillary membrane and the perfusion of the lungs by blood. Efficient gas exchange in the lungs requires a balanced ventilation-perfusion ratio, with areas receiving ventilation well perfused and areas receiving blood flow capable of ventilation. Basic ventilation studies are performed with a spirometer and recording device as the patient breathes through a mouthpiece and connecting tube; a nose clip prevents nasal breathing. Measurements or calculations are made of the tidal volume (TV), or gas inspired and expired in a normal breath; the inspiratory reserve volume (IRV), or the maximal volume that can be inspired after a normal respiration; the expiratory reserve volume (ERV), or the maximal volume that can be expired forcefully after a normal expiration; the residual volume (RV), or the gas remaining in the lungs after maximal expiration; and the minute volume, or the gas inspired and expired in 1 minute of normal breathing. The vital capacity of the lungs is equal to TV + IRV + ERV, and the total lung capacity to TV + IRV + ERV + RV. Bronchospirometric measurements of the ventilation and oxygen consumption of each lung separately are performed by using a specially constructed double-lumen catheter with two balloons. One balloon is inflated to seal off the contralateral lung when the other lung is tested. Arterial blood gas studies, including determinations of the acidity, partial pressure of carbon dioxide and of oxygen, and oxyhemoglobin saturation, provide information on the diffusion of gas across the alveolar capillary membrane and the adequacy of oxygenation of tissues. See also **blood gas determination, forced expiratory volume, maximum breathing capacity.**

pulmonary groove, a depression on each side of the vertebral bodies that accommodates the posterior part of the lung.

pulmonary hypertension, abnormally high blood pressure within the pulmonary circulation. See also **cor pulmonale.**

pulmonary infarction (PI) [L, *pulmoneus,* lungs, *infarcire,* to stuff], necrosis in a part of a lung caused by an obstruction in a branch of a pulmonary artery. See also **pulmonary embolism.**

pulmonary infiltrate with eosinophilia (PIE), a hypersensitivity reaction characterized by infiltration of alveoli



Vascular changes in pulmonary hypertension
(Kumar et al, 2010)

with eosinophils and large mononuclear cells, edema, and inflammation of the lungs. The simplest form of the condition, in which patchy, migratory infiltrates cause minimal symptoms, is a self-limited reaction elicited by helminthic infections and by certain drugs, such as paraaminosalicylic acid, sulfonamides, and chlorpropamide. A more prolonged illness, characterized by fever, night sweats, cough, dyspnea, weight loss, and more severe tissue reaction, occurs in certain drug allergies and in bacterial, fungal, and parasitic infections. Tropical eosinophilia with paroxysmal nocturnal asthma, dyspnea, cough, low-grade fever, and malaise is related to filarial infection and may occur in long-standing asthma and periarteritis nodosa. See also **Löffler's syndrome.**

pulmonary insufficiency [L, *pulmoneus,* lungs, *in* + *sufficere,* to suffice], a failure of the pulmonary valve to close properly.

pulmonary ligament, a thin bladelike fold of pleura extending from the hilum to the mediastinum that may stabilize the position of the inferior lobe of the lung and may also accommodate the down-and-up translocation of structures in the root during breathing.

pulmonary opening, opening of pulmonary trunk, pulmonary orifice.

pulmonary orifice, orifice of pulmonary trunk, the opening between the pulmonary trunk and the right ventricle of the heart. Also called *opening of pulmonary trunk*.

pulmonary oxygen toxicity [L, *pulmoneus,* lungs; Gk, *toxikon,* poison], a form of oxygen poisoning caused by breathing air having an oxygen concentration of 50% or higher for 12 to 24 hours. Pathophysiological effects include pulmonary capillary endothelial damage and alveolar epithelial cell destruction. Clinical manifestations include cough, substernal pain, nausea, vomiting, and atelectasis.

pulmonary pleura, the part of the pleural membrane that covers the lungs, as distinguished from the parietal layer of pleura that lines the inner aspect of the thoracic cavity. Also called **visceral pleura.**

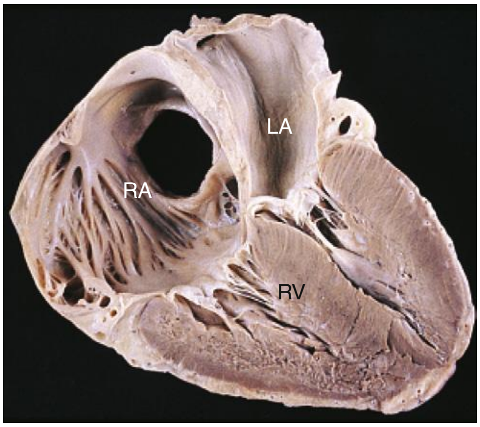
pulmonary renal syndrome, antiglioblastoma multiforma nephritis.

pulmonary stenosis, an abnormal cardiac condition generally characterized by concentric hypertrophy of the right ventricle with relatively little increase in diastolic volume. When the ventricular septum is intact, this condition may be caused by valvular stenosis, infundibular stenosis, or both; it produces a pressure difference during systole between the right ventricular cavity and the pulmonary artery. Pulmonary stenosis is most often congenital but also may be produced after birth by any of a number of types of lesions. Severe pulmonary stenosis may result in heart failure and death, but mild to moderate forms of this disorder are relatively well tolerated. Also called **pulmonic stenosis.** See also **congenital cardiac anomaly, valvular heart disease, valvular stenosis.**

pulmonary sulcus tumor, a destructive, invasive neoplasm that develops at the apex of the lung and infiltrates the ribs, vertebrae, and brachial plexus. Also called **Pancoast's tumor.**

pulmonary surfactant. See **surfactant,** def. 2.

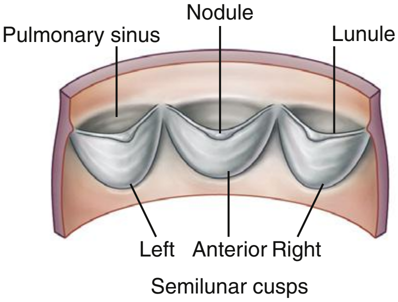
pulmonary trunk, the short, wide vessel that conveys venous blood from the right ventricle of the heart to the lungs. It is approximately 5 cm long and 3 cm in diameter, and it ascends obliquely, dividing into right and left branches.



Pulmonary stenosis *(Damjanov and Linder, 2000)*

pulmonary tuberculosis, infection of the lungs by *Mycobacterium tuberculosis*. The first infection is usually quiescent but may develop later into tuberculous pneumonia and other conditions. See also **tuberculosis.**

pulmonary valve, a cardiac structure composed of three semilunar cusps that close during each heartbeat to prevent blood from flowing back into the right ventricle from the pulmonary trunk. The cusps are separated by sinuses that resemble tiny buckets when they are closed and filled with blood. These flaps grow from the lining of the pulmonary trunk. When they collapse from the ejection of ventricular blood, they open the valve and allow deoxygenated blood to flow through the pulmonary artery and on to the lungs. Compare **aortic valve, mitral valve, tricuspid valve.**



Pulmonary valve *(Drake, Vogl, and Mitchell, 2010)*

pulmonary vascular resistance (PVR), the resistance in the pulmonary vascular bed against which the right ventricle must eject blood.

pulmonary vein, one of two pairs of large vessels that return oxygenated blood from each lung to the left atrium of the heart. The right pulmonary veins pass dorsal to the right atrium and the superior vena cava. The left pulmonary veins pass ventral to the descending thoracic aorta. Compare **pulmonary trunk.**

pulmonary ventilation. See **respiration,** def. 2.

pulmonary wedge pressure (PWP), the pressure produced by an inflated latex balloon against the inner wall of a pulmonary artery. A pulmonary artery catheter or similar balloon-tipped catheter is inserted through a subclavian, jugular, or femoral vein to the vena cava and on through the right atrium and ventricle to the pulmonary artery. The balloon is inflated briefly, during which time it measures left ventricular diastolic pressure. The procedure is used in the diagnosis of congestive heart failure, myocardial infarction, and other conditions. Also called **pulmonary artery wedge pressure.**

pulmonary Wegener's granulomatosis, a rare fatal disease of young or middle-aged men, characterized by granulomatous lesions of the respiratory tract, focal necrotizing arteritis, and finally widespread inflammation of body organs. Pulmonary infarction and glomerulonephritis may occur.

pulmonic. See **pulmonary.**

-pulmonic, suffix meaning "the lungs": *apulmonic, gastropulmonic, intrapulmonic.*

pulmonic stenosis. See **pulmonary stenosis.**

pulmonologist /po͝ol′mə·nol′ə·jist/ [L, *pulmo,* lung], an individual skilled in pulmonology.

pulmonology /po͝ol′mōnol′ə·jē/ [L, *pulmo,* lung], the science concerned with the anatomy, physiology, and pathology of the lungs.

pulp [L, *pulpa,* flesh], any soft, coherent, solid, spongy tissue, such as that contained within the spleen, the pulp chamber of the tooth, or the distal subcutaneous pads of the fingers and the toes. **—pulpy,** *adj.*

pulp abscess [L, *pulpa,* flesh + *abscedere,* to go away], an abscess that develops in the pulp cavity of a tooth.

pulpaceous /pulpā′shəs/, pertaining to a substance that is pulpy or macerated.

pulpal /pul′pəl/, pertaining to pulp.

pulp amputation. See **pulpotomy.**

pulp canal, the space occupied by the nerves, blood vessels, and lymphatic vessels in the radicular part of the tooth. The internal anatomy of the tooth progresses apically from the pulp chamber to pulp canal to the apex. Also called **root canal.**

pulp canal therapy. See **root canal therapy.**

pulp cavity, the space in a tooth bounded by the dentin and containing the dental pulp. It is divided into the pulp chamber and the pulp canal.

pulp chamber, the space occupied by the nerves, blood vessels, and lymphatic vessels deep within the crown of the tooth. Internal anatomy of the tooth progresses from pulp chamber to pulp canal to apex.

pulpectomy /pulpek′təmē/ [L, *pulpa,* flesh; Gk, *ektomē,* excision], the surgical removal of all or part of the pulp of a tooth.

pulpifaction /pul′pifak′shən/, the act of reducing something to a pulp.

pulpitis /pulpī′tis/, infection or inflammation of the dental pulp.

pulpless tooth /pulp′ləs/, a tooth in which the dental pulp is necrotic or has been removed. Also called **devital tooth, nonvital tooth.**

pulpodontia. See **endodontics.**

pulpotomy /pul·pot′ə·mē/, root canal therapy consisting of partial excision of the dental pulp. Also called **pulp amputation.**

pulp pinch. See **pinch.**

pulp stone. See **denticle.**

pulp test. See **vitality test.**

pulpy. See **pulp.**

pulpy nucleus, the central part of each intervertebral disk, consisting of a pulpy elastic substance that loses some of its resiliency with age. The nucleus pulposus may be suddenly compressed and squeeze out through the annular fibrocartilage, causing a herniated disk and extreme pain. Also called **nucleus pulposus.**

pulsate /pul′sāt/ [L, *pulsare,* to beat], to throb or vibrate rhythmically, as does the heart during its contraction-relaxation cycle.

pulsatile /pul′sətil/ [L, *pulsare,* to beat], pertaining to an activity characterized by a rhythmic pulsation.

pulsatile assist device (PAD), a flexible, valveless balloon conduit contained within a rigid, plastic cylinder that is inserted into the arterial circulation to provide pulsatile perfusion during a cardiopulmonary bypass.

pulsatile hematoma. See **pseudoaneurysm.**

pulsatility index /pul′sətil′itē/, a measure of the variability of blood velocity in a vessel, equal to the difference between the peak systolic and minimum diastolic velocities divided by the mean velocity during the cardiac cycle.

pulsating exophthalmos /pul′sāting/ [L, *pulsare,* to beat; Gk, *ex* + *ophthalmos,* eye], an eye disorder characterized by a bulging, pulsating eyeball, caused by an arteriovenous aneurysm involving the internal carotid artery and the cavernous sinus of the orbit.

pulsation /pəl·sā′shən/ [L, *pulsatio*], a throb or rhythmical beat, as of the heart.

pulse [L, *pulsare,* to beat], **1.** a rhythmic beating or vibrating movement. **2.** a brief electromagnetic wave. **3.** the regular, recurrent expansion and contraction of an artery, produced by waves of pressure caused by the ejection of blood from the left ventricle of the heart as it contracts. The pulse is easily detected on superficial arteries, such as the radial and carotid arteries, and corresponds to each beat of the heart.

pulse curve. See **sphygmogram.**

pulsed Doppler, a type of Doppler device that transmits a short-duration burst of sound into the region to be examined. The Doppler-shifted signals are processed from a limited depth range. The depth range is determined by a sample gate whose position and size usually can be selected by the instrument operator.

pulse deficit, a condition in which a peripheral pulse rate is less than the ventricular contraction rate as auscultated at the apex of the heart or seen on the electrocardiogram, indicating a lack of peripheral perfusion.

pulsed laser, a laser that emits short bursts of energy at fixed intervals rather than a continuous stream of energy.

pulse duration (P.D., PD), (in ultrasonics) a measure of the time a transducer oscillates for each pulse. The shorter the pulse duration, the better the axial resolution.

pulse-echo response profile, a graph of the amplitude of an ultrasound echo from a small reflector versus the distance from the reflector beam axis. The reflector is scanned perpendicular to the axis of the ultrasound transducer beam.

pulse-echo ultrasound, a diagnostic technique in which short-duration ultrasound pulses are transmitted into the region to be studied, and echo signals resulting from scattering and reflection are detected and displayed. The depth of a reflective structure is inferred from the delay between pulse transmission and echo reception.

pulse generator, the power source for a cardiac pacemaker system, usually fueled by lithium, supplying impulses to the implanted electrodes either at a fixed rate or in some programmed pattern.

pulse height analyzer, a device that accepts or rejects electronic pulses according to their amplitude or energy, commonly used to select certain gamma radiation energies.

pulseless disease. See **Takayasu's arteritis.**

pulseless electrical activity (PEA), continued electrical rhythmicity of the heart in the absence of effective mechanical function. It may be caused by the uncoupling of ventricular muscle contraction from electrical activity or may be a result of cardiac damage with respiratory failure and cessation of cardiac venous return. Also called **electromechanical dissociation.**

pulse MR, a magnetic resonance (MR) technique that uses radiofrequency pulses and Fourier transformation of the MR signal. Pulse MR has largely replaced older, continuous-wave techniques.

pulse oximeter, a optical device that measures the amount of oxygen-saturated hemoglobin in the tissue capillaries by transmitting a beam of light through the tissue to a receiver. This noninvasive method of measuring the saturated hemoglobin is a useful screening tool for determining basic respiratory and cardiovascular function. This cliplike device may be used on an earlobe, across the bridge of the nose, in the mouth, on a toe, or on a fingertip. As the amount of saturated hemoglobin alters the wavelengths of the transmitted light, analysis of the received light is translated into a percentage of oxygen saturation (SO_2) of the blood. Also called *(informal) pulse ox*. Compare **blood gas determination.**

pulse point, one of the sites on the surface of the body where arterial pulsations can be easily palpated. The most commonly used pulse point is over the radial artery at the wrist. Other pulse points include the temporal artery in front of the ear; the common carotid artery at the lower level of the thyroid cartilage; the facial artery at the lower margin of the jaw; and the femoral, popliteal, posterior tibialis, and dorsalis pedis pulse points.

pulse pressure, the difference between the systolic and diastolic blood pressures, normally 30 to 50 mm Hg.

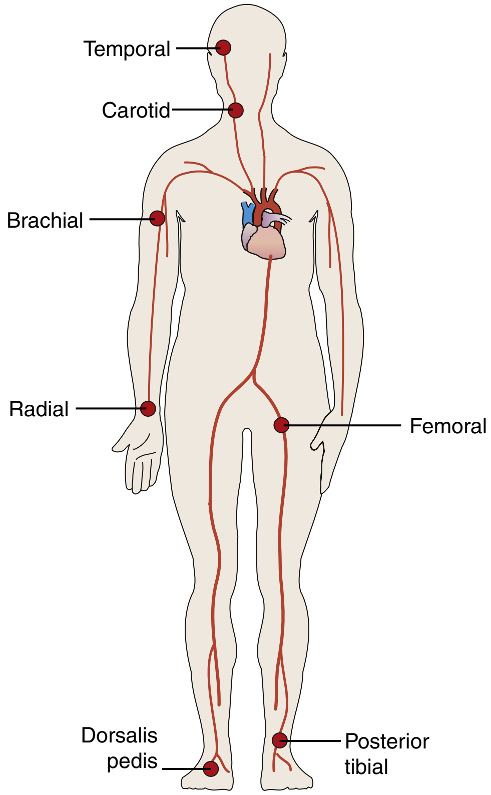
pulser /pul′sər/, a component of an ultrasound instrument that provides signals for exciting the piezoelectric transducer in order to transmit an ultrasound beam.

pulse rate [L, *pulsare* + *reri,* to calculate], the number of pulse beats per minute, normally the same as the heart rate. The normal pulse rate in an average adult varies from 60 to 80 beats/min, with fluctuations occurring with exercise, injury, illness, and emotional reactions. The average pulse rate for a newborn is 120 beats/min, which slows throughout childhood and adolescence. At about 12 years of age, females begin to have a higher pulse rate than males.

pulse repetition frequency (PRF), (in ultrasonics) the number of acoustic pulses transmitted per second.

pulse sequence, the sequence of radiofrequency pulses and magnetic gradients used to generate a magnetic resonance image.

PULSES profile, an assessment tool that measures six functions and factors to evaluate the degree of independence possessed by a disabled individual. The score is used in the assessment of progress made in rehabilitation as well as to help identify the severity of disability. The six are: *P*hysical condition (i.e., general health), *U*pper limb function, *L*ower limb function, *S*ensory function, *E*xcretory function, and *S*upport (e.g., social, psychological, financial support).



Pulse points *(LaFleur Brooks and LaFleur Brooks, 2012)*

pulse wave [L, *pulsare,* to beat; AS, *wafian*], a transient increase in blood pressure that spreads like a wave through the arterial system. It begins with the ejection of blood by the ventricles during systole.

pulse width. See **duration.**

-pulsion, suffix meaning the "action or condition of pushing forward": *compulsion, lateropulsion, retropulsion*.

pulsus alternans /pul′səs ôl′tərnanz/ [L, *pulsare* + *alternare,* to alternate], a pulse characterized by a regular alternation of weak and strong beats without changes in the pulse rate. Also called **alternans, alternating pulse.**

pulsus magnus. See **full pulse.**

pulsus paradoxus, an abnormally large decrease in systolic blood pressure and pulse wave amplitude during inspiration. The normal fall in pressure is less than 10 mm Hg. An excessive decline may be a sign of tamponade, adhesive pericarditis, severe lung disease, advanced heart failure, or other conditions. Also called **paradoxic pulse.**

pulsus parvus et tardus [L, *pulsus,* beat, *parvus,* small, *tardus,* slow], a small pulse with low pressure that rises and falls gradually. The condition occurs in aortic stenosis.

pulsus tardus [L, *pulsus,* beat, *tardus,* slow], a pulse with a gradual rise and fall in amplitude.

pultaceous, pertaining to a substance that is pulpy or macerated.

pulverize /pul′vərīz/ [L, *pulvis,* dust], to reduce to a fine powder.

pulverulent /pulver′ələnt/, having the form of a fine powder.

pulvule /pul′vyo͞ol/ [L, *pulvis,* dust], a proprietary type of capsule containing a dose of a drug in powder form.

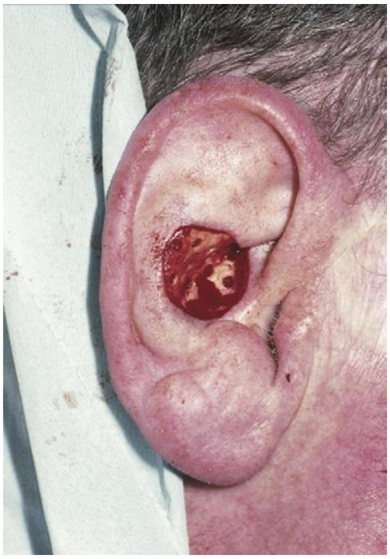
pumice /pum′is/ [L, *pumex*], a finely divided volcanic rock used in powdered or solid form for smoothing or polishing surfaces.

pump [ME, *pumpe*], **1.** *n,* an apparatus used to move fluids or gases by suction or positive pressure, such as an infusion pump or stomach pump. **2.** *n,* a physiological mechanism by which a substance is moved, usually by active transport across a cell membrane, such as a sodium-potassium pump. **3.** *v,* to move a liquid or gas by suction or positive pressure.

pump lung. See **adult respiratory distress syndrome.**

pump oxygenator [ME, *pumpe* + Gk, *oxys,* sharp, *genein,* to produce], a device that pumps oxygenated blood through the body during cardiopulmonary surgery.

punch biopsy [L, *pungere,* to prick; Gk, *bios,* life, *opsis,* view], the removal of living tissue for microscopic examination, usually bone marrow aspirates from the sternum, by means of a punch. Compare **exfoliative cytology, needle biopsy.**



Punch biopsy on the ear *(White and Cox, 2006)*

punchdrunk syndrome, a condition resulting from repeated cerebral concussions, characterized by an abnormal gait, slow movement, tremor, and slurred or halting speech.

punch forceps, a surgical instrument used to cut out a disk of dense or resistant tissue, such as bone and cartilage. The ends of the blades of the punch forceps are perforated to grip the involved tissue. There are several varieties of this instrument, with blades and tips specially designed for different surgical needs.

punct-, prefix meaning “a point, or like a point”: *punctate, punctiform, punctograph.*

punctate /pungk′tāt/ [L, *punctum,* point], marked with elevated or colored dots or punctures.

punctiform /pungk′tifôrm/, of very small size, as is a bacterial colony in a solid medium.

punctum /pungk′təm/, a physiological area or point.

punctum caecum, blind spot.

punctum lacrimale /lak′rimā′lē/ *pl. puncta lacrimalia* [L, *punctum,* prick, *lacrima,* tear], a minute circular aperture in the medial opening into the nasolacrimal sac. The puncta drain the tears that travel from the lacrimal glands through the lacrimal ducts to the conjunctiva. Puncta clogged with mucus or dirt cause irritation and discomfort.

puncture /pungk′chər/ [L, *punctura*], **1.** *v,* to prick or pierce a surface, as with a needle or knife. **2.** *n,* a wound or opening made by piercing.

puncture of the antrum [L, *punctura* + Gk, *antron,* cave], a cavity or hollow, as is made in piercing the wall of the maxillary sinus to drain pus.

puncture wound [L, *punctura* + AS, *wund*], a traumatic injury caused by skin penetration by an object, such as a knife, nail, or slender fragment of metal, wood, glass, or other material. In such an injury to the eye, a lung, or a visceral organ, the object or implement is not removed until the person has been transported to a medical facility. Minor puncture wounds are treated with thorough cleansing. If a puncture wound is allowed to close at the skin before deeper healing has occurred, suppuration often results. A tetanus toxoid immunization is usually given for such wounds.

punitive damages. See **damages.**

Punnett square [Reginald C. Punnett, English geneticist, 1875–1967; OFr, *esquarre*], a matrix that shows all of the possible combinations of male and female gametes when one or more pairs of independent alleles are crossed. Letters representing the male and female gametes are placed along the left side and the top of the matrix, respectively. The genotypes of the offspring produced by each pairing of gametes occupy the cells in the matrix. See also **pedigree.**

Punnett square *(Patton and Thibodeau, 2007)*

P.U.O., abbreviation for *pyrexia of unknown origin.*

pupa /pyo͞o′pə/ [L, doll], a stage between the larval and adult stages in the life cycle of many insects, including flies, butterflies, and beetles. It has the basic external features of the adult form but without expanded wings.

pupil /pyo͞o′pəl/ [L, *pupa,* doll], a circular opening in the iris of the eye, located slightly to the nasal side of the center of the iris. Like the iris, the pupil lies posterior to the cornea and the anterior chamber of the eye and is anterior to the lens. Its diameter changes with contraction and relaxation of the muscular fibers of the iris as the eye responds to changes in light, emotional states, and autonomic stimulation. The pupil is the window of the eye through which light passes to the lens and the retina. See also **dilator pupillae, sphincter pupillae. —pupillary,** *adj.*

pupill-. See **pupillo-.**

pupillary /pyo͞o′piler′ē/ [L, *pupilla*], pertaining to the pupil.

pupillary reflex. See **accommodation reflex, light reflex.**

pupillary ruff, a brown wrinkled rim on the edge of the pupil, derived from posterior pigment epithelium of the iris.

pupillary skin reflex. See **ciliospinal reflex.**

pupillo-, pupill-, prefix meaning "the pupil": *pupillometer, pupilloplegia, pupillostatometer.*

pupillometry /pyo͞o′pilom′ətrē/, the measurement of the pupil.

pupillomotor /pyo͞o′pilōmō′tər/, pertaining to the autonomic nerve fibers of the smooth muscles of the iris.

PUPPP /pup/, abbreviation for **pruritic urticarial papules and plaques of pregnancy.**

PUPs, abbreviation for *previously untreated patients,* usually infants participating in clinical trials.

pur-, prefix meaning "pus": *puric, puriform, purohepatitis.*

pure /pyo͞or/, **1.** free of contamination by extraneous matter. **2.** a state in which a substance contains nothing other than itself.

pure dwarf. See **primordial dwarf.**

pure science. See **science.**

pure tone audiometry. See **audiometry.**

purgation. See **catharsis.**

purgative /pur′gətiv/ [L, *purgare,* to purge], a strong medication usually administered by mouth to promote evacuation of the bowel or to produce several bowel movements.

purge /purj/ [L, *purgare*], **1.** *v*, to evacuate the bowels, as with a cathartic. **2.** *n*, a cathartic. **3.** *v*, to make free of an unwanted substance. **—purgative,** *n., adj.*

purified cotton, cotton freed from impurities, bleached, and sterilized. It is used as a surgical dressing.

purified protein derivative (PPD) /pyo͞o′rifīd/, a dried form of tuberculin used in testing for past or present infection with tubercle bacilli. This product is usually introduced into the skin during such tests and may produce a tuberculin reaction (wheal) within 48 to 72 hours. See also **tuberculin test, tuberculosis.**

purine /pyo͞o′rēn/ [L, *purus,* pure, *urina,* urine], any one of a large group of nitrogenous compounds. Purines are produced as end products in the digestion of certain proteins in the diet, but some are synthesized in the body. Purines are also present in many medications and other substances, including caffeine, theophylline, and various diuretics, muscle relaxants, and myocardial stimulants. Hyperuricemia may develop in some people as a result of an inability to metabolize and excrete purines. A low-purine diet or a purine-free diet may be required. Foods that are high in purines include anchovies and sardines; sweetbreads, liver, kidneys, and other organ meats; legumes; and poultry. The foods lowest in purine content include eggs, fruit, cheese, nuts, sugar, gelatin, and vegetables other than legumes.

purine base [L, *purus,* pure], any of the purine derivatives found in animal waste products or in nucleic acids. They include hypoxanthine, xanthine, and uric acid (waste products), and adenine and guanine (nucleic acids).

purine-free diet, a diet that excludes foods that are rich sources of purines. Foods particularly high in purines include organ meats, such as liver, kidney, and sweetbreads, as well as red meats, poultry, and fish. Those items can be replaced by milk, eggs, cheese, and some vegetable sources of protein. See also **purine.**

purine-low diet, a diet that excludes some foods rich in purines, such as certain meat products, fish, and poultry, and particularly anchovies, meat extracts, sardines, and organ meats. Also called **low-purine diet.**

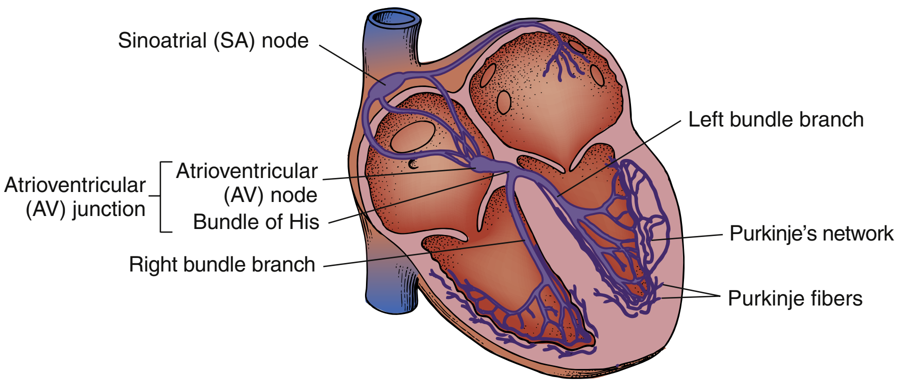
purine-restricted diet. See **low-purine diet.**

Purinethol, a trademark for an antineoplastic **(mercaptopurine).**

Purkinje's cells /pərkin′jēz, pur′kinjēz, -jāz/ [Johannes E. Purkinje, Czech physiologist, 1787–1869], large neurons with dendrites that extend to the molecular lay and provide the only output from the cerebellar cortex after the cortex processes sensory and motor impulses from the rest of the nervous system.

Purkinje's fiber [Johannes E. Purkinje], one of the myocardial fibers that are the termination of the bundle branches. The fibers comprise part of the conduction system of the heart. See also **Purkinje's network.**

Purkinje's network [Johannes E. Purkinje], a complex fibrous network of large muscle cells that spread through the right and the left ventricles of the heart and carry the impulses that contract those chambers almost simultaneously. The fibers that connect with Purkinje's fibers start in the atrioventricular (AV) node in the right atrium of the heart, along the lower part of the interatrial septum. Impulses generated in the sinoatrial node travel through the muscle fibers of both atria of the heart, starting atrial contraction. As the impulse enters the AV node from the right atrium, it allows both atria to contract completely before the impulse spreads into the ventricles. The velocity of the impulse increases after the impulse leaves the AV node and spreads via the atrioventricular bundle (bundle of His) to the bundle branches,



Purkinje's network *(Phillips, 2012)* and finally to Purkinje's fibers. Purkinje's fibers are larger in diameter than ordinary cardiac muscle fibers and contain relatively few peripheral myofibrillae. They have abundant sarcoplasm and larger central nuclei than ordinary cardiac muscle. See also **cardiac cycle, intraventricular block.**

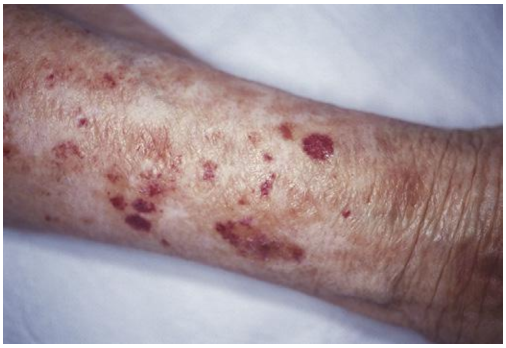
purposeful activity /pur′pəsf͝ool/, activity that depends on consciously planned and directed involvement of the person. It is believed that conscious involvement in body movements enhances the development of sensorimotor control and coordination during therapeutic or rehabilitative exercises.

purpur-, prefix meaning "purple": *purpuriferous, purpuriparous, purpurogenous*.

purpura /pur′pyərə/ [L, purple], any of several bleeding disorders characterized by hemorrhage into the tissues, particularly beneath the skin or mucous membranes, producing ecchymoses or petechiae. The two major kinds of purpura are **thrombocytopenic purpura** and **nonthrombocytopenic purpura.** **—purpuric,** *adj*. Compare **petechiae** and **ecchymosis**.

purpura rheumatica [L, *purpura,* purple; Gk, *rheum,* flow], a distinctive clinical sign associated with hemorrhages of the skin and other tissues. The lesions are red or purple and do not blanche on pressure. Purpura is related to either a disorder of the blood or an abnormality affecting the blood vessels.

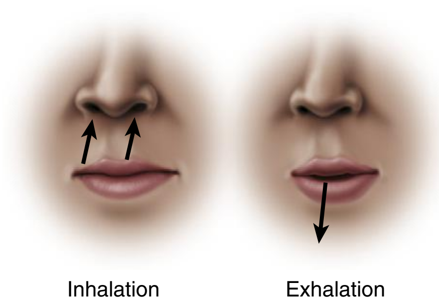
purpura senilis /senē′lis/ [L, *purpura,* purple, *senilis,* aged], a skin condition affecting older people and characterized by fragile blood vessel walls that rupture on minimal trauma. Also called **senile purpura.**



Purpura senilis *(Swartz, 2009)*

purpuric. See **purpura.**

pursed-lip breathing /purst-/, respiration characterized by deep inspirations followed by prolonged expirations through pursed lips. It is done to increase expiratory airway pressure, improve oxygenation of the blood, and help prevent early airway closure.



Pursed-lip breathing *(Harkreader, Hogan, and Thobaben, 2007)*

purse-string suture [L, *sutura*], a continuous suture placed in a circle about a round wound. The opening is closed by tightly drawing the ends of the suture together.

purulence /pyo͞or′(y)ələns/ [L, *purulentus,* pus formation], the condition of producing or discharging pus. Also called **purulency.**

purulent /pyo͞or′(y)ələnt/ [L, containing pus], producing or containing pus.

purulent conjunctivitis [L, *purulentus,* pus formation, *conjunctivus,* connecting; Gk, *itis,* inflammation], an inflammation of the conjunctiva caused by suppurative microorganisms, including species of *streptococci, gonococci,* and *pneumococci*.

purulent diarrhea [L, *purulentus,* pus formation; Gk, *dia* + *rhein,* to flow], diarrhea in which stools contain pus, a sign of a purulent GI tract infection.

purulent inflammation [L, *purulentus,* pus formation, *inflammare,* to set afire], an inflammation that is accompanied by the formation of pus.

purulent iritis [L, *purulentus,* pus formation; Gk, *iris,* rainbow, *itis,* inflammation], an inflammation of the iris accompanied by the formation of pus.

purulent keratitis [L, *purulentus,* pus formation; Gk, *keras,* horn, *itis,* inflammation], a severe form of keratitis leading to disintegration of the cornea if untreated. The condition commonly begins with a bacterial infection of the lacrimal sac, occurs frequently in elderly patients who have poor nutrition, and spreads into a pus-producing ulcer.

purulent pancreatitis [L, *purulentus,* pus formation; Gk, *pan,* all, *kreas,* flesh, *itis,* inflammation], inflammation of the pancreas accompanied by pus formation.

purulent rhinitis [L, *purulentus,* pus formation; Gk, *rhis,* nose, *itis,* inflammation], an infection of the nasal mucosa that is accompanied by pus formation. The condition is often secondary to a systemic infection, such as measles.

purulent synovitis [L, *purulentus,* pus formation; Gk, *syn,* together; L, *ovum,* egg], an inflammation of the synovial membrane of a joint with pus formation in the cavity.

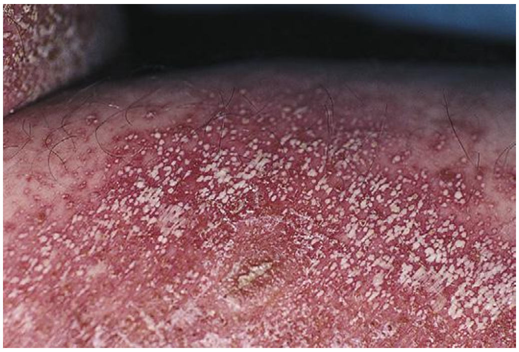
pus [L, corrupt matter], a creamy, viscous fluid exudate that is the result of fluid remains of necrosis of tissues. It is usually pale yellow to yellow green, sometimes whitish, and sometimes bloody. Its main constituent is an abundance of polymorphonuclear leukocytes. Bacterial infection is its most common cause. The character of the pus, including its color, consistency, quantity, or odor, may be of diagnostic significance.

pus cell, a necrotic polymorphonuclear leukocyte, a major component of pus. Also called *pus corpuscle*.

push-up block. See **handblock.**

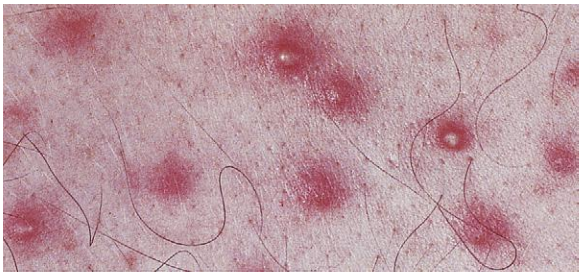
pus in urine [L, *pus* + Gk, *ouron,* urine], the presence of pus in a urine sample, indicating a urinary tract infection anywhere from the kidneys to the urethra. Cloudiness in urine may be caused by either pus or chemicals, a difference determined by simple laboratory tests.

pustular psoriasis [L, *pustula,* blister; Gk, *psoriasis,* itch], a severe form of psoriasis consisting of bright red patches and sterile pustules all over the body. Crops of lesions lasting 4 to 7 days occur every few days in cycles over weeks or months. Recurrences are inevitable. Fever, leukocytosis, and hypoalbuminemia are associated. In rare cases, hypovolemia and kidney failure occur. Hospitalization may be necessary for fluid replacement, steroid therapy, and sedation. Compare **guttate psoriasis.** See also **psoriasis.**



Pustular psoriasis *(Callen et al, 2000)*

pustule /pus′cho͞ol/ [L, *pustula*], a small circumscribed elevation of the skin containing fluid that is usually purulent. **—pustular,** *adj.*



Pustule *(du Vivier, 2002)*

putamen /pyo͞otā′mən/ [L, *putamen,* husk], a part of the lentiform nucleus that is lateral to the globus pallidus. It is associated with the corpus striatum and receives connections from the suppressor centers of the cortex.

putrefaction /pyo͞o′trəfak′shən/ [L, *puter,* rotten, *facere,* to make], the decay of enzymes, especially proteins, that produces foul-smelling compounds, such as ammonia, hydrogen sulfide, and mercaptans. **—putrefactive,** *adj.*

putrefactive /-fak′tiv/ [L, *puter,* rotten, *facere,* to make], causing, promoting, or relating to putrefaction.

putrefy /pyo͞o′trəfī/ [L, *puter,* rotten, *facere,* to make], to decay, with the production of foul-smelling substances, especially putrescine and mercaptans associated with the decomposition of animal tissues and proteins.

putrescine /pyo͞o′tresēn/, a foul-smelling toxic ptomaine produced by the decomposition of the amino acid ornithine during the decay of animal tissues, bacillus cultures, and fecal bacteria.

putrid /pyo͞o′trid/ [L, *putridus,* rotten], decomposed.

putromaine /pyo͞otrō′mān/, any toxin produced by the decay of food within a living body.

PUVA, an abbreviation for a psoriatic photochemotherapy treatment consisting of a medication called *p*soralen plus *u*ltra*v*iolet light of *A* (long) wavelength.

P value, (in research) the statistical probability of the occurrence of a given finding by chance alone in comparison with the known distribution of possible findings, considering the kinds of data, the technique of analysis, and the number of observations. The P value may be noted as a decimal: P <.01 means that the likelihood that the phenomena tested occurred by chance alone is less than 1%. The lower the P value, the less likely the finding would occur by chance alone.

PVB. See **VBP.**

PVC, **1.** abbreviation for **polyvinyl chloride. 2.** abbreviation for **premature ventricular complex.**

PVP-I, abbreviation for **povidone-iodine.**

PVR, abbreviation for **pulmonary vascular resistance.**

pW, abbreviation for *picowatt.*

PWA, abbreviation for *person with AIDS.*

P wave, the component of the cardiac cycle shown on an electrocardiogram as an inverted U-shaped curve that follows the T wave and precedes the QRS complex. It represents atrial depolarization.

P′ wave (P prime wave), a P wave that is generated from a site other than the sinus node; an ectopic P wave.

PWP, abbreviation for **pulmonary wedge pressure.**

pyaemic embolism. See **pyemic embolism.**

pycno-, pykno-, prefix meaning “density or thickness”: *pyknometer, pyknophrasia.*

pyel-. See **pyelo-.**

pyelitis /pī′əlī′tis/, an inflammation of the renal pelvis, often accompanied by symptoms such as pain and tenderness in the loins, irritability of the bladder, bloody or purulent urine, and a peculiar pain on flexion of the thigh. See also **pyelonephritis.**

pyelo-, pyel-, prefix meaning “pelvis or kidney”: *pyelocaliectasis, pyelocystitis, pyelograph.*

pyelogram /pī′əlōgram′/ [Gk, *pyelos,* pelvis, *gramma,* record], a radiographic picture of the kidneys and ureters taken after the IV or intraureteral injection of a radiopaque contrast medium. It shows the size and location of the kidneys, the outline of the ureters and bladder, the filling of the renal pelves, the patency of the urinary tract, and any cysts or tumors within the kidneys. Preparation for an IV pyelogram includes withholding of fluids for 8 hours and testing for sensitivity to the iodine in the contrast medium; people with known sensitivity are not tested lest anaphylaxis occur. Patients able to tolerate the contrast medium may feel warm and experience a salty taste when it is injected. Retrograde pyelograms, which demonstrate filling of the renal collecting structures, are taken after the contrast medium is injected into the ureters by means of catheters in a cystoscope introduced through the urethra into the bladder. Also called **urogram.**

pyelography. See **intravenous pyelography.**

pyelointerstitial backflow, backflow of fluid from the renal pelvis into interstitial tissue under certain conditions of back pressure.

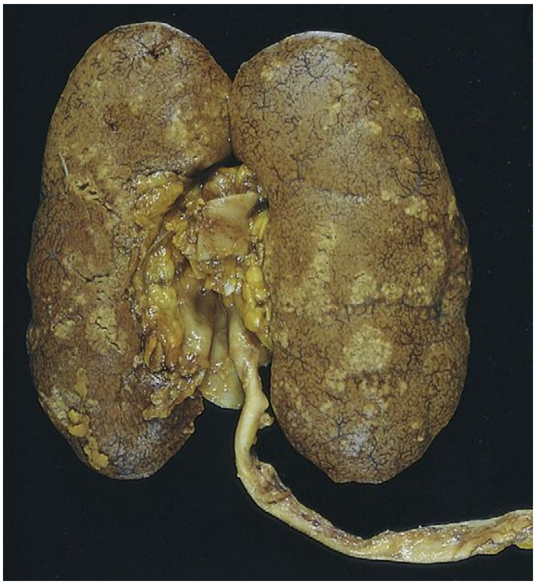
pyelolithotomy /pī′əlō′lithot′əmē/, a surgical procedure in which renal calculi are removed from the pelvis of the ureter.

pyelonephritis /pī′əlōnəfrī′tis/ [Gk, *pyelos* + *nephros,* kidney, *itis,* inflammation], a diffuse pyogenic infection of the pelvis and parenchyma of the kidney. **Acute pyelonephritis** usually results from an infection that ascends from the lower urinary tract to the kidney. *Escherichia coli* contamination of the urethral meatus is a common cause in females. Infection may spread to the kidney from other locations in the body. The onset of acute pyelonephritis is rapid and characterized by fever, chills, pain in the flank, nausea, and urinary frequency. Urinalysis reveals the presence of bacteria and white blood cells (WBCs). Antimicrobial treatment is continued for 10 days to 2 weeks. Relapse or reinfection is common. **Chronic pyelonephritis** develops slowly after bacterial infection of the kidney and may progress to renal failure. Most cases are associated with some form of obstruction, such as a stone or a stricture of the ureter. Treatment includes removal of the cause of obstruction and long-term antimicrobial therapy.

■ OBSERVATIONS: The onset of symptoms is fairly rapid and is characterized by dull, constant flank pain, chills, and fever. Concomitant signs of a lower urinary tract infection (e.g., urinary frequency and dysuria) occur in about one third of individuals. Clinical symptoms are confirmed by urinalysis, which shows antibody-coated bacteria, bacteriuria, WBC casts, and pyuria; a CBC shows an increase in WBCs. Renal function studies may assist in the diagnosis of chronic disease. The most common complication of acute disease is septic shock and/or chronic pyelonephritis. With chronic disease, there is a 2% to 3% chance of developing end-stage renal failure.

■ INTERVENTIONS: Oral or parenteral antiinfective drugs are used to combat infection. Continuous suppression antiinfective therapy may be used to treat recurrent or chronic infection. Antipyretics are used for fever. Hydration is managed by forcing oral fluids or using IV fluids for those unable to take in adequate oral fluids. Follow-up urine cultures are used to track effectiveness of antiinfective drugs. Surgery is used to drain large collections of pus and to correct underlying obstructions. Placement of a nephrostomy tube may be necessary to promote drainage of urine.

■ NURSING CONSIDERATIONS: Key nursing goals for acute pyelonephritis are to reduce fever, relieve pain, promote comfort, and prevent complications. Individuals should be encouraged to drink at least 8 glasses of fluids daily even after acute infection subsides. Input and output should be closely monitored and urine should be checked for frequency, consistency, color, and odor. Rest is indicated to reduce fatigue, increase comfort, and allow the body to combat the infection. Education is aimed at teaching the individual about the disease, with a focus on the necessity to continue the full course of antibiotic therapy and to get follow-up urine cultures to ensure that infection is gone. Instruction is also necessary in preventing infection (cleansing perineum, proper wiping technique, adequate fluid intake, and cleansing after sexual activity) and in recognizing and treating early signs of urinary tract infection.



Acute pyelonephritis *(Kumar et al, 2007)*

pyelonephritis of pregnancy, a renal infection during pregnancy characterized by dilation of the renal pelvis and the ureters. Some degree of ureteric obstruction may be caused by the gravid uterus.

pyeloplasty /pī′əlōplas′tē/, the surgical reconstruction of the kidney pelvis.

pyelosinus backflow, backflow of fluid from the renal pelvis into the renal sinus under certain conditions of back pressure.

pyelovenous backflow, backflow of fluid from the renal pelvis into the venous system under certain conditions of back pressure.

pyemesis /pī·em′əsis/, the action of vomiting purulent material.

pyemic embolism /pī·ē′mik/ [Gk, *pyon,* pus, *haima,* blood, *embolos,* plug], an infective embolus producing an abscess. Also spelled **pyaemic embolism.**

pygeum, an herbal product derived from an evergreen tree native to Africa.

■ USES: This herb is used for benign prostate hypertrophy, for which there is some evidence of efficacy, and as an antiinflammatory medication, for which there are insufficient reliable data regarding efficacy.

■ CONTRAINDICATIONS: Pygeum is not recommended during pregnancy and lactation, in children, or in those with known hypersensitivity to this plant.

pygmalianism /pigmā′lē·əniz′əm/ [Gk, *Pygmalion,* mythic sculptor who fell in love with his statue], a psychosexual abnormality in which the individual directs erotic fantasies to an object that he or she has created.

pygmy /pig′mē/ [L, *pygmaeus,* dwarf], an extremely small person whose body parts are proportioned accordingly. Also spelled **pigmy.** See also **primordial dwarf.**

pygo-, prefix meaning “buttocks”: *pygoamorphus, pygodidymus, pygopagus.*

pygoamorphus /pī′gō·əmôr′fəs/ [Gk, *pyge,* buttocks, *a* + *morphe,* not form], asymmetric, conjoined twins in which the parasitic member is represented by an undifferentiated amorphous mass attached to the autosite in the sacral region.

pygodidymus /pī′gōdid′əməs/ [Gk, *pyge,* buttocks, *didymos,* twin], **1.** a malformed fetus that has a double pelvis and hips. **2.** conjoined twins who are fused in the cephalothoracic region but separated at the pelvis.

pygomelus /pīgom′ələs/ [Gk, *pyge* + *melos,* limb], a malformed fetus that has an extra limb or limbs attached to the buttock. Also called **epipygus.**

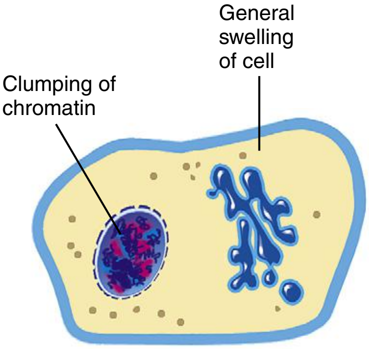
pygopagus /pīgop′əgəs/ [Gk, *pyge* + *pegos,* fixed], conjoined twins consisting of two fully formed or nearly formed fetuses united in the sacral region so that they are positioned back to back.

pyknic /pik′nik/ [Gk, *pyknos,* thick], describing a body structure characterized by short, round limbs; a full face with a broad head and thick shoulders; a short neck; stockiness; and a tendency to obesity. Compare **asthenic habitus, athletic habitus.** See also **endomorph.**

pykno-. See **pycno-.**

pyknodysostosis /pik′nō·dis′os·tō′sis/ [Gk, *pyknos,* thick + *dys,* bad + *osteon,* bone + *osis,* condition], an autosomal-recessive symptom complex consisting of dwarfism, osteopetrosis, partial agenesis of terminal digits of hands and feet, cranial anomalies, frontal and occipital bossing, and hypoplasia of the angle of the mandible.

pyknosis /piknō′sis/, the condensation of nuclear material into a solid, darkly staining mass in a dying cell thickness, especially shrinking of cells through degeneration.



Pyknosis *(Huether and McCance, 2008)*

pyla /pī′lə/, the opening between the third ventricle and the cerebral aqueduct.

pyle-, prefix meaning "portal vein": *pylemphraxis, pylephlebectasis, pylephlebitis.*

pylethrombophlebitis /pī′ləthrom′bōfləbī′tis/, inflammation of the portal vein with formation of a thrombus.

pylon /pī′lon/ [Gk, gate], an artificial lower limb, often a narrow vertical support consisting of a socket with wooden side supports and a rubber-clad peg end. It may be used as a temporary prosthesis.

pylori. See **pylorus.**

pyloric /pīlôr′ik/ [Gk, *pyle,* gate, *ouros,* guard], pertaining to the pylorus, the opening between the stomach and duodenum.

pyloric antrum, that part of the stomach between the pyloric canal and the body of the stomach.

pyloric canal, the narrow, constricted region of the pyloric part of the stomach.

pyloric constriction, the constriction at the distal end of the pylorus, overlying the pyloric orifice, marking the junction of the stomach and duodenum.

pyloric obstruction and dilation /pīlôr′ik/ [Gk, *pyle,* gate, *ouros,* guard; L, *obstruere,* to build against, *dilatare,* to widen], a reaction of the stomach to pyloric obstruction, which increases the resistance to the expulsion of partly digested food from the stomach. As a result, the stomach may become hypertrophied, then dilated. Excessive consumption of food and beverages contributes to the condition.

pyloric orifice [Gk, *pyle,* gate, *ouros,* guard; L, *orificium,* opening], the opening of, or passage between, the stomach into the duodenum, lying to the right of the midline at the level of the upper border of the first lumbar vertebra. The orifice is usually indicated on the surface of the stomach by the circular duodenopyloric constriction.

pyloric spasm. See **pylorospasm.**

pyloric sphincter, a sphincter at the opening from the stomach into the duodenum. It is usually closed, opening only for a moment when a peristaltic wave passes over it. Also called **pyloric valve.**

pyloric stenosis, a narrowing of the pyloric sphincter at the outlet of the stomach, causing an obstruction that blocks the flow of food into the small intestine. The condition occurs as a congenital defect in 1 of 200 newborns and occasionally in older adults secondary to an ulcer or fibrosis at the outlet. Diagnosis is made in infants by the presence of forceful projectile vomiting and palpation of a hard, prominent pylorus and in adults by x-ray examinations after a barium meal. Surgical correction is done with the patient under light general anesthesia after the stomach is emptied. The muscle fibers of the outlet are cut, without severing the mucosa, to widen the opening. After surgery in adults, a stomach tube remains in place and observation is maintained for signs of hemorrhage or of blockage of the tube. See also **pyloromyotomy.**

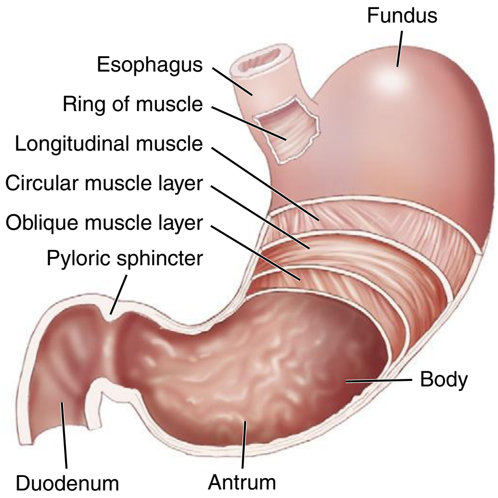
pyloric ulcer. See **peptic ulcer.**

pyloric valve. See **pyloric sphincter.**

pyloro-, prefix meaning "the pylorus": *pylorodilator, pyloroplasty, pyloroptosis.*

pyloroduodenitis /pilôr′ōdo͞o′ədənī′tis/, an inflammation of the pylorus and the duodenum.

pyloromyotomy /pīlôr′ōmī·ot′əmē/ [Gk, *pyle* + *ouros* + *mys,* muscle, *temnein,* to cut], the incision of the longitudinal and circular muscle of the pylorus, which leaves the mucosa intact but separates the incised muscle fibers. It is the treatment of choice for hypertrophic pyloric stenosis, a congenital condition that obstructs the stomach. Also called **Fredet-Ramstedt operation, Ramstedt-Fredet operation.** See also **pyloric stenosis.**



Hypertrophic pyloric stenosis *(Hagen-Ansert, 2006)*

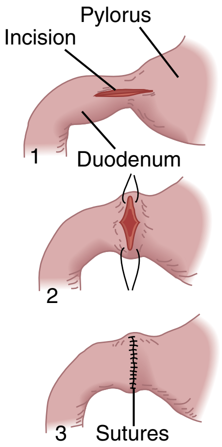
pyloroplasty /pīlôr′əplas′tē/ [Gk, *pyle* + *ouros* + *plassein,* to mold], a surgical procedure performed to relieve pyloric stenosis by widening the pyloric outlet. Before surgery any electrolyte imbalances or fluid deficiencies are corrected; sodium chloride and potassium chloride solutions may be given to correct ion losses from vomiting, which is characteristic of pyloric stenosis. With the patient under anesthesia the pyloric opening is dilated. Diarrhea is a common postoperative complication.

pylorospasm /pīlôr′əspaz′əm/ [Gk, *pyle, ouros* + *spasmos*], a spasm of the pyloric sphincter of the stomach, as occurs in pyloric stenosis.

pylorostomy /pī′lôros′təmē/, the surgical establishment of a fistula from the abdominal surface to the stomach at a point near the pylorus.

pylorotomy /pī′lôrot′əmē/ [Gk, *pyle,* gate, *ouros,* guard, *temnein,* to cut], a surgical incision of the pylorus, usually performed to remove an obstruction.

pylorus /pīlôr′əs/ *pl.* **pylori,** pyloruses [Gk, *pyle,* gate, *ouros,* guard], a narrow, nearly tubular part of the stomach that angles to the right from the body of the stomach toward the duodenum. The most common position of the pylorus is about 3 cm to the right of the sagittal axis. It is distinctively



Pyloroplasty *(Black and Hawks, 2009)*

marked by the thickening of the pyloric sphincter, and its lining is composed of an intestinal kind of epithelium rather than the gastric kind common to the body of the stomach. **—pyloric,** *adj.*

pyo- /pī′ō-/, prefix meaning "pus": *pyocalyx, pyocele, pyocyte.*

pyocele, an accumulation of pus in the scrotum.

pyocolpos, an accumulation of pus in the vagina.

pyocyanic /pī′ōsī·an′ik/, pertaining to pus that is blue or to an organism that produces blue pus, such as *Pseudomonas pyocyanea.*

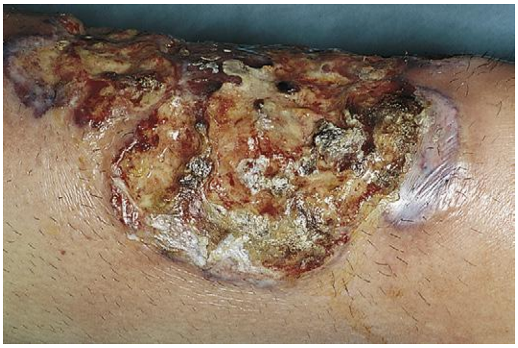
pyocyanin /pī′ōsī′ənin/, a blue or blue-green pigment that may be extracted from ***Pseudomonas aeruginosa*** with chloroform.

pyocyst /pī′əsist/ [Gk, *pyon,* pus, *kytos,* cell], a pus-filled cyst.

pyocystitis /-sistī′tis/, an inflammation involving a pus-filled cyst within the urinary bladder.

pyoderma /pī′ōdur′mə/ [Gk, *pyon,* pus, *derma,* skin], any purulent skin disease, such as impetigo. Also called **pyodermia.**

pyoderma gangrenosum, a rapidly evolving, idiopathic, chronic debilitating skin disease that usually accompanies a systemic disease, especially chronic ulcerative colitis, and is characterized by irregular, boggy, blue-red ulcers with undermined borders surrounding purulent necrotic bases.



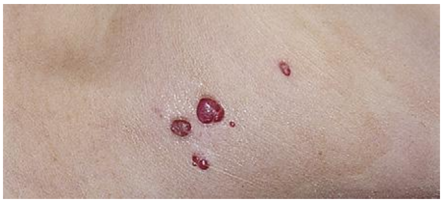
Pyoderma gangrenosum *(Callen et al, 2000)*

pyodermia. See **pyoderma.**

pyogenic /pī′əjen′ik/ [Gk, *pyon* + *genein,* to produce], pus-producing.

pyogenic exotoxin, extracellular toxin secreted by ***Streptococcus pyogenes*** that may be associated with fever and the development of renal failure, respiratory distress, and necrosis.

pyogenic granuloma, a small nonmalignant mass of excessive granulation tissue, usually found at the site of an injury. This condition is most often seen in pregnant women, children, and patients taking Indinavir, Soriatane, Accutane, and oral contraceptives. Most often a dull red, it contains numerous capillaries, bleeds readily, and is very tender. It may be attached by a narrow stalk. Treatment is with electrocautery or topical silver nitrate. Also called **telangiectatic granuloma.** See also **granuloma.**



Pyogenic granuloma *(Callen et al, 2000)*

pyogenic infection [Gk, *pyon,* pus, *genein,* to produce; L, *inficere,* to stain], any infection that results in pus production.

pyogenic microorganisms [Gk, *pyon,* pus, *genein,* to produce, *mikros,* small, *organon,* instrument], microorganisms that produce pus. They include species of bacilli, clostridia, gonococci, meningococci, pseudomonas, staphylococci, and streptococci.

pyohemothorax /-hem′ōthôr′aks/ [Gk, *pyon,* pus, *haima,* blood, *thorax,* chest], an accumulation of pus and blood in the pleural cavity.

pyonephrolithiasis /-nef′rōlithī′əsis/, an accumulation of pus and calculi in the kidney.

pyophylactic /-filak′tik/ [Gk, *pyon,* pus, *phylax,* protector], providing protection against purulent infections, such as administering an antibiotic before the onset of an infection.

pyophysometra /-fī′sōmē′trə/, an accumulation of pus and gas in the uterus.

pyopneumopericardium /pī′ōno͞o′mōper′ikär′dē·əm/, the presence of pus and air or gas in the pericardial sac.

pyopneumoperitonitis /pī′ōno͞o′mōper′itənī′tis/, inflammation of the peritoneal cavity caused by an accumulation of air and pus in the cavity.

pyopyelectasis /-pī′əlek′təsis/, a dilation of the renal pelvis of the kidney resulting from an accumulation of pus.

pyorrhea /pī′ərē′ə/ [Gk, *pyon* + *rhoia,* flow], **1.** a discharge of pus. **2.** a purulent inflammation of the tissues surrounding the teeth. Also spelled *pyorrhoea.* **—pyorrheal,** *adj.*

-pyorrhea, suffix meaning "the flowing or discharge of pus": *ophthalmopyorrhea, otopyorrhea.*

pyosalpinx /pī′ōsal′pingks/ [Gk, *pyon* + *salpinx,* tube], an accumulation of pus in a fallopian tube. See also **salpingitis.**

pyospermia, a complication of chronic prostatitis marked by pus in the seminal fluid. Also called **pyosemia.**

pyostatic /-stat′ik/, arresting the formation of pus.

pyostomatitis /-stō′mətī′tis/, an inflammation of the mouth.

pyothorax /-thôr′aks/, **1.** a collection of pus in the pleural cavity. **2.** purulent pleurisy.

pyoureter /pī′ōyŏŏr′ətər, -yŏŏrē′tər/, the presence of pus in the ureter.

pyoverdin /-vur′din/, a yellow pigment produced by some strains of ***Pseudomonas aeruginosa.***

pyramid /pir′əmid/ [Gk, *pyramis*], a mass of tissue rising to an apex, such as the pyramids of the cerebellum and kidneys.

pyramidal /piram′idəl/ [Gk, *pyramis*], pertaining to the shape of a pyramid.

pyramidal cell [Gk, *pyramis* + L, *cella*, storeroom], a neuron with a pyramid-shaped cell body in the gray matter of the cerebral cortex.

pyramidalis /piram′idā′lis/, one of a pair of anterolateral muscles of the abdomen, contained in the lower end of the sheath of the rectus abdominis, which arises from the crest of the pubis and is inserted into the linea alba upward about halfway to the navel. It is innervated by a branch of the twelfth thoracic nerve and functions to tense the linea alba. Compare **rectus abdominis, transversus abdominis.**

pyramidal nucleus [Gk, *pyramis* + L, *nucleus,* nut kernel], a band of gray matter lying between the olivary nucleus and the midline that projects fibers contralaterally to the vermis part of the cerebellum.

pyramidal tract, a pathway composed of groups of nerve fibers in the white matter of the spinal cord through which motor impulses are conducted to the anterior horn cells from the opposite side of the brain. These descending fibers, the nerve cell bodies of which are found in the precentral cortex, regulate the voluntary and reflex activity of the muscles through the anterior horn cells.

pyramidotomy /piram′idot′əmē/, the surgical severance of pyramidal tracts in the treatment of disorders associated with involuntary muscle contractions.

pyrantel pamoate /pīran′təl/, an anthelmintic.

■ INDICATIONS: It is prescribed in the treatment of infestation by roundworms or pinworms.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. Caution should be used in anemia or severe malnutrition.

■ ADVERSE EFFECTS: Among the more serious adverse effects are nausea, abdominal cramps, diarrhea, dizziness, and skin rash.

pyrazinamide /pī′rəzin′əmīd/, an antimycobacterial.

■ INDICATIONS: It is prescribed in combination chemotherapy in the treatment of tuberculosis of hospitalized patients who fail to respond to other medications.

■ CONTRAINDICATIONS: Severe liver damage, acute gout, or known hypersensitivity to this drug prohibits its use. Use with caution in renal failure, chronic gout, diabetes mellitus, or porphyria.

■ ADVERSE EFFECTS: Common side effects include malaise, nausea, GI upset, and arthralgia and myalgia. Among the more serious adverse reactions are hepatotoxicity and hyperuricemia.

pyrenemia /pī′rənē′mē·ə/, a condition in which nucleated erythrocytes are present in the blood.

pyrethrin and piperonyl butoxide /pī′rəthrin, piper′ənil/, a fixed-combination scabicide and pediculicide.

■ INDICATIONS: It is prescribed in the treatment of infestations of head, body, and pubic lice.

■ CONTRAINDICATIONS: Known hypersensitivity to chrysanthemums, ragweed, or this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are irritation of the skin and the mucous membranes.

pyretic /pīrek′tik/ [Gk, *pyretos,* fever], pertaining to or characterized by fever. Also called *pyrectic*.

pyreto-, prefix meaning "fever": *pyretogen, pyretography, pyretotherapy.*

pyretogenic /pī′rətojen′ik/ [Gk, *pyretos,* fever, *genein,* to produce], inducing, causing, or resulting from a fever.

pyretotherapy. See **pyrotherapy.**

pyrexia. See **fever.**

-pyrexia, suffix meaning a "febrile condition": *apyrexia, electropyrexia, physiopyrexia.*

Pyridium, trademark for a urinary tract analgesic (phenazopyridine hydrochloride).

pyridostigmine bromide /pir′idōstig′mēn/, an acetylcholinesterase inhibitor that prolongs the effects of neuronally released acetylcholine.

■ INDICATIONS: It is prescribed in the treatment of myasthenia gravis and is used as an antagonist to nondepolarizing muscle relaxants, such as curare.

■ CONTRAINDICATIONS: Intestinal or urinary obstruction, bradycardia, hypotension, or known hypersensitivity to this drug or to other anticholinesterases prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are nausea, diarrhea, abdominal cramps, muscle cramps, and weakness.

pyridoxal phosphate /pir′ədok′səl/, an enzyme that acts with pyridoxamine phosphate and transaminase to catalyze the reversible transfer of an amino group from an alpha-amino acid to an alpha-keto acid, especially alpha-ketoglutaric acid. Such processes are essential to metabolism.

pyridoxamine phosphate /pir′ədok′səmēn/, an enzyme that participates with pyridoxal phosphate and transaminase in the reversible transfer of an amino group from an alpha-amino acid to an alpha-keto acid.

pyridoxine /pir′ədok′sēn/, a water-soluble white crystalline vitamin that is part of the B complex. It is derived from pyridine and converted in the body to pyridoxal and pyridoxamine for synthesis. It functions as a coenzyme essential for the synthesis and breakdown of amino acids, the conversion of tryptophan to niacin, the breakdown of glycogen to glucose 1-phosphate, the production of antibodies, the formation of heme in hemoglobin, the formation of hormones important in brain function, the proper absorption of vitamin B_{12}, the production of hydrochloric acid and magnesium, and the maintenance of the balance of sodium and potassium, which regulates body fluids and the functioning of the nervous and musculoskeletal systems. Rich dietary sources are meats, especially organ meats; whole-grain cereals; soybeans; peanuts; wheat germ; and brewer's yeast. Milk and green vegetables supply smaller amounts. The most common symptoms of deficiency are seborrheic dermatitis about the eyes, nose, and mouth and behind the ears; cheilosis; glossitis and stomatitis; nervousness; depression; peripheral neuropathy; and lymphopenia, leading to convulsions in infants and anemia in adults. Treatment and prophylaxis consist of administration of the vitamin and a diet rich in foods containing it. Several drugs interfere with the use of pyridoxine, notably isoniazid and penicillamine, and supplements of the vitamin are recommended with the use of these drugs. The need for increased amounts of pyridoxine is related to protein intake and occurs during pregnancy, lactation, exposure to radiation, cardiac failure, aging, and use of oral contraceptives. Also called *pyridoxine hydrochloride,* **vitamin B_6.**

pyriform. See **piriform.**

pyrimethamine /pir′imeth′əmēn/, an antimalarial.

■ INDICATIONS: It is prescribed in the treatment of malaria and toxoplasmosis.

■ CONTRAINDICATIONS: Use is contraindicated in chloroguanide-resistant malaria, in patients with megaloblastic anemia resulting from folate deficiency, and in patients who are hypersensitive to the drug. Caution is recommended in use of the drug to treat toxoplasmosis because dosages needed may be at a toxic level.

■ ADVERSE EFFECTS: Among the more serious adverse effects, primarily with large doses, are megaloblastic anemia, atrophic glossitis, leukopenia, and convulsions.

pyrimidine /pərim′ədēn/, an organic compound of heterocyclic nitrogen found in nucleic acids and in many drugs, including the antiviral drugs acyclovir, ribavirin, and trifluridine.

pyro-, prefix meaning "fire or heat, or produced by heating": *pyrocatechin, pyrodextrin, pyromania*.

pyrogen /pī′rəjən/ [Gk, *pyr,* fire, *genein,* to produce], any substance or agent that tends to cause a rise in body temperature, such as some bacterial toxins. See also **fever.** —*pyrogenic, adj*.

pyroglobulin /pī′rōglob′yəlin/, an immunoglobulin that precipitates irreversibly when heated. Pyroglobulins are often present in the blood of patients with diseases such as multiple myeloma.

pyroglutamic acid /pi′roglootam′ik/, an uncommon amino acid derivative.

pyrolagnia /pī′rōlag′nē·ə/ [Gk, *pyr* + *lagneia,* lust], sexual stimulation or gratification from watching or setting fires.

pyrolysis /pīrol′isis/, the decomposition of a chemical compound by the application of heat.

pyromania /pī′rōmā′nē·ə/ [Gk, *pyr* + *mania,* madness], an impulse-control disorder characterized by an uncontrollable urge to set fires.

pyromaniac /pī′rōmā′nē·ak/, **1.** *n*, a person having or displaying characteristics of pyromania. **2.** *adj*, pertaining to or exhibiting pyromania. —*pyromaniacal, adj*.

pyropoikilocytosis /pī′rōpoi′kilō′sītō′sis/, a recessive inherited disorder characterized by severe hemolysis, irregular shapes of red blood cells, and sensitivity of blood cells to fragmentation in vitro after minor temperature variations.

pyrosis. See **heartburn.**

pyrotherapy /pī′rōther′əpē/, a method of treatment in which the temperature of a patient is raised to a fever level. Also called **pyretotherapy, therapeutic fever.**

pyroxylin. See **nitrocellulose.**

pyrrole (C_4H_4NH) /pirōl′, pir′ōl/ [Gk, *pyrrhos,* red], a five-membered heterocyclic aromatic substance occurring naturally in many compounds in the body. Heme and porphyrin are pyrrole derivatives.

pyruvate carboxylase /pī′ro͞o·vāt kär·bok′sə·lās/, an enzyme that catalyzes the irreversible carboxylation of pyruvate, a reaction necessary for gluconeogenesis from lactate or amino acids forming pyruvate and also providing four-carbon compounds for the citric acid cycle. The enzyme is a mitochondrial protein occurring in liver but not in muscle. Deficiency of the enzyme, an autosomal-recessive trait, causes severe psychomotor retardation and lactic acidosis in infants. There is a particularly severe, rapidly fatal form, in which hyperammonemia, citrullinemia, and excess of lysine in the blood are also present.

pyruvate dehydrogenase complex /pī′ro͞o·vāt dē·hī′drō·jən·ās/, a multienzyme complex consisting of at least three distinct enzymes that catalyze the formation of acetyl coenzyme A from pyruvate and coenzyme A. The acetyl coenzyme A is used in fatty acid synthesis, for acetylations, and for oxidation by means of the citric acid cycle. Deficiency of any component of the complex results in excess of lactic acid in the blood, ataxia, and psychomotor retardation.

pyruvate kinase /pī′rəvāt/, an enzyme essential for anaerobic glycolysis in red blood cells. It catalyzes the transfer of a phosphate group from adenosine triphosphate to produce adenosine diphosphate.

pyruvate kinase deficiency, a congenital hemolytic anemia transmitted as an autosomal-recessive trait. The homozygous condition is characterized by severe chronic hemolysis. The heterozygous form is usually asymptomatic and of no clinical significance, although mild to severe anemia may occur.

pyruvic acid /pīro͞o′vik/, a compound formed as an end product of glycolysis, the anaerobic stage of glucose metabolism. It may enter the citric acid cycle if oxygen is present. Under anaerobic conditions it may be converted to lactic acid, which accumulates in muscle tissue.

pyuria /pīyo͞or′ē·ə/, the presence of an excessive number of white blood cells in the urine, typically more than four leukocytes per high-power field count. It is generally a sign of an infection in the urinary tract but can reflect inflammation from chemical or radiation causes. Bacterial pyuria usually is caused by infection of the bladder and urethra. See also **bacteriuria.**

PZI, abbreviation for *protamine zinc insulin*. See **protamine zinc insulin suspension.**

Q

Q, **1.** symbol for *blood volume*. **2.** symbol for *quantity*. **3.** symbol for **coulomb.**

Q̇, symbol for *rate of blood flow*.

q.2h., (in prescriptions) abbreviation for *quaque secunda hora,* a Latin phrase meaning "every 2 hours."

q.3h., (in prescriptions) abbreviation for *quaque tertia hora,* a Latin phrase meaning "every 3 hours."

q.4h., (in prescriptions) abbreviation for *quaque quarta hora,* a Latin phrase meaning "every 4 hours."

q.6h., (in prescriptions) abbreviation for *quaque sex hora,* a Latin phrase meaning "every 6 hours."

q.8h., (in prescriptions) abbreviation for *quaque octa hora,* a Latin phrase meaning "every 8 hours."

Q angle, the angle of incidence of the quadriceps muscle relative to the patella. The Q angle determines the tracking of the patella through the trochlea of the femur. As the angle increases, the chance of patellar compression problems increases.

QCT, abbreviation for **quantitative computed tomography.**

q.d., **1.** (in prescriptions) abbreviation for *quaque die* /dē′ā/, a Latin phrase meaning "every day." Due to the danger of misinterpretation, q.d. is on the "do not use" abbreviation list. The preferred term is *daily*. Also called *q diem,* **quotid.** **2.** abbreviation for *quartile deviation*.

qdrnt, abbreviation for **quadrant.**

Q fever [L, *febris*], an acute febrile illness, usually respiratory, caused by the rickettsia ***Coxiella burnetii (Rickettsia burnetii).*** The disease is spread through contact with infected domestic animals, by inhaling the rickettsiae from their hides or drinking their contaminated milk, or by being bitten by a tick harboring the organism. Onset is abrupt, and high fever may persist for 3 weeks or more. The illness is especially common among those who work with sheep, goats, and cattle. Treatment with tetracycline is usually effective in 36 to 48 hours. People who are regularly exposed to domestic animals can be vaccinated against Q fever. Because Q fever is transmitted by inhalation of rickettsiae, it is considered a bioterrorism agent and is classified as a category B agent by the CDC. See also **Australian Q fever.** Compare **scrub typhus.**

q.h., (in prescriptions) abbreviation for *quaque hora,* a Latin phrase meaning "every hour."

Qi, in traditional Chinese medicine, the vital energy of the human body.

qid, q.i.d, (in prescriptions) abbreviation for *quater in die* /dē′ā/, a Latin phrase meaning "four times a day."

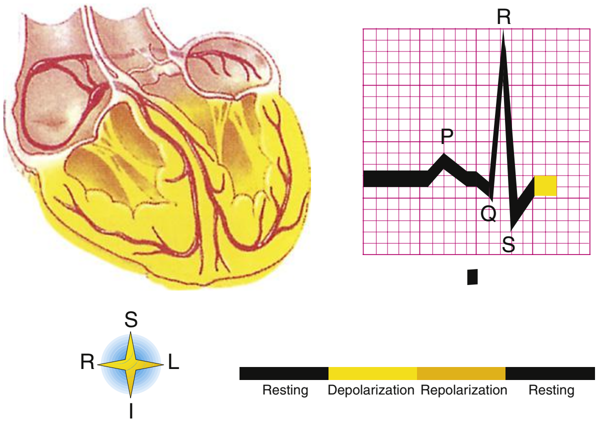
Qi Gong, a form of Chinese exercise stimulation therapy that proposes to improve health by redirecting mental focus, breathing, coordination, and relaxation. The goal is to rebalance the body's own healing capacities by activating proposed electric or energetic currents that flow along meridians located throughout the body. These meridians do not follow conventional nerve or muscle pathways. Qi Gong has been effective in the management of chronic illness (e.g., hypertension, asthma, allergies, chronic fatigue, fibromyalgia, diabetes, arthritis), wellness promotion, stress management, terminal illness (as palliation), GI conditions, musculoskeletal pains and sports injuries, tension headaches, colds and flu, and tinnitus.

q.l., abbreviation for the Latin phrase *quantum libet,* "as much as one pleases."

qli, abbreviation for *quality of life index*.

Q-R interval, the period from the start of the QRS complex to the peak of the R wave on an electrocardiogram.

QRS complex, a series of waveforms on an electrocardiogram that represents both normal and abnormal depolarization of ventricular muscle cells. It is composed of Q, R, and S waves: a Q wave is the negative deflection before the first R wave, an R wave is any positive deflection, and an S wave is the negative deflection after an R wave. If there is no R wave, the totally negative complex is designated QS. A combination of uppercase and lowercase letters is used to describe the amplitude of each wave. Some variations of the QRS complex are qR, QR, qRs, rS, RS, and rSR′. Also called **QRS wave.**



QRS Complex *(Aehlert, 2006)*

QRST complex [L, *complexus*], a series of waveforms on an electrocardiogram, consisting of the QRS complex, the S-T segment, and the T wave. It represents depolarization and repolarization of the ventriclular muscle cells.

QRS wave. See **QRS complex.**

q.s., (in prescriptions) abbreviation for *quantum sufficit,* a Latin phrase meaning "quantity required."

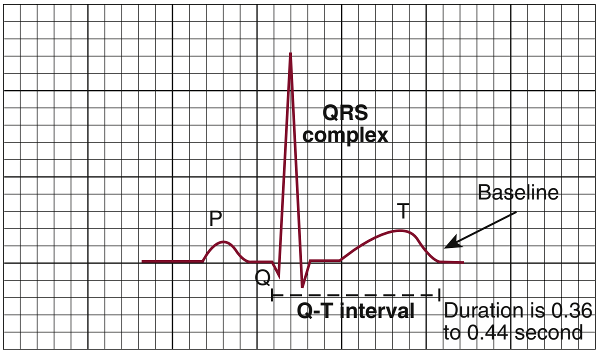
Q's test. See **Queckenstedt's test.**

Q-switched laser, a laser containing a switching device that causes the laser to produce very high intensity impulses of very short duration.

Q-switching, a laser technique used in glaucoma surgery to achieve high peak power in nanosecond pulses of energy.

qt, abbreviation for **quart.**

Q-T interval, the period from the beginning of the QRS complex to the end of the T wave on an electrocardiogram. It reflects the refractory period of the heart. A long Q-T interval is associated with the life-threatening ventricular tachycardia known as torsades de pointes. Quinidine, procainamide, and disopyramide can lengthen the Q-T interval.



Q-T Interval *(Shade et al, 2012)*

Quaalude, a trademark for a sedative-hypnotic (methaqualone). It is no longer distributed in the United States.

quack. See **charlatan.**

quad, **1.** abbreviation for *quadriceps*. **2.** abbreviation for *quadrilateral*. **3.** abbreviation for **quadrant.** **4.** abbreviation for **quadriplegia.**

quad cane, a cane adapted for increased stability by providing a four-legged rectangular base of support.

quad coughing /kwod/, a form of assisted coughing for patients with central nervous system disorders such as spinal cord injury who are unable to generate sufficient force to clear respiratory secretions. After a maximal inspiration, the patient coughs while an assistant exerts gentle upward and inward pressure with both hands on the abdomen. The increased intraabdominal pressure produces a more forceful cough.

quadr-, quadri-, prefix meaning "four": *quadrangular, quadribasic, quadrivalent*.

quadrangular bandage /kwodrang′gələr/, a towel or other large rectangular sheet of cloth folded over for use as a wrapping for a wound of the abdomen, chest, or head.

quadrant (qdrnt, quad) /kwod′rənt/ [L, *quadrans*, a fourth part], **1.** one quarter of a circle. **2.** one quarter of an anatomical area formed by the division of the area by imaginary vertical and horizontal lines bisecting each other. See **abdominal quadrant.**

quadrantanopsia /kwodran′tənop′sē·ə/, a loss of vision in a quarter section of the visual field of one or both eyes. The cause may vary with the quadrant affected.

quadrantectomy /kwod′rantek′təmē/, a partial mastectomy in which a tumor and at least a 1-inch margin of surrounding tissue along with the pectoralis muscle fascia are excised in one quadrant of a breast.

quadrant streak, a technique for microbial inoculation in which a single colony is isolated on a culture plate divided into four sections.

quadratus labii superioris. See **zygomaticus minor.**

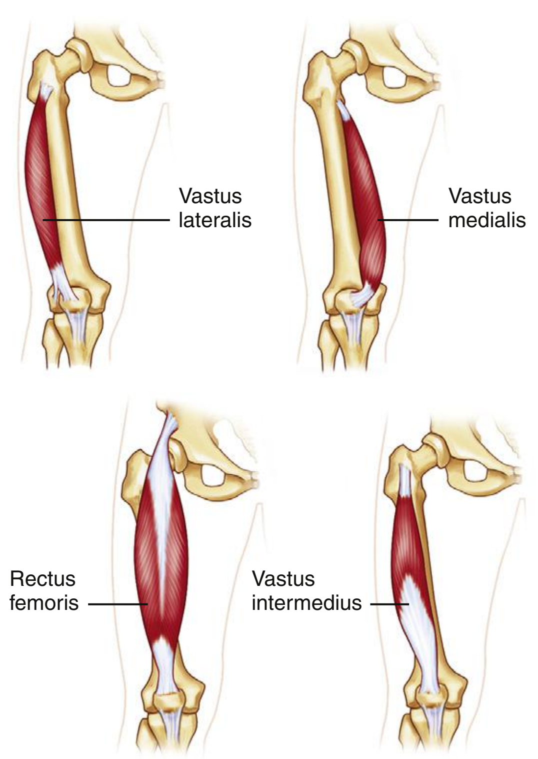
quadratus lumborum, a muscle that connects the pelvis to the spine.

quadri-. See **quadr-.**

quadriceps femoris /kwod′riseps/ [L, *quattuor,* four, *caput,* head, *femur,* thigh], the large extensor muscle of the anterior thigh, composed of the rectus femoris, the vastus lateralis, the vastus medialis, and the vastus intermedius. The quadriceps forms a large dense mass covering the front and sides of the femur. Tendons of the four parts of the muscle unite at the distal part of the thigh, forming a single strong tendon that embeds the patella and inserts onto the tibial tuberosity. The muscle functions to extend the leg.

quadriceps reflex. See **patellar reflex.**

quadridigitate. See **tetradactyly.**



Quadriceps femoris group of thigh muscles

quadrigeminal /kwod′rijem′inəl/ [L, *quadrigeminum,* fourfold], **1.** in four parts. **2.** a fourfold increase in size or frequency. **3.** having four symmetric parts.

quadrigeminal pulse, a pulse in which a pause occurs after every fourth beat.

quadrilateral socket /kwod′rilat′ərəl/, a four-sided prosthetic socket design for people with above-the-knee amputations. The posterior brim is designed to fit directly beneath the ischial tuberosity so that the person literally sits on it.

Quadrinal, a trademark for a respiratory, fixed-combination drug containing a smooth muscle relaxant (theophylline calcium salicylate), an adrenergic (epHEDrine hydrochloride), an expectorant (potassium iodide), and a sedative-hypnotic (phenobarbital).

quadripedal extensor reflex. See **Brain's reflex.**

quadriplegia (quad) /kwod′rəplē′jē·ə/ [L, *quattuor,* four; Gk, *plege,* stroke]. See **tetraplegia.**

quadrivalent /kwod′rivā′lənt/, a chemical element or radical with a valence of four.

quadruped /kwod′ro͝oped′/ [L, *quattuor,* four, *pes,* foot], **1.** any four-footed animal. **2.** a human whose body weight is supported by both arms as well as both legs. See also **prone-on-elbows.**

quadruplet /kwod′ro͝oplit, kwodro͞o′plit/ [L, *quadruplex,* fourfold], any one of four offspring born after the same gestation period during a single pregnancy. See also **Hellin's law.**

quadrupole mass filter, a four-pole magnet system used to separate charged mass fragments in a mass spectrometer.

qual anal, abbreviation for **qualitative analysis.**

quale /kwā′lē/ *pl.* **qualia** [L, *qualis,* what kind], **1.** the quality of a particular thing. **2.** a quality considered as an independent entity. **3.** (in psychology) a feeling, sensation, or other conscious process that has its unique particular quality regardless of its external meaning or frame of reference.

qualified /kwol′ifīd/ [L, *qualis*], pertaining to a health professional or health facility that is formally recognized by an appropriate agency or organization as meeting certain standards of performance related to the professional competence of an individual or the eligibility of an institution to participate in an approved health care program.

qualitative /kwol′itā′tiv/ [L, *qualis*], pertaining to the quality, value, or nature of something.

qualitative analysis (qual anal) [L, *qualis,* what kind; Gk, *analysis,* a loosening], **1.** (in chemistry) the study of a sample of material to determine what chemical substances are present. **2.** (in research) the analysis and interpretation of data that cannot be analyzed by statistical methods. Compare **quantitative analysis.**

qualitative test, a test that determines the presence or absence of a substance.

quality /kwol′itē/ [L, *qualis*], **1.** a descriptive specification of the penetrating nature of an x-ray beam. It is influenced by kilovoltage and filtration: a higher kilovoltage produces more penetration, and filtration removes selected wavelengths and "hardens" the beam. **2.** (in phonetics) refers to the nature of phonation produced by the vocal folds. Disorders of voice quality include hoarseness, harshness, breathiness, and glottal fry.

quality assessment measures, formal systematic organizational evaluation of overall patterns or programs of care, including clinical, consumer, and systems evaluation.

quality assurance. See **quality management.**

quality assurance program. See **quality management.**

quality control, a method of repeated assay of known standard materials and monitoring reaction parameters to ensure precision and accuracy.

quality factor, a term that expresses the biological damage that radiation can produce. Doses of different types of radiation can be set equal to one another if the actual absorbed dose is multiplied by the quality factor. The product is called the dose equivalent, measured in sieverts or rem.

quality management, **1.** (in health care) any evaluation of services provided and the results achieved as compared with accepted standards. In one form of **quality assurance**, various attributes of health care, such as cost, place, accessibility, treatment, and benefits, are scored in a two-part process. First, the actual results are compared with standard results; then, any deficiencies noted or identified serve to prompt recommendations for improvement. **2.** a system of review of selected hospital medical and/or nursing records by medical and/or nursing staff members, performed for the purposes of evaluating the quality and effectiveness of medical and/or nursing care in relation to accepted standards.

quality monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as systematic collection and analysis of an organization's quality indicators for the purpose of improving patient care. See also **Nursing Interventions Classification.**

quality of life^1 [L, *qualis,* what kind; AS, *lif*], a measure of the optimum energy or force that endows a person with the power to cope successfully with the full range of challenges encountered in the real world. The term applies to all individuals, regardless of illness or handicap, on the job, at home, or in leisure activities. Quality enrichment methods can include activities that reduce boredom and allow a maximum amount of freedom in choosing and performing various tasks.

quality of life^2**,** a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of current life circumstances. See also **Nursing Outcomes Classification.**

quantitative /kwon′titā′tiv/ [L, *quantus,* how much], capable of being measured.

quantitative analysis [L, *quantum,* how much; Gk, *analysis,* a loosening], **1.** (in chemistry) the determination of the amounts of constituents in a sample of material. Kinds of quantitative analysis include **gravimetric analysis, volumetric analysis,** and **spectrophotometric analysis. 2.** (in research) the use of statistical methods to analyze data. Compare **qualitative analysis.**

quantitative computed tomography (QCT), a type of computed tomography that calculates and displays bone density in three dimensions. QCT is used mainly for lumbar spine studies but can also be applied in hip and peripheral bone mineral evaluations.

quantitative inheritance. See **multifactorial inheritance.**

quantitative test [L, *quantum,* how much, *testum,* crucible], a test that determines the amount of a substance per unit volume or unit weight.

quantitative ultrasound, an ultrasound technique for assessing bone mineral density. Its main advantage is the complete absence of radiation; a disadvantage is the confounding influence of soft tissue.

quantum mechanics. See **quantum theory.**

quantum mottle. See **mottle.**

quantum theory /kwon′təm/ [L, *quantum,* how much; Gk, *theoria,* speculation], (in physics) the theory dealing with the interaction of matter and electromagnetic radiation, particularly at the atomic and subatomic levels, according to which radiation consists of small units of energy called quanta. Radiation can be absorbed only in whole quanta, and the energy content of a quantum is inversely proportional to its wavelength. Energy and frequency are expressed as $E = h\omega$. E is the energy of the quantum; h is the Planck constant; and ω is the frequency of the radiation. Also called **quantum mechanics.**

quarantine /kwor′əntēn/ [It, *quarantina,* forty], **1.** isolation of people with communicable disease or those exposed to communicable disease during the contagious period in an attempt to prevent spread of the illness. **2.** the practice of detaining travelers or vessels coming from places of epidemic disease, originally for 40 days, for the purpose of inspection or disinfection.

quart (qt) /kwôrt/ [L, *quartus,* fourth], a unit of volume fluid measure equivalent to ¼ gallon, 2 pints, 32 ounces, or 946.24 mL. The British Imperial quart is equal to 40 ounces, or 1.136 L, and the American quart for dry measure is 1.101 L.

quartan /kwôr′tən/ [L, *quartanus,* relating to the fourth], recurring on the fourth day, or at about 72-hour intervals. See also **quartan malaria.**

quartan malaria, a form of malaria, caused by the protozoan *Plasmodium malariae,* characterized by febrile paroxysms that occur every 72 hours. Also called *quartan fever.* Compare **falciparum malaria, tertian malaria.** See also **malaria.**

quarti-, prefix meaning "fourth": *quartipara, quartisect, quartisternal.*

quartile /kwôr′təl, kwôr′tīl/ [L, *quartus,* fourth], one-fourth of the distribution of scores. The first quartile would be the lowest 25% of scores, the second quartile would represent the 26% to 50% range of scores, and so on.

quartz crystal therapy, an alternative therapy that involves placement of a four- or six-sided quartz crystal over a chakra, or major energy station, of the body, such as the brow, throat, heart, stomach, abdomen, base of the spine, or near the skull, to act as a de-stressor and to support the immune system.

quartz silicosis. See **silicosis.**

quasispecies /quah′z-spe′sēz/, a swarm of viruses with similar genetic structure sharing a host with other quasispecies of different genetic makeup. Usually all quasispecies in one host are descended from a single ancestor strain.

quaternary /kwot′əner′ē, kwətur′nərē/ [L, *quattuor,* four], **1.** *adj,* pertaining to a chemical compound in which four atoms or groups of elements are bonded to one atom, such as a quaternary ammonium compound in which four organic radicals are substituted for the four hydrogen molecules on an ammonium ion. **2.** *n,* fourth-level structure in proteins, as in the structure of hemoglobin made up of two alpha-globulins and two beta-globulins.

quaternary ammonium derivative, a substance whose chemical structure has four carbon groups attached to a positively charged nitrogen atom. When the quaternary ammonium ion has more than about 16 carbon atoms, it is usually a strong emulsifying agent, highly water soluble but relatively insoluble in lipids.

quazepam /kwah′zĕ-pam/, a benzodiazepine used as a sedative and hypnotic in the treatment of insomnia. It is administered orally.

Queckenstedt's test /kwek′ənstets/ [Hans H.G. Queckenstedt, German physician, 1876–1918], a test for an obstruction in the spinal canal in which the jugular veins on each side of the neck are compressed alternately. The pressure of the spinal fluid is measured by a manometer connected to a lumbar puncture needle or catheter. Normally, occlusion of the veins of the neck causes an immediate rise in spinal fluid pressure. If the vertebral canal is blocked, no rise occurs. If increased intracranial pressure is suspected, this test should not be performed. See also **spinal canal.**

Queensland tick typhus, an infection caused by *Rickettsia australis* occurring in Australia, transmitted by ticks, and resembling mild Rocky Mountain spotted fever. Treatment includes the administration of chloramphenicol or tetracycline. Prevention depends on avoiding tick bites and on the prompt removal of attached ticks. Compare **boutonneuse fever, North Asian tick-borne rickettsiosis, Rocky Mountain spotted fever.**

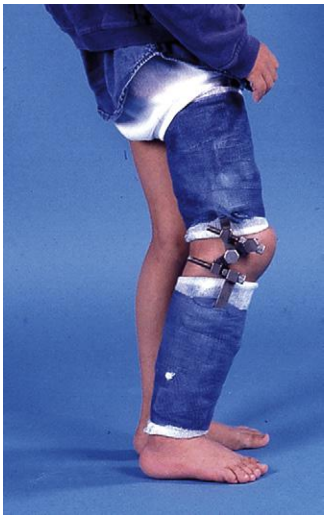
Quelidrine, a trademark for a fixed-combination respiratory drug containing adrenergics **(phenylephrine hydrochloride** and epHEDrine hydrochloride), an antihistaminic **(chlorpheniramine maleate),** an antitussive **(dextromethorphan hydrobromide),** and an expectorant (ammonium chloride).

quellung reaction /kwel′ung/ [Ger, *Quellung,* swelling; L, *re,* again, *agere,* to act], the swelling of the capsule of a bacterium, seen in the laboratory when the organism is exposed to specific antisera. This phenomenon is used to identify the genera, species, or subspecies of the bacteria causing a disease, including *Haemophilus influenzae, Neisseria meningitidis,* and many kinds of streptococci.

quenching /kwen′ching/, **1.** a process of removing or reducing an energy source, such as heat or light. **2.** stopping or diminishing a chemical or enzymatic reaction. **3.** decreasing counting efficiency in beta liquid scintillation caused by interfering materials. **4.** preventing emission of light from fluorescent compounds.

Quengel cast /kwen′gəl/, a two-section orthopedic cast for immobilizing the lower extremity from the foot or ankle to below the knee and the upper thigh to just above the knee. The two parts of the cast are connected by hinges at knee level, medially and laterally. The Quengle cast is used for the gradual correction of knee contractures.

quercetin /kwur′sitin/, a yellow, crystalline, flavonoid pigment found in oak bark, the juice of lemons, asparagus, and other plants. It is used to reduce abnormal capillary fragility.



Quengel Cast *(Herring, 2008)*

querulous paranoia /kwer′(y)ələs/ [L, *queri,* to complain; Gk, *para,* beside, *nous,* mind], a form of paranoia characterized by extreme discontent and habitual complaining, usually about imagined slights by others. Also called **paranoia querulans.**

Quervain's disease /kervānz′, kerveNz′/ [Fritz de Quervain, Swiss surgeon, 1868–1940; L, *dis;* Fr, *aise,* ease], chronic tenosynovitis of the abductor pollicis longus and extensor pollicis brevis muscles of the thumb.

Questran, a trademark for an ion exchange resin used to lower blood cholesterol levels **(cholestyramine resin).**

quetiapine, an antipsychotic/neuroleptic.

■ INDICATIONS: It is used in the treatment of psychotic disorders.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects are seizures, neuroleptic malignant syndrome, and tachycardia. Other adverse effects include extrapyramidal symptoms, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, drowsiness, insomnia, agitation, anxiety, orthostatic hypotension, abdominal pain, dry mouth, rhinitis, rash, asthenia, back pain, fever, and ear pain. Common side effects include headache, dizziness, nausea, anorexia, and constipation.

Quibron, a trademark for a fixed-combination respiratory drug containing a smooth muscle relaxant **(theophylline)** and an expectorant **(guaifenesin).**

quick connect [ME, *quic,* living; L, *connectere,* to bind], a plastic or similar connecting device that is attached to or implanted in a patient who will be joined to an electromechanical or other apparatus. A patient whose circulatory system is supported by an artificial heart, for example, may have a push-fit connector sewn to the natural atria, aorta, and pulmonary artery; a plastic lip on the artificial ventricle then can be securely snapped onto the quick-connect device.

quick-cure resin. See **self-curing resin.**

quickening /kwik′(ə)ning/ [ME, *quic,* living], the first feeling by a pregnant woman of movement of her baby in utero, usually occurring between 16 and 20 weeks of gestation.

quick pulse, a pulse that strikes the finger smartly and leaves it quickly. Also called *pulsus celer*.

quiescent /kwī·es′ənt/, **1.** inactive, quiet, or at rest. **2.** latent. **3.** dormant.

quiet alert /kwī′ət/, a period when a neonate is calm and attentive, with eyes open, ready to become acquainted with an adult person. Newborns spend about 10% of their time in this state.

Quigley traction /kwig′lē/, a type of traction for lateral malleolar and trimalleolar fractures in which a stockinette is placed around the leg and ankle and attached to an overhead frame, thus suspending the leg by the ankle.

quin-, prefix meaning "quinine": *quiniretin, quinometry, quinotoxin*.

-quin, -quine, suffix naming antimalarial medicinal compounds from quinine: *aminoquin, diodoquin, Floraquin*.

Quinaglute, a trademark for a cardiac antiarrhythmic **(quinidine gluconate).**

Quincke's disease /kwing′kēz/ [Heinrich I. Quincke, German physician, 1842–1922; L, *dis* + Fr, *aise,* ease], a potentially fatal chronic condition of subcutaneous edema, abdominal pain, urticaria, and laryngeal edema. Among its causes is anaphylactic reaction. Also called **angioedema,** *Quincke's edema*.

Quincke's pulse [Heinrich I. Quincke], an abnormal alternate blanching and reddening of the skin or nails that may be observed in several ways, such as by pressing the front edge of the fingernail and watching the blood in the nailbed recede and return. This pulsation is characteristic of aortic insufficiency and other abnormal conditions but may also occur in otherwise normal individuals. Formerly it was thought to be caused by pulsation of the capillaries; it is now known to be caused by pulsation of subpapillary arteriolar and venous plexuses. Also called **capillary pulse, Quincke's sign.**

Quinidex, a trademark for a cardiac antiarrhythmic (quinidine sulfate).

quinidine /kwin′ədēn, -din/, an antiarrhythmic agent administered as a bisulfate, gluconate, or polygalacturonate or as sulfate salts.

■ INDICATIONS: It is prescribed in the treatment of atrial flutter, atrial fibrillation, premature ventricular contractions, and tachycardias.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is contraindicated in thrombocytopenia, myasthenia gravis, and some arrhythmias, particularly those associated with heart block.

■ ADVERSE EFFECTS: Among the most serious adverse effects are cardiac arrhythmia, hypertension, and cinchonism. Rare but potentially fatal hypersensitivity reactions such as anaphylaxis and thrombocytopenia may occur. Diarrhea, nausea, and vomiting are common.

quinidine gluconate. See **quinidine.**

quinine /kwī′nīn/ [Sp, *quina,* bark], a white, bitter, crystalline alkaloid made from cinchona bark. It was formerly used in antimalarial medications and replaced when chloroquine became available. It is once again being used to treat some cases of chloroquine-resistant malaria. See also **antimalarial.**

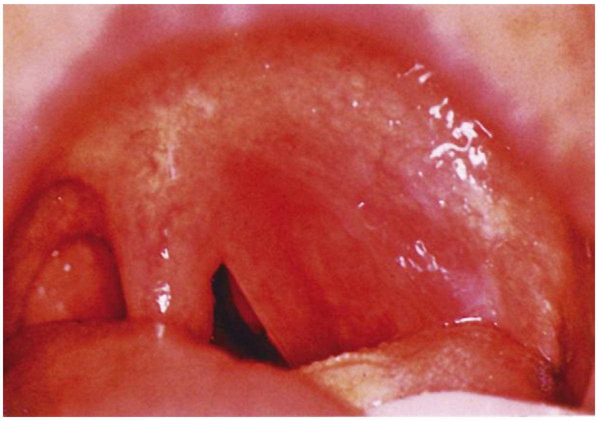
quinoa, a gluten-free, high protein grain.

quinoline /kwin′o-lēn/, an amine or alkaloid; with antiseptic, antipyretic, and antimalarial properties, derivable from quinine, coal tar, and various other sources.

quinolone /kwin′əlōn/, any of a class of antibiotics that act by interrupting the replication of deoxyribonucleic acid (DNA) molecules in bacteria. The action involves inhibition of the bacteria's gyrase so that positively supercoiled DNA cannot be relaxed for DNA transcription and replication. An example is ciprofloxacin.

quinque-, prefix meaning "five": *quinquecuspid, quinquetubercular, quinquevalent*.

quinsy. See **peritonsillar abscess.**



Quinsy *(Goldman et al, 2012)*

quint-, prefix meaning "fifth or fivefold": *quintessence, quintipara, quintuplet*.

quintan /kwin′tən/ [L, *quintanus,* relating to the fifth], recurring on the fifth day, or at about 96-hour intervals. See also **trench fever.**

quintana fever. See **trench fever.**

quintessence /kwintes′əns/ [L, *quinta* + *essentia,* the fifth essence], **1.** a highly concentrated extract of any substance. **2.** a tincture or extract containing the most essential components of plant materials.

quintuplet /kwin′to͞oplit, kwinto͞o′plit/ [L, *quintuplex,* fivefold], any one of five offspring born after the same gestation period during a single pregnancy. See also **Hellin's law.**

quinupristin /kwinu′pris-tin/, a semisynthetic antibacterial effective against a variety of gram-positive organisms. It is used in conjunction with dalfopristin in the treatment of serious bacteremia caused by vancomycin-resistant *Enterococcus faecium* and complicated skin and skin structure infections caused by *Streptococcus pyogenes* or methicillin-sensitive *Staphylococcus aureus*. It is administered intravenously.

quotid. See **q.d.**

quotidian /kwōtid′ē·ən/ [L, *quotidianus,* daily], occurring every day, for example, a malarial fever with daily attacks.

quotient /kwō′shənt/, the number obtained by dividing one number by another. See also **achievement quotient, intelligence quotient, respiratory quotient.**

quot. op. sit, abbreviation for the Latin phrase *quoties opus sit,* "as often as necessary."

q.v., **1.** abbreviation for the Latin phrase *quantum vis,* "as much as you please." **2.** abbreviation for the Latin phrase *quod vide,* "which see."

Q wave, the first negative component of the QRS complex on an electrocardiogram. Lengthening of the wave indicates myocardial infarction. If an R wave is not present, the totally negative complex is called QS. See also **QRS complex.**

R

r, **1.** abbreviation for *right*. **2.** symbol for *resistance ohm*.

R, **1.** abbreviation for **resolution.** **2.** abbreviation for **respiratory exchange ratio.** **3.** abbreviation for **roentgen.** **4.** symbol for *gas constant*. **5.** abbreviation for **respiration.** **6.** abbreviation for the amino acid **arginine.**

R_f, symbol for a ratio used in paper and thin-layer chromatography, representing the distance from the origin to the center of the separated zone divided by the distance from the origin to the solvent front.

R_i, symbol for *inhibitory receptor* molecule.

R_s, symbol for *stimulatory receptor* molecule.

R_x, symbol for the Latin *recipe,* "take." See **prescription.**

Ra, symbol for the element **radium.**

RA, **1.** abbreviation for **rheumatoid arthritis.** **2.** abbreviation for *right atrium*.

rabbit fever. See **tularemia.**

rabbit test. See **Friedman's test.**

rabeprazole, a proton pump inhibitor.

■ INDICATIONS: Rabeprazole is used to treat gastroesophageal reflux disease (GERD), severe erosive esophagitis, poorly responsive systemic GERD, pathological hypersecretory conditions such as Zollinger-Ellison syndrome, systemic mastocytosis, multiple endocrine adenomas, and active duodenal ulcers.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects are proteinuria, hematuria, pancytopenia, thrombocytopenia, neutropenia, and leukocytosis. Other adverse effects include abdominal swelling, anorexia, irritable colon, esophageal candidiasis, epistaxis, urticaria, alopecia, hypoglycemia, increased hepatic enzymes, weight gain, tinnitus, angina, tachycardia, bradycardia, palpitations, peripheral edema, urinary tract infection, increased creatinine, testicular pain, glycosuria, and fever. Common side effects include headache, dizziness, asthenia, diarrhea, abdominal pain, vomiting, nausea, constipation, flatulence, acid regurgitation, upper respiratory infections, cough, rash, and back pain.

rabid /rab′id/ [L, *rabidus,* raving], **1.** pertaining to or suffering from rabies. **2.** displaying signs of madness, agitation, delirium, hallucinations, and bizarre behavior.

rabies /rā′bēz/ [L, *rabere,* to rave], an acute, usually fatal viral disease of the central nervous system of mammals. It is transmitted from animals to people through infected saliva. **—rabid /rab′id/,** *adj.*

■ OBSERVATIONS: The reservoir of the virus is chiefly wild animals, including skunks, bats, foxes, and raccoons, and unvaccinated dogs and cats. After introduction into the human body, often by a bite of an infected animal, the virus travels along nerve pathways to the brain and later to other organs. An incubation period ranges from 10 days to 1 year and is followed by a prodromal period characterized by fever, malaise, headache, paresthesia, and myalgia. After several days severe encephalitis, delirium, agonizingly painful muscular spasms, seizures, paralysis, coma, and death ensue.

■ INTERVENTIONS: Few nonfatal cases have been documented in humans; survival in those cases has been the result of intensive supportive nursing and medical care. There is no treatment once the virus has reached the tissue of the nervous system. Local treatment of wounds inflicted by rabid animals may prevent the disease. The wound is cleansed with soap, water, and a disinfectant. A deep wound may be cauterized and rabies immune globulin injected directly into the base of the wound. For active immunization a series of three intramuscular injections with adsorbed vaccine (RVA), purified chick embryo cell vaccine, or human diploid cell rabies vaccine is begun. If vaccine is administered, intramuscular injection is given on days 0, 7, and 21 or 28. Great effort is made to locate and examine the animal. The animal that is suspected of being rabid is not immediately killed but put in isolation and carefully observed. If the animal is well in 10 days, there is little danger of rabies developing from the bite. Tissue from the animal's brain may be examined microscopically or by fluorescent antibody screening techniques.

■ NURSING CONSIDERATIONS: Rabies virus infection can be eradicated from most communities by prophylactic immunization of domestic animals, stringent measures for the control of domestic animals, and elimination of any wild animals acting as reservoirs of infection. A preexposure vaccination is advised for those at risk, such as veterinarians, animal handlers, and some laboratory workers. The nurse and other health workers may encourage compliance with such efforts and teach the necessity of avoiding direct contact with wild animals and the importance of immediate first aid for any animal bite and reporting such contact to health care providers.

rabies immune globulin (RIG), a solution of antirabies immune globulin.

■ INDICATIONS: It is used in conjunction with human diploid cell culture rabies vaccine for possible protection against rabies in persons suspected of exposure to rabies.

■ CONTRAINDICATIONS: Previous administration of this preparation or known hypersensitivity to this solution, to gamma globulin, or to thimerosal prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are soreness at the site of injection, fever, and hypersensitivity reactions.

rabies-neutralizing antibody test, a blood test performed on those who work with animals and have received the human diploid cell rabies vaccine and on those who may have been exposed to the rabies virus.

rabies vaccine, a sterile suspension of killed rabies virus prepared from duck embryo. Also called **duck embryo vaccine.**

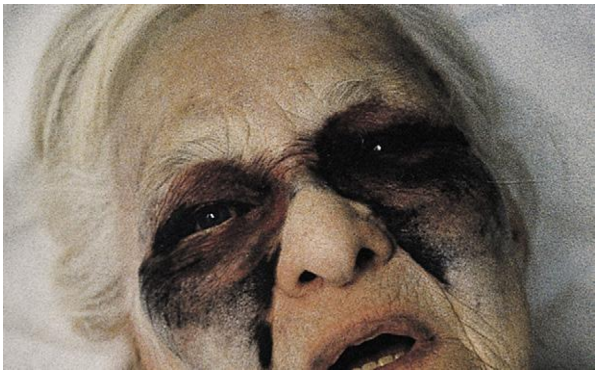
■ INDICATIONS: It is prescribed for immunization and postexposure prophylaxis against rabies.

■ CONTRAINDICATIONS: A history of allergic reaction to chicken or duck eggs or to protein prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are severe hypersensitivity reactions and pain and inflammation at the site of injection.

rabies virus group [L, *rabere,* to rave, *virus,* poison; It, *gruppo,* knot], the genus of viruses that includes the organism that causes rabies in humans, the *lyssa* virus. See also **rhabdovirus.**

raccoon eyes, ecchymotic areas surrounding both eyes, suggestive of a basilar skull fracture or childhood neuroblastoma.



Raccoon eyes *(Henry and Stapleton, 2010)*

race [It, *razza*], **1.** a vague unscientific term for a group of genetically related people who share certain physical characteristics. **2.** a distinct ethnic group characterized by traits that are transmitted through their offspring.

racemic /rāsē′mik/ [L, *racemus*, bunch of grapes], pertaining to a compound made up of equal amounts of dextrorotatory and levorotatory isomers, rendering it optically inactive under polarized light.

racemic epinephrine. See **epINEPHrine.**

racemose /ras′əmōs′/ [L, *racemus*], like a bunch of grapes. The term is used in describing a structure in which many branches terminate in nodular cystlike forms such as pulmonary alveoli.

racemose aneurysm, a pronounced dilation of lengthened and tortuous blood vessels, which may form a tumor. Also called **cirsoid aneurysm.**

-racetam, suffix for piracetam-type nootropic substances.

rachial /rā′kē·əl/ [Gk, *rhachis*, backbone], pertaining to the spinal column. Also **rachidial** /rākid′ē·əl/.

rachidial. See **rachial.**

rachio-, rachi-, rhachi-, prefix meaning “the spine”: *rachiocampsis, rachiotome, rachiotomy*.

rachiodynia. See **rachialgia.**

rachiopagus /rā′kē·op′əgəs/ [Gk, *rachis*, backbone, *pagos*, fixed], conjoined symmetric twins united back to back along the spinal column. Also called **rachipagus.**

rachiotomy. See **laminotomy.**

rachipagus, conjoined twins united back-to-back. See **rachiopagus.**

rachiresistance /rā′kēresis′təns/ [Gk, *rachis*, backbone], a failure to respond adequately to spinal anesthesia.

rachischisis /rəkis′kəsis/ [Gk, *rachis* + *schizein*, to split], a congenital fissure of one or more vertebrae. See also **neural tube defect, spina bifida.**

rachischisis totalis. See **complete rachischisis.**

rachitic. See **rickets.**

rachitic dwarf, a person whose retarded growth is caused by rickets. See also **Fanconi’s syndrome.**

rachitis /rəkī′tis/ [Gk, *rachis* + *itis*, inflammation], **1.** rickets. **2.** an inflammatory disease of the vertebral column.

rachitis fetalis annularis, congenital enlargement of the epiphyses of the long bones.

rachitis fetalis micromelia, congenital shortening of the long bones.

racial immunity /rā′shəl/ [It, *razza* + L, *immunis*, free], a form of natural immunity shared by most of the members of a genetically related population. Compare **individual immunity, species immunity.**

racial unconscious. See **collective unconscious.**

rad /rad/, abbreviation for **radiation absorbed dose.**

radappertization /rad′apur′tizā′shən/, the irradiation of food for the destruction of ***Clostridium botulinum.***

radarkymography /rā′därkīmog′rəfē/ [radar + Gk, *kyma*, wave, *graphein*, to record], a technique for showing the size and outline of the heart that uses a radar tracking device and a fluoroscopic screen to display images produced by electrical impulses passed over the chest surface.

Radford nomogram [Edward P. Radford, Jr., American physiologist, b. 1922], a mathematical chart device used in respiratory therapy to estimate combined tidal volumes and rates for mechanical ventilation. It is based on the three parameters of body weight, sex, and respiratory rate.

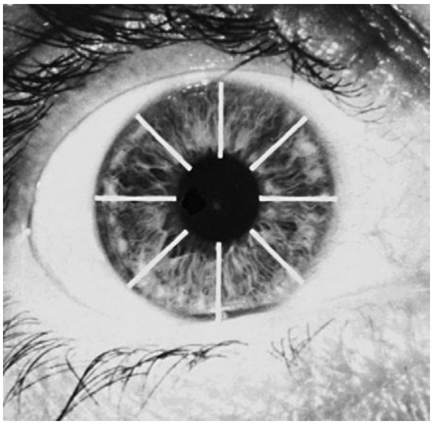
radi-, prefix meaning “root”: *radiciform, radicotomy, radiectomy*.

radial /rā′dē·əl/ [L, *radius*, ray], pertaining to the radius.

radial artery [L, *radius*, ray], an artery in the forearm, starting at the bifurcation of the brachial artery and passing in 12 branches to the forearm, wrist, and hand. In the forearm it extends from the neck of the radius to the forepart of the styloid process; in the wrist, from the styloid process to the carpus; in the hand, from the carpus, across the palm, to the little finger. In the forearm the branches of the radial artery are the radial recurrent, muscular, palmar carpal, and superficial palmar; in the wrist the branches are the dorsal carpal and the first dorsal metacarpal. In the hand the branches are the princeps pollicis, radialis indicis, deep palmar arch, palmar metacarpal, perforating, and recurrent.

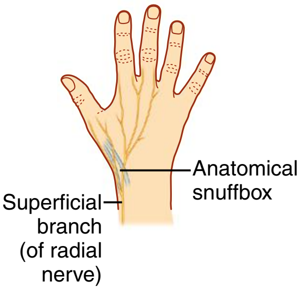
radialis. See **radial.**

radial keratotomy (RK), a surgical procedure in which a series of tiny shallow incisions is made in the cornea to flatten it, thereby reducing refractive error. The operation is performed using local anesthesia and requires only 10 minutes. Hospitalization is not necessary. Radial keratotomy usually corrects mild to moderate myopia. Compare **photorefractive keratectomy.** See also **refractive keratotomy.**



Location of incisions in radial keratotomy
(Phillips, 2007)

radial nerve, the largest branch of the brachial plexus, arising on each side as a continuation of the posterior cord. It supplies the skin of the arm and forearm and their extensor muscles. The branches of the radial nerve are the medial muscular branches, the posterior brachial cutaneous nerve, the posterior muscular branches, the posterior antebrachial cutaneous nerve, the lateral muscular branches, the superficial branch, and the deep branch. Also called **musculospiral nerve.** Compare **median nerve, musculocutaneous nerve, ulnar nerve.**



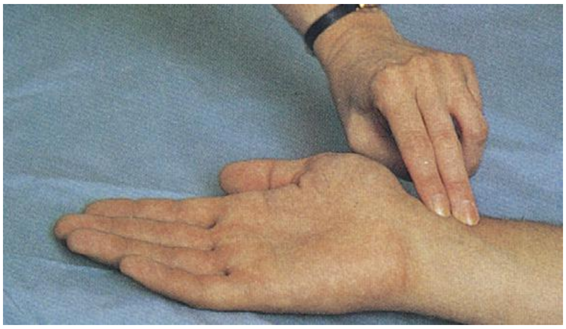
Radial nerve *(Drake, Vogl, and Mitchell, 2010)*

radial nerve palsy, a type of mononeuropathy characterized by radial nerve damage with symptoms of forearm muscle weakness and sensory loss. It may be caused by excessive compression of the radial nerve against a hard surface in individuals insensitized by the intake of alcohol or sedatives. It may also be caused by the repeated compression of the nerve by various weights. Time and the withdrawal of causative compression usually ensure full recovery. Also called **Saturday night palsy.**

radial notch of ulna, the narrow lateral depression in the coronoid process of the ulna that receives the head of the radius.

radial paralysis [L, *radius* + Gk, *paralyein*], paralysis of muscles supplied by the radial nerve, mainly the wrist and finger extensors. See **dropped wrist.**

radial pulse, the pulse of the radial artery palpated at the wrist over the radius. The radial pulse is the one most often taken because of the ease with which it is palpated.



Palpation of the radial pulse *(Potter and Perry, 2005)*

radial recurrent artery, a branch of the radial artery arising just distal to the elbow, ascending between the branches of the radial nerve, and supplying several muscles of the arm and the elbow.

radial reflex, a normal reflex elicited by tapping over the distal radius, with the response being flexion of the forearm. Flexion of the fingers may also occur if the reflex is hyperactive.

radial symmetry, a form of symmetry in which body parts are arranged around a central axis, as found in animals such as jellyfish and sea urchins.

radial tuberosity, a large blunt projection on the medial surface of the radius for the attachment of the biceps brachii tendon.

radiant /rā′dē·ənt/ [L, *radiare,* to emit rays], pertaining to any object that emits rays or is the center of rays that spread outward.

radiant energy [L, *radiare,* to emit rays; Gk, *energeia*], energy emitted as electromagnetic radiation, such as radio waves, infrared radiation, visible light, ultraviolet light, x-rays, and gamma rays.

radiant heat, a form of infrared energy that is emitted in electromagnetic waves from a central source. It proceeds outward in wavelengths greater than those of visible light. Objects absorbing the energy experience a rise in temperature.

radiate /rā′dē·āt/ [L, *radiare,* to emit rays], to diverge or spread from a common point or center.

radiate crown, **1.** a network of fibers that weaves through the internal capsule of the cerebral cortex and intermingles with the fibers of the corpus callosum. **2.** an aggregate of cells that surrounds the zona pellucida of the ovum.

radiate ligament, a ligament that connects the head of a rib with a vertebra and an associated intervertebral disk.

radiation /rā′dē·ā′shən/ [L, *radiatio*], **1.** the emission of energy, rays, or waves. **2.** the use of a radioactive substance in the diagnosis or treatment of disease.

radiation absorbed dose (rad), the standard unit of absorbed dose of ionizing radiation. One rad is equal to 0.01 J/kg of matter. Compare **roentgen.** See also **absorbed dose, rem.**

radiation burn, a burn resulting from exposure to radiant energy in the form of sunlight, x-rays, or nuclear emissions or explosion. Ionizing radiation can produce tissue damage directly by striking a vital molecule such as deoxyribonucleic acid. See also **ionizing radiation injury.**

radiation caries, tooth decay triggered by exposure of the head to ionizing radiation. It especially affects the cementoenamel junction and the coronal root area. Radiation makes the teeth more susceptible to caries by decreasing salivation, reducing the vitality of dental tissues, and altering oral bacteria. Radiation caries is often a side effect of radiation therapy for oral malignancies. See also **dental caries.**

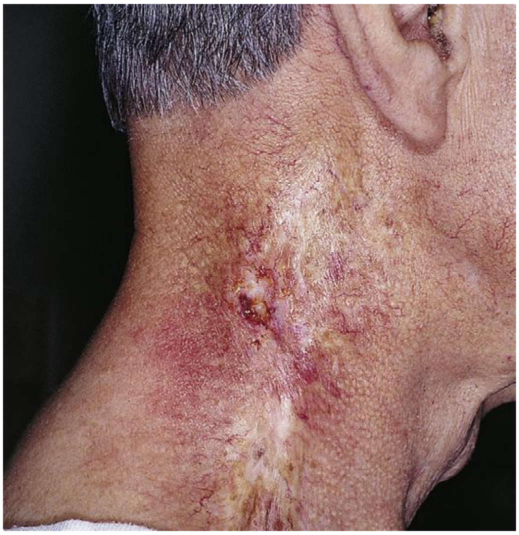
radiation cataract [L, *radiare,* to emit rays; Gk, *katarrhaktes,* portcullis], a cataract that is caused by excessive exposure of the eye to x-rays or other types of radiation that cause a change in the protein molecules of the lens.

radiation cystitis, inflammatory changes in the urinary bladder caused by ionizing radiation. Also called *radiocystitis.*

radiation dermatitis [L, *radiare,* to emit rays; Gk, *derma,* skin, *itis,* inflammation], an acute or chronic inflammation of the skin caused by exposure to ionizing radiation, as in cancer radiation therapy. Symptoms, which may not appear until 3 weeks after exposure, include redness, blistering, and sloughing of the skin. In severe cases the condition can progress to scarring, fibrosis, and atrophy. There may also be changes in skin pigmentation. Also called **radiodermatitis.**

radiation detector, a device for detecting the presence and sometimes the amount of radiation. A Geiger-Müller detector counts the number of radioactive particles reaching it and can be designed to detect cosmic radiation. An ionization chamber collects the ion pairs formed by the passage of radiation through the device.

Radiation Effects Research Foundation (RERF), an organization that studies the long-term effects of the atomic bombings of Hiroshima and Nagasaki during World War II on survivors. The RERF has focused on the incidence of leukemia, which reached a plateau around 1950 before beginning to decline, and has examined the varied effects related to the different types of radiation produced by the



Radiation dermatitis *(Callen et al, 2000)*

two bombs, one fueled with uranium and the other with plutonium. The RERF is the successor to the Atomic Bomb Casualty Commission.

radiation exposure, a measure of the ionization produced in air by x-rays or gamma rays. It is the sum of the electric charges on all ions of one sign that are produced when all electrons liberated by the radiation in a volume of air are completely stopped, divided by the mass of air in that volume. The unit of exposure is the roentgen. **Acute radiation exposure** is exposure of short duration to intense ionizing radiation, usually occurring as the result of an accidental spill of radioactive material. Exposure of the whole body to approximately 10,000 rad (100 gray) causes neurological and cardiovascular breakdown and is fatal within 24 hours. A dose between 500 and 1200 rad (5 and 12 gray) destroys GI mucosa, produces bloody diarrhea, and may cause death in several days. A dose of 200 to 500 rad (2 to 5 gray) destroys the blood-forming organs and may cause death in a few weeks.

radiation exposure, emergency procedures, first-aid treatment of a person who has received external body radiation through exposure to radioactive material or internal radiation contamination by inhaling or ingesting radioactive material. External radiation exposure is treated initially by cleansing and surgical isolation to protect others. One who has inhaled or ingested radioactive material should be given emergency treatment similar to a person who has been exposed to chemical poisons. Body wastes should be collected and checked for radiation levels. If the victim has also suffered a wound, care must be taken to avoid cross-contamination of exposed surfaces. In general, except for taking special precautions to control the spread of radiation effects, the patient should be given any lifesaving emergency treatment needed, and personnel handling the patient should wear surgical gowns, caps, and gloves. Also called **emergency handling of radiation accidents.**

radiation force, a small, steady force that is produced when a sound beam strikes a reflecting or absorbing surface. It is proportional to the acoustic power.

radiation hygiene, the art and science of protecting human beings from injury by radiation. It reduces clinical exposure from external radiation through protective barriers of radiation-absorbing material, ensures safe distances between people and radiation sources, reduces radiation exposure times, or uses combinations of all these measures. To protect against the dangers of internal radiation, precautions seek to restrict inhalation, ingestion, and other modes of entry of radioactive substances into the body.

radiation leakage, radiation going out through the x-ray tube housing in all directions rather than that of the useful beam.

radiation nephritis, kidney damage caused by ionizing radiation. Symptoms include glomerular and tubular damage, hypertension, and proteinuria, sometimes leading to renal failure. It may be acute or chronic, and some varieties do not manifest until years after the radiation exposure.

radiation oncologist, a physician with special training in the use of ionizing radiation in the treatment of cancers.

radiation oncology, the study of the treatment of cancer with ionizing radiation.

radiation protection, the use of devices, equipment, distance, and barriers to reduce the risk of exposure to ionizing radiation in a health care facility, research center, or industrial site where radiation-emitting devices are operated.

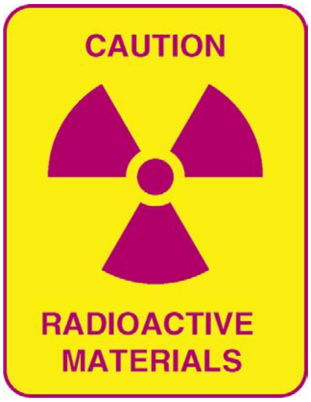
radiation risk, a hazard to health resulting from exposure to natural and synthetic radioactive materials. Radiation sources include cosmic rays, radon, radium, and other radionuclides in the soil; nuclear reactors, accelerators, and weapons; uranium mining and milling; and diagnostic and therapeutic x-ray devices.

radiation safety committee, an organization responsible for monitoring and maintaining a safe radiation environment in institutions where radiation is produced and/or used.

radiation sensitivity, a measure of the response of tissue to ionizing radiation.

radiation sickness, an abnormal condition resulting from exposure to ionizing radiation. The severity of the condition is determined by the intensity of radiation, the length of time of exposure, and the area of the body affected. Moderate exposure may cause headache, nausea, vomiting, anorexia, and diarrhea; long-term exposure may result in sterility, fetal damage in pregnant women, leukemia or other forms of cancer, alopecia, and cataracts.

radiation symbol, a universal symbol consisting of three red wedges arranged at positions 120 degrees apart around a central red circle on a yellow background. The symbol identifies sources or containers of radioactive materials and areas of potential radiation exposure.



International radiation symbol
(Harkreader, Hogan, and Thobaben, 2007)

radiation syndrome. See **radiation sickness.**

radiation therapist, an allied health professional who administers radiation therapy services to patients and observes patients during treatment. Duties may include tumor localization, dosimetry, patient follow-up, patient education, and record keeping.

radiation therapy. See **radiotherapy.**

radiation therapy management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the patient to understand and minimize the side effects of radiation treatments. See also **Nursing Interventions Classification.**

radiation therapy technologist. See **radiation therapist.**

radiation toxicity, the degree of virulence of a given exposure or dose of ionizing radiation. Also called **radiotoxicity**.

radical /rad′ikəl/ [L, *radix,* root], **1.** *n,* an atom or group of atoms that contains an unpaired electron. A radical does not exist freely in nature except for O_2, NO, and NO_2. **2.** *adj,* pertaining to drastic therapy, such as the surgical removal of an organ, limb, or other part of the body.

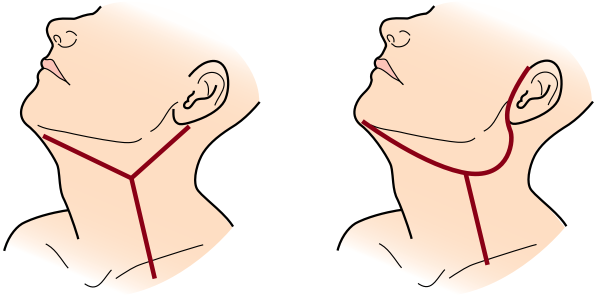
radical dissection, the surgical removal of tissue in an extensive area surrounding the operative site. Most often it is performed to identify and excise all tissue that may possibly be malignant to decrease the chance of recurrence and usually includes adjacent lymph nodes.

radical hysterectomy. See **hysterectomy.**

radical lymphadenectomy. See retroperitoneal lymphnode dissection.

radical mastectomy, surgical removal of an entire breast; pectoral muscles; axillary lymph nodes; and all fat, fascia, and adjacent tissues as one surgical treatment for breast cancer. Edema of the arm on the affected side is the rule because the axillary lymphatic structures that drain the lymph from the arm are removed during surgery. A pressure dressing is usually applied and left in place until bleeding and drainage have decreased. A drain is usually left in the wound for several days. Compare **modified radical mastectomy, simple mastectomy.** See also **lumpectomy, mastectomy.**

radical neck dissection, dissection and removal of all lymph nodes and removable tissues under the skin of the neck, performed to prevent the spread of malignant tumors of the head and neck that have a reasonable chance of being controlled. Thorough mouth hygiene is given, and antibiotics are begun. A tracheostomy may be done.



Neck incisions for radical neck dissection *(Phillips, 2012)*

radical nephrectomy, the surgical removal of a kidney, usually performed in the treatment of cancer of the kidney.

radical retropubic prostatectomy, radical prostatectomy through the retropubic space via a suprapubic incision.

radical surgery [L, *radix,* root; Gk, *cheirourgia,* surgery], surgery that is usually extensive and complex and intended to correct a severe health threat such as a rapidly growing cancer. See also **radical dissection.**

radical therapy, **1.** a treatment intended to cure, not palliate. **2.** a definitive extreme treatment, not a conservative treatment, such as radical mastectomy rather than simple or partial mastectomy.

radical vulvectomy. See **vulvectomy.**

radicidation /rā′disidā′shən/, the irradiation of food to inactivate nonsporing pathogens of *Salmonella* and other microorganisms.

radicular /rədik′yələr/ [L, *radix,* root], pertaining to a root, such as a spinal nerve root or radical.

radicular artery, arteries arising from the segmental spinal arteries at every vertebral level. They supply the anterior and posterior roots of the spine.

radicular cyst [L, *radix,* root; Gk, *kystis,* bag], a cyst with a wall of fibrous connective tissue and a lining of stratified squamous epithelium that is attached to the root apex of a tooth with dead pulp or a defective root canal filling. Also called **periapical cyst, root end cyst.**

radicular retainer, a type of retainer, such as a dowel crown, that lies within the body of a tooth, usually in the root. Resistance to displacement and shear is developed by extending an attached dowel into the root canal of the tooth. Compare **dowel.**

radicular retention, resistance to displacement of a dental prosthesis developed by placing a metal projection into the root canal of a pulpless tooth. See also **radicular retainer.**

radiculitis /rədik′yəlī′tis/ [L, *radix,* root; Gk, *itis,* inflammation], an inflammation involving a spinal nerve root, resulting in pain and hyperesthesia.

radiculopathy /rədik′yəlop′əthē/ [L, *radix,* root; Gk, *pathos,* disease], a disease involving a spinal nerve root.

radii. See **radius.**

radio- /rā′dē·ō-/, prefix meaning “radiation,” sometimes referring specifically to emission of radiant energy, to radium, or to the radius: *radioactive, radiobiology, radiohumeral.*

radioactive /rā′dē·ōak′tiv/ [L, *radius,* ray, *activus,* active], giving off radiation as the result of the disintegration of atomic nuclei.

radioactive carbon. See **tracer.**

radioactive contamination, the undesirable addition of radioactive material to the body or part of the environment, such as clothing or equipment. Contamination of the body by beta radiation may occur through the ingestion, inhalation, or absorption of a beta emitter. Instruments, drapes, surgical gloves, and clothing that come in contact with serous fluids, blood, and urine of patients containing beta or gamma radiation emitters may be contaminated. The severity of the contamination is directly related to the elapsed time between the administration of the radioactive isotope and surgery. On completion of the procedure, possibly contaminated material is isolated and checked. If found to be contaminated, it is disposed of according to institutional and federal standards for the disposal of radioactive waste.

radioactive contrast medium, a solution or colloid containing radioactive material used for visualizing soft tissue structures. Such contrast media indicate their positions or distribution in the body by their gamma ray emissions.

radioactive decay, the disintegration of the nucleus of an unstable nuclide by the spontaneous emission of charged particles, photons, or both.

radioactive element, an element subject to spontaneous degeneration of its nucleus accompanied by the emission of alpha particles, beta particles, or gamma rays. All elements with atomic numbers greater than 83 are radioactive. Naturally occurring radioactive elements include radium, thorium, and uranium. Several radioactive elements not found in nature have been produced by the bombardment of stable elements with subatomic particles in a cyclotron. Compare **stable element.** See also **radioactivity.**

radioactive half-life. See **half-life.**

radioactive implant, a small container holding a radioactive isotope that is embedded in tissues for purposes of interstitial radiotherapy.

radioactive iodine (RAI), a radioactive isotope of iodine used in diagnostic radiology and radiotherapy, especially in the treatment of some thyroid conditions. A common form is ^{131}I. Also called **radioiodine.**

radioactive iodine excretion, the elimination by the body of radioactive iodine (RAI) administered in a test of thyroid function and in the treatment of hyperthyroidism. Most RAI is excreted in urine, but small amounts may be found in sputum, perspiration, feces, and vomitus.

radioactive iodine excretion test, a method of evaluating thyroid function that entails measuring the amount of radioactive iodine (RAI) in urine after the patient is given an oral tracer dose of RAI in the form of the isotope ^{131}I. Normally, 5% to 35% of the dose is absorbed by the thyroid; absorption is increased in hyperthyroidism and decreased in hypothyroidism, and the amount excreted in urine is inversely proportional to the uptake of RAI. After administration of the tracer, a scintillation detector is placed over the patient's neck at 2, 6, and 24 hours to measure the amount of RAI accumulated by the thyroid; the amount excreted is assayed in urine collected for 24 hours after the oral dose. Diarrhea can result in low levels of RAI in urine. Renal failure, by decreasing excretion, can cause high levels. See also **radioactive iodine uptake.**

radioactive iodine uptake (RAIU), the absorption and incorporation by the thyroid of radioactive iodine (RAI), administered orally as a tracer dose in a test of thyroid function and as larger doses for the treatment of hyperthyroidism. The radioisotope ^{131}I is rapidly absorbed in the stomach and concentrated in the thyroid. Normal findings are 4% to 12% absorbed in 2 hours, 6% to 15% absorbed in 6 hours, and 8% to 30% absorbed in 24 hours. Patients receiving a large therapeutic dose of RAI may require hospitalization for several days. See also **radioactive iodine excretion test.**

radioactive tracer, a molecule containing a radioactive atom, which can be followed through a physiological system with radiation detectors.

radioactivity /-activ′itē/, the emission of alpha or beta particles or gamma radiation as a consequence of nuclear disintegration. Natural radioactivity is a property exhibited by all chemical elements with an atomic number greater than 83; artificial or induced radioactivity is created through the bombardment of stable elements with subatomic particles or high levels of gamma radiation or x-radiation.

radioallergosorbent test (RAST) /rā′dē·ō′alur′gōsôr′bənt/ [L, *radius* + Gk, *allos*, other, *ergein*, to work; L, *absorbere*, to swallow], a test in which a technique of radioimmunoassay is used to identify and quantify IgE in serum that has been mixed with any of 45 known allergens. If an atopic allergy to a substance exists, an antigen-antibody reaction occurs with characteristic conjugation and clumping. The test is an in vitro method of demonstrating allergic reactions. Compare **patch test, Prausnitz-Küstner test.**

radiobiology /-bī·ol′əjē/ [L, *radius* + Gk, *bios*, life, *logos*, science], the branch of the natural sciences dealing with the effects of radiation on biological systems. **—radiobiologic, radiobiological,** *adj.*

radiocarcinogenesis /-kär′sinəjen′əsis/, the production of cancer by exposure to ionizing radiation.

radiocarpal articulation /-kär′pəl/ [L, *radius* + Gk, *karpos*, wrist], the condyloid joint at the wrist that connects the radius and distal surface of an articular disk with the scaphoid, lunate, and triangular bones. The joint involves four ligaments and allows all movements but rotation. The capsule of the wrist joint is reinforced by palmar radiocarpal, palmar ulnocarpal, and dorsal radiocarpal ligaments. In addition, radial and ulnar collateral ligaments of the joint span the distance between the styloid processes of the radius and ulna and the adjacent carpal bones. Also called **wrist joint.**

radiochemistry /-kem′istrē/ [L, *radius* + Gk, *chemiea*, alchemy], the branch of chemistry that deals with the properties and behavior of radioactive materials and the use of radionuclides in the study of chemical and biological problems.

radiocolloids /rā′dē·ōkol′oidz/, radioisotopes in pure form in solution, which tend to act more like colloids than solutes.

radiocurable /-kyo͞o′rəbəl/, pertaining to the susceptibility of tumor cells to destruction by ionizing radiation.

radiodensity. See **radiopacity.**

radiodermatitis /-dur′mətī′tis/. See **radiation dermatitis.**

radiofrequency (rf) /-frē′kwənsē/ [L, *radius* + *frequens*], the part of the electromagnetic spectrum with frequencies lower than about 10^{10} Hz, used to produce magnetic resonance images.

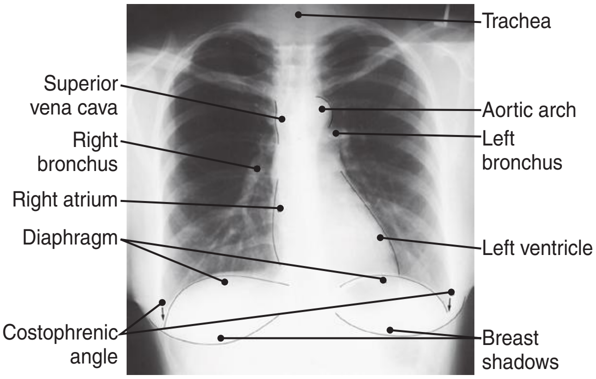
radiofrequency ablation, unmodulated, high-frequency, alternating current flow that is applied to heart tissue to raise its temperature and injure cells for the purpose of destroying ectopic foci and accessory pathways. Radiofrequency ablation of accessory pathways is a cure for the arrhythmias associated with Wolfe-Parkinson-White syndrome and is successfully used in atrial flutter and idiopathic ventricular tachycardia. It has replaced surgical ablation.

radiofrequency pulse, a short burst of electromagnetic radiation in the radiofrequency range, used in combination with magnetic gradients to generate a magnetic resonance image.

radiofrequency (rf) signal, **1.** an electrical signal whose frequency is in the rf range. **2.** a signal within an ultrasound instrument between the transducer terminals and components where rectification and filtering occur.

radiofrequency therapy, the use of radiofrequency ablation for therapeutic purposes, such as the treatment of pain syndromes and arrhythmias.

radiograph /rā′dē·əgraf′/, an x-ray image. Also called *radiogram*.



Normal radiograph of the chest

(Black and Hawks, 2009)

radiographer /rā′dē·og′rəfər/. See **radiological technologist.**

radiographic. See **radiography.**

radiographic contrast medium. See **radiopaque contrast medium.**

radiographic grid /-graf′ik/, a device used to reduce the amount of scatter radiation reaching an x-ray film. Grids consist of parallel strips of radiopaque materials alternating with strips of radiolucent materials. See also **grid.**

radiographic magnification, a procedure used to improve visualization of fine blood vessels and small bony structures during x-ray imaging. Magnification is achieved by increasing the distance of the object from the radiographic image receptor or by decreasing the distance of the x-ray source from the image receptor.

radiographic position, the specific position of the body or a body part in relation to the image receptor during x-ray imaging.

radiographic projection, the path taken by an x-ray beam as it passes through the body. For example, an anteroposterior projection refers to a beam that enters the anterior (front) of the body and exits the posterior (back).

radiographic view, the body image as seen by the image receptor of a radiographic imaging system. It is the opposite of the radiographic projection.

radiography /rā′dē·og′rəfē/ [L, *radius* + Gk, *graphein,* to record], the production of shadow images on photographic emulsion through the action of ionizing radiation. The image is the result of the differential attenuation of the radiation in its passage through the object being radiographed. **—radiographic,** *adj.*

radiohumeral /rā′dē·ōhyo͞o′mərəl/ [L, *radius* + *humerus,* shoulder], pertaining to the radius and humerus.

radioimmunoassay (RIA) /rā′dē·ō·im′yənō·as′ā/ [L, *radius* + *immunis,* free; Fr, *essayer,* to try], a technique in radiology used to determine the concentration of an antigen, antibody, or other protein in the serum. The technique involves the injection of a known amount of a radioactively labeled substance that reacts with the protein in question.

radioimmunofluorescence assay (RIFA) /rā′dē·ō·im′yənō′flo͞ores′əns/, a test for the presence of antibodies sometimes used to confirm the results of ELISA or other methods.

radioimmunosorbent test (RIST) /rā′dē·ō·im′yənōsôr′bənt/ [L, *radius* + *immunis* + *absorbere,* to swallow], a test that uses serum immunoglobulin E to detect allergies to various substances such as certain cosmetics, animal fur, dust, and grasses.

radioimmunotherapy /ra′dē·ōim-mu′no-ther′ah-pe/, use of radionuclides to deliver monoclonal antibodies to targeted cancer cells.

radioiodine /rā′dē·ō·ī′ədīn/. See **radioactive iodine.**

radioiodine uptake, uptake of radioiodine from the blood by the thyroid gland. See also **radioiodine uptake test.**

radioiodine uptake test, one of the most common thyroid function tests. A known quantity of radioiodine is administered, and 6 and 24 hours later the percent that has been absorbed by the thyroid gland is calculated. An increased uptake indicates hyperthyroidism, and a decreased uptake indicates hypothyroidism. Patients who have recently been exposed to iodine compounds, such as in dietary supplements, contrast media, medications, or antiseptics, may not be good candidates for this test.

radioisotope /rā′dē·ō·ī′sətōp/ [L, *radius* + Gk, *isos,* equal, *topos,* place], a radioactive form of an element, which may be used for therapeutic and diagnostic purposes.

radioisotope scan, a two-dimensional representation of the gamma rays emitted by a radioisotope showing its concentration in a body site, such as the thyroid gland, brain, or kidney. Radioisotopes used in diagnostic scanning may be administered intravenously or orally.

radiologic. See **radiology.**

radiological. See **radiology.**

Radiological Society of North America (RSNA), a professional organization of radiologists. The group originated the certification of operators of x-ray equipment in 1920 but is no longer involved in such certification.

radiological anatomy /-loj′ik/ [L, *radius* + Gk, *logos,* science], (in applied anatomy) the study of the structure and morphology of the tissues and organs of the body based on their x-ray visualization.

radiological technologist, a person who, under the supervision of a physician radiologist, operates radiological equipment and assists radiologists and other health professionals and whose competence has been tested and approved by the American Registry of Radiologic Technologists. Also called **radiographer, x-ray technologist.**

radiological units, units used to measure radiation, including roentgens, rads, rems, and curies.

radiologist /rā′dē·ol′əjist/, a physician who specializes in radiology. A certified radiologist is one whose competence has been tested and approved by the American Board of Radiology. Also called **roentgenologist** /rent′gənol′əjist/.

radiology /-ol′əjē/ [L, *radius* + *logos,* science], the branch of medicine concerned with radioactive substances and with the diagnosis and treatment of disease by visualizing any of the various sources of radiant energy. Three subbranches of radiology are **diagnostic radiology,** imaging using external sources of radiation; **nuclear medicine,** imaging radioactive materials that are placed into body organs; and **therapeutic radiology,** the treatment of cancer using radiation. Formerly called **roentgenology. —radiologic, radiological,** *adj.*

radiolucency /-lo͞o′sənsē/ [L, *radiare* + *lucere,* to shine], the ability of materials of relatively low atomic number to allow most x-rays to pass through them, producing dark images on x-ray film. **—radiolucent,** *adj.*

radiolucent /-lo͞o′sənt/ [L, *radiare,* to emit rays, *lucere,* to shine], pertaining to materials that allow x-rays to penetrate with a minimum of absorption.

radionecrosis /-nəkrō′sis/, tissue death caused by radiation.

radionuclide /-no͞o′klīd/ [L, *radiare* + *nucleus,* nut kernel], an isotope that undergoes radioactive decay. Any element with an excess of either neutrons or protons in the nucleus is unstable and tends toward radioactive decay, with the emission of energy that may be measurable with a detector. The processes of radioactive decay include beta particle emission, electron capture, isomeric transition, and positron emission. Positron-emitting radionuclides are important in positron emission tomography and in medical research. Radionuclides used in scintigraphy include ^{123}I, ^{131}I, ^{111}In, ^{75}Se, ^{99m}Tc, and ^{201}Tl. Radionuclides of cobalt, iodine, phosphorus, strontium, and other elements are used for treatment of tumors and cancers and for nuclear imaging of internal parts of the body. See also **nuclear scanning.**

radionuclide angiocardiography, the radiographic examination of cardiac blood vessels after an IV injection of a radiopharmaceutical.

radionuclide imaging, the noninvasive examination of various parts of the body, especially the heart, using a radiopharmaceutical such as thallium-201 and a detection device such as a gamma camera, rectilinear scanner, or positron camera. See also **cardiac radionuclide imaging.**

radionuclide organ imaging. See **nuclear scanning.**

radiopacity /-pas′itē/ [L, *radiare,* to emit rays, *opacus,* obscure], the ability to stop or reduce the passage of x-rays. Bones have relative radiopacity and therefore display as white areas on an exposed x-ray film. Lead has marked radiopacity and therefore is widely used to shield x-ray equipment and atomic power sources. Also called **radiodensity. —radiopaque,** *adj.*

radiopaque /-pāk′/ [L, *radiare* + *opacus,* obscure], not permitting the passage of x-rays or other radiant energy. See also **radioactive element, radioactivity. —radiopacity,** *n.*

radiopaque contrast medium, a substance that stops the passage of x-rays and is used to outline the interior of hollow organs, such as heart chambers, blood vessels, respiratory passages, and the biliary tract in x-ray or fluoroscopic pictures. Also called **radiographic contrast medium.** Compare **radiolucency.**

radiopathology /-pəthol′əjē/, a branch of medicine involving both pathology and radiology and concerned with the effects of ionizing radiation on body tissues.

radiopharmaceutical /-fär′məso͞o′tikəl/ [L, *radiare* + Gk, *pharmakeuein,* to give a drug], a drug that contains radioactive atoms. Kinds of radiopharmaceuticals are **diagnostic radiopharmaceutical, research radiopharmaceutical,** and **therapeutic radiopharmaceutical.**

radiopharmacist /-fär′məsist/, a person responsible for formulating and dispensing prescribed radioactive tracers and for the clinical aspects of radiopharmacy. Radiopharmacists are required to receive training in radioactive tracer techniques, the safe handling of radioactive materials, the preparation and quality control of drugs for administration to humans, and the basic principles of nuclear medicine. Some states require that radioactive drugs be dispensed by licensed pharmacists only. Others recognize radiopharmaceutic specialists who are not necessarily graduates of a school of pharmacy.

radiopharmacy /-fär′məsē/ [L, *radiare* + Gk, *pharmakeuein,* to give a drug], a facility for the preparation and dispensing of radioactive drugs and for the storage of radioactive materials, inventory records, and prescriptions of radioactive substances. The radiopharmacy is usually the correlation point for radioactive wastes, the unit responsible for waste disposal or storage, and a center for clinical investigations using radioactive tracers. It may also be a center for research and for the training of students and residents in radiology and nuclear medicine.

radioprotectant /rā′dē·opro-tek′tant/, **1.** *adj,* providing protection against the toxic effects of ionizing radiation. **2.** *n,* see **radioprotector.**

radioprotective drugs /-prətek′tiv/ [L, *radiare,* to emit rays, *protegere,* to cover; Fr, drogue], pharmaceuticals that protect the body against ionizing radiation. An example is Lugol's solution, an aqueous solution of iodine used to supply iodine internally, thereby blocking the uptake of radioactive iodine.

radioprotector /rā′dē·ōpro-tek′ter/, an agent that provides protection against the toxic effects of ionizing radiation.

radioresistance /-risis′təns/ [L, *radiare* + *resistare,* to withstand], the ability of cells, tissues, organs, organisms, chemical compounds, or any other substances to remain unchanged by radiation. Compare **radiosensitivity. —radioresistant,** *adj.*

radioresistant /-risis′tənt/, unchanged by or protected against damage by radioactive emissions such as x-rays, alpha particles, or gamma rays. Compare **radiosensitive.** See also **radioactivity.**

radioresponsive /-rispon′siv/, responding to radiation, whether harmful or beneficial.

radiosensitive /-sen′sitiv/ [L, *radiare* + *sentire,* to feel], capable of being changed by or reacting to radioactive emissions such as x-rays, alpha particles, or gamma rays. Compare **radioresistant.** See also **radioactivity.**

radiosensitivity /-sen′sitiv′itē/, the relative susceptibility of cells, tissues, organs, organisms, or any other substances to the effects of radiation. Cells of self-renewing tissues, such as those in the crypts of the intestine, are the most radiosensitive. Cells that divide regularly but mature between divisions, such as spermatogonia and spermatocytes, are somewhat less radiosensitive. Long-lived cells that usually do not divide unless there is a suitable stimulus, such as liver, kidney, and thyroid cells, are even less radiosensitive. Least radiosensitive are cells that have lost the ability to divide, such as neurons. Compare **radioresistance. —radiosensitive,** *adj.*

radiosensitizers /-sen′sitī′zərs/ [L, *radiare* + *sentire* + Gk, *izein,* to cause], drugs that enhance the killing effect of radiation on cells.

radiotherapist /-ther′əpist/, a health professional who specializes in the use of radiation, including the application of radiopharmaceuticals, in the treatment of disease. See also **radiation oncologist.**

radiotherapy /-ther′əpē/ [L, *radiare,* to emit rays; Gk, *therapeia,* treatment], the treatment of neoplastic disease by using x-rays or gamma rays to deter the proliferation of malignant cells by decreasing the rate of mitosis or impairing DNA synthesis.

radiotoxicity. See **radiation toxicity.**

radioulnar articulation /-ul′nər/ [L, *radius,* ray, *ulna,* elbow, arm], the articulation of the radius and the ulna, consisting of a proximal articulation, a distal articulation, and three sets of ligaments.

radium (Ra) /rā′dē·əm/ [L, *radius,* ray], a radioactive metallic element of the alkaline earth group. Its atomic number is 88. Four radium isotopes occur naturally and have different atomic masses: 223, 224, 226, and 228. The isotope with atomic mass 226 is the most abundant. It is formed by the disintegration of uranium 238, has a half-life of 1620 years, and decays by alpha emission to form radon 222. Radium occurs in the uranium minerals carnotite and pitchblende, which contain about 3×10^{-7} g of radium per g of uranium. Radium salts have been used extensively as radiation sources in the treatment of cancer but are gradually being replaced in such therapy by cobalt and cesium.

radium-226, a radioactive isotope used for most of the twentieth century to fill the needles and tubes required for brachytherapy. It is now being replaced by cesium-137 and cobalt-60, which have similar energy characteristics but are not subject to hazardous leakage as radium sources sometimes are.

radium insertion, the introduction of metallic radium into a body cavity, such as the uterus or cervix, to treat cancer.

radium therapy [L, *radius,* ray; Gk, *therapeia,* treatment], the use of radium and its radioactive emissions to treat disease.

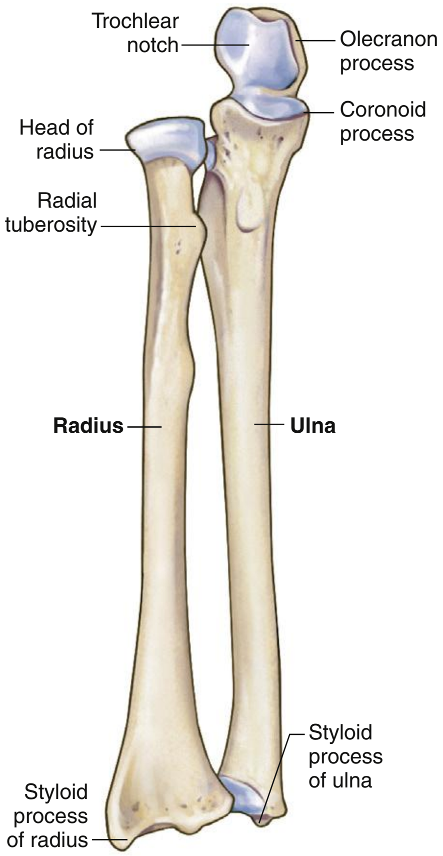
radius /rā′dē·əs/ *pl.* **radii** [L, ray], one of the outer, shorter bones of the forearm lying parallel to the ulna and partially revolving around it. Its proximal end is small and forms a part of the elbow joint. The distal end is large and forms a part of the wrist joint. The radius receives the insertions of various muscles and articulates with the humerus, ulna, scaphoid, lunate, and triangular bones.

radix. See **root.**

radon (Rn) /rā′don/ [L, *radiare,* to emit rays], a radioactive, chemically inert, gaseous element. Its atomic number is 86, and its atomic mass is 222. A decay product of radium, radon is used in radiation cancer therapy. Radon is also released by rocks, soil, and groundwater and is a common source of background radiation, with an intensity that varies in different geographic areas.

radon-222, a radioactive decay product of radium-226 that has been used to fill permanent implants in tumors. It is being replaced by the more manageable radionuclide iodine-125.

radon daughters, ions that are decay products of radon. They are regarded as a potential health hazard by the U.S.



Radius and ulna *(Patton and Thibodeau, 2010)*

Environmental Protection Agency because they tend to adhere to surfaces, such as the alveoli of the lungs, where they can cause ionizing radiation damage.

radon seed, a small, sealed tube of glass or gold containing radon and visible radiographically, for insertion into body tissues in the treatment of malignancies.

ragpicker disease. See **anthrax.**

ragweed /rag′wēd/ [ME, *ragge,* rag + AS, *weod,* herb, grass, weed], any of various species of plants of the genus *Ambrosia* whose pollen can cause hay fever.

RAI, abbreviation for **radioactive iodine.**

RAID, abbreviation for *redundant array of inexpensive disks,* a computer data storage system with rapid access time and enhanced fault tolerance.

RAIU, abbreviation for **radioactive iodine uptake.**

RA latex test, abbreviation for *rheumatoid arthritis latex test*. See **latex fixation test.**

rale. See **crackle.**

raloxifene, a selective estrogen receptor modulator.

■ INDICATION: It is used to prevent osteoporosis in postmenopausal women.

■ CONTRAINDICATIONS: Pregnancy, lactation, and known hypersensitivity to raloxifene prohibit its use.

■ ADVERSE EFFECTS: Adverse effects include insomnia, migraines, depression, hot flashes, diarrhea, anorexia, cramps, vaginitis, urinary tract infection, leukorrhea, endometrial disorder, breast pain, rash, sweating, weight gain, peripheral edema, arthralgia, myalgia, leg cramps, arthritis, sinusitis, pharyngitis, increased cough, pneumonia, and laryngitis. Nausea is a common side effect.

raltegravir, an antiretroviral.

■ INDICATION: This drug is used to treat HIV in combination with other retrovirals.

■ CONTRAINDICATIONS: Breastfeeding and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include fatigue, fever, dizziness, nausea, vomiting, diarrhea, abdominal pain, asthenia, gastritis, rash, urticaria, pruritus, pain or phlebitis at IV site, unusual sweating, alopecia, hyperamylasia, hyperglycemia, and myopathy. Life-threatening side effects include hepatitis, oliguria, proteinuria, hematuria, glomerulonephritis, acute renal failure, renal tubular necrosis, anemia, neutropenia, and rhabdomyolysis.

RAM, abbreviation for **random-access memory.**

ramelteon, a sedative-hypnotic with antianxiety properties.

■ INDICATION: This drug is used to treat insomnia.

■ CONTRAINDICATIONS: Alcohol intoxication, hepatic encephalopathy, lactation, and known hypersensitivity to this drug prohibit its use. This drug should not be administered to infants or children.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, somnolence, fatigue, headache, insomnia, depression, nausea, diarrhea, dysgeusia, vomiting, myalgia, arthralgia, decreased blood cortisol, influenza, and upper respiratory infection.

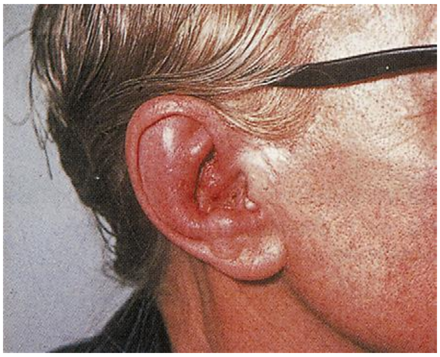
rami-, prefix meaning "branch": *ramicotomy, ramification, ramisection*.

ramification /ram′ifikā′shən/ [L, *ramus,* branch, *facere,* to make], a branching, distribution.

ramify. See **ramus.**

rampant dental caries, dental caries that involve several teeth, appear suddenly, and often progress rapidly.

Ramsay Hunt syndrome [James Ramsay Hunt, American neurologist, 1872–1937], a neurological condition resulting from invasion of the seventh nerve ganglia and the geniculate ganglion by varicella zoster virus, characterized by severe ear pain, facial nerve paralysis, vertigo, hearing loss, and often mild generalized encephalitis. The vertigo may last days or weeks but usually resolves itself. The facial paralysis may be permanent, and the hearing loss, which is rarely permanent, may be partial or total. Treatment usually includes the prescription of corticosteroid drugs. Also called **herpes zoster oticus.**



Ramsay Hunt syndrome *(Perkin et al, 2011)*

Ramstedt-Fredet operation. See **pyloromyotomy.**

ramus /rā′məs/ *pl*. **rami** [L, branch], a small branchlike structure extending from a larger one or dividing into two or more parts, such as a branch of a nerve or artery or one of the rami of the blood vessel or nerve. **—ramification,** *n*., **ramify,** *v*.

ramus of mandible, a quadrilateral process projecting upwards from the posterior part of either side of the mandible.

Ranchos Los Amigos Scale, a scale of cognitive functioning developed as a behavioral rating scale to aid in assessment and treatment of head-injured persons. Eight levels of cognitive functioning are identified, from I (no response) to VIII (purposeful and appropriate behavioral response).

rancidity /ransid′itē/, the unpleasant taste and smell of fatty foods that have undergone decomposition, liberating butyric acid and other volatile lipids.

random-access memory (RAM) /ran′dəm/, the part of a computer's memory available to execute programs and temporarily store data. It can usually be used for both reading and writing. RAM data is automatically erased when the computer is turned off unless the file has been saved. Also called *volatile memory*. Compare **read-only memory.**

random controlled trial [ME, *randoun,* run violently; Fr, *contrôle,* check, *trier,* to grind], a study plan for a proposed new treatment in which subjects are assigned on a random basis to participate either in an experimental group receiving the new treatment or in a control group that does not.

random genetic drift. See **genetic drift.**

randomization [ME, *randoun,* run violently], the process of assigning subjects or objects to a control or experimental group on a random basis.

random mating [ME, *randoun,* run violently, *gemate*], a pairing of subjects when each individual has an equal chance of mating with those of other genetic backgrounds.

random off. See **on/off phenomenon.**

random sampling [ME, *randoun,* run violently; L, *exemplum*], a method of sampling for a study in which each individual has an equal chance of being selected and the choice of a particular individual does not affect the chances of the others.

random selection, a method of choosing subjects for a research study in which all members of a particular group have an equal chance of being selected.

random voided specimen, a voided urine specimen obtained at any point in a 24-hour period.

Ranexa, a trademark for **ranolazine.**

range /rānj/ [OFr, *ranger,* to arrange in a row], the interval between the lowest and highest values in a series of data.

range abnormalities, uncertainties in the actual range from which Doppler signals or echo signals originate. In pulsed Doppler instruments a high pulse repetition frequency can result in range ambiguities.

range equation, a relationship between the distance to a reflector and the time it takes for a pulse of ultrasound to propagate to the reflector and return to the transducer.

range of accommodation [OFr, *ranger* + L, *accommodatio*], the distance between the farthest point at which an object can be seen clearly with accommodation fully relaxed and the nearest distance at which an object can be observed with full accommodation, measured in meters or centimeters.

range of motion (ROM) [OFr, *ranger* + L, *motio*], the extent of movement of a joint, measured in degrees of a circle. See also **active range of motion**, **passive range of motion.**

range-of-motion exercise [OFr, *ranger,* to arrange in a row; L, *motio,* movement], any body action involving the muscles, joints, and natural movements, such as abduction, adduction, extension, flexion, pronation, supination, and rotation. Such exercises are usually applied actively or passively in the prevention and treatment of orthopedic deformities, in the assessment of injuries and deformities, and in athletic conditioning. See also **active range of motion**, **passive range of motion.**

ranibizumab, an ophthalmic drug that binds to the receptor binding site of active forms of vascular endothelial growth factor A.

■ INDICATIONS: This drug is used in the treatment of neovascular macular degeneration.

■ CONTRAINDICATIONS: Ocular infections and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness; headache; blepharitis; cataract; conjunctival hemorrhage and hyperemia; detachment of the retinal pigment epithelium; dryness, irritation, and pain in the eye; visual impairment; vitreous floaters; ocular infection; constipation; nausea; hypertension; urinary tract infection; thromboembolism; bronchitis; cough; sinusitis; and upper respiratory infection.

ranitidine /ranit′idēn/, a histamine H_2 receptor antagonist.

■ INDICATIONS: It is prescribed in the treatment of gastroesophageal reflux disease and gastric hypersecretory conditions.

■ CONTRAINDICATIONS: Known sensitivity to this drug prohibits its use. The drug should be used in pregnancy only if clearly needed and with caution in those with severe hepatic or renal impairment.

■ ADVERSE EFFECTS: Among the most serious adverse effects are acquired hemolytic anemia, agranulocytosis, atrioventricular block, agitation, dizziness, headaches, rashes, gynecomastia, and loss of libido.

Rankine scale [William J. M. Rankine, Scottish physicist, 1820–1870], an absolute temperature scale calculated in degrees Fahrenheit. Absolute zero on the Rankine scale is −460° F, equivalent to −273° C. See also **Kelvin scale.**

rank sum test, a nonparametric statistical test for ordinal data, testing the null hypothesis that two samples are drawn from the same population against the alternative hypothesis that the two samples are drawn from two populations having probability distributions of the same shape but different locations. It is based on the value of the rank sum statistic, which is calculated as the sum of the ranks of each sample after the observations in both samples are jointly ranked in ascending order; if and only if the null hypothesis is true, the average ranks of the two samples will be similar. Also called **Mann-Whitney test, Mann-Whitney U test.**

ranolazine, an antianginal.

■ INDICATIONS: This drug is used in combination with other antianginals (such as amlodipine, beta-blockers, or nitrates) to treat chronic stable angina pectoris in those who have not responded to other treatment options.

■ CONTRAINDICATIONS: Preexisting Q-T prolongation, hepatic disease (Child-Pugh class A, B, or C), hypokalemia, renal failure, torsades de pointes, ventricular arrhythmia, ventricular tachycardia, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include headache, dizziness, palpitations, nausea, vomiting, constipation, dry mouth, peripheral edema, and dyspnea. A life-threatening side effect of this drug is Q-T prolongation.

ranula /ran′yŏŏlə/ *pl.* **ranulae** [L, *rana,* frog], a large mucocele in the floor of the mouth, usually caused by obstruction of the ducts of the sublingual salivary glands and less commonly caused by obstruction of the ducts of the submandibular salivary glands. Also called **hydroglossa.**

Ranvier's nodes /ränvē·āz′, räN-/ [Louis A. Ranvier, French pathologist, 1835–1922], constrictions in the medullary substance of a nerve fiber at more or less regular intervals.

Range-of-motion exercises

Body part	*Type of joint*	*Type of movement*
Neck, cervical spine	Pivotal 	Flexion: bring chin to rest on chest Extension: return head to erect position Extension: bend head back as far as possible
		Lateral flexion: tilt head as far as possible toward each shoulder
		Rotation: turn head as far as possible in circular movement
Shoulder	Ball and socket 	Flexion: raise arm from side position forward to position above head Extension: return arm to position at side of body Extension: move arm behind body, keeping elbow straight
		Abduction: raise arm to side to position above head with palm away from head Adduction: lower arm sideways and across body as far as possible
		Internal rotation: with elbow flexed and shoulder at side, rotate shoulder by moving arm until thumb is turned inward and toward back External rotation: with elbow flexed and shoulder at side, move arm until thumb is upward and lateral to head
		Circumduction: move arm in full circle. (Circumduction is combination of all movements of ball-and-socket joint.)
Elbow	Hinge 	Flexion: bend elbow so that lower arm moves toward its shoulder joint and hand is level with shoulder Extension: straighten elbow by lowering hand
Forearm	Pivotal 	Supination: turn lower arm and hand so that palm is up Pronation: turn lower arm so that palm is down
Wrist	Condyloid 	Flexion: move palm toward inner aspect of forearm Extension: move fingers and hand posterior to midline
		Hyperextension: bring dorsal surface of hand back as far as possible Abduction: Place hand with palm down and extend wrist laterally toward fifth finger Adduction: Place hand with palm down and extend wrist medially toward thumb
Fingers	Condyloid hinge 	Flexion: make fist Extension: straighten fingers Hyperextension: bend fingers back as far as possible Abduction: spread fingers apart Adduction: bring fingers together

Range-of-motion exercises—cont'd

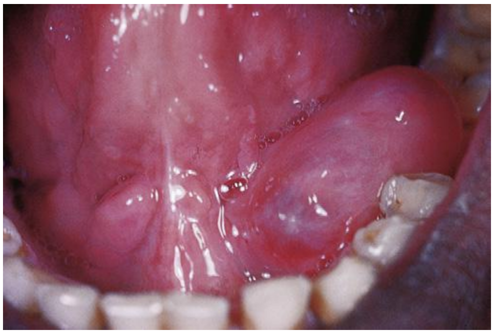
Body part	*Type of joint*	*Type of movement*
Thumb	Saddle 	Flexion: move thumb across palmar surface of hand Extension: move thumb straight away from hand Abduction: extend thumb laterally (usually done when placing fingers in abduction and adduction) Adduction: move thumb back toward hand Opposition: touch thumb to each finger of same hand
Hip	Ball and socket 	Flexion: move leg forward and up Extension: move back beside other leg
		Extension: move leg behind body
		Abduction: move leg laterally away from body Adduction: move leg back toward medial position and beyond if possible Internal rotation: turn foot and leg toward other leg at the hip External rotation: turn foot and leg away from other leg at the hip
		Circumduction: move leg in circle
Knee	Hinge 	Flexion: bring heel back toward back of thigh Extension: return leg to the floor
Ankle	Hinge 	Dorsal flexion: move foot so that toes are pointed upward Plantar flexion: move foot so that toes are pointed downward
Foot	Gliding 	Inversion: turn sole of foot medially Eversion: turn sole of foot laterally
Toes	Condyloid 	Flexion: curl toes downward Extension: straighten toes Abduction: spread toes apart Adduction: bring toes together

Modified from Potter PA, Perry AG: *Fundamentals of nursing,* ed 7, St Louis, 2009, Mosby.

rape [L, *rapere,* to seize], a sexual assault, homosexual or heterosexual, the legal definitions for which vary from state to state. Rape is a crime of violence or one committed under the threat of violence, and its victims are treated for medical and psychological trauma. See also **statutory rape.**

■ OBSERVATIONS: Characteristically the victim is frightened and feels vulnerable, humiliated, and personally violated. General physical examination may reveal cuts, bruises, and other injuries. Pelvic or genital examination may show traumatic injury to the internal or external genitalia or anus.

■ INTERVENTIONS: Careful physical examination should be conducted by specially trained health care personnel, and a detailed history obtained. Evidence and medical specimens are collected as indicated. Ideally counseling is available and offered immediately to all victims of rape. In the case of a woman who has been raped by a man, a pregnancy test may be performed to document current pregnancy status. Prophylaxis against conception may be administered. Medications may be given to prevent the development of sexually transmitted disease. Arrangements for ongoing emotional support are made.



Ranula *(Regezi, Sciubba, and Jordan, 2008)*

Rape prevention measures

Prevention of Attack

Set house lights to go on and off by timer.
Keep light on at all entrances.
Install safety locks on windows and doors.
Have key ready before reaching door of house or car.
Look in car before entering.
Never let strangers enter the house; insist on identification from all service personnel; check identity with agency if suspicious.
Do not list first name on mailbox or in telephone directory.
Be alert when walking; stay in lighted areas.
Walk down center of street if possible.
Avoid lonely or enclosed areas.

From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St Louis, 2007, Mosby.

■ NURSING CONSIDERATIONS: A trained empathetic caregiver of the same gender is assigned to stay with the victim. Privacy for the history, examination, and police interview is ensured. The victim may or may not choose to report the incident to the police. The victim must sign a special form to allow specimens to be released to a law enforcement agency. In general, it is the role of the caregiver and other specially trained medical workers to examine, treat, and collect specimens as necessary but not to decide that rape has occurred. Before discharge it should be ascertained that someone can be with the victim, since depression, anger, guilt, and fear may occur after rape. See also **sexual assault.**

rape counseling, counseling by a trained person provided to a victim of rape. Rape counseling ideally begins at the time the crime is first reported, as in an emergency department. Initially the counselor offers sensitive support for the victim by accepting the victim in a nonprejudicial, noncritical way. The victim's response to the trauma of the assault is empathetically elicited, and three basic statements are made: the counselor is sorry that the rape happened, is glad that the injuries are not worse, and does not think that the victim was wrong or did anything wrong. Counseling personnel may provide supportive services and advocacy and liaison between the victim and medical, legal, and law enforcement authorities. This involves staying with the victim during medical examination, during police or district attorney's questioning, and throughout the criminal justice process.

raphe /rā′fē/ [Gk, *rhaphe,* seam], a crease, ridge, or seam of the halves of various symmetric parts, such as the abdominal raphe of the linea alba or the raphe penis, which appears as a narrow dark streak on the inferior surface of the penis. Also spelled **rhaphe.**

raphe nuclei, a subgroup of the reticular nuclei of the brainstem found in narrow longitudinal sheets along the raphae of the medulla oblongata, pons, and mesencephalon. They include many neurons that synthesize serotonin. Their ascending fibers project to parts of the limbic system, and their descending fibers project to other brainstem nuclei, the medulla oblongata, and the pons. In the group are the magnus raphe nucleus, median raphe nucleus, obscurus raphe nucleus, pallidal raphe nucleus, pontine raphe nucleus, posterior raphe nucleus, inferior linear nucleus, intermediate linear nucleus, and superior linear nucleus.

raphe of tongue [Gk, *rhaphe,* seam; AS, *tunge*], a fibrous wall that forms a line of union between the right and left sides of the tongue.

rapid-acting insulin. See **short-acting insulin.**

rapid eye movement. See **sleep.**

rapid grower /rap′id/, a saprophytic mycobacterium in group IV of the Runyon classification system that grows within 3 to 5 days.

rapid plasma reagin test (RPR test), an agglutination examination used in screening for syphilis. The test detects two groups of antibodies. The first is a nontreponemal antibody (reagin) directed against a lipoidal agent resulting from a *Treponema pallidum* infection. The second is an antibody directed against the *T. pallidum* organism itself.

rapid pulse [L, *rapidus,* rush, *pulsare,* to beat], a pulse faster than normal. See also **tachycardia.**

rapport /rapôr′/ [Fr, agreement], a sense of mutuality and understanding; harmony, accord, confidence, and respect underlying a relationship between two persons, which is an essential bond between a therapist and patient. It should be distinguished from transference, which is unconscious.

rapprochement /räprôshmäN′/ [Fr, *rapprocher,* to bring together], (in psychology) the third subphase of the separation-individuation phase of Mahler's system of preoedipal development. This subphase occurs from approximately 14 months to 2 years or more. This stage is characterized by a rediscovery of and reestablishment with the mother or a significant nurturer in an attempt to have needs met after the initial separation of the practicing subphase in which the child practices autonomous behavior. The narcissistic inflation of the practicing subphase is replaced by a realization of separation and vulnerability.

Raptiva, a trademark for **efalizumab.**

raptus /rap′təs/ [L, *rapere,* to seize], **1.** a state of intense emotional or mental excitement, often characterized by uncontrollable activity or behavior resulting from an irresistible impulse; ecstasy; rapture. **2.** any sudden or violent seizure or attack.

rare-earth element [L, *rarus,* thin; AS, *earthe* + L, *elementum*], a metallic element having an atomic number between 57 and 71, inclusively. Also called *rare-earth metal.*

rare-earth screen, an x-ray-intensifying screen made of rare-earth elements, such as yttrium and gadolinium. These screens enable lower radiation doses to be used while producing acceptable film densities.

rarefaction /rer′əfak′shən/, reductions of density of a medium at a location in the medium accompanying the cyclic pressure reductions during the passage of a sound wave.

RAS, abbreviation for **reticular activating system.**

rasagiline, an antiparkinson agent.

■ INDICATIONS: This drug is used alone or with levodopa to treat idiopathic Parkinson's disease.

■ CONTRAINDICATIONS: Lactation, pheochromocytoma, and known hypersensitivity to this drug or monoamine oxidase inhibitors prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include drowsiness, hallucinations, depression, headache, malaise, paresthesia, vertigo, syncope, angina, orthostatic hypotension, diarrhea, dry mouth, dyspepsia, impotence, decreased libido, conjunctivitis, fever, flu syndrome, neck pain, allergic reaction, alopecia, arthralgia, arthritis, dyskinesia, and rhinitis. A life-threatening side effect is hypertensive crisis (after ingestion of tyramine products).

rasburicase, an antineoplastic antimetabolite used to reduce uric acid levels in children with leukemia or lymphoma and in chemotherapy patients with solid tumor malignancies.

rash [OFr, *rasche,* scurf], a skin eruption. Kinds of rashes are **butterfly rash, diaper rash, drug rash,** and **heat rash.**

Rashkind procedure /rash′kind/ [William J. Rashkind, American physician, 1922–1986; L, *procedere,* to go forth], the enlargement of an opening in the cardiac septum between the right and left atria. It is performed to relieve congestive heart failure in newborns with certain congenital heart defects by improving the oxygenation of the blood. The procedure allows more mixing between oxygenated blood from the lungs and systemic blood without the risk of surgery, sustaining life until the child is 2 to 3 years of age and a shunt can be created to carry systemic blood to the lungs. Before surgery a cardiac catheterization is done to pinpoint the defect. Under light general anesthesia, a deflated balloon is passed pervenously through the foramen ovale into the left atrium. The balloon is inflated and pulled across the septum to enlarge the opening. After surgery the infant is observed carefully for respiratory difficulty, signs of hypoxia, or decreasing cardiac output. Humidified oxygen is administered. Fluids and electrolytes are closely monitored. Also called **balloon septostomy.**

Rasmussen's aneurysm /rahs′moosənz/ [Fritz Waldemar Rasmussen, Danish physician, 1834–1877], dilation of a pulmonary artery in a tuberculous cavity. Rupture causes hemorrhage and hemoptysis.

raspberry leaves, an herbal product harvested from the raspberry plant, found worldwide.

■ USES: It is used to facilitate childbirth, as a uterine tonic, and as a treatment for dysmenorrhea, fever, and vomiting, but there are insufficient reliable data regarding effectiveness.

■ CONTRAINDICATIONS: It should not be used medicinally during pregnancy and lactation and is contraindicated in those with known hypersensitivity to this plant.

raspberry tongue /raz′berē/, a dark red tongue with a smooth surface and prominent papillae, seen after shedding of the white coating characteristic of the early stage of scarlet fever. See also **strawberry tongue.**

RAST, abbreviation for **radioallergosorbent test.**

rat-bite fever [AS, *raet* + *bitan,* to bite], either of two distinct infections transmitted to humans, commonly by the bite of a rat or mouse but also by contact with excretions of the mouth, nose, or urine of an infected animal. It is characterized by fever, headache, malaise, nausea, vomiting, and rash. In the United States the disease is more commonly caused by *Streptobacillus moniliformis*. Its unique features are a rash on palms and soles, painful joints, prompt healing of the wound, and a duration of 2 weeks. If left untreated, severe complications may occur, such as infection of the heart valves. In the Far East, rat-bite fever is usually caused by *Spirillum minus* and is associated with an asymmetric rash on the extremities, no joint symptoms, a relapsing fever, swelling at the site of the wound, regional lymphadenopathy, and a duration of 4 to 8 weeks. Relapse is common. Penicillin administered intramuscularly is effective in treating either form of the disease. Rat-bite fever resulting from infection caused by *Streptobacillus moniliformis* is also called **Haverhill fever.** Infection caused by *Spirillum minus* is also called **sodoku.**

rate [L, *ratus,* reckoned], a numeric ratio, often used in the compilation of data concerning the prevalence and incidence of events, in which the number of actual occurrences appears as the numerator and the number of possible occurrences appears as the denominator. When 1 person in 15 fails an examination, the failure rate is said to be 1/15 (or "one in fifteen"). Standard rates are stated in conventional units of population such as neonatal mortality per 1000 or maternal mortality per 100,000.

rate-pressure product, the heart rate multiplied by the systolic blood pressure. It is a clinical indicator of myocardial oxygen demand.

rate-responsive pacer, an electronic pacemaker whose rate can be adjusted as required to meet physiological demands.

Rathke's bundles. See **trabecula carnea.**

Rathke's pouch /rät′kēz/ [Martin H. Rathke, German anatomist, 1793–1860; OFr, *pouche*], a depression that forms in the roof of the mouth of an embryo, anterior to the buccopharyngeal membrane, around the fourth week of gestation. The walls of the diverticulum develop into the anterior lobe of the pituitary gland.

Rathke's pouch tumor. See **craniopharyngioma.**

rating of perceived exertion (RPE), a scale for quantifying perceived exertion, with 6 being extremely light exertion and 20 being extremely hard. The American College of Sports Medicine (ACSM) has recalibrated the scale from 1 to 10. The ACSM has also established minimal guidelines pertaining to the frequency, intensity, and duration of exercise needed to produce a training effect.

ratio /rā′shō/ [L, a reckoning], the relationship of one quantity to one or more other quantities, expressed as a proportion of one to the others and written either as a fraction (8/3) or linearly (8:3).

rational /rash′ənəl/ [L, *rationalis,* reasonable], **1.** pertaining to a measure, method, or procedure based on reason. **2.** pertaining to a therapeutic method based on an understanding of the cause and mechanisms of a specific disease and the potential effects of the drugs or procedures used in treating the disorder. **3.** sane; capable of normal reasoning or behavior.

rationale /rash′ənal′/ [L, *rationalis,* reasonable], a system of reasoning or a statement of the reasons used in explaining data or phenomena.

rational emotive therapy (RET), a form of cognitive therapy, originated by Albert Ellis, that emphasizes a reorganization and challenge of one's cognitive and emotional functions, a redefinition of one's problems, and a change in one's attitudes to develop more effective and suitable patterns of behavior. RET is conducted with individuals or with groups.

rationalization /rash′ənal′īzā′shən/, the most commonly used defense mechanism, in which an individual justifies ideas, actions, or feelings with seemingly acceptable reasons or explanations. It is often used to preserve self-respect, reduce guilt feelings, or obtain social approval or acceptance.

rational treatment. See **treatment.**

ratio solution, the relationship of a solute to a solution expressed as a proportion, such as 1:1000, or parts per thousand.

rat tapeworm infection. See **hymenolepiasis.**

rattle [ME, *ratelen*], an abnormal sound heard by auscultation of the lungs in some forms of pulmonary disease. It consists of a coarse vibration more intense than a crackle, very much like a rhonchus, caused by the movement of moisture and the separation of the walls of small air passages during respiration.

rattlesnake [ME, *ratelen* + AS, *snacan,* to creep], a poisonous pit viper with a series of loosely connected, horny segments at the end of the tail that make a noise like a rattle when shaken. More than 25 species of rattlesnakes are found in the Americas, including most parts of the United States. They have a hematoxin in their venom, and they are responsible for most of the poisonous snake bites in the United States. Immediate treatment includes keeping the victim quiet and immobilizing the bite area at the level of the heart. Antivenin is available. Also called *rattler.* See also **snakebite.**

rat typhus. See **murine typhus.**

rauwolfia alkaloid [Leonhard Rauwolf, German botanist, 1535–1596], any one of more than 20 alkaloids derived from the root of a climbing shrub, *Rauwolfia serpentina,* indigenous to India and the surrounding area. Formerly used as an antipsychotic agent, it is today confined to the treatment of hypertension and tranquilizing alkaloid drugs such as reserpine. Numerous trademark formulations of the principal alkaloid reserpine are available.

rauwolfia serpentina, the dried root from *Rauwolfia serpentina*.

■ INDICATIONS: It is prescribed in the treatment of mild hypertension and agitation due to psychosis.

■ CONTRAINDICATIONS: Mental depression, peptic ulcer, ulcerative colitis, electroconvulsive therapy, or known hypersensitivity to this drug prohibits its use. It can interact adversely with monoamine oxidase inhibitors.

■ ADVERSE EFFECTS: Among the more serious adverse effects are symptoms resembling parkinsonism, glaucoma, cardiac arrhythmias, and GI bleeding.

Rauzide, a trademark for a cardiovascular, fixed-combination drug containing a diuretic **(bendroflumethiazide)** and an antihypertensive **(rauwolfia serpentina).**

raw data, the information obtained by radio reception of a magnetic resonance signal as stored by a computer. Specific computer manipulation of the data is required to construct an image.

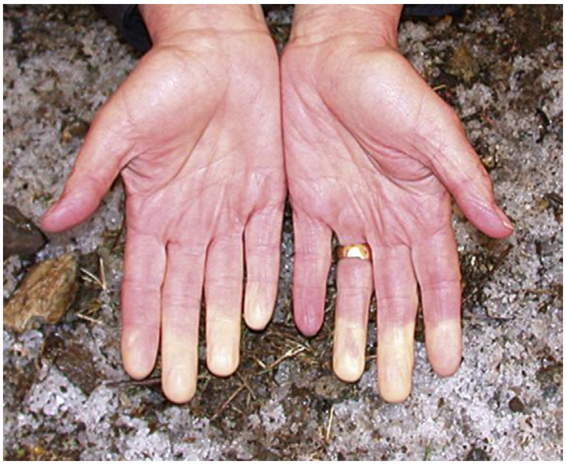
ray [L, *radius*], a beam of radiation, such as heat or light, moving away from a source.

rayl /rāl/ [John W.S. Rayleigh], the unit for characteristic acoustic impedance. Its fundamental units are kg/m^2/s.

Rayleigh scatterer /rā′lē/ [John W.S. Rayleigh, English physicist, 1842–1919], reflecting objects whose dimensions are much smaller than the ultrasonic wavelength. The scattered intensity from a volume of Rayleigh scatterers increases rapidly with increasing frequency, being related to frequency raised to the fourth power.

Ray, Marilyn Anne, a nursing theorist who introduced the Theory of Bureaucratic Caring, which emphasizes the interconnectedness of nursing care and health care organizations. The theory emphasizes the holistic nature of an organization rather than simple cause-effect relationships of individual actions. Spiritual-ethical caring by nurses, the ultimate goal of which is the promotion of well-being through caring, has a positive effect on health care organizations and can become an economic resource.

Raynaud's phenomenon /rānōz′/ [Maurice Raynaud, French physician, 1834–1881], intermittent attacks of ischemia of the extremities of the body, especially the fingers, toes, ears, and nose, caused by exposure to cold or by emotional stimuli. The attacks are characterized by severe blanching of the extremities, followed by cyanosis, then redness; they are usually accompanied by numbness, tingling, burning, and often pain. Normal color and sensation are restored by heat. The attacks usually occur secondary to such conditions as scleroderma, rheumatoid arthritis, systemic lupus erythematosus, thoracic outlet syndrome, drug intoxications, dysproteinemia, myxedema, primary pulmonary hypertension, and trauma. The condition is called *Raynaud's disease* when there is a history of symptoms for at least 2 years with no progression of symptoms and no evidence of an underlying cause. Therapy for the secondary form depends on recognition and treatment of the underlying disease. Idiopathic forms, which occur most frequently in young women 18 to 30 years of age, may be controlled by protecting the body and extremities from the cold, by the use of mild sedatives and vasodilators, and by avoiding smoking. Biofeedback techniques are useful in training the client to increase the temperature of the affected extremity, ears, or nose. Drug therapy can also relieve symptoms.



Raynaud's phenomenon
(Auerbach, 2012/Courtesy Sheryl Olsen)

Raynaud's sign. See **acrocyanosis.**

Rb, symbol for the element **rubidium.**

RBBB, abbreviation for **right bundle branch block.**

RBC, abbreviation for **red blood cell.** See **erythrocyte.**

RBE, abbreviation for **relative biological effectiveness.**

RBRVS, abbreviation for **resource-based relative value scale.**

RCEEM, abbreviation for **Recognized Continuing Education Evaluation Mechanism.**

R.C.P., abbreviation for **Royal College of Physicians.**

RCPSC, abbreviation for **Royal College of Physicians and Surgeons of Canada.**

R.C.S., abbreviation for **Royal College of Surgeons.**

RD, abbreviation for **registered dietitian.**

RDAs, abbreviation for **recommended dietary allowances.**

RDH, abbreviation for *Registered Dental Hygienist*.

rdi, abbreviation for *recommended daily intake*.

RDS, abbreviation for **respiratory distress syndrome of the newborn.**

Re, symbol for the element **rhenium.**

re-, prefix meaning “back, again, contrary”: *reaction, recombination, recurrent*.

reabsorption /rē′əbsôrp′shən/, the process of something being absorbed again, such as the removal of calcium from the bone back into the blood. Also called **resorption.**

reacher /rē′chər/, an assistive device with a pincer-type claw and an extended handle that can be used to reach and grasp objects overhead or on the floor by persons with upper extremity disabilities or those who lose the ability to bend and stoop. Also called **extended arm.**

Reach to Recovery [AS, *reacan,* to reach; ME, *recoveren,* to get back], a national volunteer organization that offers counseling and support to women with breast cancer and their families. Many of the members have had mastectomies themselves.

reaction /rē·ak′shən/ [L, *re,* again, *agere,* to act], a response to a substance, treatment, or other stimulus, such as an antigen-antibody reaction, an allergic reaction, or an adverse pharmacological reaction. **—react,** *v.,* **reactive,** *adj*.

reaction formation, an unconscious defense mechanism in which a person expresses toward another person or situation feelings, attitudes, or behaviors that are the opposite of what would normally be expected. It begins in early childhood and proceeds through life.

reaction time [L, *re,* again, *agere,* to act; AS, *tima*], the interval between the application of a stimulus and the beginning of a response.

reactivate /rē·ak′tivāt/ [L, *re* + *activus*], to make active again, as in adding fresh serum to restore the potency of an original supply of the serum.

reactivation /rē·ak′tivā′shən/, the restoration of impaired biological activity caused by chemical reaction, thermal application, genetic recombination, or helper elements.

reactivation tuberculosis, a form of secondary tuberculosis that recurs as a result of the activation of a dormant endogenous infection. Causes of the reactivation may include loss of immunity, hormonal changes, or poor nutrition.

reactive. See **reaction.**

reactive airways disease, any of several conditions characterized by wheezing and allergic reactions, the most common being asthma, bronchiolitis, and chronic obstructive lung disease.

reactive arthritis /rē·ak′tiv/ [L, *re* + *activus,* active], arthritis after an infection, such as urethritis caused by *Chlamydia trachomatis* or enteritis caused by *Campylobacter, Salmonella, Shigella,* or *Yersinia*. Compare **Reiter’s syndrome.**

reactive decision /rē·ak′tiv/ [L, *re* + *activus*], (in psychology) a decision made by an individual in response to the influence or goals of others.

reactive depression, an emotional condition, which varies in intensity and duration, characterized by an acute feeling of despondency, sadness, and depressive dysphoria. The condition is caused by some identifiable external situation or environmental stress and is generally relieved when the circumstance is altered or the conflict understood and resolved. The term is no longer in use. Also called **situational depression.** See also **depression.**

reactive gastritis, gastric inflammation caused by presence of a harmful substance, such as an NSAID, bile refluxing from the duodenum, or a toxic chemical **(chemical gastritis).** It may be either acute or chronic.

reactive hypoglycemia, low levels of glucose in the circulating blood (45 to 50 mg/dL) in an arterialized specimen after ingestion of carbohydrates by patients who have had stomach surgery, causing food to travel quickly into the intestine.

reactive inflammation [L, *re* + *activus* + *inflammare,* to set afire], an inflammation that develops as a reaction to an antigen.

reactive psychosis, (in psychiatry) a psychotic episode that results from a specific set of external circumstances. See also **brief reactive psychosis.**

reactive schizophrenia, a form of schizophrenia caused by environmental factors rather than by organic changes in the brain. Disease onset is usually rapid, symptoms are of brief duration, and the affected individual appears well immediately before and after the schizophrenic episode. See also **brief reactive psychosis, schizophrenia, schizophreniform disorder.**

reactor /rē·ak′tər/, **1.** (in psychology) a family therapist who lets a family in therapy take the lead and then follows in that direction. **2.** (in radiology) a cubicle in which radioisotopes are artificially produced.

read [AS, *raedan,* to advise], (of a computer) to retrieve or transfer data from some storage location or medium, such as a disk.

reading [AS, *raedan*], the linear process in which the genetic information contained in a nucleotide sequence is decoded, as in the translation of the messenger RNA into a sequence of amino acids in a polypeptide.

reading disorder, a language disorder in which one’s reading ability is significantly below intellectual capacity. Tests show that the problem does not involve mental retardation, chronological age, or inadequate schooling but is marked by faulty oral reading, slow reading, and reduced comprehension.

Read method [Grantley Dick-Read, English obstetrician, 1890–1959], a method of psychophysical preparation for childbirth. It was the first “natural childbirth” program, a term coined by Dr. Read in the 1930s. Basically Read held that childbirth is a normal, physiological procedure and that the pain of labor and delivery is of psychological origin—the fear-tension-pain syndrome. He countered women’s fears with education about the physiological process, encouraged a positive welcoming attitude, corrected false information, and led tours of the hospital. To decrease tension he developed a series of breathing exercises for use during the various stages of labor. To foster relaxation and optimal physical function in labor and recovery after delivery, he incorporated a series of physical exercises to be performed regularly in classes and in practice at home during pregnancy. The woman is helped to manage labor and delivery by using the Read method in the following way: During the early and middle first stage of labor, before cervical dilation has reached 7 cm, contractions are 2 to 5 minutes apart and last for 30 to 40 seconds. The mother lies on her back with her knees bent. Abdominal breathing is used during contractions. Her hands are placed over her lower abdomen, fingers touching. She breathes deeply and slowly—in through her nose and out through her mouth. The abdominal wall rises with each inhalation, which she can feel with her hands. The rate of breathing is no more than 6 breaths in 30 seconds, or 12 to 18 in one contraction. During the late part of the first stage of labor, after 7 cm of cervical dilation, the contractions are 1½ to 2 minutes apart and last for 40 to 60 seconds. Costal or diaphragmatic breathing is used during contractions. The mother’s hands are placed on her sides, over the ribs. She breathes in more shallowly, feeling her ribs move sideways against her hands. Each breath is drawn in through her nose and exhaled through her mouth. The abdominal wall does not rise and fall with this kind of breathing. The rate of breathing is no more than 6 breaths in 30 seconds, or 12 to 18 in one contraction. At the end of the first stage of labor, near full dilation, contractions may be very strong, occurring every 1½ to 2 minutes and lasting 60 to 90 seconds. The mother lies on her back with her knees bent. Panting respirations are used during the contractions. The mother holds one of her hands on her sternum, which rises and falls as she pants lightly and rapidly through her mouth. Panting continues through the end of the first stage to full dilation as the urge to push grows. Panting helps the woman avoid pushing. During the second, or expulsive, stage of labor after full dilation of the cervix, the contractions occur every 1½ to 2 minutes, last 60 to 90 seconds, and are accompanied by an urge to bear down and push. The woman lies back, head and shoulders supported in a semisitting position. She is helped to draw her legs up and hold them, with her hands behind the lower thighs and thighs on her abdomen, spread apart. As each contraction begins, she raises her head, takes a deep breath, tucks her chin on her chest, blocks the escape of air from her lungs, and bears down. During each contraction she may need to blow the air out, refill her lungs, and push again two or three times. Throughout labor she is helped to understand what is occurring and to participate and accept the experience in anticipation of the birth of the baby. Currently many authorities who advocate use of other aspects of the Read method strongly recommend that a woman in labor not lie on her back. Supine hypotension is frequently the result of this position, because the uterus can fall back, occluding the vena cava and decreasing the volume of blood returned to the heart, thus reducing the volume of the cardiac output. Maternal hypotension follows, resulting in decreased placental perfusion and an inadequate supply of oxygen to the fetus. Today the woman using the Read method spends most of labor lying on her side or in a semisitting position with her knees, back, and head well supported. Compare **Bradley method, Lamaze method.**

read-only memory (ROM), the part of a computer's memory in which information is permanently stored on specialized processors. The operator may have access to the memory, but only for purposes of reading the contents. ROM also executes automatically when the computer is started. Special equipment or programming is required to write, erase, or alter the contents of read-only memory. Compare **random access memory.**

readthrough [AS, *raedan* + *thurh,* through], transcription beyond the normal termination sequence in a DNA template, caused by the occasional failure of RNA polymerase to respond to the end-point signal.

reagent /rē·ā′jənt/ [L, *re,* again, *agere,* to act], a chemical substance known to react in a specific way. A reagent is used to detect or synthesize another substance in a chemical reaction. Examples include Benedict's reagent, used to test for glucose, and Biuret reagent, used to test for protein.

reagent strip, a strip of paper impregnated with a reagent to a given substance, used in testing for that substance in a body fluid or other secretion.

reagin /rē′ājin/ [L, *re* + *agere*], **1.** an antibody associated with human atopy, such as asthma and hay fever. It attaches to mast cells and basophils and sensitizes the skin and other tissues. In antigen-antibody reactions it triggers the release of histamine and other mediators that cause atopic symptoms. **2.** a nonspecific, nontreponemal antibody-like substance found in the serum of individuals with syphilis. It can combine with an antigen prepared as a lipid extract of normal tissue, a phenomenon that constitutes the basis of the serological tests for syphilis. **—reaginic,** *adj.*

Reagent strip *(Sorrentino, 2012)*

reaginic antibody /rē′əgin′ik/, an immunoglobulin E antibody that is more numerous in hypersensitive individuals. See also **reagin, reagin-mediated disorder.**

reagin-mediated disorder, a hypersensitivity reaction, such as hay fever or an allergic response to an insect sting, produced by reaginic (immunoglobulin E [IgE]) antibodies and causing degranulation and the release of histamine, bradykinin, serotonin, and other vasoactive amines. An initial sensitizing dose of the antigen induces the formation of specific IgE antibodies, and their attachment to mast cells and basophils results in hypersensitivity to a subsequent challenging dose of the antigen. Reactions range from a simple wheal and flare on the skin to life-threatening anaphylactic shock, depending on the size and route of entrance of the sensitizing dose and the challenging dose, the number and distribution of IgE antibodies, the responsiveness of the host, the timing of exposure to the allergen, and the tissues in which the antigen-antibody reaction occurs. The abundance of mast cells in the skin, nose, and lungs makes these areas susceptible to IgE-mediated reactions. Allergens that commonly cause these reactions include plant spores, pollens, animal danders, stings, serum proteins, foods, and certain drugs. See also **allergy, anaphylactic shock, hay fever.**

REAL classification, a classification of lymphomas based on histological criteria division based on B cells, neoplasms, Tor NK neoplasms, and Hodgkin's disease.

reality /rē·al′itē/ [L, *res,* factual], the culturally constructed world of perception, meaning, and behavior that members of a culture regard as true.

reality orientation^1, a formal activity that uses specific approaches to assist confused or disoriented persons toward an awareness of reality, or the "here and now," as by emphasizing the time, day, month, year, situation, and weather.

reality orientation^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of patient's awareness of personal identity, time, and environment. See also **Nursing Interventions Classification.**

reality principle, an awareness of the demands of the environment and the need for an adjustment of behavior to meet those demands, expressed primarily by the renunciation of immediate gratification of instinctual pleasures to obtain long-term and future goals. In psychoanalysis this function is held to be performed by the ego. Compare **pleasure principle.**

reality testing, an ego function that enables one to differentiate between external reality and an inner imaginative world and to behave in a manner that exhibits an awareness of accepted norms and customs. Impairment of reality testing is indicative of a disturbance in ego functioning that may lead to psychosis.

reality therapy, a form of psychotherapy developed by William Glassner. The aims are to help define and assess basic values within the framework of a current situation and to evaluate the person's present behavior and future plans in relation to those values. The emphasis in treatment is on the present rather than the past and on behavior rather than feelings; it focuses on responsible behavior as a means of personal fulfillment.

real time [L, *res,* factual; AS, *tid,* tide], an application of computerized equipment that allows data to be processed with relation to ongoing external events, so that the operators can make immediate diagnostic or other decisions based on the current data output. Ultrasound scanning uses real-time control systems, making results available almost simultaneously with the generation of the input data.

real-time imaging. See **dynamic imaging.**

real-time scanning, the imaging of an entire object, or a cross-sectional slice of the object, at a single moment. To produce such an image, the data must be recorded quickly over a very short time rather than by accumulation over a longer period.

reamer [AS, *ryman,* to make room], **1.** a tool with a straight or spiral cutting edge, used in a rotating motion to enlarge a hole or clear an opening. **2.** (in dentistry) an instrument with a tapered and loosely spiraled metal shaft, used for enlarging, shaping and cleaning root canals.

reapproximate /rē′əprok′simāt/ [L, *re,* again, *approximare,* to come near], to rejoin tissues separated by surgery or trauma so that their anatomical relationship is restored. **—reapproximation,** *n.*

reasonable accommodation /rē′zənəbəl/, an interpretation of the U.S. Americans With Disabilities Act regarding responsibility of an employer to provide an adequate work environment for a disabled but otherwise competent employee. The rule may apply to making facilities accessible, restructuring jobs, reassigning disabled employees to vacant positions, modifying work schedules, acquiring or modifying equipment, and adjusting training materials and examinations. The employer may not be required to provide reasonable accommodation if it can be shown to impose an "undue hardship" on the business operation.

reasonable care [L, *rationalis*], the degree of skill and knowledge used by a competent health practitioner in treating and caring for the sick and injured.

reasonable charge, **1.** (in Medicare) the lowest customary charge by a physician for a service. **2.** the prevailing charge by a group of physicians in the area for a particular service.

reasonable cost, the amount a medical insurer will reimburse for a particular health service based on the cost to the provider for delivering that service.

reasonable person, (in law) a hypothetic person who possesses the qualities that are used as an objective standard on which to judge a defendant's action in a negligence suit. In such suits it must be decided whether or not a reasonable person, under the same circumstances, would have acted in the same way as the defendant.

reasonably prudent person doctrine /rē′zənəblē′/, a concept that a person of ordinary sense will use ordinary care and skill in meeting the health care needs of a patient.

reattachment /rē′ətach′mənt/ [L, *re,* again; OFr, *attachier*], **1.** the rejoining of accidentally severed body parts. **2.** the rejoining of periodontal membrane fibers to the cementum of a tooth and the alveolar bone to restore a loosened tooth.

rebase /rēbās′/ [L, *re,* again, *basis,* base], a process of refitting a denture by replacing or adding to its base material without changing the occlusal relationships of the teeth.

rebirthing /rēbur′thing/, a form of psychotherapy developed by Leonard Orr that focuses on the breath and breathing apparatus. Orr believes the premature severing of the umbilical cord deprives the newborn of oxygen and forces him or her to suddenly learn to breathe through fluid-filled lungs, resulting in panic and terror with every breath taken. The goal of treatment is to overcome the trauma of the birth-damaged breathing apparatus so the person is able to use the breath as a supportive and creative part of life.

rebound /rē′bound/ [Fr, *rebondir,* to bounce], **1.** recovery from illness. **2.** a sudden contraction of muscle after a period of relaxation, often seen in conditions in which inhibitory reflexes are lost.

rebound congestion, swelling and congestion of the nasal mucosa that follows the vasodilator effects of decongestant medications.

rebound effect. See **aftermovement.**

rebound phenomenon [OFr, *rebondir* + Gk, *phainomenon,* anything seen], a renewal of reflex activity after the stimulus that triggered the original action has been removed. It may be indicative of a lesion of the cerebellum.

rebound tenderness, a sign of inflammation of the peritoneum in which increased pain is elicited by the sudden release of the fingertips pressing on the abdomen. Most examiners check for rebound tenderness in the quadrant opposite the area of pain. One hand is used, with the fingers placed perpendicular to the plane of the abdomen. The area of pain may be diffuse or relatively sharply circumscribed. See also **appendical reflex, peritonitis.**

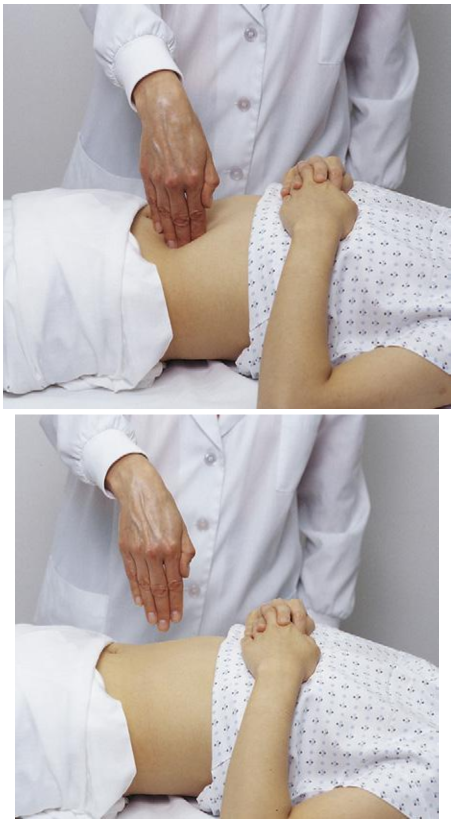
rebreather, **1.** a breathing apparatus that allows the breathing of a combination of supplied oxygen and exhaled or room air. **2.** a reservoir mask that allows room air to flow in through ports so that it is mixed with supplied oxygen.

rebreathing /rēbrē′thing/ [L, *re* + AS, *braeth,* breath], breathing in a closed system. Exhaled gas mixes with the gas in the system, and some of this mixture is then reinhaled. Rebreathing, which may result in progressively decreasing concentrations of oxygen and progressively increasing concentrations of carbon dioxide in the blood, can occur in poorly ventilated environments.

rebreathing bag, (in anesthesia) a flexible bag attached to a mask. It may function as a reservoir for anesthetic gases during surgery or for oxygen during resuscitation.

recalcification /rēkal′sifikā′shən/ [L, *re* + *calx,* lime, *facere,* to make], the restoration of lost calcium salts in the body needed for normal neuromuscular excitability, excitation-coupling contraction in cardiac and smooth muscle stimulus-secretion coupling, maintenance of tight junctions between cells, blood clotting, and compressional strength of bone.

recannulate /rēkan′yəlāt/ [L, *re* + *cannula,* small reed], to make a new opening through an organ or tissue, such as opening a passage through an occluded blood vessel.



Testing for rebound tenderness
(Wilson and Giddens, 2009)

recapitulation concept /rē′kəpit′yəlā′shən/ [L, *re* + *capitulum,* small head], the notion, formulated by German naturalist Ernst Heinrich Haeckel (1834–1919), that an organism during the course of embryonic development passes through stages that resemble the structural form of species from which it evolved. It is summarized by the statement "ontogeny recapitulates phylogeny." The concept is now regarded as an oversimplification. Also called **biogenetic law, Haeckel's law.**

receiver /risē′vər/ [L, *recipere,* to receive], **1.** (in communication theory) the person or persons to whom a message is sent. **2.** the part of a hearing aid that converts electric signals to acoustic signals.

receiver operating characteristic (ROC) curve, a curve that plots the true-positive fraction versus false-positive fraction; one use is to evaluate imaging performance.

receiving sensitivity pattern /risē′ving/, the spatial response of an ultrasound transducer as an echo detector. For a single-element transducer it is essentially the same as the transmitted beam. For transducer arrays it can be quite different from the transmitted beam.

receptive aphasia /risep′tiv/, a form of sensory aphasia marked by impaired comprehension of language. It is generally precipitated by organic impairment such as stroke. Also called **Wernicke's aphasia, Wernicke's encephalopathy.**

receptor /risep′tər/ [L, *recipere,* to receive], **1.** a chemical structure, usually of protein or carbohydrate, on the surface of a cell that combines with an antigen to produce a discrete immunological component. **2.** a sensory nerve ending that responds to various kinds of stimulation. **3.** a specific cellular protein that must first bind a hormone before cellular response can be elicited. The protein may be in the cytoplasm or in the cell membrane and has a special affinity for toxins and amboceptors.

receptor site [L, *recipere,* to receive, *situs*], a location on a cell surface where certain molecules, such as enzymes, neurotransmitters, or viruses, attach to interact with cellular components.

receptor theory of drug action, the concept that certain drugs produce their effects by acting specifically at a receptor site on a cell or within the cell or its membrane.

recess /rē′ses, rises′/ [L, *recedere,* to retreat], a small hollow cavity, such as the epitympanic recess in the middle ear or the retrocecal recess extending as a small pocket behind the cecum.

recessive /rises′iv/ [L, *recedere*], pertaining to or describing a gene, the effect of which is masked or hidden if there is a dominant gene at the same locus. If both genes are recessive and produce the same trait, the trait is expressed in the individual.

recessive allele, the member of a pair of alleles that lacks the ability to express itself in the presence of a dominant allele at the same locus. It is expressed only in the homozygous state. Compare **dominant allele.** See also **autosomal-recessive inheritance.**

recessive trait, an inherited characteristic that is determined by a recessive allele.

recidivism (recid) /risid′iviz′əm/ [L, *recidivus,* falling back], a tendency by an ill person to relapse or return to a hospital.

recipient /risip′ē·ənt/ [L, *recipere,* to receive], a person who receives a blood transfusion, tissue graft, or organ.

reciprocal beat /risip′rəkəl/, an atrial or ventricular complex on an electrocardiogram resulting from return of an impulse to its chamber of origin. Also called **echo beat.**

reciprocal change, a change detected electrocardiographically in a wall of the heart opposite the site of a myocardial infarction. In acute inferior wall infarction, reciprocal changes are considered a sign of more extensive myocardial damage.

reciprocal force, a force applied by an orthodontic anchorage in which the resistance of one or more teeth and their adnexa is used to move one or more opposing teeth and their adnexa.

reciprocal gene. See **complementary gene.**

reciprocal inhibition, the theory in behavior therapy that, if an anxiety-producing stimulus occurs simultaneously with a response that diminishes anxiety, the stimulus may cause less anxiety. For example, deep chest or abdominal breathing and relaxation of the deep muscles appear to diminish anxiety and pain in childbirth. See also **systemic desensitization.**

reciprocal roentgens, the reciprocal of the number of roentgens needed to produce a density of 1 on x-ray film. It is used to define the speed of the film.

reciprocal translocation, the mutual exchange of genetic material between two nonhomologous chromosomes. Also called **interchange.** Compare **balanced translocation, robertsonian translocation.**

reciprocation /risip′roka′shən/, the means by which one part of a removable partial denture framework is made to counter the effect created by another part of the framework.

reciprocity /res′ipros′itē/ [Fr, *réciprocité*], a mutual agreement to exchange privileges, dependence, or relationships. An example is an agreement between two governing bodies to accept the medical credentials of nurses or physicians licensed in either community.

Recklinghausen's canal /rek′linghou′sənz/ [Friedrich D. von Recklinghausen, German pathologist, 1833–1910], the small lymph space in the connective tissues of the body. Also called **von Recklinghausen's canal.**

Recklinghausen's disease. See **neurofibromatosis.**

Recklinghausen's tumor [Friedrich D. von Recklinghausen], a benign tumor, derived from smooth muscle containing connective tissue and epithelial elements, that occurs in the wall of the oviduct or posterior uterine wall. Also called **adenomyosis, von Recklinghausen's tumor.**

reclining /riklī′ning/, leaning backward. **—recline,** *v.*

recluse spider. See **brown recluse spider.**

recognition site /rek′əgnish′ən/, a location on a nucleic acid or protein to which a specific ligand binds.

Recognized Continuing Education Evaluation Mechanism (RCEEM), a control process for checking that educational activities meet certain standards and for establishing programs for evaluating educational opportunities and activities.

recombinant /rēkom′binənt/ [L, *re,* again, *combinare,* to combine], **1.** *n,* a molecule, a cell, or an organism that results from the recombination of genes, regardless of whether naturally or artificially induced. **2.** *adj,* pertaining to such a molecule, a cell, or an organism. See also **recombinant DNA.**

recombinant DNA, a DNA molecule in which rearrangement of the genes has been experimentally induced. Enzymes are used to break isolated DNA molecules into fragments that are then rearranged in the desired sequence. DNA sequences from another organism of the same or a different species may also be introduced into the molecule, which is then replicated, resulting in both genotypic and phenotypic alterations in the organism that carries the recombinant DNA. See also **genetic engineering.**

recombinant factor VIII concentrate, a concentrate of factor VIII prepared by recombinant DNA technology used to treat bleeding in hemophilia A patients (factor VIII deficiency). See **FVIII.**

recombinant FVIIa concentrate, a concentrate of activated factor VII developed to treat bleeding in hemophilia patients with inhibitors. Activated factor VII acts directly on factor X and bypasses VIII or IX activity in the coagulation process.

recombinant Lyme test, a method of identifying infection by *Borrelia burgdorferi,* the bacterium that causes Lyme disease. A protein (P-39) specific to the bacterium, produced through recombinant DNA techniques and cloning in other bacteria, is the key component in the test. It causes a strong reaction in blood cells from persons with a *B. burgdorferi* infection.

recombinant tPA. See **tissue plasminogen activator.**

recombinant vaccine, a suspension of attenuated viruses or killed microorganisms developed through recombinant DNA techniques.

recombination /rē′kombinā′shən/ [L, *re* + *combinare*], **1.** the formation of new arrangements of genes within the chromosomes as a result of independent assortment of unlinked genes, crossing over of linked genes, or intracistronic crossing over of nucleotides. See also **recombinant DNA. 2.** the coupling of oppositely charged ions liberated by ionizing radiation. Ionic recombination lowers the total number of charges collected by a dosimeter, thus causing the radiation dose to be underestimated. A technique for determining the magnitude of ionic recombination is routinely applied in accurate dosimetry.

Recombivax HB, a trademark for a hepatitis B vaccine (recombinant).

recommended dietary allowances (RDAs) /rek′əmen′did/ [L, *re* + *commendere,* to commend], levels of daily intake of essential nutrients judged by the Food and Nutrition Board of the National Research Council to be adequate to meet the known nutrient needs of practically all healthy people.

recon /rē′kon/ [L, *re* + *combinare* + Gk, *ion,* going], the smallest genetic unit that is capable of recombination, thought to be a triplet of nucleotides.

reconstitution /rē′konstit(y)o͞o′shən/ [L, *re* + *constituere,* to establish], the continuous repair of tissue damage.

reconstruction time /rē′kənstruk′shən/, the period between the end of a CT scan and the appearance of an image.

reconstructive mammaplasty, breast reconstruction after mastectomy.

reconstructive surgery. See **plastic surgery.**

record /rek′ərd/, a written form of communication that permanently documents information relevant to the care of a patient.

recorded detail /rikôr′did/, the sharpness of structural lines as recorded on a radiograph.

Recovery, Inc. /rikuv′əry/, a self-help group that provides support for persons with mental illness.

recovery room. See **postanesthesia care unit.**

recreational drug, any substance with pharmacological effects that is taken voluntarily for personal pleasure or satisfaction rather than for medicinal purposes. The term is generally applied to alcohol, barbiturates, amphetamines, THC, PCP, cocaine, and heroin but also includes caffeine in coffee and cola beverages.

recreational therapist, a person who uses recreational activities to reduce the effects of disability or illness so that patients can function more effectively in their families and communities. A baccalaureate degree is required.

recreational therapy /rē′krē·ā′shənəl/ [L, *recreare,* to renew], a form of adjunctive treatment in which games or other group activities are used as a means of modifying maladaptive behavior, awakening social interests, or improving the ability to interact and function in socially acceptable ways.

recreation therapy, a nursing intervention from the Nursing Interventions Classification (NIC) defined as purposeful use of recreation to promote relaxation and enhancement of social skills. See also **Nursing Interventions Classification.**

recrudescence /rē′kro͞odes′əns/ [L, *re* + *crudescere,* to become hard], a return of symptoms of a disease during a period of recovery.

recrudescent /-ənt/ [L, *re* + *crudescere,* to become hard], the return of disease symptoms after a period of remission.

recrudescent hepatitis, a form of acute viral hepatitis marked by a relapse during the period of recovery. A minority of patients experience it, and the prognosis for ultimate recovery is rarely affected.

recrudescent typhus. See **Brill-Zinsser disease.**

recruitment /rikro͞ot′mənt/, **1.** the perception of a rapid growth of loudness, commonly seen in sensorineural hearing losses that are cochlear in nature. The impaired ear cannot hear faint sounds but hears intense sounds as loudly as a normal ear. **2.** in muscle contractions, the ability to recruit additional motor units into action as the need to overcome resistance increases.

rect-, prefix meaning "rectum": *rectal, rectalgia, rectorrhea.*

recta, rectal. See **rectum.**

rectal abscess /rek′təl/ [L, *rectus*, straight, *abscedere*, to go away], an abscess in the perianal area.

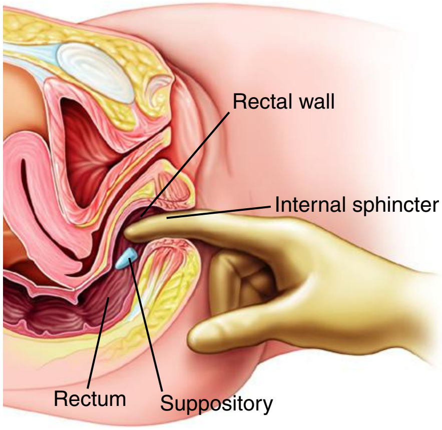
rectal alimentation [L, *rectus*, straight, *alimentum*, nourishment], the delivery of nourishment in concentrated form by injection or installation through the rectum. Also called **rectal feeding.**

rectal anesthesia [L, *rectus*, straight], general anesthesia achieved by the insertion, injection, or infusion of an anesthetic agent into the rectum. This procedure is sometimes used in children and other patients who may be uncooperative or unable to tolerate medications. Absorption is unpredictable.

rectal cancer. See **colorectal cancer.**

rectal feeding. See **rectal alimentation.**

rectal instillation of medication, the instillation of a medicated suppository, cream, or gel into the rectum. Some conditions treated by this method are constipation, pruritus ani, and hemorrhoids. The patient lies on the left side, with the lower leg extended and the upper leg flexed. The health care provider unwraps the suppository and, wearing a glove, raises the upper buttock, exposing the anus. The suppository may be self-lubricating, or it may need to be lubricated with a water-soluble lubricant. The suppository is then gently inserted past the anal sphincter. The health care provider then wipes the anus with a tissue or piece of toilet paper. Occasionally a drug may be given in a medicated enema. See also **enema.**



Rectal instillation of medicine
(Harkreader, Hogan, and Thobaben, 2007)

rectal prolapse management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention and/or manual reduction of rectal prolapse. See also **Nursing Interventions Classification.**

rectal reflex, the normal response (defecation) to the presence of an accumulation of feces in the rectum. Also called **defecation reflex.**

rectal speculum, a speculum that enlarges the diameter of the rectum for an examination.

rectal stenosis, stenosis or stricture of the rectum. Also called *proctostenosis*, *rectostenosis*.

rectal temperature [L, *rectus*, straight, *temperatura*], body temperature as measured by a clinical thermometer placed in the rectum. Rectal temperatures average 0.5° F to 0.75° F (0.3° C to 0.4° C) higher than oral temperatures.

rectal thermometer [L, *rectus* + Gk, *thermē*, heat, *metron*, measure], a clinical thermometer suitable for measuring body temperature in the rectum.

Placement of thermometer for rectal temperature measurement *(Harkreader, Hogan, and Thobaben, 2007)*

rectal ultrasound of the prostate, an ultrasound used to diagnose cancer and to help stage rectal cancers.

rectification /rek′tifikā′shən/, **1.** the conversion of alternating current into pulsating direct current. **2.** a step in echo signal processing in a pulse-echo ultrasound instrument in which radiofrequency signals, which oscillate both above and below zero volts, are converted.

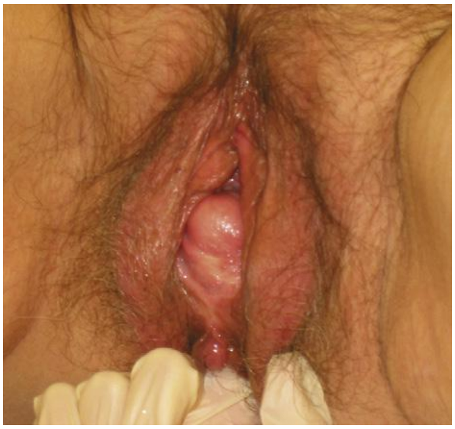
rectifier /rek′tifī′ər/, an electric device that converts alternating current into pulsating direct current (DC). Rectifiers are used to power x-ray tubes, which require a DC electric source.

rectilinear scanner /rek′tilin′ē·ər/, a device that generates an image of an anatomical structure by detecting radioactivity within the structure.

rectitis. See **proctitis.**

recto-, prefix meaning "straight or rectum": *rectoscope*, *rectosigmoidoscopy*.

rectocele /rek′təsēl′/ [L, *rectus* + Gk, *koilos*, hollow], a protrusion of the rectum and posterior wall of the vagina into the vagina. The condition, which occurs after the muscles of the vagina and pelvic floor have been weakened by childbearing, old age, or surgery, may reflect a congenital weakness in the wall and may, if severe, result in dyspareunia and difficulty in evacuating the bowel. Also called **proctocele.** Compare **cystocele.**



Rectocele protruding from the vaginal introitus
(Townsend et al, 2008)

rectocolitis. See **coloproctitis.**

rectoplasty. See **proctoplasty.**

rectosacral fascia, the fusion of the inferior part of the presacral fascia with the visceral fascia on the posterior aspect of the rectum.

rectoscope. See **proctoscope.**

rectosigmoid /rek′tōsig′moid/ [L, *rectus* + Gk, *sigma,* the letter S, *eidos,* form], pertaining to the part of the large intestine that includes the lower part of the sigmoid and the upper part of the rectum.

rectosigmoidoscopy /-sig′moidəs′kəpē/ [L, *rectus,* straight; Gk, *sigma,* the letter S, *eidos,* form, *skopein,* to view], the examination of the rectum and pelvic colon with a sigmoidoscope.

rectosigmoid sphincter, circular muscle fibers in the wall of the large intestine at the junction of the sigmoid colon and rectum. Also called *O'Beirne's sphincter.*

rectouterine excavation, rectouterine pouch. See **cul-de-sac of Douglas.**

rectovaginal fistula /-vaj′ənəl/ [L, *rectus,* straight, *vagina,* sheath, *fistula,* pipe], an abnormal passage or opening between the rectum and the vagina.

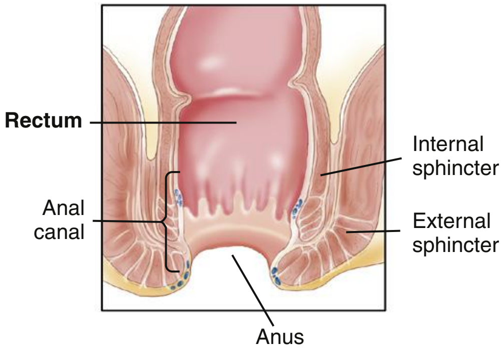
rectovaginal ligament, one of the four main uterine support ligaments. It helps hold the uterus in position by maintaining traction on the cervix. Also called **posterior ligament.**

rectovaginal septum, a band of loose connective tissue between the vagina and the ampulla of the rectum.

rectovesical /-ves′ikəl/ [L, *rectus,* straight, *vesica,* bladder], pertaining to the rectum and bladder.

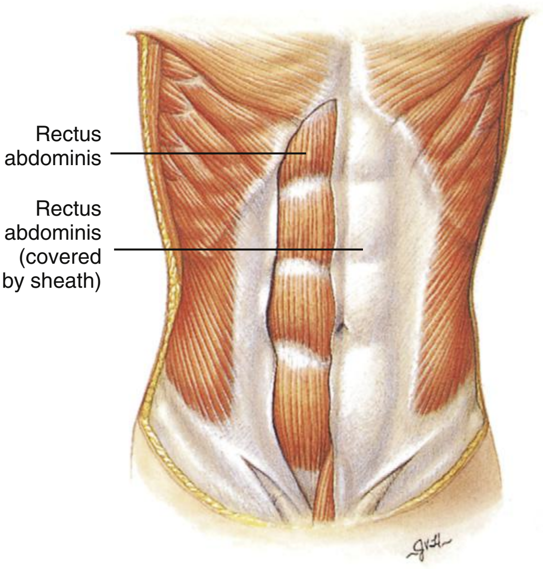
rectovesical septum, a partition that separates the posterior surface of the vagina from the rectum.

rectum /rek′təm/ *pl.* **rectums, recta** [L, *rectus*], the lower part of the large intestine, about 12 cm long, continuous with the descending sigmoid colon, proximal to the anal canal. It follows the sacrococcygeal curve, ends in the anal canal, and usually contains three transverse semilunar folds: one situated proximally on the right side, a second one extending inward from the left side, and the third and largest fold projecting caudally. Each fold is about 12 mm wide. The folds overlap when the intestine is empty or defecation occurs. **—rectal,** *adj.*



Rectum *(Leonard, 2009)*

rectus abdominis /rek′təs/, one of a pair of anterolateral muscles of the abdomen, extending the whole length of the ventral aspect of the abdomen. The pair is separated by the linea alba. Each rectus arises in a lateral tendon from the crest of the pubis and is interlaced by a medial tendon with the muscle of the opposite side. The rectus abdominis inserts into the fifth, sixth, and seventh ribs. It functions to flex the vertebral column, tense the anterior abdominal wall, and assist in compressing the abdominal contents. Compare **external abdominal oblique muscle, internal abdominal oblique muscle, pyramidalis, transversus abdominis.**

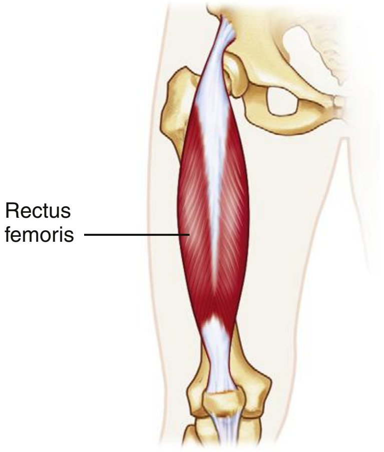


Rectus abdominis muscles *(Thibodeau and Patton, 2003)*

rectus capitis anterior, rectus capitis lateralis. See **rectus muscle.**

rectus capitus posterior. See **rectus muscle.**

rectus femoris, a fusiform muscle of the anterior thigh, one of the four parts of the quadriceps femoris. With the quadriceps group it functions to extend the lower leg. Compare **vastus intermedius, vastus lateralis, vastus medialis.** See also **quadriceps femoris.**



Rectus femoris

rectus muscle [L, straight, *musculus*], a muscle of the body that has a relatively straight form. Some rectus muscles are **rectus capitis anterior** and **rectus capitis lateralis.** Also called **rectus capitus posterior.** See also **rectus abdominis.**

recumbency /rikum′bənsē/ [L, *recumbere,* to lie down], the state of lying down or leaning against something.

recumbent /rikum′bənt/ [L, *recumbere,* to lie down], lying down or leaning backward. See also **reclining. —recumbency,** *n.*

recuperate /riko͞o′pərāt/ [L, *recupare,* to regain], to recover one's health and strength.

recuperation /riko͞o′pərā′shən/ [L, *recupare,* to regain], the process of recovering health and strength.

recurrence /rikur′əns/ [L, *recurrere,* to run back], the reappearance of a sign or symptom of a disease after a period of remission.

recurrence risk, the chance that a disease found in one member of a proband will appear in other members of the same pedigree.

recurrent /rikur′ənt/ [L, *recurrere,* to run back], a disease sign or symptom that returns periodically.

recurrent bandage [L, *recurrere,* to run back], a strip of cloth that is wrapped several times around itself, usually applied to the head or amputated limb.

recurrent caries, an acidic destruction of dental tissues which have previously experienced such destruction and have already received dental restoration.

recurrent fever. See **relapsing fever.**

recurrent inhibition. See **Renshaw cells.**

recurrent polyserositis. See **familial Mediterranean fever.**

recurrent respiratory papillomatosis, the recurrent growth of benign squamous cell papillomas in the larynx and trachea, caused by the human papillomavirus and leading to severe narrowing of the airway that may require frequent treatments. Onset is in childhood or early adulthood.

recurring scarring aphthae. See **Sutton's disease.**

recurvatum /rē′kərvā′təm/ [L, *recurvare,* to bend back], backward thrust or bending, for example, of the knee caused by weakness of the quadriceps or a joint disorder.

red blindness. See **protanopia.**

red blood cell. See **erythrocyte.**

red blood cell cast, a urine sediment cast that contains red blood cells, signifying bleeding in the kidney, seen in glomerulonephritis.

red blood cell (RBC) count [AS, *read* + *blod* + L, *cella,* storeroom; Fr, *conter,* to count], a count of the erythrocytes in a specimen of whole blood, commonly made with an electronic counting device. The normal concentrations of RBCs in the whole blood of males are 4.6 to 6.2 million/mm^3. In females the concentrations are 4.2 to 5.4 million/mm^3.

red blood cell indices, a series of mathematical parameters that characterize the red cell population in terms of volume, hemoglobin mass, and hemoglobin concentration. Derived mathematically from the red cell count, hemoglobin, and hematocrit values, the indices are useful in making differential diagnoses of several kinds of anemia. The values reported are the mean cell hemoglobin, the mean cell hemoglobin concentration, the mean cell volume, and the red cell distribution width.

red blood cells, a preparation of red blood cells separated from a donor unit of whole blood. It is administered to restore adequate levels of hemoglobin and oxygen-carrying capability without overloading the vascular system with excess fluid.

red blood cell (RBC) survival study, a nuclear scan that is often performed on patients with hemolytic anemia. The test is carried out in two parts. The first determines the half-life of the RBC within the circulation, and the second images the spleen, liver, and pericardium.

Red Book of the American Academy of Pediatrics, a book published by the American Academy of Pediatrics, Inc., updated approximately every 3 years, that serves as the standard reference source of recommendations regarding infectious diseases and immunization practices for infants, children and adolescents.

red bug. See **chigger.**

red cell. See **erythrocyte.**

red cell indexes, a series of relationships that characterize the red cell population in terms of size, hemoglobin content, and hemoglobin concentration. Derived mathematically from the red cell count and hemoglobin and hematocrit values, the indexes are useful in making differential diagnoses of several kinds of anemia. The values reported are the mean corpuscular hemoglobin, the mean corpuscular hemoglobin concentration, and the mean corpuscular volume. Also called *red cell indices*. See also **iron deficiency anemia.**

red clover, a preparation of the flower heads of *Trifolium pratense,* used internally for coughs and respiratory symptoms and externally for chronic skin conditions, such as psoriasis and eczema. It is also used in traditional Chinese medicine.

red corpuscle. See **erythrocyte.**

Red Cross. See **American Red Cross, International Red Cross Society.**

redeye. See **allergic conjunctivitis.**

red fever. See **dengue fever.**

red-green blindness, red-green color blindness, popular names for any imperfect perception of red and green tints, including all of the most common types of color vision deficiency. See **deuteranomaly, deuteranopsia,** and **protanopia**.

red hepatization. See **hepatization.**

redia /rē′dē·ə/, an elongated second or third larval stage of a trematode that develops in a sporocyst and matures into numerous cercariae.

red infarct [AS, *read* + L, *infarcire,* to stuff], a pathological change that occurs in brain tissue that has been rendered ischemic by lack of blood. With restricted blood flow, diapedesis of red blood cells occurs into the parenchyma of the brain without actually producing a well-formed hematoma, producing only infiltration of erythrocytes.

red man syndrome. See **red neck syndrome.**

red marrow [AS, *read* + AS, *mearh,* marrow], the red vascular substance consisting of connective tissue and blood vessels containing primitive blood cells, macrophages, megakaryocytes, and fat cells. It is found in the cavities of many bones, including flat and short bones, bodies of the vertebrae, sternum, ribs, and articulating ends of long bones. Red marrow manufactures and releases leukocytes, erythrocytes, and thrombocytes into the bloodstream. Compare **yellow marrow.**

red mite. See **chigger.**

red neck syndrome, an allergic reaction to a rapid infusion of the antimicrobial agent vancomycin. It is characterized by flushing, pruritus, and erythema of the head and upper body resulting from histamine release. Also called **red man syndrome.**

redon /rē′don/, the smallest unit of DNA capable of recombination, which may be as small as one base pair. Compare **cistron, muton.**

redox, an abbreviation for *reduction-oxidation* (reaction). See **oxidation-reduction reaction.**

red tide. See ***Gonyaulax catenella,*** **shellfish poisoning.**

reduce /rid(y)o͞os′/ [L, *reducere,* to lead back], **1.** (in surgery) to restore a part to its original position after displacement, as in the reduction of a fractured bone by bringing ends or fragments back into alignment or of a hernia by returning the bowel to its normal position. A fracture may be reduced under local or general anesthesia. If performed by external manipulation alone, the reduction is said to be closed; if surgery is necessary, it is said to be open. See also **fracture, hernia, invagination, traction. 2.** to decrease the amount, size, extent, or number of something, as of body weight.

reducible hernia /rid(y)o͞o′səbəl/ [L, *reducere,* to lead back, *hernia,* rupture], a hernia in which the protruding tissues can be manipulated into a normal position.

reducing agent /rid(y)o͞o′sing/ [L, *reducere,* to lead back, *agere,* to do], a substance that donates electrons to another substance in a chemical reaction.

reducing diet. See **weight-reduction diet.**

reduction /riduk′shən/ [L, *reducere*], **1.** also called **hydrogenation.** The addition of hydrogen to a substance. **2.** the removal of oxygen from a substance. **3.** the decrease in the valence of the electronegative part of a compound. **4.** the addition of one or more electrons to a chemical substance. **5.** the correction of a fracture, hernia, or luxation. **6.** the reduction of data, as in converting interval data to an ordinal or nominal scale of measurement.

reduction division. See **meiosis.**

reductionism /riduk′shəniz′əm/, an approach that tries to explain a form of behavior or an event in terms of a specific category of phenomena, such as biological, psychological, or cultural, negating the possibility of an interrelation of causal phenomena.

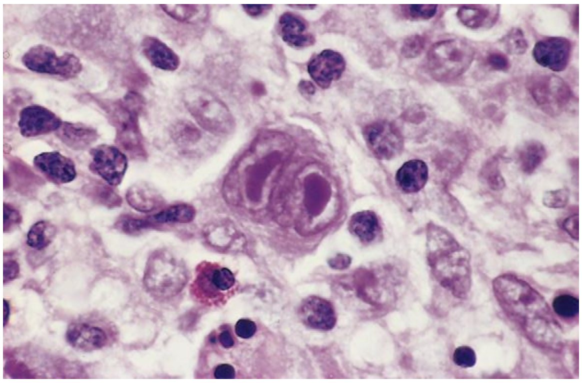
reduction ureteroplasty. surgical tapering or plication of the ureter for treatment of megaureter.

redux. See **oxidation-reduction reaction.**

red yeast. See **monascus.**

Reed, Pamela G., a nursing theorist who developed the Self-Transcendence Theory. Self-transcendence is the expansion of a person's concept of self through introspection, interaction with other people and the surrounding environment, integration of the past and future, and spirituality. It is based on the belief that, to maintain a sense of well-being, older adults must continue their cognitive development during the process of aging.

Reed-Sternberg cell [Dorothy M. Reed, American pathologist, 1874–1964; Karl Sternberg, Austrian pathologist, 1872–1935], one of a number of large, abnormal, multinucleated reticuloendothelial cells in the lymphatic system found in Hodgkin's disease. The number and proportion of Reed-Sternberg cells identified are the basis for the histopathological classification of Hodgkin's disease.



Reed-Sternberg cell *(Kumar et al, 2007/Courtesy Dr. Robert W. McKenna, Department of Pathology, University of Texas Southwestern Medical School)*

reefer. See **cannabis.**

reentry /rē·en′trē/ [L, *re*, again; Fr, *entrée*], (in cardiology) the reactivation of myocardial tissue for the second or subsequent time by the same impulse. Reentry is one of the most common arrhythmogenic mechanisms. For example, paroxysmal supraventricular tachycardia may be caused by sinus nodal reentry, atrioventricular (AV) nodal reentry, or AV reentry by way of the AV node and an accessory pathway; atrial flutter is caused by an atrial macroreentry circuit. Reentry also underlies some forms of ventricular tachycardia and extrasystoles. AV and AV nodal reentry mechanisms may be terminated by a vagal maneuver, adenosine, or procainamide.

refeeding /re-fēd′ing/, restoration of normal nutrition after a period of fasting or starvation.

refeeding syndrome, moderate to severe electrolyte and fluid shifts occurring during a period of refeeding. Hypophosphatemia is common, and heart failure sometimes occurs.

refereed journal /ref′ərēd′/ [L, *referre*, to bring back, *diurnalis*, daily record], a professional or literary journal in which articles or papers are selected for publication by a panel of referees who are experts in the field. They read and evaluate each of the articles submitted for publication. The important national professional journals in medicine and nursing are refereed.

reference electrode /ref′ərəns/ [L, *referre*, to bring back; Gk, *elektron*, amber, *hodos*, way], an electrode that has an established potential and is used as a reference against which other potentials may be measured.

reference group, a group with which a person identifies or wishes to belong.

reference interval, distribution of test results that are normal for a selected population of healthy persons. Reference intervals are interpreted according to age, sex, and race. Also called *reference range, normal range*.

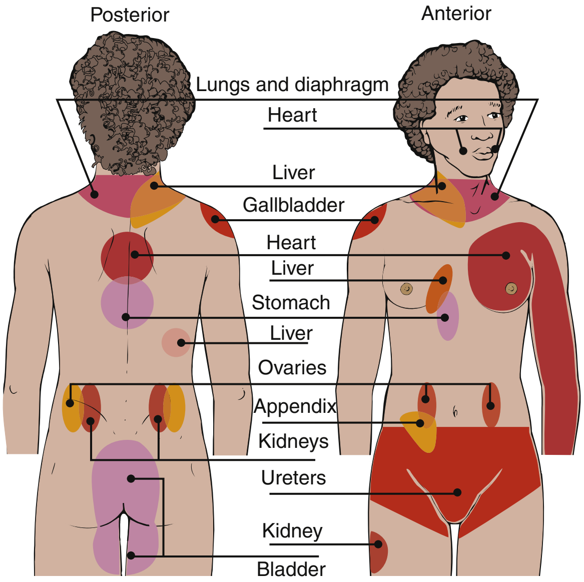
referential idea. See **idea of reference.**

referential index deletion /ref′əren′shəl/, a neurolinguistic programming term that pertains to the omission of the specific person being discussed.

referral^1 /rifur′əl/ [L, *referre*, to bring back], a process whereby a patient or the patient's family is introduced to additional health resources in the community, as in helping a patient find an appropriate community health nurse after discharge from a hospital.

referral^2**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as arrangement for services by another care provider or agency. See also **Nursing Interventions Classification.**

referred pain /rifurd′/ [L, *referre* + *poena*, punishment], pain felt at a site different from that of an injured or diseased organ or body part. Angina, the pain of coronary artery insufficiency, may be felt in the left shoulder, arm, or jaw. In gallbladder disease, pain may be felt in the right shoulder or scapular region.



Typical areas of referred pain *(Lewis et al, 2011)*

referred sensation, a feeling or impression that occurs at a site other than where the stimulus is initiated. Also called **reflex sensation.** See also **sensation,** def. 1.

refined birth rate /rifīnd/ [L, *re* + *finire,* to finish], the ratio of total births to the total female population, considered during a period of 1 year. Compare **birth rate, crude birth rate, true birth rate.**

refl, abbreviation for *reflexive.*

reflecting /riflek′ting/, a communication technique in which the listener picks up the feeling or tone of the patient's message and repeats it back to the patient. This often includes restatement of selected patient words. It encourages the patient to continue with clarifying comments. It is a means of assisting patients to better understand their own thoughts and feelings.

reflection /riflek′shən/ [L, *reflectere,* to bend back], **1.** a form of reentry in myocardial tissue in which, after encountering delay in one fiber, an impulse enters a parallel fiber and returns retrogradely to its source. **2.** the return or reentry of ultrasound waves where there is a discontinuity in the characteristic acoustic impedance along the propagation path. The intensity of the reflection is related to the difference in the characteristic acoustic impedance across the interface.

reflective layer /riflek′tiv/, a thin layer of magnesium oxide or titanium oxide between the phosphor and the base of an intensifying screen, used in radiography. Its function is to intercept and redirect isotropically emitted light from the phosphor to the x-ray film.

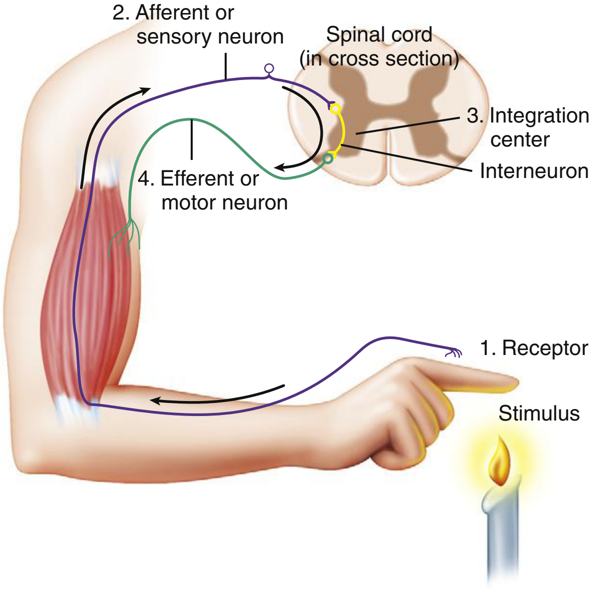
reflex /rē′fleks/ [L, *reflectere,* to bend back], **1.** a backward or return flow of energy or of an image, as a reflection. **2.** a reflected action, particularly an involuntary action or movement.

reflex action, the involuntary functioning or movement of any organ or body part in response to a particular stimulus. The function or action occurs immediately, without the involvement of the will or consciousness.

reflex ankle clonus. See **ankle clonus.**

reflex apnea, involuntary cessation of respiration caused by irritating noxious vapors or gases.

reflex arc [L, *reflectere,* to bend back, *arcus,* bow], a simple neurological unit of a sensory neuron that carries a stimulus impulse to the spinal cord, where it connects with a motor neuron that carries the reflex impulse back to an appropriate muscle or gland.



2. Afferent or sensory neuron
Spinal cord (in cross section)
3. Integration center
Interneuron
4. Efferent or motor neuron
1. Receptor
Stimulus

Reflex arc *(Harkreader, Hogan, and Thobaben, 2007)*

reflex bladder. See **spastic bladder.**

reflex center [L, *reflectere,* to bend back; Gk, *kentron*], any part of the nervous system in which reception of afferent impulses results in a discharge of efferent impulses leading to some change in a muscle or gland.

reflex dyspepsia, an abnormal condition characterized by impaired digestion associated with the disease of an organ not directly involved with digestion. See also **dyspepsia.**

reflex emesis [L, *reflectere,* to bend back; Gk, *emesis,* vomiting], vomiting or gagging that is induced by touching the mucous membrane of the throat or is a result of other noxious stimuli. Also called **gag reflex, vomiting reflex.**

reflex hammer [L, *reflectere,* to bend back; AS, *hamer*], a percussion mallet with a rubber head used to tap tendons, nerves, or muscles to elicit reflex reactions.

reflex incontinence, the urinary incontinence that accompanies detrusor hyperreflexia.

reflex inhibiting pattern (RIP), a conscious set of neuromuscular actions directed toward inhibition of a natural reflex. Examples include actions taken to suppress a sneeze and the learned inhibitions of toilet training.

reflexology /rē′fleksol′əjē/, a bodywork technique that uses reflex points on the hands and feet. Pressure is applied at points that correspond to various body parts with the intention of eliminating blockages thought to produce pain or disease. The goal is to bring the body into balance.

reflex seizure, an epileptic seizure in response to a sensory stimulus, which may be tactile, visual, auditory, or musical.

reflex sensation. See **referred sensation.**

reflex sympathetic dystrophy (RSD), a diffuse, persistent pain involving central reorganization of sensory processing. It is characterized by vasomotor disorders, limited joint mobility, and trophic changes. The condition usually follows an injury to an afferent pathway and affects an extremity. Also called **complex regional pain syndrome.**

reflex tachycardia [L, *reflectere,* to bend back; Gk, *tachys,* fast, *kardia,* heart], a rapid heart sinus rhythm caused by a variety of autonomic nervous system effects, such as blood pressure changes, fever, or emotional stress.

reflex vasodilation [L, *reflectere,* to bend back, *vas,* vessel, *dilatare,* to spread out], any blood vessel dilation that results from stimulation of vasodilator nerves or inhibition of vasoconstrictors of the sympathetic nervous system, including by epinephrine-type drugs.

reflux /rē′fluks/ [L, *refluere,* to flow back], an abnormal backward or return flow of a fluid. Kinds of reflux include **gastroesophageal reflux, hepatojugular reflux,** and **vesicoureteral reflux.**

reflux esophagitis, esophageal irritation and inflammation that result from reflux of the stomach contents into the esophagus. See also **gastroesophageal reflux.**

reflux laryngitis, a burning sensation in the hypopharynx and larynx caused by nocturnal gastric reflux. It occurs most commonly in older patients who sleep in the recumbent position.

refracting angle. See **angle of refraction.**

refracting medium. See **medium.**

refraction /rifrak′shən/ [L, *refringere,* to break apart], **1.** *n,* the change of direction of energy as it passes from one medium to another of different density. **2.** *n,* an examination to determine and correct refractive errors of the eye. **3.** *n,* (in ultrasonography) the phenomenon of bending wave fronts as the acoustic energy propagates from the medium of one acoustic velocity to a second medium of differing acoustic velocity. **4.** *adj,* pertaining to the recovery period after an action potential either in muscular or nervous tissue. **—refractive,** *adj.*

refraction of eye [L, *refringere,* to break apart; AS, *eage*], the deflection of light from a straight path through the eye by various ocular tissues, including the cornea, lens, aqueous humor, and vitreous body.

refractive error /rifrak′tiv/, a defect in the ability of the lens of the eye to focus an image accurately, as occurs in nearsightedness and farsightedness.

refractive index, a numeric expression of the refractive power of a medium as compared with that of air, which has a refractive index value of 1. The refractive index is related to the number, charge, and mass of vibrating particles in the material through which light is passing and may be used as a measure of the total solids in a solution.

refractive keratotomy (RK), a surgical procedure in which a varying number of radial or perpendicular incisions are made to flatten the cornea, resulting in the elimination or reduction of myopia or astigmatism. Incisions are made partially through the cornea sparing the central cornea. This type of refractive surgery has been largely replaced by newer methods. See also **radial keratotomy.**

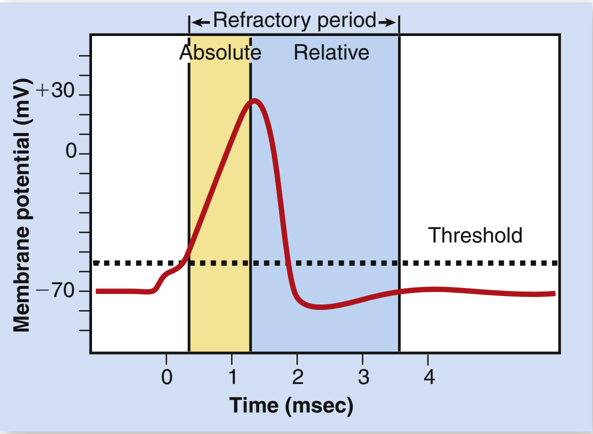
refractometer /rē′frəktom′ətər/ [L, *refringere,* to break apart; Gk, *metron,* measure], an instrument for measuring the refractive index of a substance, used primarily for measuring the refractivity of solutions. See also **refractive index.**

refractoriness /rifrak′tôrines′/, the property of excitable tissue that determines how closely together two action potentials can occur.

refractory /rifrak′tərē/ [L, *refringere*], **1.** pertaining to a disorder that is resistant to treatment. **2.** property of conductive tissue to return to original related state in preparation for a second stimulus.

refractory medium. See **medium.**

refractory period, the time from phase 0 to the end of phase 3 of the action potential, divided into effective and relative. In pacing terminology, the period during which a pulse generator is unresponsive to an input signal of specified amplitude. The **effective refractory period** is from phase 0 to approximately −60 mV during phase 3 of the action potential, a time during which it is impossible for the myocardium to respond with a propagated action potential, or even to a strong stimulus. The **relative refractory period** is from approximately −60 mV during phase 3 to the end of phase 3 of the action potential, the time during which a depressed response is possible to a strong stimulus. Also called *refractory phase, refractory state.*



Refractory period *(Patton and Thibodeau, 2010)*

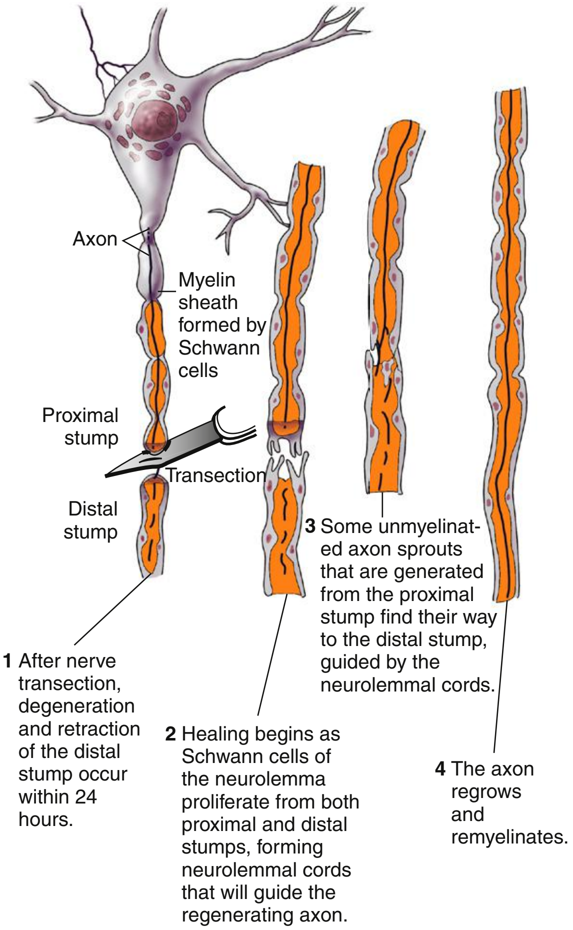
reframing /rēfrā′ming/, changing the conceptual and/or emotional viewpoint in relation to which a situation is experienced and placing it in a different frame that fits the "facts" of a concrete situation equally well, thereby changing its entire meaning.

refrigeration anesthesia. See **cryoanesthesia.**

Refsum's syndrome /ref′so͞omz/ [Sigvald Refsum, Norwegian physician, 1907–1991], a rare hereditary disorder of lipid metabolism in which phytanic acid cannot be broken down. It is characterized by ataxia, abnormalities of the bones and skin, peripheral neuropathy, cardiomyopathy, deafness, and retinitis pigmentosa. Foods containing phytanic acid must be avoided to prevent progressive deterioration. Also called **phytanic acid storage disease.**

refusal of treatment, the right of a patient to refuse treatment after the physician has informed the patient of the diagnosis, prognosis, available alternative interventions, risks and benefits of those options, and risk and probable outcome of no intervention.

regeneration /rijen′ərā′shən/, the process of repair, reproduction, or replacement of lost or injured cells, tissues, or organs. Also called **neogenesis.**



Axon
Myelin sheath formed by Schwann cells
Proximal stump
Transection
Distal stump
1 After nerve transection, degeneration and retraction of the distal stump occur within 24 hours.
2 Healing begins as Schwann cells of the neurolemma proliferate from both proximal and distal stumps, forming neurolemmal cords that will guide the regenerating axon.
3 Some unmyelinated axon sprouts that are generated from the proximal stump find their way to the distal stump, guided by the neurolemmal cords.
4 The axon regrows and remyelinates.

Regeneration of a nerve *(Ignatavicius and Workman, 2010)*

regimen /rej′imən/ [L, guidance], a strictly regulated therapeutic program such as a diet or exercise schedule.

regional /rē′jənəl/ [L, *regio,* territory], pertaining to a geographic area, such as a regional medical facility, or to a part of the body, such as regional anesthesia.

regional anatomy, the study of the structural relationships among the organs and the parts of the body. Kinds of regional anatomy are **surface anatomy** and **cross-sectional anatomy.**

regional anesthesia, **1.** anesthesia provided by injecting a local anesthetic to block a group of sensory nerve fibers. The tissues are anesthetized layer by layer, as the surgeon approaches the deeper structures of the body. Regional anesthesia has largely replaced local anesthesia for major procedures. Kinds of regional anesthesia include **Bier block, brachial plexus anesthesia, caudal anesthesia, conduction anesthesia, epidural anesthesia,** *intercostal anesthesia,* **paracervical block, pudendal block,** and **spinal anesthesia.** Compare **general anesthesia, local anesthesia, topical anesthesia.** See also **anesthesia. 2.** (in dentistry) the loss of sensation to pain, temperature, and pressure of a tooth, teeth, jaw, and soft tissue caused by deposit of a local anesthetic agent in close proximity to a nerve or nerves. Examples include posterior superior alveolar block, middle superior alveolar block, and anterior superior alveolar block. Compare **block anesthesia, local infiltration of anesthesia.**

regional control, the control of cancer in sites that represent the first stages of spread from the local origin.

regional enteritis. See **Crohn's disease.**

regional hyperthermia, the elevation of temperature over an extended volume of tissue.

regionalization /rē′jənal′īzā′shən/, (in health care planning) the organization of a system for the delivery of health care within a region to avoid costly duplication of services and to ensure availability of essential services.

regional medical program (RMP), a program of community health planning that includes all the medical resources available in a region that may be mobilized to meet a specific medical objective. The RMP was authorized by the Health, Disease, Cancer and Stroke Amendments passed by the U.S. Congress in 1965. See also **regionalization.**

region of interest (ROI), an area on a digital image that circumscribes a desired anatomical location. Image processing systems permit drawing of ROIs on images. The average parametric value is computed for all pixels within the ROI and returned to the operator.

region of recombination, the first stage of amplitude of an electric signal in a gas-filled radiation detector, when the voltage is very low. No electrons are attracted to the central electrode, and ion pairs produced in the chamber will recombine.

regiospecific, a chemical reaction favoring a single positional or structural isomer.

register /rej′istər/ [L, *regerere,* to bring back], **1.** in computed tomography, a device in the central processing unit that stores information for future use. **2.** See **vocal register.**

registered dietitian (RD) /rej′istərd/, a professional trained in foods and the management of diets (dietetics) who is credentialed by the Commission on Dietetic Registration of the American Dietetic Association. Credentialing is based on completion of a BS degree or MS degree program, an approved dietetic internship, and passing a registration examination.

registered nurse (RN), **1.** (U.S.) a nurse who has completed a course of study at a state-approved school of nursing and passed the National Council Licensure Examination. A registered nurse may use the initials RN after the signature. RNs are licensed to practice by individual states. **2.** (Canada) a nurse who has completed a course of study at an approved school of nursing and passed an examination administered by the Canadian Nurses Association Testing Service, called the Comprehensive Examination for Nurse Registration Licensure. See also **nurse, nursing.**

registered record administrator (RRA), a medical record administrator who has successfully completed the credentialing examination conducted by the American Medical Record Association.

registered respiratory therapist (RRT), an allied health professional who has successfully completed the written registry and clinical simulation examination of the National Board for Respiratory Care and who specializes in scientific knowledge and theory of clinical problems of respiratory care. Usually a 2- or 4-year college affiliation leading to an associate or bachelor's degree is required. Duties include the collection and evaluation of patient data to determine an appropriate care plan, selection and assembly of equipment, conduction of therapeutic procedures, and modification of prescribed plans to achieve one or more specific objectives.

registered technologist (RT), a medical professional who is certified by the American Registry of Radiologic Technologists or equivalent certifying agency in one or more of the following disciplines: radiography, nuclear medicine, radiation therapy, mammography, computed tomography, magnetic resonance imaging, cardiovascular interventional technology, or quality management. See also **radiological technologist.**

registrar /rej′isträr/, an administrative officer whose responsibility is to maintain the records of an institution.

registration /rej′istrā′shən/ [L, *registratio*], **1.** a learning or memory recorded in the central nervous system of an impression resulting from a stimulus. **2.** the recording of vital personal information such as health data. **3.** the recording of professional qualification information relevant to government licensing regulations.

registry /rej′istrē/ [L, *regerere,* to bring back], **1.** an office or agency in which lists of nurses and records pertaining to nurses seeking employment are maintained. **2.** (in epidemiology) a listing service for incidence data pertaining to the occurrence of specific diseases or disorders, such as a tumor registry.

Regitine, a trademark for an alpha-adrenergic blocking agent (phentolamine hydrochloride).

regression /rigresh′ən/ [L, *regredi,* to go back], **1.** a retreat or backward movement in conditions, signs, or symptoms. **2.** a return to an earlier, more primitive form of behavior. **3.** a tendency in physical development to become more typical of the population than of the parents, such as a child who attains a height closer to the average than to that of tall or short parents. **—regress,** *v.*

Regroton, a trademark for a fixed-combination cardiovascular drug containing a diuretic **(chlorthalidone)** and an antihypertensive **(reserpine).**

regular diet /reg′yələr/ [L, *regula,* rule], a full, well-balanced diet containing all of the essential nutrients needed for optimal growth, tissue repair, and normal functioning of the organs. Such a diet contains foods rich in proteins, carbohydrates, high-quality fats, minerals, and vitamins in proportions that meet the specific caloric requirements of the individual. Also called **normal diet.**

regular insulin, a fast-acting insulin prescribed in the treatment of diabetes mellitus when the desired action is relatively prompt, intense, and short-acting. It can be mixed with long-acting forms of insulin. Regular insulin prepared from zinc insulin crystals is slightly longer-acting than the amorphous noncrystalline form of this type of insulin preparation. Insulin lispro, a slightly modified form of human insulin that is now widely used, has a faster onset and shorter duration of action than regular insulin.

regulative cleavage. See **indeterminate cleavage.**

regulative development /reg′yəlā′tiv/ [L, *regula,* rule], a type of embryonic development in which the fertilized ovum undergoes indeterminate cleavage, producing blastomeres that have similar developmental potencies and are each capable of giving rise to a single embryo. Determination of the particular organs and parts of the embryo occurs during later stages of development and is influenced by inductors and intercellular interaction. Damage or destruction of various cells during the early stages of development results in readjustments and substitutions so that a normal organism is formed. Compare **mosaic development.**

regulator /reg′yəlā′tər/, (in genetics) the part of a DNA molecule undergoing replication that controls the replication and coordinates with cell division.

regulator gene /reg′yəlā′tər/, a gene that regulates or suppresses the activity of one or more structural genes. Also called **repressor gene.**

regulatory HIV gene, one of a set of genes in the genome of the human immunodeficiency virus (HIV) that influence the expression of other HIV genes. One regulatory gene *(tat)* stimulates expression, a second *(nef)* may inhibit expression, and a third *(rev)* provides feedback to the others.

regulatory sequence /reg′yələtôr′ē/ [L, *regula* + *sequi,* to follow], a series of DNA nucleotides that regulate the expression of a gene.

regurgitant menstruation. See **retrograde menstruation.**

regurgitant murmur /rigur′jitənt/ [L, *re* + *gurgitare,* to flow back, *murmur,* humming], a heart murmur caused by the backflow of blood through the partly closed cusps of a defective valve. Kinds of regurgitant murmurs include **diastolic** and **systolic murmurs.**

regurgitation /rēgur′jitā′shən/ [L, *re,* again, *gurgitare,* to flow back], **1.** the backward flow from the normal direction, as the return of swallowed food into the mouth. **2.** the backward flow of blood through a defective heart valve, named for the affected valve, as in aortic regurgitation. See also **reflux.**

regurgitation jaundice [L, *re* + *gurgitare,* again to flow back; Fr, *jaune,* yellow], jaundice caused by bile pigment entering the blood and lymphatic systems as a result of biliary obstruction.

rehabilitation (rehab) /rē′habil′itā′shən/ [L, *re* + *habitalas,* aptitude], the restoration of an individual or a part to normal or near normal function after a disabling disease, injury, addiction, or incarceration. **—rehabilitate,** *v.*

rehabilitation center, a facility providing therapy and training for rehabilitation. The center may offer occupational therapy, physical therapy, vocational training, and special training such as speech therapy. See also **rehabilitation.**

rehabilitation counselor, a human services professional who assists persons with disabilities to become or remain productive and self-sufficient. The counselor may help clients deal with personal, environmental, and societal problems; arrange for medical and psychological services; and arrange vocational assessment, training, and job placement. Education is typically from 18 to 24 months of academic and field-based clinical training. Rehabilitation counselors may earn certification from the Commission on Rehabilitation Counselor Certification and are eligible for licensure by nearly all states that regulate counselors.

rehabilitation teacher, a human services professional who teaches the blind and visually impaired independent living skills, as well as communication skills using Braille and assistive technology.

Rehfuss stomach tube /rā′fəs/ [Martin E. Rehfuss, American physician, 1887–1964], a specially designed gastric tube with a graduated syringe, used for withdrawing specimens of the contents of the stomach for study after a test meal.

rehydration /rē′hīdrā′shən/ [L, *re* + Gk, *hydor*, water], restoration of normal water balance in a patient by giving fluids orally or intravenously.

Reid's base line [Robert W. Reid, Scottish anatomist, 1851–1939], the base line of the skull, a hypothetic line extending from the inferior orbital ridge to the center of the aperture of the external auditory meatus. Also called **Frankfurt line.**

Reifenstein's syndrome /rī′fənstīnz/ [Edward C. Reifenstein, Jr., American physician, 1908–1975], male hypogonadism of unknown origin, marked by azoospermia, undescended testes, gynecomastia, testosterone deficiency, and elevated gonadotropin titers. The condition appears to be inherited as an X-linked recessive trait, but no chromosomal abnormality has been identified.

reiki /ra′ke/, an Eastern healing tradition whose purpose is to rebalance the complex energy systems that compose the body when they have become out of balance. In this tradition, people are considered to be surrounded by an unlimited universal energy source from which the physical universe is built. The energy systems in the healthy body are in balance, but they can be disrupted by stress, and this unbalancing may have physical manifestations such as pain. The reiki practitioner is trained to channel energy from the universal energy source, which flows through his or her hands to the body of the receiver. The result is the rebalancing of mind and body, the strengthening of body and spirit, the opening of energy blockages, the creation of a sense of well-being, and the healing of illnesses. Reiki sessions are generally held in a quiet setting in comfortable surroundings and may be as short as 5 minutes for treatment of a specific part of the body or as long as an hour for a full-body treatment.

reiki therapy /rī′kē/, a complementary therapy in which a trained practitioner places his or her hands on or above a specific body area and transfers what is called "universal life energy" to the patient. That energy, it is claimed, provides "strength, harmony, and balance" necessary to treat health disturbances. The therapy, derived from an ancient Buddhist practice, involves a total of 15 hand positions covering all the body systems.

reimbursement /rē′imburs′mənt/ [L, *re* + *im*, in; Fr, *bourse*, purse], a method of payment, usually by a third-party payer, for medical treatment or hospital costs.

reimplantation /rē′im·plan·tā′shən/, the planting back of tissue or a structure, such as a tooth, in the site from which it was previously lost or removed.

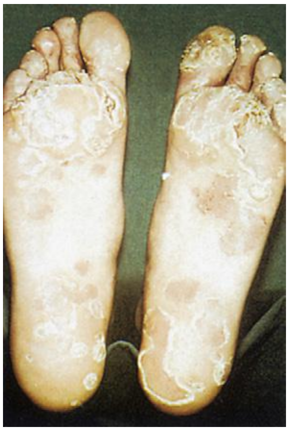
reinfection /rē′infek′shən/, a second infection by the same microorganism, either after recovery or during the original infection.

reinforcement /rē′infôrs′mənt/ [L, *re* + Fr, *enforcir*, to strengthen], (in psychology) a process in which a response is strengthened by the fear of punishment or the anticipation of reward.

reinforcement-extinction, a process of socialization in which one learns to engage in certain behaviors (reinforcement) or to avoid certain behaviors (extinction). The anticipated result is that the reinforced behaviors become habitual and those that undergo extinction disappear.

reinforcer /rē′infôr′sər/, (in psychology) a consequence that increases the probability that an operant will recur.

Reiter's syndrome /rī′tərz/ [Hans Reiter, German physician, 1881–1969], an arthritic disorder predominantly of adult males, resulting from infection with *Shigella flexneri*, *Salmonella*, *Yersinia*, or *Chlamydia* or from enterocolitis. It most often affects the ankles, feet, and sacroiliac joints and is usually associated with conjunctivitis and urethritis. The onset may be marked by unexplained diarrhea and low-grade fever, followed in 2 to 4 weeks by conjunctivitis. Superficial ulcers may form lesions on the palms and the soles. Arthritis usually persists after the conjunctivitis and urethritis subside, but it may become episodic. Treatment includes a short course of tetracycline to treat the infection and phenylbutazone to relieve pain and inflammation in the joint. Sexual partners should also be tested. Recovery is expected, but recurrent arthritic symptoms may continue for several years. See also **dactylitis, reactive arthritis.**



Reiter's syndrome *(Moll, 1997)*

reject analysis /rē′jekt/, the study of rejected radiographs to determine the cause for their being discarded.

rejection /rijek′shən/ [L, *re* + *jacere*, to throw], **1.** an immunological attack against organisms or substances that the immune system recognizes as foreign, including grafts and transplants. See also **acute rejection, chronic rejection. 2.** the act of excluding or denying affection to another person.

rejunctive /rijungk′tiv/, (in contextual psychotherapy) pertaining to a relationship that is characterized by moves toward trustworthy relatedness.

rejuvenation /rējo͞o′vənā′shən/ [L, *re* + *juvenis*, youth], the restoration of youthful health and vitality.

relapse /rilaps′/ [L, *relabi*, to slide back], **1.** *v*, to exhibit again the symptoms of a disease from which a patient appears to have recovered. **2.** *n*, the recurrence of a disease after apparent recovery.

relapsing [L, *relabi*, to slide back], pertaining to the return of disease after a period of apparent recovery.

relapsing fever, any one of several acute infectious diseases marked by recurrent febrile episodes, caused by various strains of the spirochete ***Borrelia.*** The disease is transmitted by both lice and ticks and is often seen during wars and famines. It has occurred in several western states of the United States but is more commonly found in South America, Asia, and Africa. The first episode usually starts with a sudden high fever (104° F to 105° F, or 40° C to 40.56° C), accompanied by chills, headache, neuromuscular pains, and nausea. A rash may appear over the trunk and extremities, and jaundice is common during the later stages. Each attack lasts 2 or 3 days and culminates in a crisis of high fever, profuse sweating, and a rise in heart and respiratory rate. This is followed by an abrupt drop in temperature and a return to normal blood pressure. People typically relapse after 7 to 10 days of normal temperature but eventually recover completely. In louse-borne disease there is usually only a single relapse; in tick-borne disease several successively milder relapses may occur. See also **African tick fever.**

relapsing polychondritis, a rare disease of unknown cause resulting in inflammation and destruction of cartilage with replacement by fibrous tissue. Autoimmunity may be involved in this condition. Most commonly the ears and noses of middle-aged people are affected with episodes of tender swelling, often accompanied by fever, arthralgias, and episcleritis. Consequences include floppy ears, collapsed nose, hearing loss, or hoarseness and airway obstruction because of laryngeal and tracheal cartilage involvement. Corticosteroids suppress the activity of the disease.

relation searching /rilā′shən/ [L, *relatio*], (in nursing research) a study design used to discover and describe relationships between and among variables. It may be used to describe various nursing situations to examine the efficacy of certain aspects of nursing care.

relationship therapy /rilā′shənship′/ [L, *relatio* + AS, *scieppan,* to shape], a therapy that is based on a totality of client-therapist relationship and encourages the growth of self in the client. It has been described as "an experience in living that takes place within a relationship with another person."

relative biological effectiveness (RBE) /rel′ətiv/ [L, *relatio*], a measure of the cell-killing ability of a particular radiation compared with that of 250 keV x-rays. The ratio of the number of cells killed with the test radiation over the number killed with the 250 keV radiation is the RBE.

relative centrifugal force (RCF), a method of comparing the force generated by various centrifuges on the basis of the speeds of rotation and distances from the center of rotation.

relative cephalopelvic disproportion. See **cephalopelvic disproportion.**

relative growth, the comparison of the various increases in size of similar organisms, tissues, or structures at different time intervals.

relative humidity (r/h), the amount of moisture in the air compared with the maximum the air could contain at the same temperature.

relative molecular mass. See **molecular mass.**

relative periodontal pocket. See **periodontal pocket.**

relative pocket. See **periodontal pocket.**

relative refractory period. See **refractory period.**

relative risk, the ratio of the chance of a disease developing among members of a population exposed to a factor compared with a similar population not exposed to the factor. In many cases the relative risk is modified by the duration or intensity of exposure to the causative factors.

relative sterility [L, *relatio* + *sterilis,* barren], a condition of infertility in which one or more factors tend to reduce the chances of becoming pregnant. See also **sterility.**

relative value unit (RVU), a comparable service measure used by hospitals to permit comparison of the amounts of resources required to perform various services within a single department or between departments. It is determined by assigning weight to such factors as personnel time, level of skill, and sophistication of equipment required to render patient services. RVUs are a common method of physician bonus plans based partially on productivity.

relativism. See **cultural relativism.**

relax /rilaks′/ [L, *relaxare,* to ease], to reduce tension or anxiety.

relaxant /rilak′sənt/ [L, *relaxare,* to ease], a drug or other agent that tends to reduce tension, as a muscle relaxant or bowel relaxant.

relaxation /rē′laksā′shən/ [L, *relaxare,* to ease], **1.** a reducing of tension, as when a muscle relaxes between contractions. **2.** (in magnetic resonance imaging) the return of excited nuclei to their normal unexcited state by the release of energy.

relaxation oven, a part of the xerographic plate conditioner system used to eliminate ghost images in mammograms. The plate is heated in the oven so that any residual electrostatic charge on the surface will be removed.

relaxation response, a protective mechanism against stress that brings about decreased heart rate, lower metabolism, and decreased respiratory rate. It is the physiological opposite of the "fight or flight," or stress, response.

relaxation therapy^1, treatment in which patients are taught to perform breathing and relaxation exercises and to concentrate on a pleasant situation. An integral part of the Lamaze method of childbirth, relaxation therapy is also used to relieve various kinds of pain and physical manifestations of stress. Various yoga exercises and aspects of hypnotherapy may be included in the treatment program, and biofeedback techniques may be used to demonstrate actions that induce relaxation. Some patients learn through relaxation therapy to relax taut muscles at will, to abort migraine attacks, or to reduce their blood pressure. See also **Lamaze method.**

relaxation therapy^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of techniques to encourage and elicit relaxation for the purpose of decreasing undesirable signs and symptoms such as pain, muscle tension, or anxiety. See also **Nursing Interventions Classification.**

relaxation time, in magnetic resonance imaging, the characteristic time it takes for a sample of atoms, whose nuclei have first been aligned along a static magnetic field and then excited to a higher-energy state by a radiofrequency (rf) signal, to return to a lower-energy equilibrium state. Two time parameters are used to describe the return, or relaxation, to the equilibrium state once the rf signal is turned off: **T_1** describes the relaxation of the system of spins into a condition of thermal equilibrium with its surroundings. **T_2** describes the relaxation of the energy that is traded within the system itself. Maps of the values of T_1 or T_2 as a function of position in the cross-sectional view constitute magnetic resonance images. Also called **transverse relaxation time.**

relaxin /rilak′sin/, a hormone obtained from the corpora lutea of swine and used to relax the pelvic ligaments and dilate the cervix during labor. The medication has also been used to treat dysmenorrhea.

release therapy /rilēs′/ [ME, *relesen,* to release], a type of pediatric psychotherapy used to treat children with stress and anxiety related to a specific recent event.

releasing hormone (RH), one of several peptides produced by the hypothalamus and secreted directly into the anterior pituitary gland via a connecting vein. Each of the releasing hormones stimulates the pituitary to secrete a specific tropic hormone. Thus corticotropic-releasing hormone stimulates the pituitary to secrete adrenocorticotropic hormone, whereas growth hormone–releasing hormone stimulates the secretion of growth hormone. Previously called *releasing factor.*

releasing stimulus, (in psychology) an action or behavior by one individual that serves as a cue to trigger a response in others. An example is yawning by one person, which results in yawning by others in the group.

reliability /rilī′əbil′itē/ [L, *religare,* to fasten behind], (in research) the extent to which a test measurement or device produces the same results with different investigators, observers, or administration of the test over time. If repeated use of the same measurement tool on the same sample produces the same consistent results, the measurement is considered reliable. Compare **validity.**

relief area [L, *relevare,* to lighten], the part of the tissue surface under a prosthesis on which pressure is reduced or eliminated.

relieve /rē·lēv′/ [L, *relevare,* to lighten], to mitigate or remove pain or distress.

relieving factor /rilē′ving/, an agent that alleviates a symptom.

religiosity /rilij′ē·os′itē/ [L, *religiosus*], a psychiatric symptom characterized by the demonstration of excessive or affected piety.

religious addiction prevention, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention of a self-imposed controlling religious lifestyle. See also **Nursing Interventions Classification.**

religious ritual enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating participation in religious practices. See also **Nursing Interventions Classification.**

-relin, suffix for prehormones or hormone-release stimulating peptides.

reline /rēlīn′/ [L, *re* + *linea*], the resurfacing of the tissue side of a denture with new base material. See **rebase.**

-relix, suffix for hormone-release inhibiting peptides.

relocation stress reduction, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the individual to prepare for and cope with movement from one environment to another. See also **Nursing Interventions Classification.**

rem /rem, är′ē′em′/, abbreviation for *roentgen equivalent man,* a dose of ionizing radiation that produces in humans the same effect as one roentgen of x-radiation or gamma radiation. See also **sievert.**

REM /rem, är′ē′em′/, abbreviation for **rapid eye movement.** See **sleep.**

remasking /rēmas′king/, in digital fluoroscopy, the production of one or more additional mask images if the first is inadequate because of patient motion, noise, or other factors. See also **mask image.**

remedial /rimē′dē·əl/ [L, *remediare,* to cure], designed to improve or cure.

remifentanil, an opiate agonist analgesic.

■ INDICATIONS: It is used in combination with other drugs in general anesthesia and as a primary anesthetic in general surgery.

■ CONTRAINDICATIONS: Use is prohibited in people with hypersensitivity to remifentanil and in children less than 12 years of age.

■ ADVERSE EFFECTS: Life-threatening effects are asystole, respiratory depression, and apnea. Other adverse effects include drowsiness, confusion, sedation, euphoria, delirium, agitation, anxiety, anorexia, constipation, cramps, dry mouth, urinary retention, dysuria, rash, urticaria, bruising, flushing, diaphoresis, pruritus, tinnitus, blurred vision, miosis, diplopia, palpitations, change in blood pressure, facial flushing, syncope, and rigidity. Common side effects are dizziness, headache, nausea, vomiting, and bradycardia.

reminiscence /rem′inis′əns/ [L, *reminisci,* to remember], the recollection of past personal experiences and significant events.

reminiscence therapy^1, a psychotherapeutic technique in which self-esteem and personal satisfaction are restored, particularly in older persons, by encouraging patients to review past experiences of a pleasant nature. It is used in Alzheimer's disease when initially long-term memory stores are more intact than short-term and in other forms of dementia.

reminiscence therapy^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as using the recall of past events, feelings, and thoughts to facilitate pleasure, quality of life, or adaptation to present circumstances. See also **Nursing Interventions Classification.**

remission /rimish′ən/ [L, *remittere,* to abate], the partial or complete disappearance of the clinical and subjective characteristics of a chronic or malignant disease. Remission may be spontaneous or the result of therapy. In some cases remission is permanent, and the disease is cured. Compare **cure.**

remittent fever /rimit′ənt/ [L, *remittere* + *febris,* fever], diurnal variations of an elevated temperature with exacerbations and remissions but never a return to normal.

remnant radiation /rem′nənt/ [L, *remanere,* to remain], the radiation that passes through an object and can produce an image on an x-ray film.

remodeling /rēmod′əling/ [L, *re* + *modus,* to copy again], the process of changing a body part or area, as in reconstructive surgery.

remote afterloading /rimōt′/ [L, *removere,* to remove], a radiotherapy technique in which an applicator, such as an acrylic mold of an area to be irradiated, is placed in or on the patient and then loaded from a safe source with a high-activity radioisotope. The applicator contains grooves for the insertion of nylon tubes into which the radioactive material can be introduced. Remote afterloading is used in the treatment of head, neck, vaginal, and cervical tumors. See also **afterloading.**

remotivation /rē′mōtivā′shən/ [L, *re* + *motus,* movement], the use of special techniques that stimulate patients to become motivated to learn and interact.

remotivation group, a treatment group that is organized with the purpose of stimulating the interest, awareness, and communication of withdrawn and institutionalized mental patients.

removable lingual arch /rimo͞o′vəbəl/ [L, *removere,* to remove], an orthodontic arch wire designed to fit the lingual surface of the teeth and aid their orthodontic movement. Two posts soldered to each end of the wire fit snugly into the vertical tubes of molar anchor bands.

removable orthodontic appliance, a device placed inside the mouth to correct or alleviate malocclusion and designed to be removed or replaced by the patient.

removable partial denture, a partial denture made so that it can readily be removed from the mouth. See **partial denture.**

removable rigid dressing, a dressing similar to a cast, used to encase the stump of an amputated limb. It is usually applied to permit the fitting of a temporary prosthesis so that ambulation can begin soon after surgery.

ren-, prefix meaning "kidney": *renicardiac, reniform, renocortical.*

renal /rē′nəl/ [L, *ren,* kidney], pertaining to the kidney.

renal acidosis [L, *ren,* kidney, *acidus,* sour; Gk, *osis,* condition], an excessive increase in the H^+ ions in body fluids because of impaired kidney function. The acidosis can result from excessive loss of bicarbonate or from the inability to excrete phosphoric and sulfuric acid.

renal adenocarcinoma. See **renal cell carcinoma.**

renal aminoaciduria, aminoaciduria caused by defective transport mechanisms for amino acids in the renal tubules.

renal anemia, anemia occurring as a complication of chronic kidney disease, mainly caused by deficiency of erythropoietin in the blood.

renal angiography, a radiographic examination of the renal artery and associated blood vessels after the injection of a contrast medium.

renal anuria. See **anuria.**

renal artery, one of a pair of large, visceral branches of the abdominal aorta, arising inferior to the superior mesenteric artery at the level of the disk between the first and second lumbar vertebrae. The left renal artery is somewhat more superior than the right. Before reaching the kidney, each divides into four branches. The renal arteries supply the kidneys, suprarenal glands, and the ureters.

renal biopsy, the removal of kidney tissue for microscopic examination. It is conducted to establish the diagnosis of a renal disorder and to aid in determining the stage of the disease, the appropriate therapy, and the prognosis. An open biopsy involves an incision, permits better visualization of the kidney, and carries a lower risk of hemorrhage. A closed or percutaneous biopsy performed by aspirating a specimen of tissue with a needle requires a shorter period of recovery and is less likely to cause infection. Contraindications to percutaneous biopsy include bleeding disorders, uncontrolled hypertension, and presence of a single kidney.

■ METHOD: Before biopsy, the procedure is explained and the patient is medically evaluated and tested for bleeding or coagulation time. Aspirin or coumadin therapy is discontinued for a period of time determined by the physician. Informed consent is obtained. The patient's blood is usually typed and crossmatched with two units of donor blood that are held for a possible transfusion until there is no threat of bleeding after the procedure. An open biopsy is generally carried out in the operating room, but the percutaneous procedure may be performed in the radiology department or the patient's room. The location of the kidney, determined by a plain x-ray film, dye contrast study, or fluoroscopic or ultrasound examination, is marked on the patient's skin in ink for a needle biopsy. The patient is then placed prone over a sandbag and soft pillow with the body bent at the level of the diaphragm, the shoulders on the bed, and the spine in straight alignment. A local anesthetic is injected, and the physician inserts the biopsy needle in the lower pole of the kidney, because this area contains the smallest number of large renal vessels. The needle is quickly withdrawn, and, after pressure is applied to the site for 30 to 60 minutes, a pressure bandage is applied. The patient is turned and kept supine and motionless for the next 4 hours. The dressing, blood pressure, and pulse are checked every 5 to 10 minutes for the first hour, then at frequency determined by institutional protocols. Excessive drainage, decreased blood pressure, tachycardia, or elevated temperature is reported to the physician. Fluids are forced to the maximum allotted for the patient's condition. The amount and character of urinary output are noted, and the physician is informed if hematuria occurs. The patient is kept in bed for at least 24 hours and is cautioned not to lift any heavy objects for 10 days or to take any anticoagulants until the physician gives permission.

■ INTERVENTIONS: The nurse offers an explanation of the procedure, prepares and positions the patient for the percutaneous procedure, and, on its completion, provides care and emotional support.

■ OUTCOME CRITERIA: A biopsy is the most accurate measure for determining the nature and stage of a renal pathological condition.

renal calculus, a concretion occurring in the kidney. If the stone is large enough to block the ureter and stop the flow of urine from the kidney, it must be removed by either major surgical or radiological fluoroscopy procedures. Also called **kidney stone, nephritic calculus, nephrolith.** See also **nephroscope.**

renal calyx, the first unit in the system of ducts in the kidney carrying urine from the renal pyramid of the medulla to the renal pelvis for excretion through the ureters. There are two divisions: the **minor renal calyx,** with several others, drains into a larger **major renal calyx,** which in turn joins other major calyces to form the renal pelvis.

renal capsule [L, *ren,* kidney, *capsula,* little box], the investing tissue around the kidney, divided into the fibrous renal capsule and the adipose renal capsule.

renal cast, a cast formed from gelled protein precipitated in the renal tubules and molded to the tubular lumen. Pieces of these casts break off and are washed out with the urine. Types named for their constituent material include epithelial, granular, hyaline, and waxy casts. In renal disease, casts may be seen containing red or white blood cells. Also called **urinary cast.**

renal cell carcinoma, a malignant neoplasm of the kidney. Also called **adenocarcinoma of the kidney, clear cell carcinoma of the kidney.** See also **kidney cancer, Wilms' tumor.**

renal colic, sharp, severe pain in the lower back over the kidney, radiating forward into the groin. Renal colic usually accompanies forcible dilation of a ureter, followed by spasm as a stone is lodged or passed through it. See also **urinary calculus.**

renal corpuscle. See **malpighian corpuscle.**

renal cortex, the highly vascularized granular outer layer of the kidney, containing approximately 1.25 million glomeruli and convoluted tubules, which filter body wastes from the blood, reclaim useful materials, and dispose of the remainder as urine.

renal cortical necrosis, necrosis of the renal cortex caused by ischemia, often following acute tubular necrosis. It is usually seen as a complication of an obstetric condition such as abruptio placentae, septic abortion, preeclampsia, retained fetus, or amniotic fluid embolism.

renal diabetes mellitus. See **renal glycosuria.**

renal dialysis [L, *ren,* kidney; Gk, *dia,* + *lysis,* loosening], a process of diffusing blood across a semipermeable membrane to remove substances that a normal kidney would eliminate, including poisons, drugs, urea, uric acid, and creatinine. Renal dialysis may restore electrolytes and acid-base imbalances. See also **continuous ambulatory peritoneal dialysis, hemodialysis.**

renal diet, a diet prescribed in chronic renal failure and designed to control intake of protein, potassium, sodium, phosphorus, and fluids, depending on individual conditions. Carbohydrates and fats are the principal sources of energy. Protein is limited; the amount is determined by the patient's condition and is usually supplied from milk, eggs, and meat. Cereals, bread, rice, and pasta are the primary sources of calories. Some vegetables and fruits are included, depending on the degree of restriction of potassium and phosphorus. Special commercial flours and breads have been developed that are protein-free and low in potassium and sodium. The low potassium level of the diet also makes it useful in hyperkalemia. The diet may be nutritionally inadequate and should be supplemented with vitamins and electrolytes. See also **Giordano-Giovannetti diet.**

renal dwarf, a dwarf whose retarded growth is caused by renal failure.

renal failure, inability of the kidneys to excrete wastes, concentrate urine, and conserve electrolytes. The condition may be acute or chronic. **Acute renal failure** is characterized by oliguria and the rapid accumulation of nitrogenous wastes in the blood (azotemia). It results from hemorrhage, trauma, burn, toxic injury to the kidney, acute pyelonephritis or glomerulonephritis, or lower urinary tract obstruction. Many forms of acute renal failure are reversible after the underlying cause has been identified. Acute renal failure may have three typical phases: prodromal, oliguric, and postoliguric. Treatment includes restricted intake of fluids and of all substances that require excretion by the kidney. Antibiotics and diuretics are also used.

Chronic renal failure may result from many other diseases. The early signs include sluggishness, fatigue, and mental dullness. Later, anuria, convulsions, GI bleeding, malnutrition, and various neuropathies may occur. The skin may turn yellow-brown. Congestive heart failure and hypertension are frequent complications, the results of hypervolemia. Urinalysis reveals greater than normal amounts of urea and creatinine, waxy casts, and a constant volume of urine regardless of variations in water intake. Anemia frequently occurs. The prognosis depends on the underlying cause. Treatment usually includes restricted water and protein intake and the use of diuretics. When medical measures have been exhausted, long-term hemodialysis or peritoneal dialysis is often begun, and kidney transplantation is considered. See also **acute tubular necrosis.**

renal failure index (RFI), an assessment of acute renal failure that compares the sodium clearance with the creatinine clearance: RFI lm= U_{Na} U_{Cr}/P_{Cr}, where P_{Cr} lm= plasma concentration of creatinine, U_{Cr} lm= urinary concentration of creatinine, and U_{Na} lm= urinary concentration of sodium. A value below 1.0 indicates renal failure because of prerenal azotemia, and a value above 2.0 suggests that it is caused by acute tubular necrosis.

renal fascia, a membranous condensation of extraperitoneal fascia that encloses the perirenal fat surrounding the kidney.

renal fat. See **adipose capsule.**

renal glycosuria [L, *ren,* kidney; Gk, *glykys,* sweet, *ouron,* urine], a familial condition characterized by lowered renal threshold to sugar. Blood glucose levels may be normal, although sugar is excreted in the urine. Also called **renal diabetes mellitus.**

renal hematuria [L, *ren,* kidney; Gk, *haima,* blood, *ouron,* urine], presence of blood in the urine because of a kidney disorder.

renal hypercalciuria, hypercalciuria caused by primary renal wasting of calcium, which stimulates production of parathyroid hormone to increase calcium resorption in the intestine. This type is not linked to formation of renal calculi.

renal hypertension, hypertension resulting from aortic or renal artery atherosclerosis or from kidney disease, including chronic glomerulonephritis, chronic pyelonephritis, renal carcinoma, and renal calculi. Analgesic abuse and certain drug reactions may also result in renal hypertension. Therapy depends on the cause and may include antibiotics, diuretics, or surgery. Untreated renal hypertension is likely to result in kidney damage and cardiovascular disease.

renal insufficiency [L, *ren,* kidney, *in* + *sufficere,* to suffice], partial kidney function failure characterized by less than normal urine excretion.

renal lithiasis. See **nephrolithiasis.**

renal nanism, dwarfism associated with infantile renal osteodystrophy.

renal osteodystrophy, a condition resulting from chronic renal failure and characterized by uneven bone growth and demineralization. See also **renal nanism, renal rickets.**

renal papilla. See **papilla.**

renal parenchyma, the functional tissue of the kidney, consisting of the nephrons.

renal pelvis [L, *ren* + *pelvis,* basin], a funnel-shaped dilation that drains urine from the kidney into the ureter.

renal plasma flow (RPF), the amount of plasma that perfuses the kidneys per unit time. Approximately 90% of the total constitutes the *effective renal plasma flow,* the portion that perfuses functional renal tissue, such as the glomeruli.

renal pseudotumor, any mass in the kidney that is normal tissue but mimics something abnormal, such as in Bertin's column hypertrophy or a dromedary hump.

renal pyramid [L, *ren,* kidney; Gk, *pyramis*], any one of several conical masses of tissue that form the kidney medulla. The base of each pyramid adjoins the kidney's cortex; the apex terminates at a renal calyx. The pyramids consist of the loops of Henle and the collecting tubules of the nephrons.

renal replacement lipomatosis, asymmetric fatty change in the kidney where renal parenchyma has become replaced by fatty tissue, such as with an infection or presence of a calculus. Symptoms include decreased renal function with inflammation, pain, pyuria, and sometimes pyelonephritis.

renal revascularization, surgical correction of occlusion of a renal artery through a technique such as renal artery endarterectomy or one of the bypass procedures.

renal rickets, a condition characterized by rachitic changes in the skeleton and caused by chronic nephritis. See also **renal osteodystrophy.**

renal scan, a radiographic scan of the kidneys performed after the IV injection of a radioactive substance. It is used to assess renal perfusion and function, particularly in renal failure and renovascular hypertension and following kidney transplantation.

renal sclerosis [L, *ren,* kidney; Gk, *skerosis,* hardening], arteriosclerosis or fibrosis of the arterioles of the kidney. See also **nephroangiosclerosis.**

renal sinus cyst, a cyst in a renal sinus, usually derived from aberrant lymphatic vessels, occurring either alone or in groups. Most appear after the fifth decade of life in association with inflammation, obstruction, or a calculus. They may be asymptomatic or may expand to cause pelvic compression and local deformity with pain, hematuria, infection, and pyuria.

renal sinus lipomatosis, increased fat in the renal sinuses. A symmetric, usually asymptomatic, increase is seen in obesity, steroid therapy, and the atrophy that accompanies the aging process. An asymmetric increase known as **renal replacement lipomatosis,** which can have severe symptoms, occurs when infection destroys part of the renal parenchyma.

renal transplantation [L, *ren,* kidney, *transplantare*], the surgical transfer of a complete kidney from a donor to a recipient.

renal tuberculosis, disease of the kidney caused by *Mycobacterium tuberculosis,* usually from bacillemia in cases of pulmonary tuberculosis. Pathological changes include granulomatous inflammation and caseous necrosis of kidney tissue. Also called *nephrotuberculosis.*

renal tubular acidosis (RTA), an abnormal condition associated with persistent dehydration, metabolic acidosis, hypokalemia, hyperchloremia, and nephrocalcinosis. It is caused by the kidney's inability to conserve bicarbonate and to adequately acidify the urine. Some forms of RTA are more prevalent in women, older children, and young adults. Prolonged RTA can cause hypercalciuria and the formation of kidney stones. Prognosis depends on treatment and the extent of renal damage but is usually good. Compare **distal renal tubular acidosis, ketoacidosis, metabolic acidosis, proximal renal tubular acidosis, respiratory acidosis.**

■ OBSERVATIONS: Common signs and symptoms of RTA, especially in children, include anorexia, vomiting, constipation, retarded growth, excessive urination, nephrocalcinosis, and rickets. RTA can also cause urinary tract infections and pyelonephritis. Confirming diagnosis of distal RTA is based on laboratory tests that show impaired urine acidification in association with systemic metabolic acidosis. Confirming diagnosis of proximal RTA is based on tests that show bicarbonate wasting as a result of impaired reabsorption. Other significant laboratory findings may include decreased sodium bicarbonate, pH, potassium, and phosphorus; increased serum chloride, alkaline phosphatase, urinary bicarbonate, and potassium; and urine with low specific gravity.

■ INTERVENTIONS: Treatment includes the replacement of excessively secreted substances, especially bicarbonate, and may include the administration of sodium bicarbonate tablets, potassium, vitamin D to preserve calcium metabolism, and antibiotics to counter pyelonephritis. Surgery may be required to remove renal calculi.

■ NURSING CONSIDERATIONS: The nurse carefully monitors the results of altered laboratory tests, especially those involving potassium levels and urine pH. The patient's urine is strained to capture any kidney stones for analysis, and the nurse is alert to any signs of hematuria. A patient with a low potassium level is usually advised to eat potassium-rich foods such as bananas, oranges, and baked potatoes. The patient and family are encouraged to seek genetic counseling and RTA screening.

renal tubule [L, *ren,* kidney, *tubulus,* small tube], the part of the kidney's nephron that leads from the glomerulus to the collecting tubules. It consists of a looping segment and two convoluted sections. These canals resorb selected materials back into the blood and secrete, collect, and conduct urine.

renal vein renin assay, a blood test used to diagnose renovascular hypertension. It is helpful in determining whether a stenosis seen on a renal angiogram is significantly contributing to hypertension.

Rendu-Osler-Weber syndrome. See **hereditary hemorrhagic telangiectasia.**

Renese, a trademark for a thiazide diuretic **(polythiazide).**

renin /rē′nin/ [L, *ren,* kidney], a renal proteolytic enzyme, produced by and stored in the juxtaglomerular apparatus that surrounds each arteriole as it enters a glomerulus. The enzyme affects the blood pressure by catalyzing the change of angiotensinogen to angiotensin I, which is then converted to angiotensin II, strong pressor. Normal findings of adult plasma renin, measured in an upright position and sodium depleted, are 2.9 to 10.8 ng/mL/hr. Compare **rennin.**

renin-angiotensin system, the regulation of sodium balance, fluid volume, and blood pressure. In response to reduced perfusion, renin is secreted, which hydrolyzes a plasma globulin to release angiotensin I, which is rapidly hydrolyzed to angiotensin II, a powerful vasoconstrictor; angiotension II also stimulates aldosterone secretion, which causes sodium retention, an increase in blood pressure, and restoration of renal perfusion, which shuts off the signal for renin release (negative feedback). Angiotensin-converting enzyme also deactivates bradykinin, a vasodilator. Also called *renin-angiotensin-aldosterone system.*

renin test. See **plasma renin activity.**

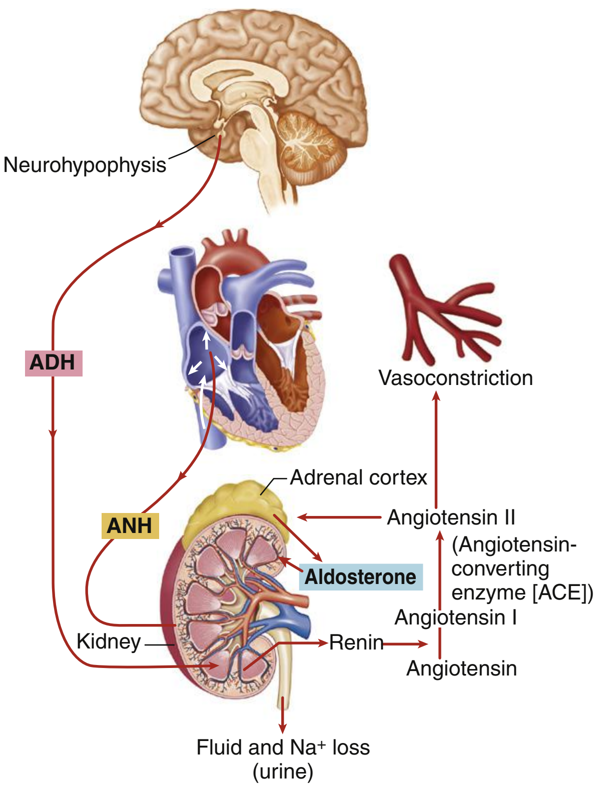
rennin /ren′in/ [ME, *rennen,* to run], a milk-curdling enzyme that occurs in the gastric juices of infants and is also contained in the rennet produced in the stomach of calves and other ruminants. It is an endopeptidase that converts casein to paracasein and was formerly used extensively as a curdling agent by the cheese industry. An artificially produced microbial rennet rather than the enzyme extracted from rennet in calves is used in half of the cheese produced in the United States today. Also called **chymosin.** Compare **renin.**

renogram /rē′nəgram/, a radiographic image resulting from a renal scan.

-renone, suffix for spironolactone-type aldosterone antagonists.

renoprotective /re′no-pro-tek′tiv/, protecting the kidney against harmful effects, such as of a drug or other chemical.

Renshaw cells /ren′shô/ [B. Renshaw, American neurologist, 1911–1948; L, *cella,* storeroom], small cells that reduce motor neuron discharge through a feedback circuit involving axon collaterals that excite interneurons. The system prevents rapid repeated firing of motor neurons.



Renin-angiotensin system *(Patton and Thibodeau, 2010)*

ReoPro, a trademark for a preparation of an antithrombotic agent **(abciximab).**

reovirus /rē′ōvī′rəs/ [*r*espiratory *e*nteric *o*rphan + L, *virus*], any one of three ubiquitous, double-stranded ribonucleic acid viruses found in the respiratory and alimentary tracts of both healthy and sick people. Reoviruses have been implicated in some cases of upper respiratory tract disease and infantile gastroenteritis.

repaglinide, an antidiabetic.

■ INDICATION: It is used to treat stable type 2 diabetes mellitus.

■ CONTRAINDICATIONS: Known hypersensitivity to meglitinides, diabetic ketoacidosis, and type 1 diabetes mellitus prohibit its use.

■ ADVERSE EFFECTS: Hypoglycemia is a life-threatening effect. Other adverse effects include paresthesia, nausea, vomiting, diarrhea, constipation, dyspepsia, rash, allergic reactions, back pain, arthralgia, upper respiratory infection, sinusitis, rhinitis, and bronchitis. Headache and weakness are common side effects.

repeat /rĕ-pēt′/, something done or occurring more than once, particularly over and over.

repercussion /rē′pərkush′ən/ [L, *repercussio,* rebounding], **1.** (in obstetrics) ballottement. **2.** being driven back by a powerful resistance. **3.** the reduction of a swelling or tumor.

reperfusion /rē′pərfyo͞o′zhən/, blocked arteries are opened to reestablish blood flow. It may be accomplished through thrombolytic therapy or percutaneous transluminal angioplasty.

repetition compulsion /rep′ətish′ən/ [L, *repetere,* to repeat], an unconscious need to revert to and repeat earlier situations, behavior patterns, and acts to experience previously felt emotions or relationships. See also **compulsion.**

repetition time (TR), in magnetic resonance pulse sequences, the time interval before the basic pulse sequence is repeated.

repetitive stress injury /ripetʹətiv/, tissue damage associated with tasks that require repeated movements of the hands, legs, or trunk, such as meat cutting, computer keyboarding, or playing musical instruments. Effects include chronic nerve and joint pain, spine damage, and carpal tunnel syndrome. Among recommended preventive measures are frequent rest breaks and ergonomic improvements for the workplace.

replacement /riplāsʹmənt/ [Fr, *replacer,* to put in place again], the substitution of a missing part or substance with a similar structure or substance, such as the replacement of an amputated limb with a prosthesis or the replacement of lost blood with donor blood.

replacement therapy, **1.** the use of a medicinal product to replace a natural hormone or enzyme that the body is no longer able to produce in sufficient amounts. **2.** a psychotherapeutic technique of replacing abnormal behavior with healthy, constructive activities.

replication /repʹlikāʹshən/ [L, *replicare,* to fold back], **1.** a process of duplicating, reproducing, or copying; literally, a folding back of a part to form a duplicate. **2.** (in research) the exact repetition of an experiment, performed to confirm the initial findings. **3.** (in genetics) the duplication of the polynucleotide strands of DNA or the synthesis of DNA. The process involves the unwinding of the double helix molecule to form two single strands, each of which acts as a template for the synthesis of a complementary strand. The two resulting molecules of DNA each contain one new and one parental strand, which coil to form the double helix. **—replicate,** *v.*

replicator /repʹlikāʹtər/ [L, *replicare*], a segment of DNA that initiates and controls the replication of the molecule.

replicon /repʹləkon/ [L, *replicare*], a segment of DNA that is undergoing replication. It is regulated by a section of the molecule called the regulator, which controls replication and coordinates it with cell division.

repolarization /rēpōʹlərīzāʹshən/ [L, *re* + *polus,* pole; Gk, *izein,* to cause], the process by which the membrane potential of a neuron or muscle cell is restored to the cell's resting potential. In a cardiac muscle cell, the repolarization process begins after phase 0 of the action potential and is completed by the end of phase 3. It encompasses the effective and relative refractory periods and correlates with the Q-T interval on the electrocardiogram. See also **cardiac action potential.**

report /ripôrtʹ/ [L, *re* + *portare,* to carry], (in nursing) the transfer of information from the nurses on one shift to the nurses on the following shift or before the transfer of a patient from one unit to another. Report is given systematically at the time of change of shift. The nurse manager, team leader, or primary nurse conducts the report, summarizing the progress and status of each patient for the nurses who will next assume responsibility for the care. The provider of the information is said to "give report," and the oncoming staff to "take report." Report may be given to the assembled oncoming staff, or it may be tape recorded so that staff members can listen to it individually or in a group on their own schedule. The Kardex and medcard of each patient are updated before report, and staff members are informed of the changes during report.

reportable diseases /ripôrʹtəbəl/, diseases that must be reported by the health care provider to public health authorities, given their contagious nature. They include but are not limited to malaria, poliomyelitis, typhus, yellow fever, cholera, bubonic plague, STDs, and AIDS.

repositioning /rēʹpəzishʹəning/ [L, *reponere,* to put back], the restoration of an organ or body part to its natural position, as repositioning an inverted uterus or changing the position of the jaws.

representative group /repʹrəsenʹtətiv/, a group of individuals whose members represent all the various sectors of a community.

repression /ripreshʹən/ [L, *reprimere,* to press back], **1.** the act of restraining, inhibiting, or suppressing. **2.** (in psychoanalysis) an unconscious defense mechanism that also underlies all defense mechanisms, whereby unacceptable thoughts, feelings, ideas, impulses, or memories, especially those concerning some traumatic past event, are pushed from the consciousness because of their painful guilt association or disagreeable content and are submerged in the unconscious, where they remain dormant but operant. Such repressed emotional conflicts are the source of anxiety that may lead to any of the anxiety disorders. Compare **suppression. —repress,** *v.,* **repressive,** *adj.*

repressive-inspirational approach /ripresʹiv/, a psychotherapeutic approach used in some groups to discourage the breaking down of defense mechanisms. Members are encouraged to focus on positive feelings and group strengths. This approach is commonly used in groups of patients with chronic mental illness.

repressor /ripresʹər/ [L, *reprimere,* to press back], a protein produced by a regulator gene in a bacterial genome. It binds to a sequence of nucleotides in an operator gene, blocking the transcription of one or more structural genes.

repressor gene. See **regulator gene.**

reproduction /rēʹprədukʹshən/ [L, *re* + *producere,* to produce], **1.** the sum of the cellular and genetic phenomena by which organisms produce offspring similar to themselves so that the species is perpetuated. In humans the germ cells, spermatozoa in the male and ova in the female, unite during fertilization to form the new individual. Kinds of reproduction include **asexual reproduction, cytogenic reproduction,** and **sexual reproduction. 2.** the creation of a similar structure, situation, or phenomenon; duplication; replication. **3.** the recalling of a former idea or impression or of something previously learned. **—reproductive,** *adj.*

reproductive /rēʹprədukʹtiv/ [L, *re* + *producere,* to produce], pertaining to the process of reproduction.

reproductive endocrinology, the study of the maternal female hormone system, including the activities of the hypothalamus, pituitary, and ovaries from puberty through menopause.

reproductive system, the male and female gonads, associated ducts and glands, and external genitalia that function in the procreation of offspring. In women these include the ovaries, fallopian tubes, uterus, vagina, clitoris, and vulva. In men they include the testes, epididymis, vas deferens, seminal vesicles, ejaculatory duct, prostate, and penis. Also called **genital tract, genitourinary system, urogenital system.**

reproductive technology management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a patient through the steps of complex infertility treatment. See also **Nursing Interventions Classification.**

repulsion /ripulʹshən/ [L, *repellere,* to drive away], **1.** the act of repelling, disjoining. **2.** a force that separates two bodies or things. **3.** (in genetics) the situation in linked inheritance in which the alleles of two or more mutant genes are located on homologous chromosomes so that each chromosome of the pair carries one or more mutant and wild-type genes, which are located close enough to be inherited together. Compare **coupling.** See also **trans configuration.**

request for proposal (RFP) /rikwest′/ [L, *requaerere,* to require, *propronere,* to propound], a solicitation by a funding agency for proposals to accomplish a particular goal. The RFP lists the requirements a project must meet to receive funding.

required arch length /rikwī′ərd/ [L, *requaerere,* to require], the sum of the mesiodistal widths of all the natural teeth in a dental arch. It represents the minimum arch length that can accommodate all of the teeth in the arch.

RES, abbreviation for **reticuloendothelial system.**

Rescriptor, a trademark for an antiretoviral nonnucleoside reverse transcriptase inhibitor (delaviridine).

Rescue Remedy, a trademark for a Bach remedy composed of the essences of five flowers (cherry plum, clematis, impatiens, rock rose, and star of Bethlehem) used for the acute treatment of stress.

research /risurch′, rē′surch/ [Fr, *rechercher,* to investigate], the diligent inquiry or examination of data, reports, and observations in a search for facts or principles.

research data collection, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collecting research data. See also **Nursing Interventions Classification.**

research hypothesis, a statement created to predict the outcome of a study. See **predictive hypothesis.**

research instrument, a testing device for measuring a given phenomenon, such as a paper and pencil test, a questionnaire, an interview, a research tool, or a set of guidelines for observation.

research measurement, an evaluation of the quantity or incidence of a given variable obtained by using a research instrument.

research radiopharmaceutical, a drug that is labeled with a small quantity of a radioactive tracer to allow its biodistribution to be studied. It may later be used in a nonradioactive form.

resection /risek′shən/, the excision of a significant part of an organ or structure. Resection of an organ may be partial or complete. One type of resection is a **wedge resection.** **—resect,** *v.*

reserpine /res′ərpēn/, a depleter of biogenic amines (e.g., norepinephrine, dopamine) from nerve terminals.

■ INDICATIONS: It is prescribed in the treatment of mild to moderate high blood pressure and has unlabeled uses for tardive dyskinesia and certain neuropsychiatric disorders.

■ CONTRAINDICATIONS: Mental depression, peptic ulcer, ulcerative colitis, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are mental depression, extrapyramidal effects, impotence, aggravation of peptic ulcer, and paradoxical excitement.

reserve /rizurv′/ [L, *reservare,* to save], a potential capacity to maintain vital body functions in homeostasis by adjusting to increased need, such as cardiac reserve, pulmonary reserve, and alkali reserve. See also **homeostasis.**

reserve capacity [L, *reservare,* to save; Gk, *aer*], the volume of air that can be exhaled with maximum effort after completion of a normal expiration. Also called *reserve air,* **supplemental air.**

reserve cell carcinoma. See **oat cell carcinoma.**

reservoir /rez′ərvwär/ [Fr, réservoir], a chamber or receptacle for holding or storing a fluid.

reservoir bag, a component of an anesthesia machine in which gas accumulates, forming a reserve supply of gas for use during manual control of ventilation. It serves as a visible monitor of respiratory rate and depth.

reservoir host, a nonhuman host that serves as a means of sustaining an infectious organism as a potential source of human infection. Wild monkeys are reservoir hosts for the yellow fever virus, which can spread from the jungle to infect humans.

reservoir of infection, a continuous source of infectious disease. People, animals, and plants may be reservoirs of infection.

resident /rez′idənt/ [L, *residere,* to remain], **1.** a physician in one of the postgraduate years of clinical training after the first, or internship, year. The length of residency varies according to the specialty. See also **PGY.** **2.** a person who receives inpatient care in a long-term care facility.

resident bacteria, bacteria living in a specific area of the body.

residential care facility /rez′iden′shəl/, a facility that provides custodial care to persons who, because of physical, mental, or emotional disorders, are not able to live independently.

residual /rizij′o͞o·əl/ [L, *residuum,* remainder], **1.** *adj,* pertaining to the part of something that remains after an activity that removes the bulk of the substance. **2.** *n,* (in psychology), an aftereffect of an experience that influences latent behavior.

residual air. See **residual volume.**

residual cyst, an odontogenic cyst that remains in the jaw after the removal of a tooth or by incomplete removal of all cystic material from the cystic area.

residual dental caries, any decayed material remaining in a prepared tooth cavity.

residual function [L, *residuum,* remainder, *functio,* performance], the remaining ability to function after a serious illness or injury.

residual limb, the portion of a limb remaining after an amputation.

residual ridge, the part of the alveolar ridge that remains after the alveolar process has disappeared after extraction of the teeth.

residual schizophrenia [L, *residuum*], a form of schizophrenia in which the essential features of delusions, hallucinations, incoherence, or gross disorganization are much less prominent. See also **schizophrenia.**

residual urine, urine that remains in the bladder after urination.

residual volume (RV) [L, *residuum,* remainder, *volumen,* papyrus roll], the amount of air remaining in the lungs at the end of a maximum expiration.

residue-free diet /rez′id(y)o͞o/ [L, *residuum,* remainder; AS, *freo* + Gk, *diaita,* way of life], a diet free of nondigestible cellulose or fiber, such as found in semisolid bland food.

resilience /rizil′yəns/ [L, *resilere,* to spring back], **1.** a concept that proposes a recurrent human need to weather periods of stress and change successfully throughout life. The ability to weather each period of disruption and reintegration leaves the person better able to deal with the next change. **2.** the ability of a body to return to its original form after being stretched or compressed.

resiliency promotion, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting individuals, families, and communities in development, use, and strengthening of protective factors to be used in coping with environmental and societal stressors. See also **Nursing Interventions Classification.**

resin /rez′in/ [L, *resina*], **1.** a mixture of carboxylic acids, essential oils, and terpenes (hydrocarbons of the formula $C_{10}H_{16}$), occurring as exudations on various trees and shrubs or produced synthetically. Resins are highly combustible semisolids or amorphous solids that are insoluble in water, although some are soluble in ethanol and others in carbon tetrachloride, ether, and volatile oils. Most are soft and sticky but harden after exposure to cold. **2.** any of a variety of solid or semisolid amorphous substances that are insoluble in organic solvents but not in water. Orally administered bile-acid binding resins such as cholestyramine and colestipol interrupt the normal enterohepatic circulation of bile acids and increase their excretion in the stool. Since bile acids are synthesized by the liver from cholesterol, the liver extracts more LDL cholesterol from the plasma to replace them, and, as a consequence, circulating levels of LDL cholesterol decrease.

res ipsa loquitur /rās′ ip′sə lok′wito͝or/ [L, the thing speaks for itself], a legal concept, important in many malpractice suits, describing a situation in which an injury occurred when the defendant was solely and exclusively in control and in which the injury would not have occurred had due care been exercised. Classic examples of res ipsa loquitur are a sponge left in the abdomen after abdominal surgery or the amputation of the wrong extremity.

resistance /rizis′təns/ [L, *resistere,* to withstand], **1.** an opposition to a force, such as the resistance offered by the constriction of peripheral vessels to the blood flow in the circulatory system. **2.** the frictional force that opposes the flow of an electric charge, as measured in ohms. **3.** (in respiratory therapy) the process or power of acting against a force placed on it, pertaining to thoracic resistance, tissue resistance, and airway resistance.

resistance form, the shape given to a prepared tooth cavity imparting strength and durability to the masticatory dislodging forces of a dental restoration and remaining tooth structure.

resistance-inducing factor (RIF), an agent that interferes with multiplication of a virus or other pathogen.

resistance-inducing factor test. See **Rubin's test.**

resistance to flow, the pressure differential required to produce a given rate of flow of a gas or liquid through a vessel.

resistance training, any method or form of strength training used to resist, overcome, or bear force.

resistance transfer factor. See **R factor.**

resistance vessels, the blood vessels, including small arteries, arterioles, and metarterioles that form the major part of the total peripheral resistance to blood flow.

resistant /rizis′tənt/, pertaining to the ability of a microorganism to remain unaffected by an antimicrobial agent.

resistive magnet /resis′tiv/, a simple electromagnet in which electricity passing through coils of wire produces a magnetic field.

resocialization /rēsō′shəlīzā′shən/ [L, *re* + *socialis,* partners; Gk, *izein,* to cause], the reintegration of a client into family and community life after critical or long-term hospitalization.

resolution (R) [L, *re* + *solvere,* to solve], **1.** the state of having made a firm determination or decision on a course of action. **2.** the ability of an imaging process to distinguish adjacent structures in an object. It is an important measure of image quality. **3.** the ability of a chromatographic system to separate two adjacent peaks. The degree of separation between two peaks is represented by the symbol **R.**

resolving power /rizol′ving/, **1.** the ability to separate closely migrating substances, as in electrophoresis. **2.** the ability to distinguish closely positioned objects as distinct entities.

resolving time, the minimum time between radiation-induced ionizations that can be detected by a Geiger-Müller–type scintillation device.

resonance [L, *vocalis* + *resonare,* to sound again], **1.** an echo or other sound produced by percussion of an organ or cavity of the body during a physical exam. **2.** the process of energy absorption by an object that is tuned to absorb energy of a specific frequency. Other frequencies have no effect. **3.** modification of the laryngeal tone as it passes through the pharynx and oral cavity to produce an increase in the intensity and quality of the sound.

resonance frequency, **1.** in an ultrasound transducer, the frequency for which the response of a transducer to an ultrasound beam is a maximum. **2.** the frequency at which the transducer most efficiently converts electric signals to mechanical vibrations. **3.** (in magnetic resonance) the frequency at which a nucleus absorbs radio energy when placed in a magnetic field.

resonant /rez′ənənt/ [L, *resonare,* to sound again], pertaining to a sound that vibrates on percussion or is amplified by sympathetic vibrations in another medium.

resonating /rez′ənā′ting/ [L, *resonare,* to sound again], pertaining to vibrations or pulsations that are synchronous with a source of sound waves or electromagnetic oscillations.

resorb /risôrb′/ [L, *resorbere,* to swallow again], to absorb again.

resorbent /risôr′bənt/ [L, *resorbere*], a material or agent that is used to absorb blood or other substances.

resorcinated camphor /rizôr′sinā′tid/, a mixture of camphor and resorcinol, used for the treatment of pediculosis and itching.

resorcinol /rizôr′sinol/, an antiseptic substance used as a keratolytic agent in the dermatoses. It is also used in dyes and pharmaceutics and as a chemical intermediate.

resorption /risôrp′shən/ [L, *resorbere,* to swallow again], **1.** the loss of substance or bone by physiological or pathological means, such as the reduction of the volume and size of the residual ridge of the mandible or maxillae. **2.** the cementoclastic and dentinoclastic action that may occur on a tooth root. Also called **external resorption** or **internal resorption.**

resource-based relative value scale (RBRVS), a system for a Medicare fee schedule designed to address the promise of compensation to a physician for the time involved in giving physical and mental status examinations and obtaining patient history from family members.

Respbid, a trademark for a smooth muscle relaxant **(theophylline).**

Res. Phys., abbreviation for *resident physician.*

respiration (R) /res′pirā′shən/ [L, *respirare,* to breathe], **1.** the molecular exchange of oxygen and carbon dioxide within the body's tissues. **2.** also called **breathing, pulmonary ventilation, ventilation,** the process of moving air into and out of the lungs. The rate varies with the age and condition of the person. **—respiratory,** *adj.*

respiration of infants [L, *respirare,* to breathe, *infans,* unable to speak], a rate of breathing that averages 40 to 50 breaths per minute at birth and declines to 15 to 20 breaths per minute at puberty.

respiration rate [L, *respirare,* to breathe, *ratum,* rate], the rate of breathing. It is typically from 40 to 50 breaths per minute for newborns, 20 to 25 breaths per minute for older children, and 12 to 20 breaths per minute for teenagers and adults. An adult rate of 25 breaths per minute may be regarded as accelerated, whereas a rate of less than 12 breaths per minute is abnormally low. The rate may be more rapid in fever, acute pulmonary infection, diffuse pulmonary fibrosis, gas gangrene, left ventricular failure, thyrotoxicosis, and states of tension. Slower breathing rates may result from head injury, coma, or narcotic overdose. Also called **breathing frequency, respiratory rate.** See also **bradypnea, hyperpnea, hypopnea.**

Patterns of respiration

Pattern		*Description*
Normal (eupnea)		Regular and comfortable at a rate of 12-20 breaths per minute
Bradypnea		Slower than 12 breaths per minute
Tachypnea		Faster than 20 breaths per minute
Hyperventilation (hyperpnea)		Faster than 20 breaths per minute, deep breathing
Sighing		Frequently interspersed deeper breath
Air trapping		Increasing difficulty in getting breath out
Cheyne-Stokes		Varying periods of increasing depth interspersed with apnea
Kussmaul		Rapid, deep, labored
Biot		Irregularly interspersed periods of apnea in a disorganized sequence of breaths
Ataxic		Significant disorganization with irregular and varying depths of respiration

From Mosby: *Mosby's PDQ for RN*, ed 2, St Louis, 2008, Mosby.

respirator /res′pirā′tər/ [L, *respirare*], an apparatus used to modify air for inspiration or to improve pulmonary ventilation. The term is commonly used to mean a ventilator. See also **IPPB unit, nebulizer.**

respiratory. See **respiration.**

respiratory acidosis, an abnormal condition characterized by a low plasma pH resulting from reduced alveolar ventilation. The hypoventilation inhibits the excretion of carbon dioxide, which consequently combines with water in the body to produce carbonic acid, thus reducing plasma pH. Respiratory acidosis can result from disorders such as airway obstruction, medullary trauma, neuromuscular disease, chest injury, pneumonia, pulmonary edema, emphysema, and cardiopulmonary arrest. It may also be caused by the suppression of respiratory reflexes with narcotics, sedatives, hypnotics, or anesthetics. Also called **carbon dioxide acidosis.** Compare **metabolic acidosis.** See also **metabolic alkalosis, respiratory alkalosis.**

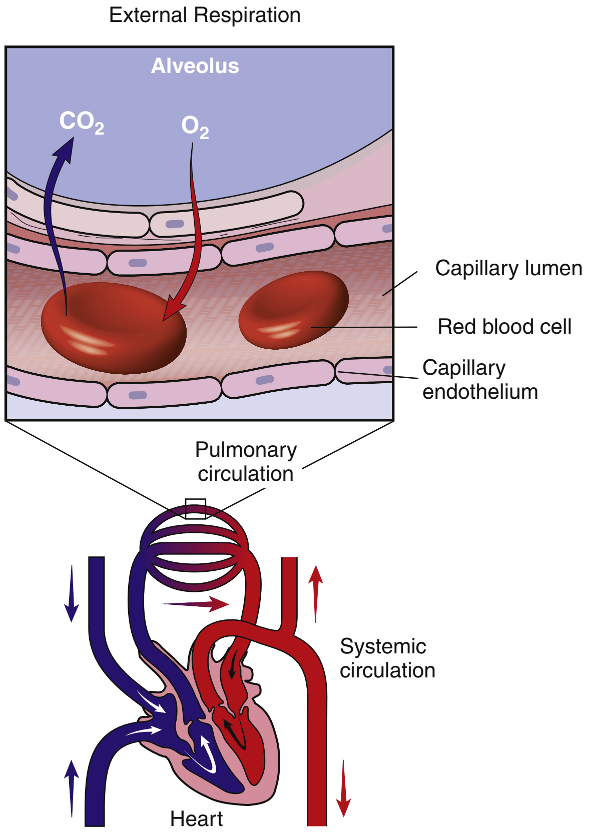
■ OBSERVATIONS: Some common signs and symptoms of respiratory acidosis are headache, dyspnea, fine tremors, tachycardia, hypertension, and vasodilation. Confirming diagnosis is usually based on a $PaCO_2$ over the normal 45 mm Hg and an arterial pH below 7.35.

■ INTERVENTIONS: Ineffective treatment of acute respiratory acidosis can lead to coma and death. Treatment seeks to remove or inhibit the underlying causes of associated hypoventilation. Any airway obstructions are immediately removed. Mechanical ventilation and oxygen therapy may be used, and IV bronchodilators and sodium bicarbonate may be administered.

■ NURSING CONSIDERATIONS: The patient with respiratory acidosis is carefully monitored for any changes in arterial blood gas pressures, electrolyte concentrations, and respiratory, cardiovascular, and central nervous system functions. In patients requiring mechanical ventilation, patent airways are maintained and tracheal tubes are suctioned as needed. Adequate hydration is also important.

respiratory alkalosis, an abnormal condition characterized by a high plasma pH resulting from increased alveolar ventilation. The consequent acceleration of carbon dioxide excretion lowers the plasma level of carbonic acid, thus raising plasma pH. The hyperventilation may be caused by pulmonary and nonpulmonary problems. Some pulmonary causes are acute asthma, pulmonary vascular disease, and pneumonia. Some nonpulmonary causes are aspirin toxicity, anxiety, fever, metabolic acidosis, inflammation of the central nervous system, gram-negative septicemia, and hepatic failure. Compare **metabolic alkalosis.** See also **metabolic acidosis, respiratory acidosis.**

■ OBSERVATIONS: Deep and rapid breathing at rates as high as 40 breaths per minute is a major sign of respiratory



Mechanism of respiration *(Bonewit-West, 2012)*

Assessment of respiration rate
(Elkin, Perry, and Potter, 2007)

alkalosis. Other symptoms are lightheadedness, dizziness, peripheral paresthesia, tingling of the hands and feet, muscle weakness, tetany, and cardiac arrhythmia. Confirming diagnosis is often based on a $PaCO_2$ below 35 mm Hg and a pH greater than 7.45. PaO_2 may be higher than 100. In the acute stage, blood pH rises in proportion to the fall in $PaCO_2$, but in the chronic stage it remains within the normal range of 7.35 to 7.45. The carbonic acid concentration is normal in the acute stage of this condition but below normal in the chronic stage.

■ INTERVENTIONS: Treatment of respiratory alkalosis concentrates on removing the underlying causes. Severe cases, especially those caused by extreme anxiety, may be treated by having the patient breathe into a paper bag and inhale exhaled carbon dioxide to compensate for the deficit being created by hyperventilation. Sedatives may also be administered to decrease the ventilation rate.

■ NURSING CONSIDERATIONS: The nurse monitors neurological, neuromuscular, and cardiovascular functions, arterial blood gases, and serum electrolyte levels. The patient benefits from explanations of laboratory tests and treatment.

respiratory arrest, the cessation of breathing.

respiratory assessment, an evaluation of the condition and function of a person's respiratory system.

■ METHOD: The nurse or other health care provider asks if the person coughs; wheezes; is short of breath; tires easily; or experiences chest or abdominal pain, chills, fever, excessive sweating, dizziness, or swelling of feet and hands. Signs of confusion; anxiety; restlessness; flaring nostrils; cyanotic lips, gums, earlobes, or nails; clubbing of extremities; fever; anorexia; and a tendency to sit upright are noted if present. The person's breathing is closely observed for evidence of slow, rapid, irregular, shallow, or Cheyne-Stokes respiration; hyperventilation; and a long expiratory phase or periods of apnea, as well as for retractions in the suprasternal, supraclavicular, substernal, or intercostal areas during breathing. The presence of tachycardia, bradycardia, or sinus arrhythmia or evidence of congestive heart failure such as crackles, rhonchi, edema, hepatosplenomegaly, abdominal distension, or pain is recorded. The thorax is examined for scoliosis, kyphosis, funnel or barrel chest, or unequal shoulder height and is palpated for indications of thoracic expansion, tracheal deviation, crepitations, or fremitus. Percussion is performed to evaluate resonance, hyperresonance, tympany, and dull or flat sounds. Crackles, rhonchi, wheezing, friction rubs, the transmission of spoken words through the chest wall, and decreased or absent breath sounds are detected by auscultation. Background information pertinent to the evaluation includes allergies, recent exposure to infection, immunizations, exposure to environmental irritants, previous respiratory disorders and operations, preexisting chronic conditions, medication currently taken, the person's smoking habits, and the family history. Valuable diagnostic aids include a chest x-ray examination; complete blood count; electrocardiogram, pulmonary function tests, and bronchoscopy; determination of blood gases and electrolytes; studies of sputum, throat, or nasopharyngeal cultures; gastric washings; lung scans; and biopsies.

■ INTERVENTIONS: The nurse or other health care provider collects the background information and the results of diagnostic tests and may perform the examination. In a respiratory care unit, a registered nurse, staff nurse, nurse clinician, or practitioner may interpret data from electrocardiographic tracings, set up and adjust a respirator, titrate medications, and obtain specimens for blood gas determination.

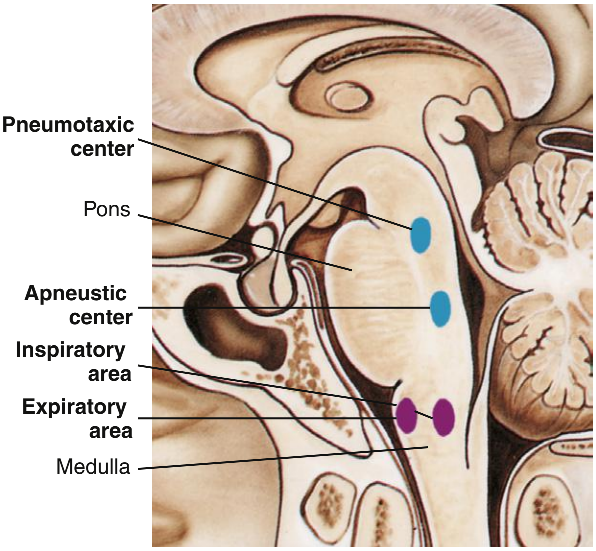
■ OUTCOME CRITERIA: An accurate and thorough assessment of respiratory function is an essential component of the physical examination and is vital to the diagnosis or ongoing care of a respiratory illness.

respiratory bronchiole. See **bronchiole.**

respiratory burn, tissue damage to the respiratory system resulting from the inhalation of a hot gas or burning particles, as may occur in a fire or explosion. Immediate hospitalization and oxygen therapy are recommended. Compare **smoke inhalation.**

respiratory care practitioner, a health professional with special training and experience in the treatment and rehabilitation of patients with respiratory disorders. The respiratory care practitioner typically does not diagnose but must be competent with patient assessment in a variety of clinical settings.

respiratory center, a group of nerve cells in the pons and medulla of the brain that controls the rhythm of breathing in response to changes in levels of oxygen, carbon dioxide, and hydrogen ions in the blood and cerebrospinal fluid. Such changes activate central and peripheral chemoreceptors, which send impulses to the respiratory center, triggering an increase or a decrease in the breathing rate. In patients with retention of carbon dioxide, the respiratory center becomes insensitive to carbon dioxide, and the main stimulus to ventilation is hypoxemia. If such patients inhale air with a high oxygen content, breathing may be depressed, leading to a further rise in blood carbon dioxide levels. The respiratory center is inhibited by barbiturates, anesthetics, tranquilizing agents, and morphine. See also **hyperventilation, hypoventilation, hypoxia.**



Respiratory centers of the brainstem
(Thibodeau and Patton, 2007)

respiratory component (αPCO_2), the acid component of an acid-base control system that is modified by the respiratory status.

respiratory cycle. See **breathing cycle.**

respiratory depressant [L, *respirare,* to breathe, *depremere,* to press down], a drug or other agent that diminishes normal breathing functions. Most respiratory depressants, such as alcohol and opiates, act by depressing the central nervous system.

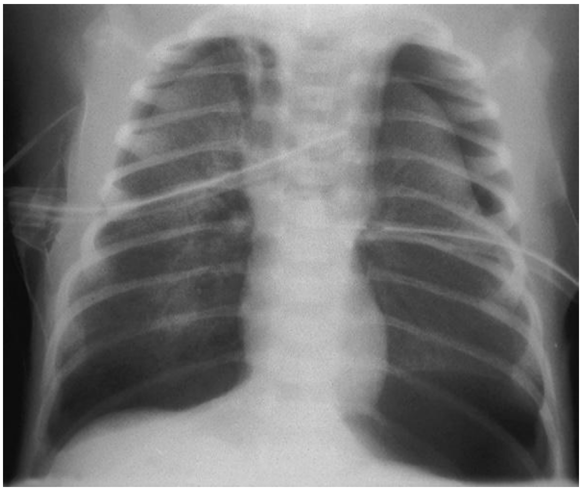
respiratory depression [L, *respirare,* to breathe, *depremere,* to press down], respiration that has a rate below 12 breaths per minute or that fails to provide full ventilation and perfusion of the lungs. Also called **respiratory insufficiency.**

respiratory distress syndrome of the newborn (RDS), an acute lung disease of the newborn, characterized by airless alveoli, inelastic lungs, a respiration rate greater than 60 breaths per minute, nasal flaring, intercostal and subcostal retractions, grunting on expiration, and peripheral edema. The condition occurs most often in premature babies. It is caused by a deficiency of pulmonary surfactant, resulting in overdistended alveoli and at times hyaline membrane formation, alveolar hemorrhage, severe right-to-left shunting of blood, increased pulmonary resistance, decreased cardiac output, and severe hypoxemia. The disease is self-limited; the infant dies in 3 to 5 days or completely recovers with no aftereffects. Treatment includes measures to correct shock, acidosis, and hypoxemia and use of continuous positive airway pressure to prevent alveolar collapse. Also called **hyaline membrane disease, idiopathic respiratory distress syndrome.** Compare **adult respiratory distress syndrome.**

■ OBSERVATIONS: Signs and symptoms usually appear within 6 hours of birth and include rapid respirations, nostril flaring, expiratory grunting, chest retractions, labored breathing, frothing at lips, inspiratory crackles, cyanosis, and weak cry. These manifestations progress to apnea, flaccidity, unresponsiveness, mottling, peripheral edema, oliguria, hypotension, and bradycardia. Diagnosis is made by clinical exam, chest x-rays that display a diffuse granular pattern in bilateral lung fields indicating atelectasis, and bronchograms representing dilated air-filled bronchioles. Pulmonary function studies are run to differentiate a pulmonary from extrapulmonary illness. Blood gases are taken to determine the extent of respiratory function and acid-base imbalances. Possible complications include intraventricular hemorrhage, tension pneumothorax, retinopathy of prematurity, bronchopulmonary dysplasia, apnea, patent ductus arteriosus, congestive heart failure, neurological sequelae, necrotizingal enterocolitis, pneumonia, sepsis, and/or death.

■ INTERVENTIONS: Treatment is largely supportive. Exogenous surfactant is administered as soon as possible after birth and the infant is transported to the intensive care unit. Ventilation is started by continuous positive airway pressure. Warm, humidified oxygen therapy is used. Nutrition is managed by parenteral therapy (nipple and gavage feeding are contraindicated). Continued and aggressive laboratory monitoring of respiratory, circulatory, acid-base, and electrolyte status is performed. Blood transfusions may be necessary to replace blood lost during aggressive monitoring. Preventive measures are instituted with pregnant women by administering betamethasone injections to those mothers 24 to 48 hours before the delivery of any premature infant 24 to 34 weeks in gestation.

■ NURSING CONSIDERATIONS: Acute nursing care is focused on adequate ventilation, oxygenation, maintenance of fluid and nutrition, and prevention of complications. Positioning aids in ventilation; use of blanket rolls and warmers reduces heat loss and lowers oxygen and glucose consumption and metabolic requirements. Careful intake and output, daily weights, and hydration assessments are used to monitor fluids and nutrition. Care clustering helps provide rest between the multiple interventions, such as suctioning, blood sticks, arterial blood gas draws, medication administration, and assessments. Parental support and education about infant treatments and monitoring are necessary. Parents should be educated about the self-limiting nature of the disease. The need for long-term medical follow-up should be stressed to monitor for and detect potential neurological and respiratory sequelae. Nursing also plays a role in the prevention of RDS by assisting pregnant women to maintain careful control of maternal diabetes and by encouraging early and consistent prenatal care.



Respiratory distress syndrome in a newborn
(Adam et al, 2008)

respiratory diverticulum, a pouchlike protrusion from the foregut that gives rise to the trachea, bronchi, and the branches that form the tracheobronchial tree.

respiratory exchange ratio (R), the ratio of the amount of carbon dioxide produced to the amount of oxygen consumed or taken up.

respiratory failure, the inability of the cardiovascular and pulmonary systems to maintain an adequate exchange of oxygen and carbon dioxide in the lungs. Respiratory failure may be caused by a failure in oxygenation or in ventilation. Oxygenation failure is characterized by refractory hypoxemia and occurs in diseases that affect the alveoli or interstitial tissues of the lungs, such as alveolar edema, emphysema, fungal infections, leukemia, lobar pneumonia, lung carcinoma, various pneumoconioses, pulmonary eosinophilia, sarcoidosis, or tuberculosis. Ventilatory failure, characterized by increased arterial tension of carbon dioxide, occurs in acute conditions in which retained pulmonary secretions cause increased airway resistance and decreased lung compliance, as in bronchitis. Ventilation may also be reduced by depression of the respiratory center by barbiturates or opiates, hypoxia, hypercapnia, intracranial diseases, trauma, or lesions of the neuromuscular system or thoracic cage. Respiratory failure in preexisting chronic lung diseases may be precipitated by added stress, as with cardiac failure, surgery, anesthesia, or respiratory tract infections. Treatment of respiratory failure includes clearing the airways by suction, bronchodilators, or tracheostomy or endotracheal tube with ventilator support; antibiotics for infections that are usually present; anticoagulants for pulmonary thromboemboli; and electrolyte replacement in fluid imbalance. Oxygen may be administered in some cases; in others it may further decrease the respiratory reflex by removing the stimulus of a decreased level of oxygen. Chronic respiratory failure may result in cor pulmonale with congestive heart failure and respiratory acidosis. See also **acute respiratory failure, airway obstruction, carbon dioxide, hypercapnia, hyperventilation, hypoxemia, hypoxia, respiratory acidosis.**

respiratory insufficiency. See **respiratory depression.**

respiratory monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collection and analysis of patient data to ensure airway patency and adequate gas exchange. See also **Nursing Interventions Classification.**

respiratory muscles, the muscles that produce volume changes of the thorax during breathing. The inspiratory muscles include the hemidiaphragms, external intercostals, scaleni, sternomastoids, trapezius, pectoralis major, pectoralis minor, subclavius, latissimus dorsi, serratus anterior, and muscles that extend the back. The expiratory muscles are the internal intercostals, the abdominals, and the muscles that flex the back.

respiratory quotient (RQ), the ratio of the volume of carbon dioxide produced to the volume of oxygen consumed per unit of time by the body under steady-state conditions. Depending on the net metabolic needs of all parts of the body at a given moment, the ratio ranges from 0.7 to 1 and averages around 0.8. The RQ varies for different metabolic fuels: the RQ of fat is lower than that of protein, which is lower than that of glucose. Also called **metabolic respiratory quotient.**

respiratory rate. See **respiration rate.**

respiratory rhythm, a regular, oscillating cycle of inspiration and expiration, controlled by neuronal impulses transmitted between the respiratory centers in the brain and the muscles of inspiration in the chest and diaphragm. The normal breathing pattern may be altered by a variety of conditions. See also **apnea, apneustic breathing, Biot's respiration, Cheyne-Stokes respiration, chronic obstructive pulmonary disease, Hering-Breuer reflex, hyperventilation, hypoventilation, Kussmaul breathing, tachypnea.**

respiratory standstill, the cessation of respiratory movements.

respiratory status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as movement of air in and out of the lungs and exchange of carbon dioxide and oxygen at the alveolar level. See also **Nursing Outcomes Classification.**

respiratory status: airway patency, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as open, clear tracheobronchial passages for air exchange. See also **Nursing Outcomes Classification.**

respiratory status: gas exchange, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as alveolar exchange of carbon dioxide and oxygen to maintain arterial blood gas concentrations. See also **Nursing Outcomes Classification.**

respiratory status: ventilation, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as movement of air in and out of the lungs. See also **Nursing Outcomes Classification.**

respiratory syncytial virus (RSV, RS virus), a member of a subgroup of myxoviruses that in tissue culture cause formation of giant cells or syncytia. It is a common cause of epidemics of acute bronchiolitis, bronchopneumonia, and the common cold in young children and sporadic acute bronchitis and mild upper respiratory tract infections in adults. Symptoms of infection with this virus include fever, cough, and severe malaise. The virus occasionally is fatal in infants. Systemic invasion by the virus does not happen, and secondary bacterial invasion is uncommon. Treatment includes rest, high humidity, adequate fluid intake, and, in severe cases, oxygen and ribavirin aerosol. Compare **rhinovirus.** See also **bronchiolitis, bronchitis, bronchopneumonia, cold.**

respiratory syncytial virus immune globulin (RSV-IGIV), an immune serum.

■ INDICATIONS: It is used in children less than 2 years of age with bronchopulmonary dysplasia or in those born prematurely to prevent serious lower respiratory tract infection caused by respiratory syncytial virus.

■ CONTRAINDICATIONS: Factors that prohibit its use are hypersensitivity to this drug or to other human immunoglobulin preparations and IgA deficiency.

■ ADVERSE EFFECTS: Life-threatening effects are respiratory distress, hypoxia, anaphylaxis, and angioneurotic edema. Other adverse effects are tachypnea, rales, wheezing, fever, hypertension, tachycardia, fluid overload, diarrhea, gastroenteritis, vomiting, rash, overdose effect, and inflammation at the injection site.

respiratory syncytial virus immune globulin intravenous, a preparation of immunoglobulin G from pooled adult human plasma selected for high titers of antibodies against respiratory syncytial virus. It is used for passive immunization of infants and children less than 24 months of age, administered by IV infusion.

respiratory system. See **respiratory tract.**

respiratory therapist, a graduate of a program approved by the Commission on Accreditation of Allied Health Education Programs, designed to qualify the person for the registry examination of the National Board for Respiratory Care. See also **registered respiratory therapist.**

respiratory therapy (RT), **1.** any treatment that maintains or improves the ventilatory function of the respiratory tract. **2.** *(informal)* the department in a health care facility that provides respiratory therapy for the patients of the facility.

respiratory therapy technician, a graduate of a program approved by the Commission on Accreditation of Allied Health Education Programs, designed to qualify the person for the technician certification examination of the National Board for Respiratory Care. The program requires a special curriculum of basic sciences with supervised clinical experience.

respiratory therapy technician, certified (CRTT), an allied health professional who administers general respiratory care. Duties can include collection and review of clinical data; examination of the patient by inspection, palpation, percussion, and auscultation; and assembling and maintaining equipment used in respiratory care.

respiratory tract, the complex of organs and structures that performs the pulmonary ventilation of the body and the exchange of oxygen and carbon dioxide between ambient air and blood circulating through the lungs. It also warms the air passing into the body and assists in the speech function by providing air for the larynx and the vocal cords. Every 24 hours about 500 cubic feet of air (150 m^3) passes through the respiratory tract of the average adult, who breathes in and out between 12 and 18 times a minute. The respiratory tract is divided into the upper respiratory tract and the lower respiratory tract. Also called **respiratory system.** See also the **Color Atlas of Human Anatomy**, pp. A28-A31.

respiratory tract infection, any infectious disease of the upper or lower respiratory tract. **Upper respiratory tract infections (URIs)** includes the common cold, laryngitis, pharyngitis, rhinitis, sinusitis, and tonsillitis. **Lower respiratory tract infections** include bronchitis, bronchiolitis, pneumonia, and tracheitis.

respiratory zone, the air sacs where gas exchange actually occurs in the lungs, usually below the seventeenth division of bronchi.

respirometer /res′pirom′ətər/ [L, *respirare,* to breath; Gk, *metron,* measure], an instrument used to analyze the quality of a patient's respirations.

respite care[1] /res′pit/ [L, *respicere,* to look back], **1.** short-term health services for the dependent older adult, either at home or in an institutional setting. **2.** the provision of temporary care for a patient who requires specialized or intensive care or supervision that is normally provided by his or her family at home. Respite care provides the family with relief from demands of the patient's care.

respite care[2]**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as provision of short-term care to provide relief for family caregiver. See also **Nursing Interventions Classification.**

respite time /res′pit/, relief time from responsibilities for the care of a patient, an individual, or a family member.

respondeat superior /respon′dē·at/ [L, let the master answer], the concept that an employer may be held liable for torts committed by employees acting within the scope of their employment.

respondent conditioning. See **classical conditioning.**

responder /rispon′dər/ [L, *respondere,* to promise in return], a person whose tumor shrinks in volume by at least 50% as a result of chemotherapy, radiation, or other treatment.

response /rispons′/ [L, *responsum,* reply], **1.** a reaction of an organism to a stimulus. **2.** (in psychology) a category of negative punishment in which the reinforcer is lost or withdrawn after an operant.

response time, **1.** the period between the input of information into a computer, central processing unit, or other processor and the response or output, measured in milliseconds or nanoseconds, or fractions thereof. **2.** the period between the application of a stimulus and the response of a cell or cells.

rest[1] [AS, *restan,* to rest], an extension from a prosthesis that provides vertical support for a dental restoration.

rest[2]**,** a nursing outcome from the Nursing Outcomes Classification (NOC) defined as quantity and pattern of diminished activity for mental and physical rejuvenation. See also **Nursing Outcomes Classification.**

rest angle. See **occlusal rest angle.**

rest area, a prepared surface on a tooth or fixed restoration into which an arm or a removable partial denture fits. Also called **rest seat,** *incisal rest,* **occlusal rest.**

resting cell, a cell that is not undergoing division. See also **interphase.**

resting membrane potential, the transmembrane voltage that exists when a neuron or muscle cell is not producing an action potential.

resting potential [AS, *rest* + L, *potentia,* power], the electric potential across a nerve cell membrane before it is stimulated to release the charge. The resting potential for a neuron is between 50 and 100 mV, with the excess of negatively charged ions inside the cell membrane.

resting tremor, an involuntary tremor occurring when the person is at rest. It is one of the signs of Parkinson's disease. Also called **passive tremor.** See also **action tremor, tremor.**

restitution /res′tit(y)o͞o′shən/, the spontaneous turning of the fetal head to the right or left after it has extended through the vulva.

rest jaw relation, the postural relation of the mandible to the maxilla when the patient is resting comfortably in the upright position. The condyles are in a neutral, unstrained position in the mandibular fossae, and the mandibular musculature is in a state of minimum tonic contraction necessary to maintain the posture.

rest joint position, the position of a joint where the joint surfaces are relatively incongruent and the support structures are relatively lax. The position is used extensively in passive mobilization procedures.

restless legs syndrome [AS, *restlaes* + ONorse, *leggr*], a benign condition of unknown origin characterized by an irritating sensation of uneasiness, tiredness, and itching deep within the muscles of the leg, especially the lower part of the limb, and accompanied by twitching and sometimes by pain. The only relief is walking or moving the legs. The condition may be associated with various psychiatric disorders, probably as a form of extrapyramidal hyperkinesis. Also called **anxietas tibiarum, Ekbom's syndrome, Wittmaack-Ekbom syndrome.**

restoration /res′tôrā′shən/ [L, *restaurare,* to restore], any tooth filling, inlay, crown, partial or complete denture, or prosthesis that restores or replaces missing tooth structure, entire teeth, or oral tissues. Also called **dental restoration, prosthetic restoration.**

restoration contour, the profile of the surfaces of teeth that have been restored.

restoration of cusps, a reduction and inclusion of tooth cusps within a tooth cavity preparation and their restoration to functional occlusion with an artificial dental material.

restorative /ristôr′ətiv/ [L, *restaurare*], pertaining to the power or ability to restore or renew a person to a normal state of health or consciousness.

Restoril, a trademark for a hypnotic agent **(temazepam).**

restraint /ristrānt′/ [L, *restringere,* to confine], any one of numerous mechanical devices or chemical agents used to hinder or restrict a patient's movement. Examples of mechanical restraints are specially designed slings, jackets, or diapers. Restraints that are too tight may cause skin irritation; those that fit too loosely do not serve their purpose. When a restraining device needs to be used, it should be correctly sized for the patient and allow enough space for two fingers to fit between the patient's skin and the restraint. Restraints are usually removed every 4 hours or more frequently to assess skin integrity and provide skin care. Release of restraints at least every 2 hours is recommended to allow range-of-motion exercises and assistance with activities of daily living. Throughout the period of restraint, it is important to continue recording all physical and psychosocial assessments in accordance with hospital protocol. The least restrictive restraint that promotes patient safety or positioning is required. See also **mechanical restraint.**

A restraint belt helps prevent forward sliding in wheelchairs *(Courtesy Posey)*

restraint in bed [L, *restringere,* to confine; AS, *bedd*], the confinement of a person to bed rest by the use of mechanical, physical, or chemical means, if needed.

Restraint bed

(Courtesy Max-Secure Systems, Inc., Williamsville, New York)

restraint of trade, an illegal act that interferes with free competition in a commercial or business transaction so as to restrict the production of a product or the provision of a service, affect the cost of a product or a service, or control the market in any way to the detriment of the consumers or purchasers of the service or product. The Clayton Act and the Sherman Antitrust Act are U.S. federal statutes that embody the basic concepts of the definition and the illegal nature of restraint of trade.

restriction endonuclease /ristrik′shən en′dōno͞o′klē·ās/ [L, *restringere* + Gk, *endon,* within; L, *nucleus,* nut kernel; Fr, *diastase,* enzyme], an enzyme that cleaves DNA at a specific site. Each of the many endonucleases isolated from various bacteria acts at a different site, making it possible for researchers to divide DNA molecules at selected locations. See also **restriction fragment length polymorphism.**

restriction fragment, a fragment of DNA produced by cleavage by a specific endonuclease.

restriction fragment length polymorphism (RFLP), a difference in the DNA sequences of homologous chromosomes as revealed by different lengths of the restriction fragments produced by enzymatic digestion of a selected region of chromosomes. RFLPs are believed to be inherited according to mendelian laws and have been used to locate the genes associated with several inherited disorders, including Huntington's disease.

restrictive cardiomyopathy. See **constrictive cardiomyopathy.**

restrictive disease, a respiratory disorder characterized by restriction of expansion of the lungs or chest wall, resulting in diminished lung volumes and capacities. Causes include impaired neuromuscular contraction, impaired lung expansion, thoracic deformities, and pleural-based diseases.

rest seat. See **rest area.**

resume, résumé. See **curriculum vitae.**

resuscitation^1 /risus′itā′shən/ [L, *resuscitare,* to revive], the process of sustaining the vital functions of a person in respiratory or cardiac failure while reviving him or her by using techniques of artificial respiration and cardiac massage, correcting acid-base imbalance, and treating the cause of failure. See also **cardiopulmonary resuscitation. —resuscitate,** *v.*

resuscitation^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administering emergency measures to sustain life. See also **Nursing Interventions Classification.**

resuscitation: fetus, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administering emergency measures to improve placental perfusion or correct fetal acid-base status. See also **Nursing Interventions Classification.**

resuscitation: neonate, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administering emergency measures to support newborn adaptation to extrauterine life. See also **Nursing Interventions Classification.**

resuscitator /risus′itā′tər/, an apparatus for pumping air into the lungs. It consists of a mask snugly applied over the mouth and nose, a reservoir for air, and a manually or electrically powered pump. Often oxygen may be added to the air in the reservoir. See also **Ambu bag, bag-valve-mask resuscitator.**

RET, abbreviation for **rational emotive therapy.**

retail dentistry /rē′tāl/ [ME, *retailen,* to divide into pieces], the practice of fee-for-service dentistry in an exclusively retail environment, such as a shopping center or a department store, with the specific intention of attracting the customers of that retail environment by using the marketing techniques of the retailers involved.

retain. See **retention.**

retained placenta /ritānd′/ [L, *retinere,* to hold, *placenta,* flat cake], the failure of the placenta to be delivered during an appropriate period, usually 30 minutes, following birth of the infant.

retainer [L, *retinere,* to hold], **1.** the part of a dental prosthesis that is cemented to an abutment tooth to which the suspended part of a bridge (called the pontic) is attached. It may be an inlay, a partial crown, or a complete crown. **2.** an appliance for maintaining teeth positions and jaw relations gained by orthodontic procedures. Also called *retaining orthodontic appliance*. **3.** the part of a fixed prosthesis that attaches a pontic to the abutment teeth. **4.** any clasp, attachment, or device for fixing or stabilizing a dental prosthesis.

retake /rē′tāk/, the repeat of a radiograph because of inadequate technical quality, patient motion, mispositioning of the body part, or equipment malfunction.

retard. See **retarded.**

retardation /rē′tärdā′shən/ [L, *retardare,* to check], the slowing down of any mental or physical activity or failure of intellectual abilities to develop normally, as in mental retardation. Psychomotor retardation may occur in depression, and a conditioned response to an unconditioned stimulus may be retarded in appearance.

retarded. /ritär′did/ [L, *retardare,* to check], (of physical, intellectual, social, or emotional development) abnormally slow. **—retard** /ritärd′/, *v.*

retarded dentition, an abnormal delay in the eruption of the primary or secondary teeth resulting from malnutrition, malposition of the teeth, a hereditary factor, or a metabolic imbalance, such as hypothyroidism. Compare **precocious dentition.**

retarded depression, the depressive phase of bipolar disorder.

retarded ejaculation, the inability of a male to ejaculate after having achieved an erection. This often accompanies the aging process.

retch [AS, *hraecan,* to spit], a strong, wrenching attempt to vomit that does not bring up anything. Compare **eructation, vomit.**

rete /rē′tē/ [L, net], a network, especially of arteries or veins. **—retial** /rē′tē·əl/, *adj.*

rete arteriosum. See **arterial network.**

retention /riten′shən/, **1.** a resistance to movement or displacement. **2.** the ability of the digestive system to hold food and fluid. **3.** the inability to urinate or defecate. **4.** the ability of the mind to remember information acquired from reading, observation, or other processes. **5.** the inherent property of a dental restoration to maintain its position without displacement under axial stress. **6.** a characteristic of proper tooth cavity preparation in which provision is made for preventing vertical displacement of the cavity filling. **7.** a period of treatment during which an individual wears an appliance to maintain teeth in positions to which they have been moved by orthodontic procedures. **—retain,** *v.*

retention cyst [L, *retinere,* to hold; Gk, *kystis,* bag], a cyst caused by blockage of the excretory duct of a gland, so that glandular secretions are retained. Also called **secretory cyst.**

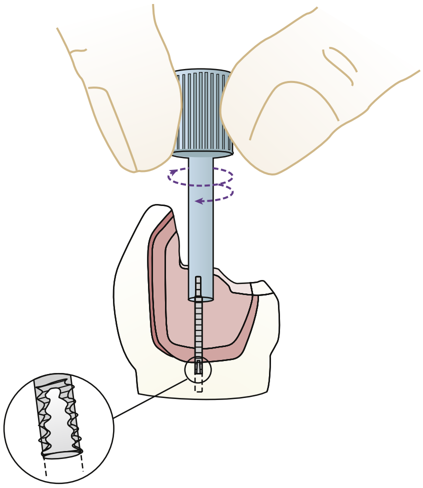
retention enema [L, *retinere,* to hold; Gk, *enienai,* to send in], a medicinal or nutrient enema specially formulated so that it will remain in the bowel without stimulating the nerve endings that would ordinarily result in evacuation. See also **oil retention enema.**

retention form, the provision made in a prepared tooth cavity to hold in place a restoration and to prevent its displacement.

retention groove, a depression formed by preparing vertical constrictions in a prepared tooth cavity, which improves the holding ability (retention form) of a restoration. Compare **resistance form.**

retention of urine, an abnormal, involuntary accumulation of urine in the bladder as a result of a loss of muscle tone in the bladder, neurological dysfunction or damage to the bladder, obstruction of the urethra, or administration of a narcotic analgesic, especially morphine.

retention pin, a small metal pin that extends from a metal casting into the dentin of a tooth to improve the holding ability of a tooth restoration.



Placement of a retention pin
(Bird and Robinson, 2012)

retention procedure, a method established by state laws or mental health codes for committing a person to a psychiatric institution. Most states recognize four types of retention: emergency, informal, involuntary, and voluntary admission.

retention time (t_a), **1.** (in chromatography) the amount of time elapsed from the injection of a sample into the chromatographic system to the recording of the peak (band) maximum of the component in the chromatogram. **2.** the length of time a compound is retained on a chromatography column.

retention with overflow [L, *retinere,* to hold; AS, *ofer* + *flowan*], a complication of bladder outlet obstruction in which the bladder is full but is not emptied completely. Urine dribbles out with a sense of urgency, or uncontrollable intermittent leakage occurs. Also called **paradoxic incontinence.**

rete peg. See **epithelial peg.**

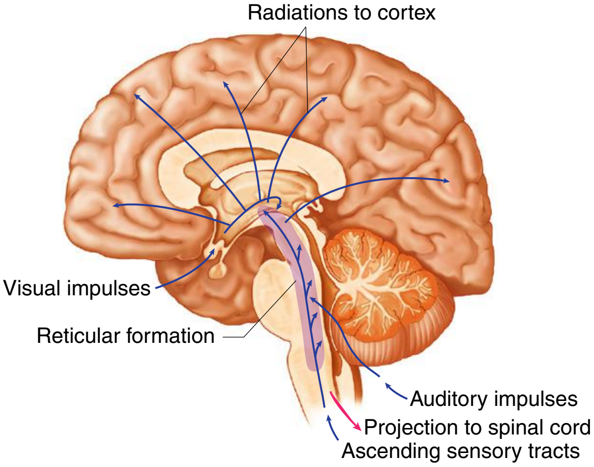
reteplase /ret′ĕ-plās/, a recombinant form of tissue plasminogen activator used intravenously as a thrombolytic agent in treatment of myocardial infarction.

retial. See **rete.**

reticul-, prefix meaning "netlike": *recticulation, reticulocyte, reticulopod.*

reticular /ritik′yələr/ [L, *reticulum,* little net], (of a tissue or surface) having a netlike pattern or structure.

reticular activating system (RAS), a functional (rather than morphological) system in the brain essential for wakefulness, attention, concentration, and introspection. A network of nerve fibers in the thalamus, hypothalamus, brainstem, and cerebral cortex contributes to the system.



Reticular activating system
(Patton and Thibodeau, 2010)

reticular formation, a small, thick cluster of neurons nestled within the brainstem, including the medulla that controls the level of consciousness and other vital functions of the body. The reticular formation constantly monitors the state of the body through connections with the sensory and motor tracts. Certain nerve cells in the formation regulate the flow of hydrochloric acid in the stomach. Other cells regulate swallowing, tongue movements, and movements of the face, eyes, and tongue.

reticular membrane, a netlike membrane over the organ of Corti; the free ends of the outer acoustic hair cells pass through its apertures. Also called *reticular lamina.*

reticular nuclei, nuclei found in the reticular formation of the brainstem, primarily in longitudinal columns in three groups: the median column reticular nuclei (which include the raphe nuclei), the medial column reticular nuclei, and the lateral column reticular nuclei. The term also encompasses several other nuclei that are not in any of the three columns, such as the reticular nucleus of the thalamus.

reticulated pigmented poikiloderma, a red coloration in the cheeks and neck. See **poikiloderma of Civatte.**

reticulation film fault /ritik′yəlā′shən/ [L, *reticulum* + *atio,* process], a defect in a radiograph or photograph that appears as a network of corrugations. It is usually caused during film development by an excessive temperature difference between any two of the three darkroom solutions: the developer, the fixer, and the clearing agent.

reticulin /ritik′yəlin/ [L, *reticulum,*], an albuminoid substance found in the connective fibers of reticular tissue.

reticulocyte /ritik′yələsīt′/ [L, *reticulum* + Gk, *kytos,* cell], an immature erythrocyte characterized by a meshlike pattern of nucleic acids when stained using new methylene blue dye. Reticulocytes normally account for less than 2% of the circulating erythrocytes. A greater proportion reflects increased bone marrow generation of red blood cells. Compare **erythrocyte.** See also **normoblast.** Also called *polychromatophilic erythrocyte* when seen in a Wright-stained peripheral blood film.

reticulocyte count, a count of the number of reticulocytes in a whole blood specimen, used in determining bone marrow activity. The reticulocyte count is lowered in hemolytic diseases and chronic infection; it is elevated after hemorrhage or during recovery from anemia. The normal concentration of reticulocytes in whole blood in adults is 0.5% to 1.5% of total red blood cells.

reticulocytopenia /ritik′yəlōsī′təpē′nē·ə/ [L, *reticulum* + Gk, *kytos,* cell, *penia,* poverty], a decrease below the reference interval lower limit of 0.5% in the number of reticulocytes in a blood sample.

reticulocytosis /-sītō′sis/, an increase over the reference interval upper limit of 2.0% in the number of reticulocytes in the circulating blood that may represent a normal increase in activity of the bone marrow in response to blood loss.

reticuloendothelial cells /ritik′yəlō·en′dōthē′lē·əl/ [L, *reticulum* + Gk, *endon,* within, *thele,* nipple], albuminoid or scleroprotein cells lining vascular and lymph vessels and capable of phagocytosing bacteria, viruses, and colloidal particles or of forming immune bodies against foreign particles.

reticuloendothelial system (RES), a functional rather than anatomical system of the body involved primarily in defense against infection and in disposal of the products of the breakdown of cells. It is made up of macrophages; the Kupffer cells of the liver; and the reticulum cells of the lungs, bone marrow, spleen, and lymph nodes. Disorders of this system include **eosinophilic granuloma, Gaucher's disease,** *Hand's disease,* and **Niemann-Pick disease.**

reticuloendothelioma /-thē″lē·ō′mə/, a tumor consisting of cells of the reticuloendothelial system.

reticuloendotheliosis /ritik′yəlō·en′dōthē′lē·ō′sis/, an abnormal condition characterized by increased growth and proliferation of the cells of the reticuloendothelial system. See also **reticuloendothelial system.**

reticulogranular /-gran′yələr/ [L, *reticulum* + *granulum,* little grain], pertaining to a cloudy appearance of the lungs on a chest radiograph of a patient with respiratory distress syndrome.

reticulosarcoma. See **undifferentiated malignant lymphoma.**

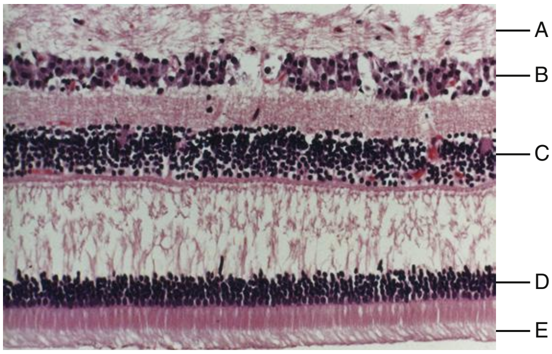
reticulum cell sarcoma. See **histiocytic malignant lymphoma.**

retin-, prefix meaning "retina": *retinol, retinopathy.*

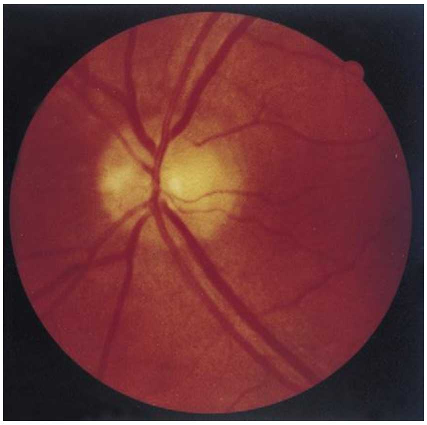
-retin, suffix for retinol derivatives.

retina /ret′inə/ [L, *rete,* net], a 10-layered, delicate nervous tissue membrane of the eye, continuous with the optic nerve, that receives images of external objects and transmits visual impulses through the optic nerve to the brain.

The retina is soft and semitransparent and contains rhodopsin. It consists of the outer pigmented layer and the nine-layered retina proper. These nine layers, starting with the most internal, are the internal limiting membrane, the stratum opticum, the ganglion cell layer, the inner plexiform layer, the inner nuclear layer, the outer plexiform layer, the outer nuclear layer, the external limiting membrane, and the layer of rods and cones. The outer surface of the retina is in contact with the choroid, the inner surface with the vitreous body. The retina is thinner anteriorly, where it extends nearly as far as the ciliary body, and thicker posteriorly, except for a thin spot in the exact center of the posterior surface where focus is best. The photoreceptors end anteriorly in the jagged ora serrata at the ciliary body, but the membrane of the retina extends over the back of the ciliary processes and the iris. The retina becomes clouded and opaque if exposed to direct sunlight. See also **Jacob x membrane, macula, optic disc.**



Layers of the retina: *A,* nerve fiber layer; *B,* ganglion cell layer; *C,* inner nuclear layer; *D,* outer nuclear layer; *E,* rods and cones *(Kumar, Abbas, and Fausto, 2005/ Courtesy Dr. Umberto De Girolami, Department of Pathology, Brigham and Women's Hospital)*



Retina *(Wilson and Giddens, 2005/Courtesy Dr. Frances C. Gaskin)*

Retin-A, a trademark for an antiacne medication **(tretinoin).**

retinaculum /ret′inak′yələm/ *pl.* **retinacula** [L, halter], **1.** a structure that retains an organ or tissue. **2.** an instrument for retracting tissues during surgery.

retinaculum extensorum manus. See **extensor retinaculum of the hand.**

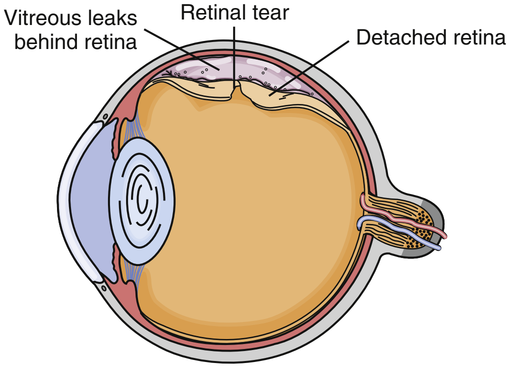
retinal /ret′inəl, ret′inal′/ [L, *rete*], **1.** *n,* an aldehyde precursor of vitamin A produced by the enzymatic dehydration of retinol. It is the active form of the vitamin necessary for night, day, and color vision. See also **retinene, vitamin A. 2.** *adj,* pertaining to the retina.

retinal detachment, a separation of the retina from the retinal pigment epithelium in the back of the eye. It usually results from a hole or tear in the retina that allows the vitreous humor to leak between the choroid and the retina. Severe trauma to the eye, such as a contusion or penetrating wound, may be the proximate cause, but in the great majority of cases retinal detachment is the result of internal changes in the vitreous chamber associated with aging or, less frequently, inflammation of the interior of the eye.

■ OBSERVATIONS: In most cases, retinal detachment develops slowly. The first symptom is often the sudden appearance of a large number of floating spots loosely suspended in front of the affected eye. The person may not seek help because the number of spots tends to decrease during the days and weeks after the detachment. The person may also notice a curious sensation of flashing lights as the eye is moved. Because the retina does not contain sensory nerves that relay sensations of pain, the condition is painless. Detachment usually begins at the thin peripheral edge of the retina and extends gradually beneath the thicker, more central areas. The person perceives a shadow that begins laterally and grows in size, slowly encroaching on central vision. As long as the center of the retina is unaffected, the vision, when the person is looking straight ahead, is normal. When the center becomes affected, the eyesight is distorted, wavy, and indistinct. If the process of detachment is not halted, total blindness of the eye ultimately results. The condition does not spontaneously resolve itself.

■ INTERVENTIONS: Surgery is usually required to repair the hole and prevent leakage of vitreous humor that separates the retina from its source of nourishment, the choroid. If the condition is discovered early when the hole is small and the volume of vitreous humor lost is not large, the retinal hole may be closed by causing a scar to form on the choroid and to adhere to the retina around the hole. The scar may be produced by heat, laser energy, or cold. The scar is held against the retina by local pressure achieved by a variety of surgical techniques.

■ NURSING CONSIDERATIONS: Retinal detachment requires treatment. The degree of restoration of sight depends on the extent and duration of separation. Unless replaced, a detached retina slowly dies after several years of detachment. Blindness resulting from retinal detachment is irreversible.

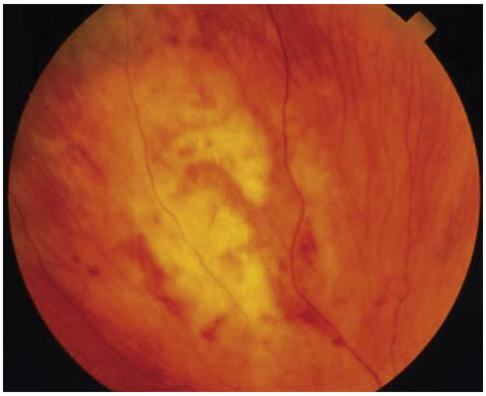


Retinal detachment: tear in retina *(Monahan et al, 2007)*

retinal fissure, a ventral groove formed by invagination of the optic cup and its stalk by vascular mesenchyme from which the hyaloid vessels develop. Also called **optic fissure.**

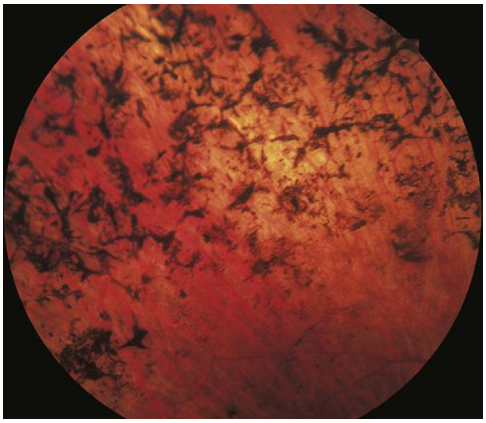
retinene /ret′inin/ [L, *rete*], either of the two carotenoid pigments found in the rods of the retina that are precursors of vitamin A and are activated by light. See also **retinal, retinol.**

retinitis /ret′inī′tis/ [L, *rete,* net; Gk, *itis,* inflammation], an inflammation of the retina.



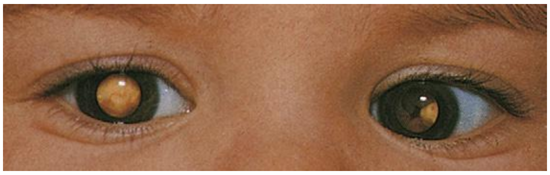
Retinitis secondary to cytomegalovirus infection *(Goldman et al, 2008)*

retinitis pigmentosa [L, *rete,* net; Gk, *itis,* inflammation; L, *pigmentum,* paint], a group of diseases, often hereditary, characterized by bilateral primary degeneration of the retina beginning in childhood and progressing to blindness by middle age. Clinical signs include night blindness, reduced visual fields, depigmentation of the retinal pigment epithelium, and macular degeneration. Length of time to legal blindness varies widely.



Retinitis pigmentosa *(Kanski, 2006))*

retinoblastoma /ret′inōblastō′mə/ *pl.* **retinoblastomas, retinoblastomata** [L, *rete* + Gk, *blastos,* germ, *oma,* tumor], a congenital hereditary neoplasm developing from retinal germ cells. Characteristic signs are diminished vision, strabismus, retinal detachment, and an abnormal pupillary reflex. The rapidly growing tumor may invade the brain and metastasize to distant sites. Treatment includes removal of the eye and as much of the optic nerve as possible, followed by radiation and chemotherapy. It is bilateral in about 30% of the cases. The more affected eye is enucleated, and the other eye is treated with radiation, antibiotics, cryotherapy, or photocoagulation, singly or in combination. Because many of the cases are transmitted as an autosomal-dominant trait with incomplete penetration, genetic counseling is advisable.



Retinoblastoma *(Skarin, 2010)*

retinocerebral angiomatosis. See **von Hippel-Lindau disease.**

retinochoroiditis /-kôr′oidī′tis/ [L, *rete,* net; Gk, *chorion,* skin, *itis,* inflammation], an inflammation of the retina and choroid coat of the eye. Compare **chorioretinopathy.**

retinodialysis /ret′inō′dī·al′isis/ [L, *rete* + Gk, *dia,* through, *lysis,* loosening], a separation or tear in the retina in its anterior part, in the area of the ora serrata, just behind the ciliary body.

retinoid /ret′inoid/ [L, *rete,* net; Gk, *eidos,* form], **1.** resembling the retina. **2.** pertaining to any of a group of compounds whose molecules contain 20 carbon atoms structurally related to retinal, retinol, and other substances, some of which exhibit vitamin A activity. Retinoid analogs have been used in the prevention and treatment of various skin cancers and treatment of the digestive and respiratory tracts. **3.** resinlike or having a resemblance to resin.

retinol /ret′inol/ [L, *rete*], one form of vitamin A. It is found in the retinas of mammals. See also **vitamin A.**

retinol equivalent (RE), a unit used for quantifying the vitamin A value of sources of vitamin A, including both preformed retinoids in animal foods and precursor carotenoids in plant foods. RE is defined as 3.3 International Units of vitamin A.

retinopathy /ret′inop′əthē/ [L, *rete* + Gk, *pathos,* disease], a group of noninflammatory eye disorders. Major contributing conditions include diabetes, hypertension, and atherosclerotic vascular disease.

retinopexy /ret′inopek′se/, restoration of the retina to its proper anatomical location.

retinoschisis /ret′i·nos′ki·sis/ [L, *rete,* net + *schisis,* cleavage], splitting of the retina. In the *juvenile form* the splitting occurs in the nerve fiber layer (stratum opticum), and in the *adult form* in the outer plexiform layer. The disorder is usually more benign and slowly progressive than retinal detachment. Compare **retinal detachment.**

retinoscope /ret′inəskōp′/ [L, *rete,* net; Gk, *skopein,* to view], an instrument used in retinoscopy to determine errors of refraction.

retinoscopy /ret′inos′kəpē/ [L, *rete,* net; Gk, *skopein,* to view], a procedure for examining the eyes for possible errors of refraction. The examiner shines a light into the eye through the pupillary opening and notes the movements of reflex from the fundus, which will vary with the type of refractive error. The movements indicate the types of lenses needed to neutralize the refractive errors. Also called **shadow test.**

retirement center /ritī′ərmənt/ [Fr, *retirer,* to withdraw; Gk, *kentron,* center], a facility or organized program to provide social services and activities for senior citizens who generally do not require ongoing health care.

retract /ritrakt′/ [L, *retractare,* to draw back], to shrink, make shorter, or pull back.

retracted nipple [L, *retractare,* to draw back; ME, *neb*], a nipple drawn inward, resulting from cancer or adhesions below the skin surface or a natural condition present at birth.

retractile mesenteritis /rē·trak′tīl/ [L, *retractare,* to draw back; Gk, *mesos,* middle + *enteron,* intestine + *itis,* inflammation], inflammation of the mesentery producing thickening, sclerosis, and retraction and occasionally resulting in distortion of intestinal loops.

retraction /ritrak′shən/ [L, *retractare,* to draw back], **1.** the displacement of tissues to expose a part or structure of the body. **2.** a distal movement of the teeth. **3.** a distal or retrusive position of the teeth, dental arch, or jaw.

retraction of the chest, the visible sinking in of the soft tissues of the chest between and around the firmer tissue of the cartilaginous and bony ribs, as occurs with increased inspiratory effort or obstruction at some level of the respiratory tract. The extent of retraction depends on the level of an obstruction. Retraction begins in the intercostal spaces. If increased effort is needed to fill the lungs, supraclavicular and infraclavicular retraction may be seen. In infants, sternal retraction occurs with only a slight increase in respiratory effort, the result of the pliability of their chests. Compare **intercostal bulging.**

retractor /ritrak′tər/ [L, *retractare*], an instrument for holding back the edges of tissues and organs to maintain exposure of the underlying anatomical parts, particularly during surgery.

retro-, prefix meaning “backward, or located behind”: *retronasal, retroperitoneal, retroversion.*

retroanterograde amnesia /ret′rō·anter′ōgrād/ [L, *retro,* backward, *antero,* foremost, *gradus,* step; Gk, *amnesia,* forgetfulness], a memory disorder in which current events may be assigned to the past and past events may be regarded as current.

retroaortic node /ret′rō·ā·ôr′tik/ [L, *retro,* backward; Gk, *aerein,* to raise], a node in one of three sets of lumbar lymph nodes that serve various structures in the abdomen and pelvis. They lie below the cisterna chyli on the bodies of the third and the fourth lumbar vertebrae and receive the lymphatic trunks from the lateral aortic nodes and preaortic nodes. The efferent vessels from the retroaortic nodes end in the cisterna chyli. Compare **lateral aortic node, preaortic node.**

retroauricular /ret′rō·ôrik′yələr/ [L, *retro,* backward, *auricula,* little ear], pertaining to a location behind the ear.

retrobulbar /-bul′bər/ [L, *retro,* backward, *bulbus,* swollen root], **1.** pertaining to the area behind the pons (posterior to the medulla oblongata). **2.** pertaining to the area behind the eyeball.

retrobulbar block, a block performed by injection of a local anesthetic into the retrobulbar space to anesthetize and immobilize the eye.

retrobulbar neuritis [L, *retro,* backward, *bulbus,* swollen root; Gk, *neuron* + *itis,* inflammation]. See **optic neuritis.**

retrobulbar pupillary reflex, an abnormal response of a pupil to light. After initial constriction of the pupil, dilation occurs as the stimulus continues. It is a sign of retrobulbar neuritis.

retrocaecal. See **retrocecal.**

retrocalcaneal space, the space between the posterior calcaneus and the calcaneal tendon, occupied by the calcaneal bursa.

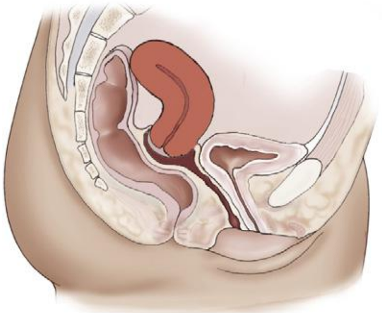
retrocecal /-sē′kəl/ [L, *retro,* backward, *caecus,* blind], pertaining to the region behind the cecum. Also spelled **retrocaecal.**

retroclusion /ret′roklo͞o′zhən/, a method of controlling hemorrhage from an artery by compressing it between tissues on either side. A needle is inserted through the tissues above the bleeding vessel, then turned around and down so that it also passes through the tissues beneath the artery.

retrofilling /ret′rofil′ing/, a method of root canal therapy in which the canal is filled from the apex, which has been surgically exposed.

retroflexion /-flek′shən/ [L, *retro* + *flectere,* to bend], an abnormal position of an organ, such as the uterus, in which the organ is tilted back acutely and folded over on itself.

retroflexion of the uterus, a condition in which the body of the uterus is bent backward at an angle with the cervix, the position of which usually remains unchanged.



Retroflexion of the uterus *(Leonard, 2009)*

retrognathia /ret′rōnā′thē·ə/ [L, *retro,* backward; Gk, *gnathos,* jaw], a condition in which either or both jaws recede with respect to the frontal plane of the forehead. According to Angle’s Classification of Malocclusion, the facial profile of a person with a Class II malocclusion is retrognathic. Also called **mandibular retroposition, mandibular retrusion, maxillary retroposition, maxillary retrusion.**

retrognathism /ret′rōnā′thizəm/ [L, *retro* + Gk, *gnathos,* jaw], a facial abnormality in which a jaw, usually the mandible, or both jaws are posterior to their normal facial positions. Also called **bird face retrognathism.**

retrograde /ret′rəgrād/ [L, *retro* + *gradus,* step], **1.** moving backward; moving in the opposite direction to that which is considered normal. **2.** degenerating; reverting to an earlier state or worse condition. **3.** catabolic.

retrograde amnesia, the loss of memory for events occurring before a particular time in a person’s life, usually before the event that precipitated the amnesia. The condition may result from disease, brain injury or damage, or a traumatic emotional incident. Compare **anterograde amnesia.**

retrograde cystoscopy, a technique for radiographically examining the bladder in which a catheter is inserted through the urethra into the bladder, allowing the urine present in the bladder to pass through the catheter. A radiopaque medium is introduced, filling the bladder, and the contour of the bladder is observed, using serial x-ray films or fluoroscopy. Also called **cystoscopic urography.** See also **cystogram, retrograde pyelography.**

retrograde ejaculation [L, *retro,* backward, *gradus,* step, *ejaculari,* to throw out], an ejaculation of semen in a reverse direction into the urinary bladder. It may result from surgery or medication.

retrograde filling, a restoration placed in the apical part of a tooth root to seal the apex of a previously treated root canal. Also called **postresection filling.**

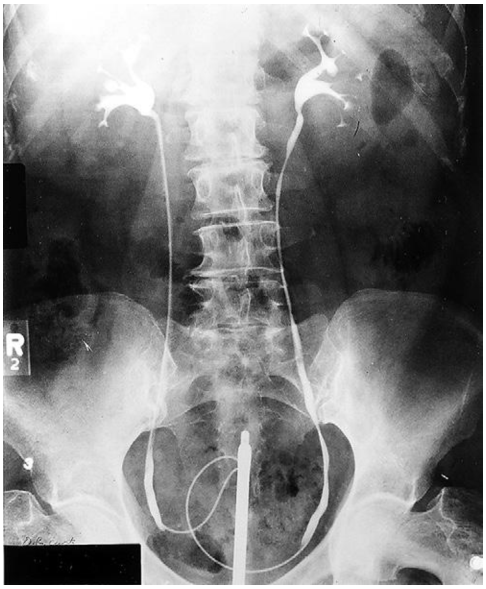
retrograde flow [L, *retro,* backward; AS, *flowan*], the flow of fluid in a direction other than normal, as in regurgitation.

retrograde infantilism. See **acromegalic eunuchoidism.**

retrograde infection, an infection that spreads along a tubule or duct against the flow of secretions or excretions, as in the urinary and lymphatic systems.

retrograde menstruation, a backflow of menstrual discharge through the uterine cavity and fallopian tubes into the peritoneal cavity. Fragments of endometrium may attach to the ovaries or other organs, causing endometriosis. Also called **regurgitant menstruation.**

retrograde pyelography, a radiological technique for examining the structures of the collecting system of the kidneys that is especially useful in locating a urinary tract obstruction. A radiopaque contrast medium is injected through a urinary catheter into the ureters and the calyces of the pelves of the kidneys. Rarely, severe anaphylactoid reaction to the medium may occur because of a patient's hypersensitivity to the iodine in the medium, and infection or trauma may result from the catheterization.



Normal retrograde pyelography
(Wein et al, 2007)

retrograde urethrography, radiographic examination of the urethra after suspicion of obstruction of its external orifice and injection of contrast material that travels in a retrograde direction towards the bladder. It is used for evaluation of strictures, diverticula, and trauma.

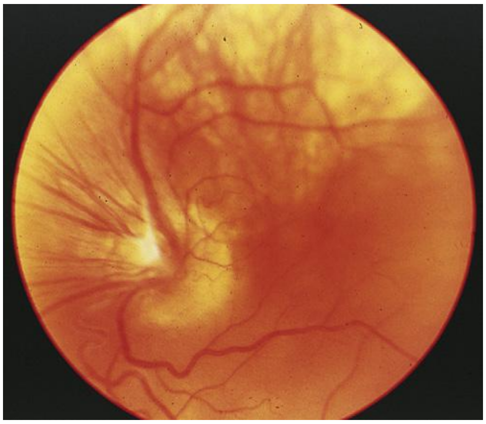
retrograde urography. See **retrograde pyelography.**

retrograde Wenckebach /veng′kəbäk, -bäkh/ [Karel F. Wenckebach, Dutch-Austrian physician, 1864–1940], a delay in the conduction of impulses from the ventricles or atrioventricular junction to the atria. The delay increases progressively until an impulse fails to reach the atria.

retrogression /-gresh′ən/ [L, *retro* + *gradi,* to step], a return to a less complex state, condition, or behavioral adaptation; degeneration; deterioration. See also **regression.**

retroinguinal space, the subdivision of the extraperitoneal space bounded by the peritoneum above and the fascia transversalis below.

retrolental fibroplasia /-len′təl/ [L, *retro* + *lentil,* lens, *fibra,* fiber; Gk, *plassein,* to mold], **1.** a formation of fibrous tissue behind the lens of the eye, resulting in blindness. **2.** a severe form of retinopathy in premature infants associated with complete retinal detachment. It can be prevented by timely administration of retinal laser therapy.



Retrolental fibroplasia
(Zitelli and Davis, 2007)

retromammary space, a layer of loose connective tissue separating the breast from the deep fascia, providing some degree of movement over underlying surfaces.

retromolar pad /-mō′lər/ [L, *retro* + *mola,* mill; D, *paden,* cushion], a mass of soft tissue, usually pear-shaped, that marks the distal termination of the mandibular residual ridge. It is composed of mucous glands and fibers of the buccinator muscle, the pterygomandibular raphe, the superior constrictor muscle, and the temporal tendon.

retromylohyoid space /ret′rōmī′lōhī′oid/ [L, *retro* + Gk, *myle,* mill, *hyoeides,* U-shaped; L, *spatium*], the part of the alveolingual sulcus that is distal to the distal end of the mylohyoid ridge.

retroperitoneal /-per′itənē′əl/ [L, *retro* + Gk, *peri,* around, *teinein,* to stretch], pertaining to organs closely attached to the posterior abdominal wall and partly covered by peritoneum, rather than suspended by that membrane.

retroperitoneal abscess, a collection of pus between the peritoneum and the posterior abdominal wall.

retroperitoneal fibrosis, a chronic inflammatory process, usually of unknown cause, in which fibrous tissue surrounds the large blood vessels in the lower lumbar area. It frequently causes constriction of the midportion of the ureters, which may lead to hydronephrosis and azotemia. Occasionally the fibrosis spreads upward to involve the duodenum, bile ducts, and superior vena cava. Symptoms include low-back and abdominal pain; weakness; weight loss; fever; and, with urinary tract involvement, frequency of urination, hematuria, polyuria, or anuria. Methysergide, taken to prevent migraine headaches, is one known cause of this condition. Treatment includes stopping methysergide and instituting surgical release of the ureters from the fibrosis with transplantation laterally or intraperitoneally.

retroperitoneal hematoma, hematoma resulting from a retroperitoneal hemorrhage.

retroperitoneal hemorrhage, hemorrhage from the kidney into the retroperitoneal space, such as from trauma, vasculitis, an aneurysm, a tumor, a renal infarct, or a cyst.

retroperitoneal lymph node dissection, surgical removal of lymph nodes bilaterally behind the peritoneum, and the lymph channels and fat around both renal pedicles, the vena cava, and the aorta, including the bifurcation of the aorta. The dissection is usually performed in an attempt to eliminate sites of lymphoma or metastases from malignancies originating in pelvic organs or genitalia. Also called **radical lymphadenectomy.**

retroperitoneum /-per′itənē′əm/ [L, *retro,* backward; Gk, *peri + teinein,* to stretch], the space behind the peritoneum.

retropharyngeal abscess /-fərin′jē·əl/ [L, *retro* + Gk, *pharynx,* throat], a collection of pus in the tissues behind the pharynx accompanied by difficulty in swallowing, fever, and pain. Occasionally the airway becomes obstructed. Treatment includes appropriate parenteral antibiotics and surgical drainage. Tracheostomy may be necessary. Compare **parapharyngeal abscess, peritonsillar abscess.**

retroplacental /-pləsen′təl/, behind the placenta.

retrospective chart audit /-spek′tiv/ [L, *retro* + *spicere,* to look], a format for an audit developed by the Joint Commission on Accreditation of Healthcare Organizations. The audit involves several steps that outline a procedure for evaluating the effectiveness of the care given at a particular institution and for correcting any deficiencies found by reviewing the patient's records after discharge and comparing the data with standards held to be adequate by the Commission.

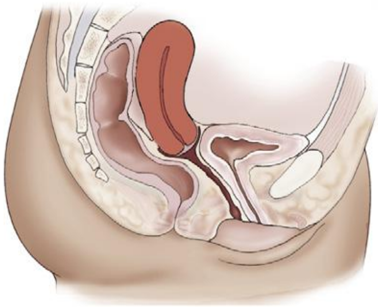
retrospective nursing audit. See **nursing audit.**

retrospective study, a study in which a search is made for a relationship between one (usually current) phenomenon or condition and another that occurred in the past. An example is a study of the family histories of young women diagnosed as having clear cell adenomas of the vagina, which yielded a relationship between the administration of diethylstilbestrol to the mothers of the women during pregnancy and the development of the condition in the daughters. See also **case-control study.**

retrosternal /-stur′nəl/ [L, *retro,* backward; Gk, *sternon,* chest], behind the sternum.

retrouterine /re′trōyo͞o′tərin/, behind the uterus.

retroversion /-vur′zhən/ [L, *retro* + *vertere,* to turn], **1.** a common condition in which an organ is tipped backward, usually without flexion or other distortion. The uterus may be retroverted in as many as one fourth of normal women. Uterine retroversion is measured as first-, second-, or third-degree, depending on the angle of tilt with respect to the vagina. Compare **anteversion.** See also **anteflexion, retroflexion. 2.** also called **retrusion,** an abnormal condition in which the teeth or other maxillary and mandibular structures are posterior to their normal positions. **—retrovert,** *v.*



Retroversion of the uterus *(Leonard, 2009)*

Retrovir, a trademark for an antiretroviral drug **(zidovudine).**

retrovirus /-vī′rəs/ [L, *retro* + *virus*], any of a family of ribonucleic acid (RNA) viruses containing the enzyme reverse transcriptase in the virion. The genetic information of the virus is stored in a molecule of single-stranded ribonucleic acid. After entering the target cell, the virus uses reverse transcriptase to direct the cell to make viral deoxyribonucleic acid (DNA). The DNA becomes integrated into the DNA of the host cell. Retroviruses are enveloped and assemble their capsids in the cytoplasm of the host cell. Retroviruses are used in laboratory research to import foreign DNA into a cell. They are transmitted by sexual contact with an infected person, through exposure to infected blood or blood products, and perinatally from an infected mother to the child. Human immunodeficiency virus (HIV1, HIV2), which causes acquired immunodeficiency syndrome, is a retrovirus. Other retroviruses include members of the Oncornaviridae family, such as human T cell lymphotropic virus type 1 (HTLV-1) and human T cell lymphotropic virus type 2 which cause adult T cell leukemia, hairy cell leukemia, tropical spastic paresis, and HTLV-1-associated myelopathy.

retrusion. See **retroversion,** def 2.

Rett's syndrome /ret/ [Andreas Rett, Austrian physician, 20th century], a pervasive developmental disorder affecting the gray matter of the brain, occurring exclusively in females and present from birth. It is progressive and is characterized by autistic behavior, ataxia, dementia, seizures, and loss of purposeful use of the hands, with cerebral atrophy, mild hyperammonemia, and decreased levels of biogenic amines. Also called **cerebroatrophic hyperammonemia.**

reuptake /re·up′tāk/, reabsorption of a previously secreted substance.

revaccination /rēvak′sinā′shən/, an immunization that is repeated, although the original was successful.

revascularization /rēvas′kyəler′īzā′shən/ [L, *re* + *vasculum,* small vessel; Gk, *izein,* to cause], the restoration by surgical means of blood flow to an organ or a tissue, as in bypass surgery.

reverberation /rivur′bərā′shən/, **1.** the phenomenon of multiple reflections within a closed system. **2.** an artifact in ultrasound caused by multiple echoes from parallel tissue interfaces.

Reverdin's needle /reverdaNz′/ [Jaques L. Reverdin, Swiss surgeon, 1842–1929], a surgical needle with an eye that can be opened and closed with a slide.

reversal film /rivur′səl/, (in radiology) a reverse-tone duplicate of an x-ray image, showing black changed to white and white to black. It is produced by exposing single-emulsion subtraction film through a standard x-ray film. Also called **diapositive, positive mask.**

reverse anaphylaxis. See **inverse anaphylaxis.**

reverse Barton's fracture /rivurs′/ [L, *revertere,* to turn back; John R. Barton, American surgeon, 1794–1871], a break in the volar articular surface of the radius, with associated displacement of the carpal bones and radius.

reverse bevel. See **contra bevel,** def 1.

reverse Colles' fracture. See **Smith fracture.**

reverse curve, a convex curve of dental occlusion, as viewed in the frontal plane.

reversed bandage /rivurst′/, a roller bandage that is reversed on itself with a half twist so that it lies smoothly, conforming to the contour of the extremity. See also **roller bandage.**

reversed coarctation. See **Takayasu's arteritis.**

reversed I:E ratio. See **inverse I:E ratio.**

reversed phase, a chromatographic mode in which the mobile phase is more polar than the stationary phase.

reverse isolation, isolation procedures designed to protect a patient from infectious organisms that might be carried by the staff, other patients, or visitors or on droplets in the air or on equipment or materials. Absolute reverse isolation is rarely necessary and requires elaborate specialized equipment. Protective modified reverse isolation is less restrictive but is not prolonged needlessly because the patient usually feels lonely and sensorially deprived. Handwashing, gowning, gloving, sterilization, or disinfection of materials brought into the area and other details of housekeeping vary with the reason for the isolation and the usual practices of the hospital.

reverse peristalsis. See **antiperistalsis.**

reverse transcriptase (RT) /revers′tran-skrip′tās/, an enzyme of RNA viruses that catalyzes the transcription of RNA to DNA, which is then incorporated into the genome of the host cell. This is the reverse of the usual mechanism for replication of genetic information; in the presence of this enzyme, it is the RNA that serves as the template for DNA copies. It is one mechanism by which reproduction of cancer cells is facilitated. Also called *RNA-dependent DNA polymerase*. See also **retrovirus.**

reverse transcriptase inhibitor, a compound that inhibits the enzyme used by retroviruses to synthesize complementary DNA from viral RNA inside host cells.

reverse Trendelenburg [Friedrich Trendelenburg], a position in which the lower extremities are placed lower than the body and head, which are elevated on an inclined plane.

reversible /rivur′sibəl/, able to return to its original state or condition, as in a chemical reaction.

reversible brain syndrome, any of a group of acute brain disorders characterized by a disruption of cognition, as in delirium. The symptoms widely vary. The disorder is related to a variety of biological stressors. Recovery is likely.

reversible obstructive airway disease, a condition characterized by bronchospasm reversible by intervention. An example is asthma.

reversible vascular hyperplasia, a variation of Kaposi's sarcoma in which human immunodeficiency virus may induce cells to produce a chemical growth factor. The growth factor, in turn, makes lymphatic endothelial cells proliferate. The process may cascade as each new Kaposi's sarcoma cell produces more growth factor.

reversion /rivur′zhən/, **1.** the appearance in offspring of traits expressed in previous but not recent generations. **2.** a return to an original phenotype, by mutation or reinstatement of the original genotype.

review of systems (ROS) /rivyo͞o′/ [Fr, *revoir,* to see again], (in a health history) a system-by-system review of the body functions. The ROS is begun during the initial interview with the patient and completed during the physical examination, as physical findings prompt further questions. Questions about family or personal history are included in each section. One outline of the systems and some of the signs and symptoms that might be noted or reported are as follows:

■ SKIN: bruising, discoloration, pruritus, birthmarks, moles, ulcers, decubiti, changes in the hair or nails, sun exposure and protection.

■ HEMATOPOIETIC: spontaneous or excessive bleeding, fatigue, enlarged or tender lymph nodes, pallor, history of anemia.

■ HEAD AND FACE: pain, traumatic injury, ptosis.

■ EARS: tinnitus, change in hearing, running or discharge from the ears, deafness, dizziness.

■ EYES: change in vision, pain, inflammation, infections, double vision, scotomata, blurring, tearing.

■ MOUTH AND THROAT: dental problems, hoarseness, dysphagia, bleeding gums, sore throat, ulcers or sores in the mouth.

■ NOSE AND SINUSES: discharge, epistaxis, sinus pain, obstruction.

■ BREASTS: pain, change in contour or skin color, lumps, discharge from the nipple.

■ RESPIRATORY TRACT: cough, sputum, change in sputum, night sweats, nocturnal dyspnea, wheezing.

■ CARDIOVASCULAR SYSTEM: chest pain, dyspnea, palpitations, weakness, intolerance of exercise, varicosities, swelling of extremities, known murmur, hypertension, asystole.

■ GASTROINTESTINAL SYSTEM: nausea, vomiting, diarrhea, constipation, quality of appetite, change in appetite, dysphagia, gas, heartburn, melena, change in bowel habits, use of laxatives or other drugs to alter the function of the gastrointestinal tract.

■ URINARY TRACT: dysuria, change in color of urine, change in frequency of urination, pain with urgency, incontinence, edema, retention, nocturia.

■ GENITAL TRACT (FEMALE): menstrual history, obstetric history, contraceptive use, discharge, pain or discomfort, pruritus, history of venereal disease, sexual history.

■ GENITAL TRACT (MALE): penile discharge, pain or discomfort, pruritus, skin lesions, hematuria, history of venereal disease, sexual history.

■ SKELETAL SYSTEM: heat; redness; swelling; limitation of function; deformity; crepitation: pain in a joint or an extremity, the neck, or the back, especially with movement.

■ NERVOUS SYSTEM: dizziness, tremor, ataxia, difficulty in speaking, change in speech, paresthesia, loss of sensation, seizures, syncope, changes in memory.

■ ENDOCRINE SYSTEM: tremor, palpitations, intolerance of heat or cold, polyuria, polydipsia, polyphagia, diaphoresis, exophthalmos, goiter.

■ PSYCHOLOGICAL STATUS: nervousness, instability, depression, phobia, sexual disturbances, criminal behavior, insomnia, night terrors, mania, memory loss, perseveration, disorientation.

Revised Trauma Score, a system of combining cardiopulmonary assessment with the Glasgow Coma Score in estimating the degree of injury and the prognosis in a trauma patient. The cardiopulmonary factors included are respiratory rate and systolic blood pressure.

Revlimid, a trademark for **lenalidomide.**

Reyataz, a trademark for **atazanavir.**

Reye's syndrome /rāz′/ [Ralph D.K. Reye, Australian pathologist, 1912–1978], a combination of acute encephalopathy and fatty infiltration of the internal organs that may follow acute viral infections. This syndrome has been associated with influenza B, chickenpox (varicella), the enteroviruses, and the Epstein-Barr virus. It usually affects people under 18 years of age, characteristically causing an exanthematous rash, vomiting, and confusion about 1 week after the onset of a viral illness. In the late stage there may be extreme disorientation followed by coma, seizures, and respiratory arrest. Laboratory tests reveal greater than normal amounts of SGOT and SGPT, bilirubin, and ammonia in the blood. A specimen obtained by liver biopsy shows fatty degeneration and confirms the diagnosis. Mortality varies between 20% and 80%, depending on the severity of symptoms. The cause of Reye's syndrome is unknown; however, there appears to be an association with the administration of aspirin. Therefore aspirin is given only if prescribed by a physician for any condition in infants or children. Aspirin should not be given in cases of chickenpox or suspected influenza. No specific treatment is available. Insulin, antibiotics, and mannitol may be given. Blood gases, blood pH, and blood pressure are monitored frequently. Intensive supportive nursing care with meticulous monitoring of all vital functions and prompt correction of any imbalance are of extreme significance in the outcome of this syndrome.

■ OBSERVATIONS: Reye's syndrome is staged by the characteristics manifested. In stage I, the child is usually quiet, lethargic, and drowsy, with episodes of vomiting. Pupil reactions are brisk, and commands are followed. Serum lab values show evidence of liver dysfunction; EEG is type 1. In stage 2, there is evidence of deep lethargy, confusion, delirium, and combativeness. Reflexes are hyperreflexic, and hyperventilation is present. Pupillary reactions are sluggish. In stage 3, senses are obtunded, and light coma is present with seizure activity and decorticate rigidity. Pupillary light reaction is still intact. EEG is type II. In stage 4, the coma deepens with seizure activity and decerebrate rigidity. There is loss of oculocephalic reflexes, and pupils are fixed. EEG is type III or IV, and there is evidence of brain dysfunction. In stage 5, there is deep coma, loss of deep tendon reflexes, respiratory arrest, fixed and dilated pupils, and type IV EEG. Definitive diagnosis is established by liver biopsy or by a threefold rise in levels of serum aspartate aminotransferase, serum alanine aminotransferase, or serum ammonia. Survivors may exhibit a neuropsychological deficit.

■ INTERVENTIONS: Deterioration is generally rapid and requires early diagnosis and aggressive treatment. Care in stages 1 and 2 is largely supportive, with frequent monitoring and evaluation of neurological status. Management of cerebral edema and increased intracranial pressure is a key focus in stages 3 through 5 and is monitored with an ICP monitor and treated by administration of mannitol, glycerol, and/or hyperventilation via endotracheal tube and ventilator. Pancuronium bromide is used to immobilize the child on a ventilator. Seizures are managed by IV phenytoin. NG tubes, urinary catheters, and peripheral IVs are placed to manage fluids. An arterial catheter is placed to permit continuous blood pressure measurement and monitor blood gases. A central venous catheter permits monitoring of blood volume and cardiac function and administration of hypertonic solutions. A pulmonary artery catheter may be inserted to monitor pulmonary artery pressure and cardiac output. A cooling blanket may be indicated to manage temperature. If increased intracranial pressure fails to respond to treatment, a decompressive craniotomy may be indicated. Prevention is targeted around routine vaccinations for influenza and varicella and avoidance of aspirin in children.

■ NURSING CONSIDERATIONS: Nursing interventions during acute disease are continuous and intensive. Careful evaluation is required for neurological, cardiac, and respiratory systems. Management is required for multiple lines and tubes, including peripheral and central IV lines, arterial lines, CVP lines, ICP monitors, retention catheters, NG tubes, and endotracheal tubes. Management of ventilator settings is required. Careful fluid management and intake and output is required to reduce cerebral edema and prevent dehydration. Careful supportive care, including careful hygiene, positioning, and passive range of motion, is required to maintain skin integrity and prevent sequelae of immobility. Sensory stimulation is needed for the unconscious child. Emotional support for parents is essential because the sudden severity and intensity of the disease and the aggressive treatment is a source of extreme anxiety and fear. Prevention is targeted around education about maintaining routine vaccinations for influenza and varicella and the avoidance of aspirin in children.

rf, **1.** abbreviation for **radiofrequency.** **2.** abbreviation for **rheumatic fever.**

Rf, **1.** symbol for the element **rutherfordium.** **2.** (in chromatography) abbreviation for *retardation factor* or *ratio to (solvent) front*.

RF, abbreviation for **rheumatoid factor.**

R factor, an episome in bacteria that is responsible for drug resistance and is transmissible to progeny and to other bacterial cells by conjugation. The part of the episome involved in replication and transmission is called **resistance transfer factor.**

RFP, abbreviation for **request for proposal.**

RF test. See **latex fixation test.**

RGP, abbreviation for *rigid gas permeable*. See **rigid gas permeable contact lens.**

Rh, **1.** abbreviation for *rhesus*. See **Rh factor.** **2.** symbol for the chemical element **rhodium.**

-rh-, combining forms containing **-rh-** or **-(r)rh:** *anarrhea, arteriorrhexis*.

r/h, **1.** abbreviation for **relative humidity.** **2.** abbreviation for *roentgens per hour.*

rhabdo-, rhabdi-, prefix meaning "rod-shaped" or "pertaining to a rod": *rhabdocyte, rhabdomyoma, rhabdosarcoma*.

rhabdomyo-, prefix meaning "striated or skeletal muscle": *rhabdomyolysis, rhabdomyoma*.

rhabdomyoblast /rab′dōmī′əblast′/ [Gk, *rhabdos*, rod, *mys*, muscle, *blastos*, germ], large, round, spindle-shaped cells with cross striations, found in some rhabdomyosarcomas.

rhabdomyoblastoma. See **rhabdomyosarcoma.**

rhabdomyolysis /rab′dōmī·ol′isis/, a paroxysmal, potentially fatal syndrome caused by the breakdown of skeletal muscle fibers. It is characterized by the presence of myoglobin in the urine. It may result from untreated compartment syndrome. It is also associated with acute renal failure.

rhabdomyoma /rab′dōmī·ō′mə/ *pl*. **rhabdomyomas, rhabdomyomata** [Gk, *rhabdos*, rod, *mys*, muscle, *oma*], a tumor of striated muscle that may occur in the uterus, vagina, pharynx, tongue, or heart. Also called **myoma striocellulare.**

rhabdomyosarcoma /rab′dōmī′ō·särkō′mə/ *pl*. **rhabdomyosarcomas, rhabdomyosarcomata** [Gk, *rhabdos* + *mys*, muscle, *sarx*, flesh, *oma*], a highly malignant tumor derived from primitive striated muscle cells that occurs most frequently in the head and neck and is also found in the genitourinary tract, extremities, body wall, and retroperitoneum. In some cases the onset is associated with trauma. The initial symptoms depend on the site of tumor development and indicate local tissue or organ destruction, such as dysphagia, vaginal bleeding, hematuria, or obstructed flow of urine. Diagnostic measures may include barium x-ray studies, angiography, or tomography. Embryonal rhabdomyosarcoma occurs in the head, neck, or trunk of young children; alveolar rhabdomyosarcoma is usually seen in the extremities of adolescents; and the pleomorphic form is most common in the legs of adults. Surgical excision is rarely possible because the tumor is poorly encapsulated and tends to spread. Amputation of an affected limb or extremity may be curative. Radiotherapy and chemotherapy with combinations of actinomycin D, adriamycin, cyclophosphamide, and vinCRIStine may greatly increase the length of survival. Also called **rhabdomyoblastoma,** *rhabdosarcoma*.

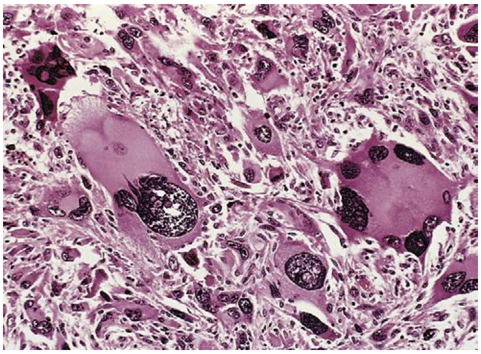
rhabdosphincter /rab′dōsfingk′tər/, a sphincter composed of striated muscle fibers.

rhabdovirus /rab′dōvī′rəs/ [Gk, *rhabdos* + L, *virus*, poison], a member of a family of viruses that includes the organism causing rabies.

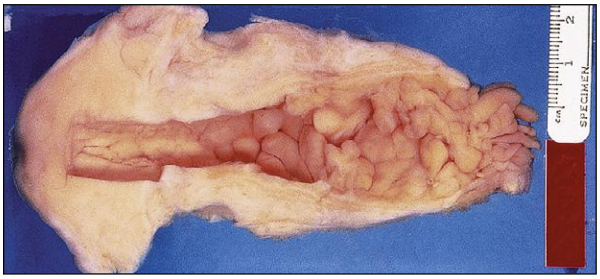
rhachi-. See **rachio-.**

rhagades /rag′ədēz/ [Gk, chinks], cracks or fissures in skin that has lost its elasticity, especially common around the mouth. See also **cheilosis.**

-rhage, -rrhage, -rhagia, -rrhagia, suffix meaning "excessive flow": *hemorrhage, metrorrhagia*.



Rhabdomyosarcoma
(Kumar et al, 2007/Courtesy Dr. Trace Worrell, Department of Pathology, University of Texas Southwestern Medical School)



Botryoid rhabdomyosarcoma
(Silverberg et al, 2006/Courtesy Dr. Frederick Askin)

Rh antiserum [Rh, rhesus; Gk, *anti,* against; L, *serum,* whey], a serum that contains Rh antibodies.

rhaphe. See **raphe.**

-rhaphy, -rrhaphy, suffix meaning "suturing in place": *colporrhaphy, gastrorrhaphy.*

Rh blood group. See **Rh factor.**

rhd, **1.** abbreviation for *radioactive health data.* **2.** abbreviation for **rheumatic heart disease.**

rhe /rē/, **1.** an absolute unit of fluidity in the centimeter-gram-second system. **2.** the reciprocal of the unit of viscosity expressed as 1/poise or 1/centipoise.

-rhea, -rrhea, suffix meaning "flow or discharge": *galactorrhea, rhinorrhea.*

rhegmatogenous /reg′mətoj′ənəs/ [Gk, *rhegma,* breakage, *gen,* producing], arising from a tear or rupture in an organ.

rhegmatogenous retinal detachment, a separation of the retina associated with a hole, break, or tear in the sensory layer of the retina. The detachment occurs secondary to the passage of vitreous fluid through the break.

rhenium (Re) /rē′nē·əm/ [L, *Rhenus,* Rhine], a hard, brittle metallic element. Its atomic number is 75; its atomic mass is 186.21. Rhenium has a high melting point and is used in x-ray tube anodes and thermometers for measuring high temperatures.

rheo-, prefix meaning "electric current, stream, flow": *rheobase, rheoscope, rheostosis, rheotaxis.*

rheobase /rē′əbās/, the least amount of electricity that will produce a stimulated response.

rheoencephalogram /rē′ō·ensef′əlōgram′/, a graphic representation of the changes in electric conductivity of the head caused by blood flowing through vessels in the head.

rheogram /rē′əgram/, a plot of shear stress versus the shear flow of a fluid.

rheology /rē·ol′əjē/, the study of the flow and deformation of matter.

Rheomacrodex, a trademark for a plasma expander (dextran 40).

rheometry /rē·om′ətrē/ [Gk, *rheos,* current, *metron,* measure], a technique for measuring the velocity of blood flow.

rheostat /rē′əstat/ [Gk, *rheos,* current, *statikos,* causing to stand], a variable resistance electric device that can be adjusted to control the strength of a current.

rheostosis /rē′ostō′sis/, a condition of bone overgrowth marked by streaks in the bones.

rhestocythemia /res′tōsīthē′mē·ə/, the presence of damaged red blood cells in the peripheral circulation.

Rhesus factor. See **Rh factor.**

rheum /ro͞om/ [Gk, *rheuma,* flow], a watery or mucous discharge from the skin or mucous membranes.

rheumatic. See **rheumatism.**

-rheumatic, suffix meaning "relating to or exhibiting traits of rheumatism": *postrheumatic, prerheumatic, pseudorheumatic.*

rheumatic aortitis, an inflammatory condition of the aorta occurring in rheumatic fever. It is characterized by disseminated focal lesions that may progressively form patches of fibrosis.

rheumatic arteritis, a complication of rheumatic fever characterized by generalized inflammation of arteries and arterioles. Fibrin mixed with cellular debris may invade, thicken, and stiffen vessel walls, and the affected vessels may be surrounded by hemorrhage and exudate.

rheumatic carditis [Gk, *rheuma,* flux, *kardia,* heart, *itis,* inflammation], pericarditis, myocarditis, and endocarditis that may be associated with acute rheumatic fever.

rheumatic chorea. See **Sydenham's chorea.**

rheumatic endocarditis [Gk, *rheuma,* flux, *endon,* within, *kardia,* heart, *itis,* inflammation], inflammation of the endocardium in association with acute rheumatic fever.

rheumatic fever (rf), a systemic inflammatory disease that may develop as a delayed reaction to an inadequately treated infection of the upper respiratory tract by group A beta-hemolytic streptococci. The disease usually occurs in young school-age children and may affect the brain, heart, joints, skin, or subcutaneous tissues. Also called **acute articular rheumatism.** See also **rheumatic heart disease.**

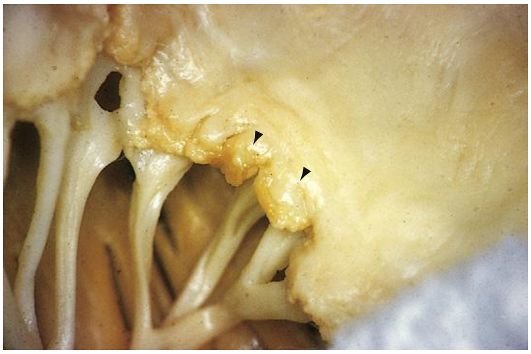
■ OBSERVATIONS: The onset of rheumatic fever is usually sudden, often occurring 1 to 5 symptom-free weeks after recovery from a sore throat or scarlet fever. Early symptoms generally include fever, joint pain, nosebleeds, abdominal pain, and vomiting. The major manifestations of this disease include migratory polyarthritis affecting numerous joints and carditis, which causes palpitations, chest pain, and, in severe cases, symptoms of cardiac failure. Sydenham's chorea is usually the sole late sign of rheumatic fever and may initially be manifested as an increased awkwardness and tendency to drop objects. As the chorea progresses, irregular body movements may become extensive, occasionally involving the tongue and facial muscles, resulting in incapacitation. Other developments may include transient erythema marginatum with circular lesions and subcutaneous rheumatic nodules on various joints and tendons, the spine, and the back of the head. There is no specific diagnostic test for rheumatic fever. The development of serum antibodies to streptococcal antigens is a positive diagnostic sign. Affected individuals may also develop leukocytosis, moderate anemia, and proteinuria. C-reactive protein, evaluated in a specimen of blood, is abnormally high in concentration. Recurrences of rheumatic fever are common. Except for carditis, all the manifestations of the disease usually subside without any permanent effects. Mild cases may last 3 to

4 weeks. Severe cases with associated arthritis and carditis may last 2 to 3 months.

■ INTERVENTIONS: Management of rheumatic fever includes bed rest and severe restriction of normal activity. Penicillin is often administered, even if throat cultures are negative, and steroids or salicylates may be used, depending on the severity of any associated carditis and arthritis.

■ NURSING CONSIDERATIONS: Symptoms largely determine the type of nursing care. The nurse is alert to signs of toxicity associated with salicylate, steroid, and antibiotic therapies. The nurse also monitors the patient's fluid status with regard to cardiac function, helps minimize joint pains by properly positioning the patient, and gives emotional support.

rheumatic heart disease (rhd), damage to heart muscle and heart valves caused by episodes of rheumatic fever. When a susceptible person acquires a group A beta-hemolytic streptococcal infection, an autoimmune reaction may occur in heart tissue, resulting in permanent deformities of heart valves or chordae tendineae. Involvement of the heart may be evident during acute rheumatic fever, or it may be discovered long after the acute disease has subsided. See also **aortic stenosis, mitral valve stenosis, rheumatic fever.**



Rheumatic heart disease *(Kumar et al, 2007)*

rheumatic nodules [Gk, *rheuma,* flux; L, *nodulus,* small knot], aggregations of fibroblasts and lymphoid cells that may accumulate in soft tissues and over bony prominences of patients afflicted with rheumatoid arthritis and rheumatic fever.

rheumatic scoliosis [Gk, *rheuma,* flux, *skoliosis,* curvature], a form of scoliosis associated with muscle spasms and acute inflammation. Also called **inflammatory scoliosis.**

rheumatid /ro͞o′mətid/ [Gk, *rheuma,* flux], a skin eruption that sometimes occurs with rheumatic disorders.

rheumatism /ro͞o′mətiz′əm/ [Gk, *rheuma,* flux], *nontechnical* **1.** any of a large number of inflammatory conditions of the bursae, joints, ligaments, or muscles characterized by pain, limitation of movement, and structural degeneration of one or more parts of the musculoskeletal system. **2.** the syndrome of pain, limitation of movement, and structural degeneration of elements in the musculoskeletal system, as may occur in gout, rheumatoid arthritis, systemic lupus erythematosus, ankylosing spondylitis, and many other diseases. **—rheumatic, rheumatoid,** *adj.*

rheumatoid arteritis /ro͞o′mətoid/ [Gk, *rheuma,* flux, *arteria,* airpipe, *itis,* inflammation], inflammation of the arterial walls associated with a rheumatic disorder. See also **rheumatoid coronary arteritis.**

rheumatoid arthritis (RA) [Gk, *rheuma,* flux, *eidos,* form, *arthron,* joint, *itis,* inflammation], a chronic, inflammatory, destructive, and sometimes deforming collagen disease that has an autoimmune component. It is characterized by symmetric inflammation of synovial membranes and increased synovial exudate, leading to thickening of the membranes and swelling of the joints. Rheumatoid arthritis usually first appears when patients, most often women, are between 36 and 50 years of age. The course of the disease is variable but is most frequently marked by alternating periods of remission and exacerbation. Also called **arthritis deformans, atrophic arthritis.** See also **ankylosing spondylitis, juvenile rheumatoid arthritis.**

■ OBSERVATIONS: The medical diagnosis and prognosis of rheumatoid arthritis are based on a variety of clinical and laboratory findings. Clinical data, mainly from radiographic studies and physical examination, classify the progress of the disease into four stages. Stage I, representing early effects, is based on x-ray films showing the onset of bone changes. Stage II, moderate rheumatoid arthritis, incorporates cases in which there is evidence of some muscle atrophy and loss of mobility, in addition to x-ray findings. Stage III, severe rheumatoid arthritis, is marked by joint deformity, extensive muscle atrophy, soft tissue lesions, and definite bone and cartilage destruction. Stage IV includes all the stage III clinical signs plus fibrous or bony ankylosis. Rheumatoid arthritis may also be classified on the basis of functional capacity: class I, no loss of function; class II, minor impairment of functional capacity with some pain and immobility; class III, capacity limited to a few tasks; and class IV, confinement to bed or a wheelchair. The disease may first be present with fatigue, weakness, poor appetite, low-grade fever, anemia, and an increased erythrocyte sedimentation rate. The diagnostic criteria listed by the American Rheumatism Association include morning stiffness, joint pain or tenderness, swelling of at least two joints, subcutaneous nodules (called arthritic nodules and usually found at pressure points such as the elbows), structural changes in joints seen on x-ray film, a positive rheumatoid factor agglutination test, decreased precipitation of mucin from synovial fluid, and characteristic histological changes on pathological examination of the fluid. Higher titers of rheumatoid factor are correlated with more severe forms of the disease, especially forms with extraarticular manifestations, such as cardiac involvement, vasculitis, pulmonary disease, and proteinuria. There may also be a thickening of synovial membranes, called pannus formation. In long-term, severe, chronic rheumatoid arthritis, Felty's syndrome may be present. Rheumatoid arthritis is not always progressive, deforming, or debilitating; most patients may continue in their jobs.

■ INTERVENTIONS: Treatment includes sufficient rest, range-of-motion exercises to maintain joint function, medication for the relief of pain and reduction of inflammation, orthopedic intervention to prevent or correct deformities, proper nutrition, and weight loss, if necessary. Salicylates are usually given. If improvement is not achieved, other antiinflammatory agents may be used, such as indomethacin, phenylbutazone, antimalarials, gold salts, or some antineoplastic drugs. Corticosteroids are prescribed with caution because of their side effects, including gastric ulcer, adrenal suppression, and osteoporosis. Other treatments, including diathermy, ultrasound, warm paraffin applications, exercise under water, and applications of heat, are occasionally used.

■ NURSING CONSIDERATIONS: The nurse monitors drug treatment and notes its effects; encourages the patient to get sufficient sleep and to rest both small and weight-bearing joints; suggests the most effective use of heat or cold; instructs the patient in muscle-strengthening exercises and methods for easing pain and preventing deformities, such as the proper use of pillows, splints, or molds; and offers emotional support. Because stress often precedes exacerbation of the condition, the patient is counseled to avoid situations known to cause anxiety, worry, fatigue, or infection.

rheumatoid coronary arteritis, an abnormal condition characterized by a thickening of the tunica intima of the coronary arteries, which may produce coronary insufficiency. Rheumatoid coronary arteritis is a collagen disease that causes inflammation and fibrinoid degeneration of connective tissue. It is commonly treated with glucocorticoids.

rheumatoid factor (RF), antiglobulin antibodies often found in the serum of patients with a clinical diagnosis of rheumatoid arthritis. Rheumatoid factors are present in about 70% of such cases, but they may also be found in such widely divergent diseases as tuberculosis, parasitic infections, leukemia, and connective tissue disorders. See also **latex fixation test.**

Joint changes in rheumatoid arthritis
(LaFleur Brooks and LaFleur Brooks, 2012)

rheumatoid factor (RF) test, a blood test whose results are positive in approximately 80% of patients with rheumatoid arthritis. Abnormal levels of RF that are lower than those characteristic of rheumatoid arthritis may indicate systemic lupus erythematosus, Sjögren's syndrome, scleroderma, and other autoimmune conditions. RF is not a useful disease marker because its presence does not disappear in patients who are experiencing a remission from the disease symptoms.

rheumatoid pneumoconiosis. See **Caplan's syndrome.**

rheumatoid spondylitis. See **Strümpell-Marie disease.**

rheumatologist /ro͞o′mətol′ə′jist/, a specialist in the treatment of disorders of the connective tissue.

rheumatology /-ol′əjē/ [Gk, *rheuma,* flux, *logos,* science], the study of disorders characterized by inflammation, degeneration, or metabolic derangement of connective tissue and related structures of the body. These disorders are sometimes referred to collectively as rheumatism.

Rh factor, refers to the D antigen, found on the erythrocytes of 85% of the Caucasian population and varying frequencies in other populations. Rh-positive or Rh-negative refers to the presence or absence of the D antigen, but many other antigens are also part of this system, most notably C, c, E, and e. D is the most immunogenic antigen outside the ABO system; therefore D-negative recipients should receive only D-negative donor blood to avoid exposure and immunization to D. D-negative mothers who carry D-positive infants should receive Rh immune globulin to prevent immunization during pregnancy and delivery. Also called **Rhesus factor.** See also **anti-Rh agglutinin, erythroblastosis fetalis, Rh_O(D) immunoglobulin.**

Rh genes [Rh, rhesus; Gk, *genein,* to produce], Rh antigens on the red cell membrane produced by allelic genes at two closely linked loci on chromosome 1, RhD and RhCE.

rhigo-, prefix meaning "shivering or cold": *rhigolene, rhigosis, rhigotic.*

Rh immune globulin. See **Rh_o(D) immunoglobulin.**

rhin-. See **rhino-.**

rhinalgia /rīnal′jə/, pain involving the nose.

Rh incompatibility, the agglutination (clumping together) of red blood cells as a result of mixing different antigens (agglutinogens) present on the surface of the cells. This agglutination is an immune reaction and depends on the formation of antibodies against the specific agglutinogen (Rh factor) present on the red blood cells and in blood from a transfusion or fetal tissues. The immune reaction does not occur immediately, but depends on the gradual formation of antibodies. For example, a D-negative (Rh negative) person who has been previously exposed to D-positive red cells through transfusion or pregnancy may produce anti-D, and therefore be incompatible with all D-positive (Rh positive) red cells. See also **Rh factor.**

rhinedema /rī′nedē′mə/, a fluid accumulation in the mucous membrane of the nose.

rhinencephalon /rī′nensef′əlon/ *pl*. **rhinencephala** [Gk, *rhis*, nose, *encephalon*, brain], the part of each cerebral hemisphere that contains the limbic system, which is associated with the emotions. See also **limbic system. —rhinencephalic,** *adj*.

rhinenchysis /rī′nenkī′sis, rīnen′kisis/, douching of the nasal cavity.

rhinitis /rīnī′tis/ [Gk, *rhis* + *itis*, inflammation], inflammation of the mucous membranes of the nose, usually accompanied by swelling of the mucosa and a nasal discharge. It may be complicated by sinusitis. Rhinitis may be **acute, allergic, atrophic,** or **vasomotor.** Also called **coryza.**

rhino- /rī′nō-/, **rhin-,** prefix meaning "nose or noselike structure": *rhinocephalia, rhinolalia, rhinoplasty*.

Rhinocort, a trademark for a nasal corticosteroid **(budesonide).**

rhinoentomophthoromycosis /ri′no-en′to-mof′tho-ro-mi-ko′sis/, the usual form of an infection by *Conidiobolus coronatus*, marked by development of large polyps in the subcutaneous tissues of the nose and paranasal sinuses. Orbital involvement with unilateral blindness may follow. Sometimes, especially in weak or immunocompromised patients, it can spread to the central nervous system and cause fatal rhinocerebral zygomycosis.

rhinolaryngitis /-ler′injī′tis/ [Gk, *rhis*, nose, *larynx*, throat, *itis*, inflammation], an inflammation of the mucous membranes of the nose and throat.

rhinolith /rī′nəlith/, a concretion in the nasal cavity.

rhinolithiasis /rī′nəlithī′əsis/, the formation of concretions in the nasal cavity.

rhinologist /rīnol′əjist/, a physician who specializes in the diagnosis and treatment of disorders of the nose.

rhinology /rīnol′əjē/, a branch of medicine specializing in the diagnosis and treatment of disorders involving the nose.

rhinomanometer /rī′nōmənom′ətər/, a device for measuring the air pressure in the nose. It is used in the diagnosis of nasal obstruction.

rhinomycosis /rī′nōmīkō′sis/, a fungal infection of the mucous membrane of the nose.

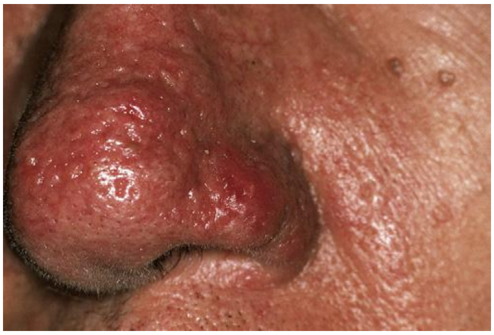
rhinopathy /rīnop′əthē/ [Gk, *rhis* + *pathos*, disease], any disease or malformation of the nose.

rhinopharyngeal. See **nasopharyngeal.**

rhinophycomycosis /rī′nōfī′kōmīkō′sis/, an infection of the nasal and paranasal sinuses caused by the phycomycete *Entomophthora coronata*. The infection often spreads to surrounding tissues, including the eye and brain.

rhinophyma /rī′nōfī′mə/ [Gk, *rhis* + *phyma*, tumor], a form of rosacea in which there is sebaceous hyperplasia, redness, prominent vascularity, swelling, and distortion of the skin of the nose. Treatment includes dermabrasion, electrosurgery, plastic surgery, and laser resurfacing. See also **rosacea.**

rhinoplasty /rī′nəplas′tē/ [Gk, *rhis* + *plassein*, to mold], a procedure in plastic surgery in which the structure of the nose is changed or shaped. Bone or cartilage may be removed, tissue grafted from another part of the body, or synthetic material implanted to alter the shape. After surgery any respiratory difficulty is reported immediately. The head of the bed should be elevated postoperatively. Frequent oral care is given, and ice compresses are applied to decrease the pain and edema that usually occur. Edema and discoloration around the eyes are expected to last for several days. The procedure is most frequently performed for cosmetic reasons.



Rhinophyma *(Regezi, Sciubba, and Jordan, 2008)*

rhinorrhagia /rī′nôrā′jə/ [Gk, *rhis*, nose, *rhegnynein*, to gush forth], a profuse nosebleed.

rhinorrhea /rī′nôrē′ə/ [Gk, *rhis* + *rhoia*, flow], **1.** the free discharge of a thin watery nasal fluid. **2.** the flow of cerebrospinal fluid from the nose after an injury to the head.

rhinosalpingitis /rī′nōsal′pinjī′tis/, an inflammation of the mucous membranes of the nose and eustachian tube.

rhinoscleroma /rī′nosklirō′mə/, a chronic inflammation in the nose, spreading to the larynx and pharynx. The cause is an infection of *Klebsiella rhinoscleromatis*.

rhinoscope /rī′nəskōp/, an instrument for examining the nasal passages through the anterior nares or through the nasopharynx.

rhinoscopy /rīnos′kəpē/ [Gk, *rhis* + *skopein*, to look], an examination of the nasal passages to inspect the mucosa and detect inflammation, deformities, or asymmetry, as in deviation of the septum. The nasal passages may be examined anteriorly by introducing a speculum into the anterior nares or posteriorly by introducing a rhinoscope through the nasopharynx. **—rhinoscopic,** *adj*.

rhinosporidiosis /rī′nōspərid′ē·ō′sis/ [Gk, *rhis* + *sporo*, seed, *osis*, condition], an infection caused by the fungus *Rhinosporidium seeberi*. It is characterized by fleshy red polyps on the mucous membranes of the nose, conjunctiva, nasopharynx, and soft palate. The disease may be acquired by swimming or bathing in infected water. The most effective treatment is electrocautery.

rhinostenosis /rī′nōstənō′sis/, an abnormal narrowing of a nasal passage.

rhinotomy /rīnot′əmē/ [Gk, *rhis* + *temnein*, to cut], a surgical procedure in which an incision is made along one side of the nose, performed to drain accumulated pus from an abscess or a sinus infection. Under local anesthesia the flap of skin and lining of the nose are turned back to provide a full view of the nasal passages for radical sinus surgery.

rhinovirus /rī′nōvī′rəs/ [Gk, *rhis* + L, *virus*, poison], any of about 100 serologically distinct, small ribonucleic acid viruses that cause about 40% of acute respiratory illnesses. Infection is characterized by dry scratchy throat, nasal congestion, malaise, and headache. Fever is minimal. Nasal discharge lasts 2 or 3 days. Children may also develop a cough. Type-specific antibodies may last for 2 to 4 years. The treatment is nonspecific and may include rest, analgesics, antihistamines, and nasal decongestants. Complete recovery is usual. Also called **coryza virus.** Compare **adenovirus, parainfluenza virus, respiratory syncytial virus.** See also **cold.**

rhitid-. See **rhytid-.**

rhitidoplasty. See **rhytidoplasty.**

rhitidosis. See **rhytidosis.**

rhizo-, prefix meaning “root”: *rhizodontropy, rhizome, rhizotomist*.

rhizoid /rī′zoid/, resembling a root or serving to anchor.

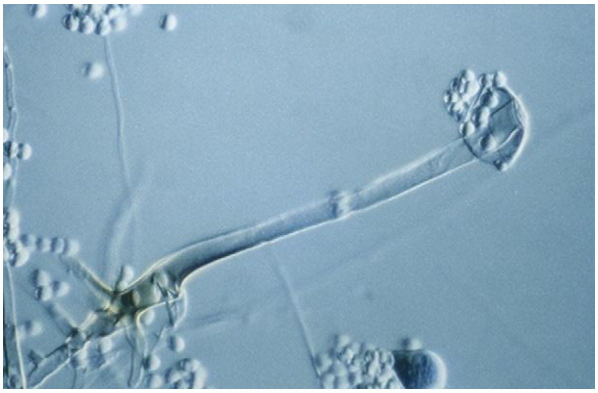
rhizome, an underground plant stem, growing more or less horizontally, that usually has roots on its underside and bears buds.

rhizomelia /rī′zōmē′lyə/ [Gk, *rhizo*, root, *melos*, limb], **1.** a disorder of the hips and shoulders. **2.** an anomaly in the length of the arms and legs of an individual.

rhizomelic /rī′zəmel′ik/ [Gk, *rhizo*, root, *melos*, limb], pertaining to the hips and shoulder.

rhizomeningomyelitis /rī′zōmining′gōmī′əlī′tis/, an inflammation of the nerve roots, meninges, and spinal cord.

Rhizopus /rī′zōpəs/, a genus of perfect fungi that includes some species identified as a cause of zygomycosis in humans. Several species are molds and saprobes on fruits, vegetables, or baked goods and can cause mucormycosis.



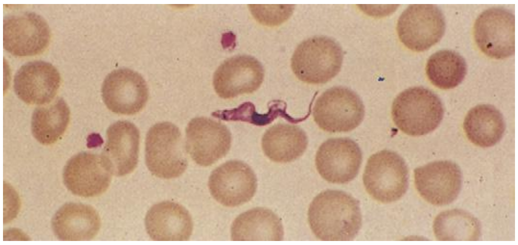
Rhizopus *(Mahon, Lehman, and Manuselis, 2011)*

rhizotomy /rīzot′əmē/, the surgical resection of the dorsal root of a spinal nerve, performed to relieve pain and sometimes to decrease spasms.

Rh negative. See **Rh factor.**

rho /rō/, P, ϱ, the seventeenth letter of the Greek alphabet.

Rhodesian trypanosomiasis /rōdē′zhən/, an acute form of African trypanosomiasis, caused by the parasite *Trypanosoma brucei rhodesiense*. The disease may progress rapidly, causing encephalitis, coma, and death in only a few weeks. Also called **kaodzera, *Trypanosoma brucei rhodesiense*.** Compare **Gambian trypanosomiasis.** See also **African trypanosomiasis.**



***Trypanosoma rhodesiense,* the parasite that causes Rhodesian trypanosomiasis**
(Goldman et al, 2012)

$\mathrm{Rh_O}$(D) immunoglobulin, a passive immunizing agent. Also called **Rh immune globulin.**

■ INDICATIONS: It is prescribed to prevent Rh sensitization after abortion, miscarriage, ectopic pregnancy, or normal birth to an Rh-negative mother of an Rh-positive infant or fetus.

■ CONTRAINDICATIONS: It is not given to an $\mathrm{Rh_O}$(D)-positive patient or to the infant or those previously sensitized to Rh.

■ ADVERSE EFFECTS: The most serious adverse effect is anaphylaxis.

rhodium (Rh) /rō′dē·əm/ [Gk, *rhodon*, rose], a grayish-white metallic element. Its atomic number is 45; its atomic mass is 102.91. Rhodium is used for providing a hard lustrous coating on other metals and in the making of mirrors.

rhodo-, prefix meaning “red”: *rhodocyte, rhodopsin, rhodotoxin*.

rhodopsin /rōdop′sin/ [Gk, *rhodon*, rose, *opsis*, vision], the purple pigmented compound in the rods of the retina, formed by a protein, opsin, and a derivative of vitamin A, retinal. Rhodopsin gives the outer segments of the rods a purple color and adapts the eye to low-density light. The compound breaks down when struck by light, and this chemical change triggers the conduction of nerve impulses. Brief periods of darkness allow the opsin and the retinal to reconstitute the rhodopsin, which accounts for the short delay a person experiences in adapting to sudden or drastic changes in lighting, as when moving out of bright sunlight into a darkened room or from darkness into bright light. Closing the eyes is a natural reflex that allows reconstitution of rhodopsin. Compare **iodopsin.** See also **visual purple.**

Rhodotorula /rō′dətôr′yələ/, a genus of yeasts, including species such as *R. rubra* that have been identified as causes of endocarditis and septicemia, particularly in immunocompromised patients.

rhoencephalography, a technique for monitoring blood flow in the brain by recording pulsatile changes in the electric impedance of the brain.

RhoGAM, a trademark for an immune globulin **($\mathrm{Rh_O}$ [D] immune globulin).**

rhombencephalon /rom′bensef′əlon/ [Gk, *rhombos*, parallelogram, *enkephalos*, brain], the most caudal of the three primary vesicles of the embryonic brain.

rhomboid /rom′boid/ [Gk, *rhombos*, rhombus, *eidos*, form], resembling the shape of an oblique equilateral parallelogram, as a rhomboid muscle.

rhomboidal sinus /rom′boidəl/, an opening in the central canal of the lumbar spinal cord.

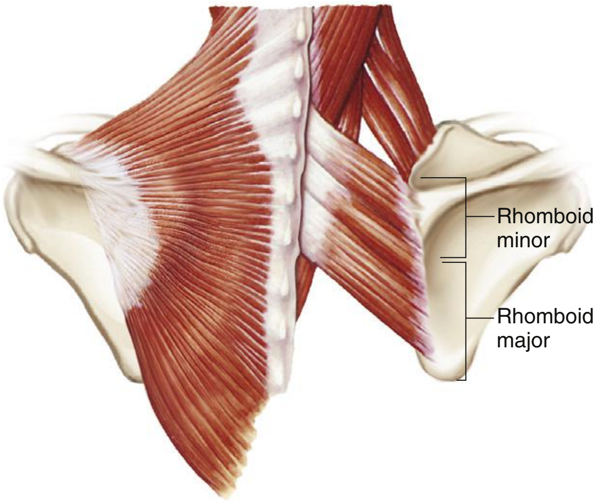
rhomboideus major /romboi′dē·əs/ [Gk, *rhombos*, rhombus, *eidos*, form], a muscle of the upper back below and parallel to the rhomboideus minor. It inserts into the lower half of the medial border of the scapula. With the rhomboideus minor, it functions to draw the scapula toward the vertebral column while supporting it and drawing it slightly upward. Compare **latissimus dorsi, levator scapulae, rhomboideus minor, trapezius.**

rhomboideus minor, a muscle of the upper back, above and parallel to the rhomboideus major. It arises from the nuchal ligament and from the spinous processes of the seventh cervical and first thoracic vertebrae. It inserts into the upper part of the medial border at the root of the spine of the scapula. With the rhomboideus major, it acts to draw the scapula toward the vertebral column while supporting the scapula and drawing it slightly upward. Compare **latissimus dorsi, levator scapulae, rhomboideus major, trapezius.**

rhomboid glossitis. See **median rhomboid glossitis.**

rhombomere /rom′bəmir/, any of the nine segments of the embryonic neural tube.

rhonchus /rong′kəs/ *pl*. **rhonchi** [Gk, *rhonchos*, snore], an abnormal sound heard on auscultation of an airway obstructed by thick secretions, muscular spasm, neoplasm, or external pressure. The continuous rumbling sound is more



Rhomboideus major and rhomboideus minor
(Patton and Thibodeau, 2010)

pronounced during expiration and characteristically clears on coughing, whereas gurgles do not.

rhotacism /rō′təsizm/, a speech disorder consisting of imperfect pronunciation of the /r/ sound. Also called **pararhotacism.** Compare **lallation.**

Rh positive. See **Rh factor.**

r-HuEPO, abbreviation for *recombinant human erythropoietin*.

rhus /rus/, any member of the genus *Rhus*. See also **rhus dermatitis.**

Rhus, a genus of vines and shrubs of the family Anacardiaceae, many of which are poisonous. Some species contain urushiol, a highly allergenic oleoresin mixture, and contact with them produces a severe dermatitis **(rhus dermatitis)** in sensitive persons. The most important toxic species are *Rhus radicans* L. (poison ivy), *R. diversiloba* L. (western poison oak), *R. quercifolia* (eastern poison oak), and *R. vernix* L. (poison sumac).

rhus dermatitis /ro͞os/ [Gk, *rhous,* sumac], a form of contact dermatitis caused by exposure to an allergenic oil, toxicodendrol, present in any part of a plant of the genus *Rhus* such as poison ivy, poison oak, or poison sumac. Contact with a rhus plant can result in severe itching, rashes, and blistering. Even the smoke of burning rhus plants may be toxic. See also **contact dermatitis, poison ivy dermatitis.**

rhyp-, prefix meaning "filth": *rhyparia, rhypophagy, rhypophobia*.

rhythm /rith′əm/ [Gk, *rhythmos*], the relationship of one impulse to neighboring impulses as measured in time, movement, or regularity of action.

rhythmic nystagmus. See **nystagmus.**

rhythm method, old popular name for natural family planning.

rhytid /ri′tid/, *pl.* **rhy′tides,** skin wrinkle.

rhytid-, rhitid-, prefix meaning "wrinkle, or wrinkled": *rhytidectomy, rhytidosis*.

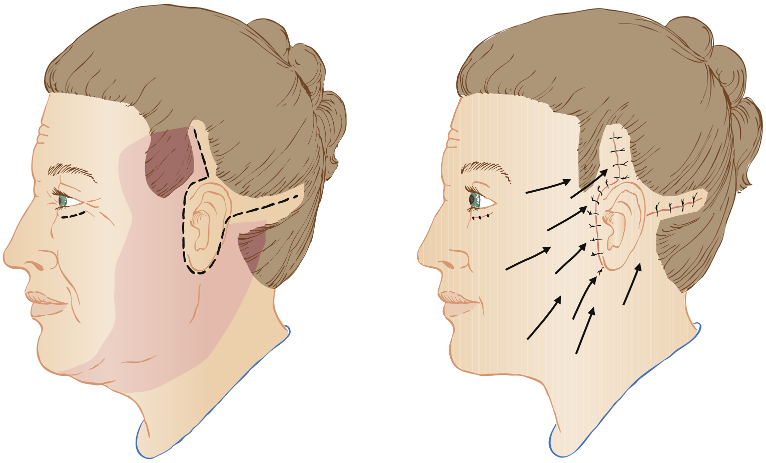
rhytidectomy. See **face lift.**

rhytidoplasty /ritid′ōplas′tē/ [Gk, *rhytis,* wrinkle, *plassein,* to mold], a procedure in reconstructive plastic surgery in which the skin of the face is tightened, wrinkles are removed, and the skin is made to appear firm and smooth. An incision is made at the hairline, and excess skin is separated from the supporting tissue and excised. The edges of the remaining skin are pulled up and back and sutured at the hairline. A pressure dressing is applied and left in place for 24 to 48 hours. Postoperative medication for pain is often necessary. The sutures are removed several days after discharge in an outpatient facility or in the surgeon's office. Also spelled **rhitidoplasty.**

rhytidosis /rit′idō′sis/ [Gk, *rhytis,* wrinkle, *osis,* condition], a wrinkling, especially of the cornea. Also spelled **rhitidosis.**

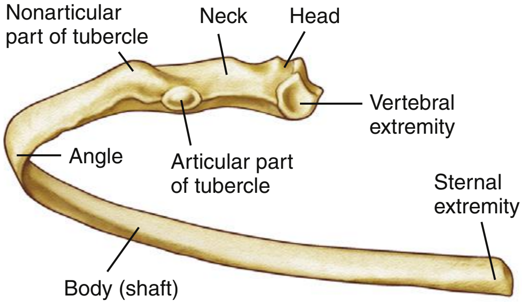
RIA, abbreviation for **radioimmunoassay.**

rib [AS, roof], one of the 12 pairs of arches of bone forming a large part of the thoracic skeleton. The first seven ribs on each side are called *true ribs* because they articulate directly with the sternum and vertebrae. The remaining five ribs are called *false ribs*. The first three attach ventrally to ribs above; the last two are free at their ventral extremities and are called **floating ribs.** True ribs are also known as vertebrosternal ribs; false ribs as vertebrocostal ribs; and floating ribs as vertebral ribs. See also **thorax.**



Before face lift and blepharoplasty
After face lift and blepharoplasty

Rhytidoplasty *(Black and Hawks, 2009)*



Rib

ribavirin /rī′bəvir′in/, an aerosol antiviral drug.

■ INDICATIONS: It is prescribed for the treatment of respiratory syncytial virus infections for the lower respiratory tract in infants and small children.

■ CONTRAINDICATIONS: It is not recommended for infants requiring assisted ventilation.

■ ADVERSE EFFECTS: Reported side effects include bacterial pneumonia, pneumothorax, apnea, hypotension, and cardiac arrest, conditions that may also have resulted from the patient's underlying disease; deteriorated respiratory function; rash; conjunctivitis; and reticulocytosis.

rib fracture, a break in a bone of the thoracic skeleton caused by a blow or crushing injury or by violent coughing or sneezing. It may also be a pathological fracture secondary to metastatic disease. The ribs most commonly broken are the fourth to eighth; if the bone is splintered or the fracture is displaced, sharp fragments may pierce the lung, causing hemothorax or pneumothorax.

■ OBSERVATIONS: The patient with a fractured rib suffers pain, especially on inspiration, and usually breathes rapidly and shallowly. The site of the break is generally very tender to the touch, and the crackling of bone fragments rubbing together may be heard on auscultation. Breath sounds may be absent, decreased, or accompanied by rales and rhonchi. The location and nature of the fracture are determined by chest x-ray studies. The patient is observed for signs of hemoptysis, hemothorax, flail chest, atelectasis, pneumothorax, and pneumonia.

■ INTERVENTIONS: Fractured ribs may be splinted with an elastic belt or bandage or adhesive strapping. To prevent irritation, the area may be shaved and painted with tincture of benzoin before the adhesive tape is applied. Increasingly, however, no splints are used, because they compromise chest expansion and predispose the patient to pulmonary complications. If hospitalization is required, the patient is placed in a semi-Fowler's position, and the blood pressure, pulse, temperature, respirations, and breath sounds are checked every 2 to 4 hours. An analgesic may be ordered, but morphine sulfate is avoided because it depresses respiration. If strapping and analgesic medication fail to relieve pain, the physician may perform a regional nerve block by infiltrating the intercostal spaces above and below the fracture site with 1% procaine.

■ NURSING CONSIDERATIONS: The nurse assists in splinting the chest, administers the ordered medication, helps the patient to turn, and instructs the patient in how to perform deep breathing, coughing, and range-of-motion exercises of the extremities.

riboflavin /ri′bōflā′vin/ [*ribose* + L, *flavus,* yellow], a yellow, crystalline, water-soluble pigment, one of the heat-stable components of the B vitamin complex. It combines with specific flavoproteins and functions as a coenzyme in the oxidative processes of carbohydrates, fats, and proteins. Small amounts of riboflavin are found in the liver and kidneys, but it is not stored to any great degree in the body and must be supplied regularly in the diet. Common sources are organ meats, milk, cheese, eggs, green leafy vegetables, meat, whole grains, and legumes. Deficiency of riboflavin is rare and produces cheilosis; local inflammation; desquamation; encrustation; glossitis; photophobia; corneal opacities; proliferation of corneal vessels; seborrheic dermatitis about the nose, mouth, forehead, ears, and scrotum; trembling; sluggishness; dizziness; edema; inability to urinate; and vaginal itching. Also called **vitamin B_2.** See also **ariboflavinosis.**

ribonuclear protein (RNP) /rī′bōno͞o′klē·ər/ [ribose; L, *nucleus,* nut kernel; Gk, *proteios,* first rank], a conjugated protein consisting of a protein molecule and a nucleic acid.

ribonuclease (RNase) /-no͞o′klē·ās/, a class of endonucleases that hydrolyzes ribonucleic acids.

ribonucleic acid (RNA) /rī′bōno͞oklē′ik/ [*ribose* + L, *nucleus,* nut kernel, *acidus,* sour], a nucleic acid, found in both the nucleus and cytoplasm of cells, that plays several roles in the translation of the genetic code and the assembly of proteins. Kinds of RNA include **messenger RNA, ribosomal RNA,** and **transfer RNA.** See also **deoxyribonucleic acid.**

ribonucleoside /rī′bōno͞o′klē·əsīd′/, a nucleoside in which the sugar component is ribose. The ribonucleosides of RNA are adenosine, cytidine, guanosine, and uridine.

ribonucleotide /-no͞o′klē·ətīd′/, a class of nucleotides in which the pentose is D-ribose.

ribose /rī′bōs/, a 5-carbon sugar that occurs as a component of RNA.

ribosomal RNA (rRNA) /rī′bōsō′məl/, the ribonucleic acid of ribosomes and polyribosomes.

ribosome /rī′bəsōm/ [*ribose* + Gk, *soma,* body], an organelle composed of RNA and protein that functions in the synthesis of protein. Ribosomes interact with messenger RNA and transfer RNA to link amino acid into a polypeptide chain in a sequence determined by the sequence of nucleotides in the messenger RNA. Ribosomes may exist singly, in clusters as polysomes, or attached to the "rough" endoplasmic reticulum. See also **translation.**

Ribosome *(Patton and Thibodeau, 2010)*

ribosome-inactivating protein (RIP), one of a variety of enzymes that cleave the *N*-glycosidic bond of adenine in a specific ribosomal RNA sequence. Type 1 RIPs are single-chain proteins. Some type 2 RIPs, such as ricin, possess a galactose-specific lectin domain that binds to cell surfaces, making them potent toxins.

ribosuria /rī′bəso͝or′ē·ə/, the presence of ribose in the urine, usually a sign of muscular dystrophy.

ribovirus. See **RNA virus.**

rib shaking, a procedure in physiotherapy in which constant, downward pressure is applied with an intermittent shaking motion of the hands on the rib cage over the area being drained. It is done with the flat part of the palm of the hand over the lung segment being drained during 4 to 12 prolonged exhalations by the patient through pursed lips.

rib vibration, a procedure in physiotherapy similar to rib shaking but done with a downward vibrating pressure with the flat part of the palm during exhalations.

RICE, abbreviation for *r*est, *i*ce, *c*ompression, *e*levation, referring to the treatment for sprains and strains.

rice diet [Gk, *oryza,* rice, *diaita,* way of living], a diet consisting only of rice, fruit, fruit juices, and sugar, supplemented with vitamins and iron. Salt is forbidden. It is prescribed for the treatment of hypertension, chronic renal disease, and obesity. It should not be followed for any length of time, because the severe dietary restrictions may lead to nutritional deficiencies or imbalance. Also called **Kempner rice-fruit diet.**

Richards, Linda, (1841–1930), a nurse considered to be the first American-trained nurse, and a graduate of the first class of the New England Hospital for Women and Children. She then studied at the Nightingale Training School in London and in 1873 organized the Massachusetts General Hospital Training School. In 1885 she was sent to Japan to develop a training school at the Charity Hospital. In 1891 she took charge of the Philadelphia Visiting Nurse Society. She is credited with being the first to keep written records on patients, a practice she started when she worked as night superintendent at Bellevue Hospital in New York City.

Richet's aneurysm. See **fusiform aneurysm.**

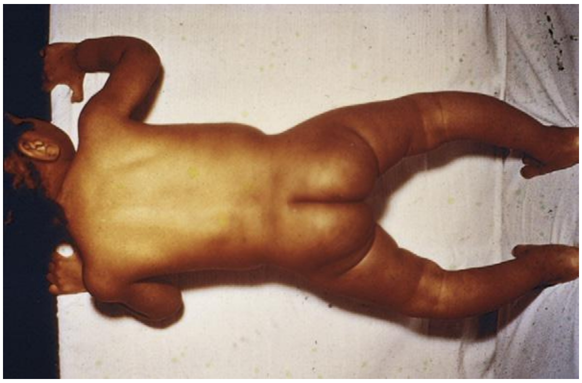
Richter's hernia /rik′tərz, rish′tərz/ [August G. Richter, German surgeon, 1742–1812], a small, nonpalpable visceral protrusion involving only a part of the intestinal wall. Also called **parietal hernia.**

ricin /rī′sin/, a poison made from waste produced in processing castor beans. It can take the form of a powder, mist, or pellet or can be dissolved in water or weak acid and can be used as a poison by ingestion, inhalation, or injection. As little as 500 micrograms can be a fatal dose. It cannot be spread by person-to-person contact. Poisoning is treated by minimizing exposure and by supportive care. There is no antidote. Also called *ricinine*. See also **ribosome-inactivating protein.**

rickets /rik′əts/ [Gk, *rachis,* backbone, *itis,* inflammation], a condition caused by the deficiency of vitamin D, seen primarily in infancy and childhood and characterized by abnormal bone formation. Symptoms include soft, pliable bones causing such deformities as bowlegs and knock-knees; nodular enlargements on the ends and sides of the bones; muscle pain; enlarged skull; chest deformities; spinal curvature; enlargement of the liver and spleen; profuse sweating; and general tenderness of the body when touched. Prophylaxis and treatment include a diet rich in calcium, phosphorus, and vitamin D and adequate exposure to sunlight. Kinds of rickets include **celiac rickets, renal rickets,** and genetic forms of *vitamin D–resistant rickets*. See also **osteodystrophy, osteomalacia, vitamin D. —rachitic,** *adj.*

■ OBSERVATIONS: Characteristic manifestations in infants and children include soft, pliable bones; softening of skull bones; enlargement of ribs at costochondral junctions; limb deformities; epiphyseal swelling (bowed legs and knock-knees); pigeon breast deformity; Harrison's groove; spinal deformities; and possible decrease in thoracic volume. Spleen and liver may be enlarged. Body is generally tender to touch. Bone deformities are seen on radiographs. Adults may have bone pain, fractures, weakness, weight loss, and malaise.

■ INTERVENTIONS: Prevention and treatment are the same and include a diet rich in calcium, phosphorus, and vitamin D and adequate exposure to sunlight. Surgical intervention may be indicated for correction of a slipped femoral epiphysis in infants and young children. Deformities may need correction through bracing. The health care team should focus on prevention, with education about the importance of calcium and vitamin D in diet and prevention of complications associated with existing disease.



Rickets *(Kumar et al, 2007)*

Rickettsia /riket′sē·ə/ *pl.* **rickettsiae** [Howard T. Ricketts, American pathologist, 1871–1910], a genus of microorganisms that combines aspects of both bacteria and viruses. They can be observed with a light microscope, divide by fission, and may be controlled with antibiotics. They also exist as viruslike intracellular parasites, living in the intestinal tracts of insects such as lice. Thus a human infested with lice is also likely to be infected with a form of typhus transmitted by *Rickettsia prowazeki*. Rickettsial diseases have been responsible for many of history's worst epidemics. The various species are distinguished on the basis of similarities in the diseases they cause. The spotted fever group includes diseases such as Rocky Mountain spotted fever and rickettsialpox; the typhus group includes epidemic typhus and murine typhus; and a miscellaneous group includes Q fever and trench fever. Rickettsial diseases are uncommon in parts of the world where insect and rodent populations are well controlled. **—rickettsial,** *adj.*

Rickettsia burnetii. See ***Coxiella burnetii.***

rickettsial disease [Howard T. Ricketts; L, *dis* + Fr, *aise,* ease], an infection caused by a species of *Rickettsia*. Examples include Rocky Mountain spotted fever and typhus.

rickettsialpox /riket′sē·əlpoks′/ [Howard T. Ricketts; ME, *pokkes,* pustules], a mild, acute infectious disease caused by *Rickettsia akari* and transmitted from mice to humans by mites *(Allodermanyssus sanguineus)*. It is characterized by an asymptomatic crusted primary lesion, chills, fever, headache, malaise, myalgia, and a rash resembling chickenpox. About 1 week after onset of symptoms, small, discrete, maculopapular lesions appear on any part of the body, but rarely on palms or soles. These lesions become vesicular and dry and form scabs. Eventually the scabs fall off, leaving no scars. Chloramphenicol or tetracycline hastens recovery. Prevention involves the elimination of house mice. Also called **Kew Gardens spotted fever.** Compare **Rocky Mountain spotted fever.** See also ***Rickettsia.***

rickettsiosis /riket′sē·ō′sis/ *pl.* **rickettsioses** [Howard T. Ricketts; Gk, *osis,* condition], any of a group of infectious diseases caused by microorganisms of the genus *Rickettsia*. Kinds of rickettsioses include a spotted fever group **(boutonneuse fever, rickettsialpox, Rocky Mountain spotted fever),** a typhus group **(epidemic typhus, murine typhus,**

scrub typhus), and a miscellaneous group **(Q fever, trench fever).** See also ***Rickettsia.***

Ridaura, a trademark for an oral disease-modifying antirheumatoid drug **(auranofin).**

rider's bone [AS, *ridan,* to ride, *ban,* bone], a bony deposit that sometimes develops in horseback riders on the inner side of the lower end of the tendon of the adductor muscle of the thigh. Also called **cavalry bone.**

rider's sprain [OFr, *espreindre,* to force out], a sprain of the adductor muscles of the thigh resulting from horseback riding.

ridge /rij/ [AS, *hyrcg*], a projection or projecting structure, such as the gastrocnemial ridge or crest on the posterior surface of the femur giving attachment to the gastrocnemius muscle.

ridge extension, an intraoral surgical operation for deepening the labial, buccal, or lingual sulci.

ridge lap, the part of an artificial tooth that is adjacent to or approximates the residual ridge. Proper ridge lap can give the appearance of a natural tooth.

Riedel's struma, Riedel's thyroiditis. See **fibrous thyroiditis.**

Rieder's cell leukemia /rē′dərz/ [Hermann Rieder, German pathologist, 1858–1932], a malignant neoplasm of blood-forming tissues characterized by the presence in blood of large numbers of atypical myeloblasts with immature cytoplasm and relatively mature lobulated, indented nuclei.

Riehl-Sisca, Joan, a nursing theorist who presented her symbolic interactionism theory in Riehl and Sister Callista Roy's book, *Conceptual Models for Nursing* (1980). The Riehl Interaction Model uses the nursing process in implementing nursing care. In symbolic interactionism theory, people interpret each other's actions on the basis of the meaning attached to the action before reacting. It is a process of interpretation between the stimulus and response. Riehl's emphasis is on the assessment and interpretation of the patient's actions by the nurse, who then makes predictions about the patient's behavior. This is done to plan interventions with the patient and the patient's family. Riehl views the nurse and patient as actively exchanging information and collecting knowledge. The nurse then selects from multiple theories, therapies, and allied health disciplines in planning and implementing effective nursing interventions. See also **Roy, Sister Callista.**

RIF, abbreviation for **resistance-inducing factor.**

rifa-, prefix for rifamycin-derived antibiotics.

rifabutin /rif′ah-bu′tin/, an antibacterial used for the prevention of disseminated *Mycobacterium avium* complex disease in patients with advanced HIV infection. It is administered orally.

Rifadin, a trademark for an antibacterial **(rifampin).**

rifampin /rif′əmpin/, an antibacterial.

■ INDICATIONS: It is prescribed in combination for the treatment of tuberculosis, staphylococcal infections, and *Legionella* pneumonia, and in meningococcal meningitis and ***Hemophilus influenzae*** prophylaxis.

■ CONTRAINDICATIONS: Liver dysfunction or disease or known hypersensitivity to this drug or to rifamycin prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are liver toxicity and a syndrome resembling influenza. GI distress; aches and cramps; and discoloration of urine, saliva, and sweat commonly occur. This drug interacts with many other drugs.

rifamycin /rif′ah-mi′sin/, any of a family of antibiotics biosynthesized from a strain of *Streptomyces mediterranei,* effective against a broad spectrum of bacteria. The five components are designated A, B, C, D, and E; rifamycins O, S, and SV are derivatives of the B component, and AG and X are derivatives of the O component. It is used for the initial treatment and retreatment of pulmonary tuberculosis and for prevention of meningococcal infections in close contacts of patients with *Neisseria meningitidis* infections.

rifapentine, an antitubercular.

■ INDICATIONS: Rifapentine is used to treat pulmonary tuberculosis. It must be used in combination with at least one other antitubercular.

■ CONTRAINDICATION: Known hypersensitivity to rifamycin prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects include pancreatitis, hematuria, proteinuria, thrombocytopenia, leukopenia, neutropenia, lymphopenia, and leukocytosis. Other adverse effects include rash, pruritus, urticaria, acne, visual disturbances, gout, arthrosis, edema, aggressive reaction, bilirubinemia, hepatitis, increased AST/ALT, pyuria, urinary casts, headache, fatigue, anxiety, dizziness, anemia, purpura, and hematoma. Common side effects include nausea, vomiting, anorexia, diarrhea, and heartburn.

rifaximin, a miscellaneous antiinfective.

■ INDICATION: This drug is used to treat traveler's diarrhea caused by *Escherichia coli* in adults and children older than 12 years of age.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include abnormal dreams, dizziness, insomnia, and vomiting. Common side effects include abdominal pain, constipation, defecation urgency, flatulence, nausea, rectal tenesmus, headache, and pyrexia.

Rift Valley fever, a bunyavirus infection of Egypt and east Africa spread by mosquitoes or by handling infected sheep, buffalo, goats, camels, and cattle. Those individuals infected with RVF virus typically exhibit no symptoms or a mild illness that involves fever and abnormalities of the liver. It is characterized by abrupt fever, chills, headache, and generalized aching, followed by epigastric pain, anorexia, loss of taste, and photophobia. Retinitis may cause vision loss in 1% to 10% of cases. The disease is of short duration; recovery occurs typically after 2 days to a week and is usually complete. There is no specific treatment. A killed virus vaccine that provides protection for 2 years is available in the United States for those at risk, such as laboratory workers and veterinarians.

RIG, abbreviation for **rabies immune globulin.**

Riga-Fede disease /rē′gä fā′dā/ [Antonio Riga, Italian physician, 1832–1919; Francesco Fede, Italian pediatrician, 1832–1913], an ulceration of the lingual frenum in some infants, caused by abrasion of the frenum by natal or neonatal teeth. Also called **Fede's disease.**

right atrial catheter, an indwelling IV catheter inserted centrally or peripherally and threaded into the superior vena cava and right atrium.

right atrioventricular orifice, the opening between the right atrium and ventricle of the heart. Also called **tricuspid orifice.**

right atrioventricular valve. See **tricuspid valve.**

right brachiocephalic vein [AS, *riht* + Gk, *brachion,* arm, *kephale,* head], a vessel, about 2.5 cm long, that starts in the root of the neck at the junction of the internal jugular and the subclavian veins on the right side and descends vertically from behind the sternal end of the clavicle to join the left brachiocephalic vein and form the superior vena cava. The right brachiocephalic vein, like the left, receives various tributaries, such as the vertebral vein, the internal thoracic vein, and the inferior thyroid vein. Compare **left brachiocephalic vein.**

right bundle branch block (RBBB), impaired transmission or absence of transmission of electric impulses from the atrioventricular (AV) bundle of His to the right ventricle. The block may be complete or incomplete and may be caused by a lesion in the right bundle branch or a small, focal lesion in the AV bundle. RBBB is often associated with right ventricular hypertrophy, especially in athletes and individuals under 40 years of age. In older individuals RBBB is commonly caused by coronary artery disease. A complete RBBB commonly occurs after surgical closure of a ventricular septal defect.

right common carotid artery, the shorter of the two common carotid arteries, arising from the brachiocephalic trunk, passing obliquely from the level of the sternoclavicular articulation to the upper border of the thyroid cartilage, and dividing into the right internal and external carotids. Compare **left common carotid artery.**

right coronary artery, one of a pair of branches of the ascending aorta, arising in the right posterior aortic sinus, passing along the right side of the coronary sulcus, and dividing into the right interventricular artery and a large marginal branch. It supplies both ventricles, the right atrium, and the sinoatrial node. Compare **left coronary artery.**

right coronary vein. See **small cardiac vein.**

right-handedness, a natural tendency to favor the use of the right hand. Also called **dextrality.** See also **cerebral dominance, handedness.**

right-hand rule, a principle of physics in which the direction of current flow in a wire is related to the position of the imaginary lines of force of the magnetic field about the wire. Thus, if the fingers of the right hand are flexed to represent the magnetic field and the thumb is extended, the thumb points in the direction of current flow.

right-heart failure, an abnormal cardiac condition characterized by the impairment of the right side of the heart and congestion and elevated pressure in the systemic veins and capillaries. The most common cause of right-heart failure is left-heart failure because both sides of the heart are part of a circuit and what affects one side will eventually affect the other. Right ventricular infarction, pulmonic stenosis, and pulmonary hypertension can also result in right-heart failure. In failure associated with either side of the heart, cardiac output is usually decreased. Also called **right-sided failure.** Compare **left-heart failure.** See also **heart failure.**

right hepatic duct, the duct that drains bile from the right lobe of the liver into the common bile duct.

righting reflex [AS, *riht* + L, *reflectere,* to bend back], any one of the neuromuscular responses to restore the body to its normal upright position when it has been displaced. The righting reflexes involve complicated mechanisms and processes associated with the structures of the internal ear, such as the utricle, the saccule, the macula, and the semicircular canals. Any change in the position of the head produces a change in the pressure on the gelatinous membrane of the macula. The fibers of the nerve (vestibular branch of the eight cranial nerve) transmit impulses to the brain, producing a sense of position. The head and trunk are thus kept in alignment. Also activating righting reflexes are proprioceptors in muscles and tendons and visual nerve impulses. Also called **body righting reflex.**

right interventricular artery. See **dorsal interventricular artery.**

right lymphatic duct, a vessel that conveys lymph from the right upper quadrant of the body into the bloodstream in the neck at the junction of the right internal jugular and the right subclavian veins. About 1.25 cm long, the duct courses over the medial border of the scalenus anterior. At its orifice are two semilunar valves that prevent venous blood from flowing backward into the duct. Lymph drains into the right lymphatic duct from numerous capillaries and vessels and from three lymphatic trunks in the right quadrant. Compare **thoracic duct.** See also **lymphatic system.**

right part of liver, the part of the liver that receives blood from the right branches of the hepatic portal vein and hepatic artery proper and whose bile flows out through the right hepatic duct. Also called *right liver.*

right pulmonary artery, the longer and slightly larger of the two arteries conveying venous blood from the heart to the lungs. It arises from the pulmonary trunk, bends to the right behind the aorta, and divides into two branches at the root of the right lung. Compare **left pulmonary artery.**

right-sided failure. See **right-heart failure.**

right subclavian artery, a large artery that arises from the brachiocephalic artery. It has several important branches: the axillary, vertebral thoracic, and internal thoracic arteries and the cervical and costocervical trunks, which perfuse the right side of the upper body.

right-to-know laws, laws that require employers to inform workers regarding health effects of materials they must handle, including toxic chemicals and radioactive substances. Under the authority of the U.S. Occupational Safety and Health Act of 1970, the National Institute for Occupational Safety and Health periodically revises recommendations or limits of exposure to potentially hazardous substances in the workplace. It also recommends appropriate preventive measures designed to reduce or eliminate adverse health effects of these hazards and publishes its recommendations in a variety of public documents.

right-to-left shunt [ME, *shunten*], a shunt in which unoxygenated venous blood bypasses the lungs and directly enters the arterial system, as in the tetralogy of Fallot and other conditions.

right umbilical vein, the right of the two veins in the umbilical cord that carry blood from the placenta to the sinus venosus of the heart in the early embryo. It degenerates during the seventh week.

right ventricle, the relatively thin-walled chamber of the heart that pumps blood received from the right atrium into the pulmonary arteries to the lungs for oxygenation. The right ventricle is shorter and rounder than the long conical left ventricle. The chordae tendineae of the tricuspid valve of the right ventricle are finer than the coarse strands of the chordae tendineae of the left ventricle. See also **heart.**

right ventricular thrust. See **precordial movement.**

rigid. See **rigidity.**

rigid gas permeable (RGP) contact lens, a contact lens made of rigid plastic that transmits oxygen to the cornea, which makes the lens more comfortable to wear. In comparison with soft lenses, RGP lenses hold their shape better and offer clearer vision, are more durable, and are less prone to harbor bacteria and protein deposits. However, they cause discomfort on initial wearing and require a short adaptation period. Also called **gas permeable contact lens.**

rigidity /rijid′itē/ [L, *rigere,* to be stiff], a condition of hardness, stiffness, or inflexibility. **—rigid,** *adj.*

rigidus /rij′idəs/ [L, stiff], a deformity characterized by limited motion, especially dorsiflexion of the great toe. This condition causes pain and may ultimately produce degenerative changes of the involved joints.

rigor /rig′ər/ [L, stiffness], **1.** a rigid condition of the body tissues, as in rigor mortis. **2.** a violent attack of shivering that may be associated with chills and fever.

rigor mortis /môr′tis/, the rigid stiffening of skeletal and cardiac muscle shortly after death.

Riley-Day syndrome. See **dysautonomia.**

riluzole, a glutamate antagonist.
■ INDICATION: This drug is used to treat amyotropic lateral sclerosis.
■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.
■ ADVERSE EFFECTS: Neutropenia and exfoliative dermatitis are life-threatening effects. Other adverse effects are nausea, vomiting, dyspepsia, anorexia, diarrhea, flatulence, stomatitis, dry mouth, hypertonia, depression, dizziness, insomnia, somnolence, vertigo, pruritus, eczema, alopecia, decreased lung function, rhinitis, increased cough, hypertension, tachycardia, phlebitis, palpitations, postural hypertension, urinary tract infection, and dysuria.

rim [OE, *rima,* edge], an outer edge, which may be curved or circular, as on an occluding surface built on a temporary or permanent denture base.

rima /rī′mə/, a cleft or fissure.

Rimactane, a trademark for an antibacterial **(rifampin).**

rima glottidis. See **glottis.**

rimantadine /ri-man′tah-dēn/, an antiviral agent used in prophylaxis and treatment of influenza A.

Rima respitoria, rima vestibule. See **false glottis.**

rimexolone /r-mek′sah-lōn′/, a corticosteroid used in topical treatment of inflammation after eye surgery and of uveitis affecting the anterior structures of the eye.

rimose /rī′mōs/, having many clefts or fissures.

Rimso-50, a trademark for a urinary tract antiinflammatory agent **(dimethyl sulfoxide).**

rimula /rim′yələ/ [L, small cleft], a very small fissure in the brain or spinal cord.

ring [AS, *hring*], **1.** a circular band surrounding a central opening. **2.** a closed chainlike linkage of atoms.

ring centriole, a common misnomer for the anulus of the spermatozoon, which is not actually a centriole.

ring chromosome [AS, *hring*], a circular chromosome formed by the fusion of the two ends. It is the primary type of chromosome found in bacteria.

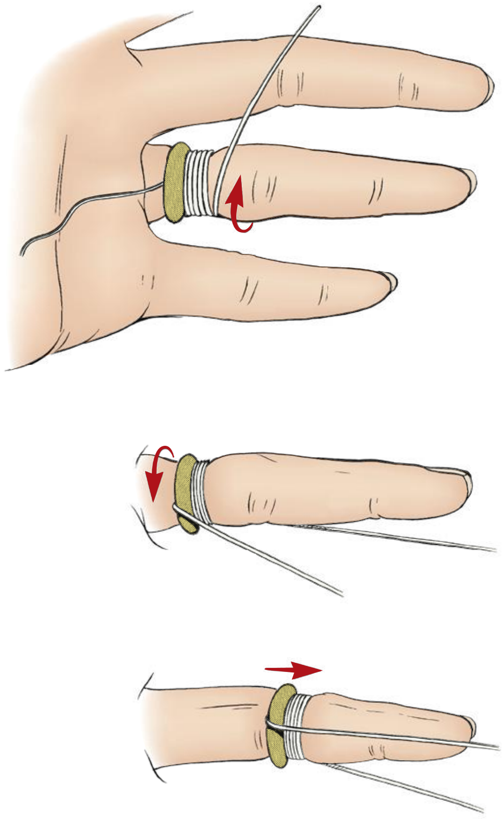
ring-down artifact, (in sonography) an echo pattern caused by reverberation in a bubble or other soft tissue entity.

ring-down time, (in ultrasonics) the time required for vibration of the transducer element at its resonance frequency to decrease to a negligible level following excitation. See also **pulse duration.**

ringed sideroblast /sid′ərōblast′/ [Gk, *sideros,* iron, *blastos,* germ], an iron-rich nucleated red blood cell precursor in the bone marrow characterized by a perinuclear ring of siderotic granules.

Ringer's lactate solution, a fluid and electrolyte replenisher. Also called **Hartmann's solution.**
■ INDICATIONS: It is prescribed for correction of extracellular volume and electrolyte depletion.
■ CONTRAINDICATIONS: Kidney failure, congestive heart failure, or hypoproteinemia prohibits its use.
■ ADVERSE EFFECTS: Among the more serious adverse effects are sodium excess and fluid overload, which may lead to pulmonary and peripheral edema.

ring removal from swollen finger, a technique for taking off a tightly fitting ring. It consists of slipping the end of a string under the ring while moving the ring toward the hand. The rest of the string is then wound around the swollen part of the finger a number of times, after which the string is unwound from the hand side, gradually easing the ring toward the fingertip. The process may need to be repeated to complete the removal.



Ring removal from swollen finger using the string technique *(Auerbach, 2012)*

ringworm. See **tinea.**

Rinne tuning fork test /rin′ə/ [Heinrich A. Rinne, German otologist, 1819–1868], a method of distinguishing conductive from sensorineural hearing loss. The base of a vibrating tuning fork is placed against the patient's mastoid bone. While one ear is tested, the other is masked. When the patient no longer hears the sound, the time in seconds is noted, and the fork is positioned about ½ inch from the ipsilateral external auditory meatus. The time the sound is heard is noted. Air-conducted sound should be heard twice as long as bone-conducted sound after bone conduction stops. In sensorineural loss the sound is heard relatively longer by air conduction; in conductive hearing loss the sound is heard longer by bone conduction. The test may be performed with tuning forks of 256, 512, and 1024 cycles.

-rinone, suffix for inamrinone-type cardiotonic agents.

Rio Grande fever. See **abortus fever.**

Riopan, a trademark for a fixed combination medication containing an antacid **(magaldrate)** and an antiflatulent **(simethicone).**

riot control agents, agents normally used for crowd control; including the compounds chloroacetophenone, chlorobenzylidenemalononitrile, chloropicrin, bromobenzylcyanide, and benzoxazepine. They are used as liquids or aerosols and exposure is by inhalation or by contact with the eyes or skin. They incapacitate by irritating the area of contact and cause irritation of the skin and mucous membranes and respiratory distress. High doses can cause blindness and death. Treatment is by removal of clothing and removing the agent from the skin and eyes. Effects cease shortly after the agent is removed. Also called **tear gas.**

RIP, **1.** abbreviation for **reflex inhibiting pattern.** **2.** abbreviation for **ribosome-inactivating protein.**

ripe cataract [OE, *ripan* + Gk, *katarrhaktes,* portcullis], a mature cataract that produces swelling and opacity of the entire lens. Also called **mature cataract.**

risedronate, a bone-resorption inhibitor.

■ INDICATION: It is used to treat Paget's disease.

■ CONTRAINDICATION: Hypersensitivity to biphosphonates prohibits its use.

■ ADVERSE EFFECTS: Dizziness and headache are adverse effects. Common side effects include abdominal pain, anorexia, diarrhea, nausea, bone pain, arthralgia, and chest pain.

risk-benefit analysis, the consideration of whether a medical or surgical procedure, particularly a radical approach, is worth the risk to the patient as compared with possible benefits if the procedure is successful.

risk control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent, eliminate, or reduce modifiable health threats. See also **Nursing Outcomes Classification.**

risk control: alcohol use, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent, eliminate, or reduce alcohol use that poses a threat to health. See also **Nursing Outcomes Classification.**

risk control: cancer, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to detect or reduce the threat of cancer. See also **Nursing Outcomes Classification.**

risk control: cardiovascular health, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to eliminate or reduce threats to cardiovascular health. See also **Nursing Outcomes Classification.**

risk control: drug use, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent, eliminate, or reduce drug use that poses a threat to health. See also **Nursing Outcomes Classification.**

risk control: hearing impairment, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent, eliminate, or reduce threats to hearing function. See also **Nursing Outcomes Classification.**

risk control: hyperthermia, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent, detect, or reduce the threat of high body temperature. See also **Nursing Outcomes Classification.**

risk control: hypothermia, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent, detect, or reduce the threat of low body temperature. See also **Nursing Outcomes Classification.**

risk control: infectious process, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent, eliminate, or reduce the threat of infection. See also **Nursing Outcomes Classification.**

risk control: sexually transmitted diseases (STD), a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent, eliminate, or reduce behaviors associated with sexually transmitted disease. See also **Nursing Outcomes Classification.**

risk control: sun exposure, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent or reduce threats to the skin and eyes from sun exposure. See also **Nursing Outcomes Classification.**

risk control: tobacco use, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent tobacco use. See also **Nursing Outcomes Classification.**

risk control: unintended pregnancy, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to reduce the possibility of unintended pregnancy. See also **Nursing Outcomes Classification.**

risk control: visual impairment, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to prevent, eliminate, or reduce threats to visual function. See also **Nursing Outcomes Classification.**

risk detection, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions taken to identify personal health threats. See also **Nursing Outcomes Classification.**

risk factor [Fr, *risque,* hazard; L, *factor,* maker], a factor that causes a person or a group of people to be particularly susceptible to an unwanted, unpleasant, or unhealthful event, such as immunosuppression, which increases the incidence and severity of infection, or cigarette smoking, which increases the risk of developing a respiratory or cardiovascular disease.

risk identification, a nursing intervention from the Nursing Interventions Classification (NIC) defined as analysis of potential risk factors, determination of health risks, and prioritization of risk reduction strategies for an individual or group. See also **Nursing Interventions Classification.**

risk identification: childbearing family, a nursing intervention from the Nursing Interventions Classification (NIC) defined as identification of an individual or family likely to experience difficulties in parenting, and prioritization of strategies to prevent parenting problems. See also **Nursing Interventions Classification.**

risk identification: genetic, a nursing intervention from the Nursing Interventions Classification (NIC) defined as identification and analysis of potential genetic risk factors in an individual, family, or group. See also **Nursing Interventions Classification.**

risk management, a function of administration of a hospital or other health facility directed toward identification, evaluation, and correction of potential risks that could lead to injury to patients, staff members, or visitors and result in property loss or damage.

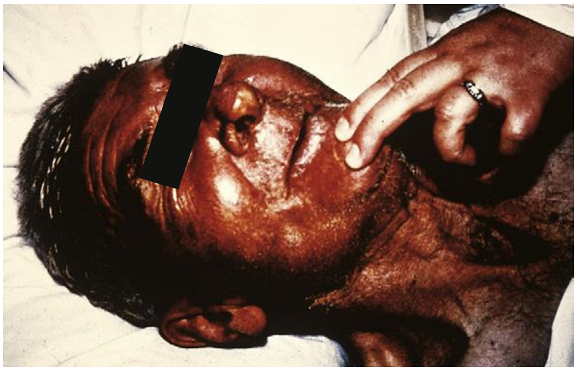
risorius /risôr′ē·əs/ [L, *ridere,* to laugh], one of the 12 muscles of the mouth. A muscular fibrous band, it arises in the fascia over the masseter and inserts into the skin at the corner of the mouth. It acts to retract the angle of the mouth, as in a smile.

Risser cast /ris′ər/ [Joseph C. Risser, American surgeon, 1892–1942], an orthopedic device for encasing the entire trunk of the body, extending over the cervical area to the chin. In rare cases it extends over the hips to the knees. The Risser cast is made of plaster of paris or fiberglass and is used to immobilize the trunk in the treatment of scoliosis and in the preoperative or postoperative correction or maintenance of correction of scoliosis. Compare **body jacket, turnbuckle cast.**

RIST, abbreviation for **radioimmunosorbent test.**

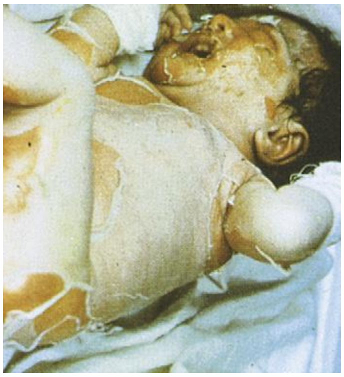
risus caninus /rī′səs/ [L, *risus,* laughter, *caninus,* doglike], a grinning facial distortion caused by tension in the occipitofrontalis and other facial muscles as a result of tetanus.

risus sardonicus /särdon′ikəs/ [L, laughter; Gk, *sardonius,* mocking], a wry masklike grin caused by spasm of the facial muscles, as seen in tetanus.



[redacted]

Risus sardonicus *(Stone and Gorbach, 2000)*



Ritter's disease
(Weston, Lane, and Morelli, 2007)

Ritalin, a trademark for a central nervous system stimulant **(methylphenidate hydrochloride).**

Ritgen maneuver, an obstetric procedure used to control delivery of the fetal head. It involves applying upward pressure from the coccygeal region to extend the head during actual delivery, thereby protecting the musculature of the perineum.

ritodrine hydrochloride /rit′ədrēn/, a uterine relaxant.
- ■ INDICATION: It is prescribed in pregnancy management to stop the uterus from contracting in preterm labor.
- ■ CONTRAINDICATIONS: It is not given before the twentieth week of gestation. Known hypersensitivity to this drug prohibits its use.
- ■ ADVERSE EFFECTS: Among the more serious adverse reactions are tachycardia, palpitations, headache, nausea, and alterations in blood pressure. Pulmonary edema and death have occurred when it has been given concomitantly with corticosteroids to prevent the development of respiratory distress syndrome in the premature neonate.

ritonavir, a protease inhibitor.
- ■ INDICATIONS: It is prescribed in the treatment of acquired immunodeficiency syndrome, as part of a multidrug regimen including at least three antiretroviral drugs.
- ■ CONTRAINDICATIONS: Hypersensitivity to ritonavir precludes its use. Concurrent use of any of several other drugs is either contraindicated or warrants caution, including ergot derivatives, benzodiazepine sedative-hypnotics, some antiarrhythmic medications, some HMG-CoA reductase inhibitors (statins), some erectile dysfunction medicines, and some analgesics.
- ■ ADVERSE EFFECTS: Protease inhibitors cause problems with lipid metabolism and lead to hyperlipidemia, hyperglycemia and redistribution of body fat (e.g., buffalo hump), central obesity, breast enlargement, and facial atrophy. Additional side effects often reported include nausea, vomiting, diarrhea, and numbness about the lips.

Ritter's disease [Gottfried Ritter von Rittershain, German physician, 1820–1883], a rare, staphylococcal infection of newborns that begins with red spots about the mouth and chin, gradually spreading over the entire body, and followed by generalized exfoliation. Vesicles and yellow crusts may also be present. Ritter's disease is usually fatal unless treated with antibiotics. Also called **dermatitis exfoliativa neonatorum.** Compare **toxic epidermal necrolysis.**

ritual /rich′o͞owəl/, **1.** a mental health disorder characterized by repetitive sequences of stereotyped daily life routines, such as repeated handwashing, that interferes with an individual's level of functioning. **2.** a prescribed order of ceremonial acts or series of acts. **3.** a detailed procedure followed faithfully or regularly.

ritual circumcision, a surgical procedure for removing the prepuce of the male in Jewish communities or the labia minora of the female in Muslim communities as a religious rite. In Jewish families the male circumcision is usually performed on the eighth day after birth. The practice dates back to the ancient Egyptians, and in some societies it is a prerequisite for marriage. See also **circumcision, clitoridectomy, female genital mutilation.**

rituximab, a miscellaneous antineoplastic.
- ■ INDICATIONS: It is used to treat non-Hodgkin's lymphoma (CD20 positive, B cell).
- ■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to murine proteins prohibits its use.
- ■ ADVERSE EFFECTS: Life-threatening effects include leukopenia, neutropenia, thrombocytopenia, and bronchospasm. Other adverse effects include fever, chills, asthenia, headache, angioedema, hypotension, and myalgia. Common side effects include nausea, vomiting, anorexia, irritation at the injection site, and rash.

rivastigmine /riv′ah-stig′mēn/, a reversible inhibitor of cholinesterase, believed to increase the level of acetylcholine available in the central nervous system. It is administered orally as the tartrate salt as an adjunct in the treatment of mild to moderate dementia of the Alzheimer type.

Rivea corymbosa, a twining vine of the botanical family of Convolvulaceae. The seeds contain indole alkaloids, a source of lysergic acid diethylamide, which have an effect of altered perception when ingested in large quantities. The seeds have been used in religious ceremonies of indigenous Latin American cultures since the era of the Aztecs. Also called **Mexican bindweed, morning glory.**

river blindness. See **onchocerciasis.**

Rivinus' notch, tympanic notch /rēvē′nəs/ [Augustus Q. Rivinus, German anatomist, 1652–1723], a deficiency in the tympanic sulcus of the ear that forms an attachment for the flaccid part of the tympanic membrane and the mallear folds. Also called *Rivinus' incisure*, *tympanic incisure*.

rivus lacrimalis /rī′vəs/ [L, stream of tears], a channel between the eyelids and the surface of the eye that normally allows a flow of moisture when the eyes are closed.

rizatriptan, a migraine agent.
- ■ INDICATION: It is used in the acute treatment of migraine.
- ■ CONTRAINDICATIONS: Factors prohibiting its use include angina pectoris, a history of myocardial infarction, documented silent ischemia, Prinzmetal's angina, ischemic heart disease, concurrent use of ergotamine-containing

preparations, uncontrolled hypertension, basilar or hemiplegic migraine, and known hypersensitivity.

■ ADVERSE EFFECTS: Adverse effects include chest tightness, chest pressure, nausea, and dry mouth. Common side effects include dizziness, headache, and fatigue.

RK, **1.** abbreviation for **radial keratotomy. 2.** abbreviation for **refractive keratotomy.**

R.L.E., abbreviation for *right lower extremity*.

R.L.L., abbreviation for *right lower lobe of lung*.

r-loop, (in molecular genetics) a distinctive loop formation seen under an electron microscope. It is composed of a single helical strand of deoxyribonucleic acid (DNA) wound with a hybrid strand containing another single strand of DNA with a strand of ribonucleic acid.

RLQ, abbreviation for *right lower quadrant* of the lung.

RMP, **1.** abbreviation for **regional medical program. 2.** abbreviation for *right mentoposterior* fetal position.

RMSF, abbreviation for **Rocky Mountain spotted fever.**

RMT, abbreviation for *right mentotransverse* fetal position.

Rn, symbol for the element **radon.**

RN, abbreviation for **registered nurse.**

RNA, abbreviation for **ribonucleic acid.**

RNA amplification, an in vitro technique used to increase the number of copies of a specific segment of RNA to aid in its detection.

RNA-dependent DNA polymerase, Also called *RNA-directed DNA polymerase*. See **reverse transcriptase.**

RNA polymerase, an enzyme that catalyzes the assembly of ribonucleoside triphosphates into RNA, with single-stranded DNA serving as the template. Also called *RNA nucleotidyltransferase*.

RNase, abbreviation for **ribonuclease.**

RNA splicing, (in molecular genetics) the process by which base pairs that interrupt the continuity of genetic information in deoxyribonucleic acid are removed from the precursors of messenger ribonucleic acid.

RNA virus, any of a group of viruses whose genome is composed of RNA, including most viruses that infect animal cells. RNA viruses include arenavirus, coronavirus, orthomyxovirus, picornavirus, rhabdovirus, and togavirus. Also called **ribovirus.**

RN, C, abbreviation for *registered nurse, certified*.

RN, CNA, abbreviation for *registered nurse, certified in Nursing Administration*.

RN, CNAA, abbreviation for *registered nurse, certified in Nursing Administration, Advanced*.

RN,CS, abbreviation for *registered nurse, clinical specialist*.

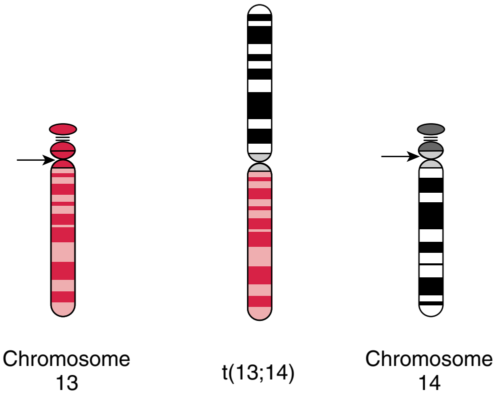
RNP, abbreviation for **ribonuclear protein.**

ROA, abbreviation for *right occipitoanterior* fetal position.

Robaxin, a trademark for a skeletal muscle relaxant **(methocarbamol).**

Robb, Isabel Hampton, (1860–1910), a Canadian-born American nursing educator and writer. She was the first to institute a systematic, step-by-step course for nursing students that integrated clinical experience and classwork and the first educator to arrange for the affiliation of her students at other hospitals for specialized training. She also helped establish university affiliation for nursing education and postgraduate courses. When the Johns Hopkins School of Nursing was established in Baltimore in 1889, she became its first director, establishing the high standards for both the practical and theoretic aspects of nursing education that became the base from which she worked to establish national standards. She was one of the founders of *The American Journal of Nursing* and of the forerunner of the American Nurses Association.

robertsonian translocation /rob′ərtsō′nē·ən/, the exchange of entire chromosome arms, with the break occurring at the centromere, usually between two nonhomologous acrocentric chromosomes. It produces one large, metacentric chromosome and one extremely small chromosome. The latter carries little genetic material and may be lost through successive cell divisions, leading to a reduction in total chromosome number. Compare **balanced translocation, reciprocal translocation.**



Robertsonian translocation

(Jorde et al, 2006)

Roberts' syndrome /rob′ərts/ [John Bingham Roberts, American surgeon, 1852–1924], a hereditary syndrome, transmitted as an autosomal-recessive trait, consisting of imperfect development of the long bones of the limbs and associated with cleft palate and lip and other anomalies.

Robinow's syndrome /rob′inouz/ [Meinhard Robinow, American physician, 1909–1997], dwarfism associated with increased interorbital distance, malaligned teeth, bulging forehead, depressed nasal bridge, and short limbs. Also called **fetal face syndrome,** *Robinow dwarfism*.

Robinul, a trademark for an anticholinergic **(glycopyrrolate).**

Robitussin, a trademark for an expectorant **(guaifenesin),** also available in various fixed-combination preparations with an antihistamine, with a decongestant, or with a cough suppressant.

robotic /rōbot′ik/, pertaining to a robot, a mechanical or electronic device that resembles a human being, operating automatically or by remote control with the ability to perform a variety of complex tasks.

robotic surgery, the performance of operative procedures with the assistance of robotic technology. It allows great precision and is used for remote-control, minimally invasive procedures. Current systems consist of computer-controlled electromechanical devices that work in response to controls manipulated by the surgeon.

Rocaltrol, a trademark for a regulator of calcium **(calcitriol).**

Rocephin, a trademark for a cephalosporin antibiotic **(ceftriaxone sodium).**

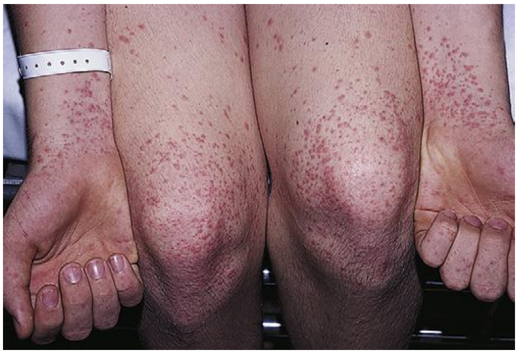
Rochalimaea /rosh′əlimē′ə/, a genus of bacteria resembling *Rickettsia* but found extracellularly in an arthropod host. The species, *R. quintana* (now called *Bartonella quintana*), is a cause of trench fever as transmitted by the body louse. A related bacterium, *R. henselae,* is a cause of bacillary angiomatosis in immunocompromised humans, including those with human immunodeficiency virus infection.

rocker knife, a knife with a rounded blade that cuts with a rocking motion, designed for patients who have functional use of one extremity.

rock fever. See **brucellosis.**

rocking bed, a device that rocks a patient from 30 degrees head up to 15 degrees head down several times a minute. The rocking moves the abdominal contents, and the resulting diaphragmatic movement assists ventilation of the lungs.

Rocky Mountain spotted fever (RMSF), a serious tick-borne infectious disease occurring throughout the temperate zones of North and South America, caused by *Rickettsia rickettsii*. It is characterized by chills, fever, severe headache, myalgia, mental confusion, and rash. Erythematous macules first appear on wrists and ankles, spreading rapidly over the extremities, trunk, and face and usually on the palms and soles. Hemorrhagic lesions, constipation, and abdominal distension are also common. The diagnosis is based on clinical examination and confirmed by laboratory analyses, including immunofluorescent antibody screens, complement fixation test, and Weil-Felix test. Early treatment with doxycycline or tetracycline is important because more than 20% of untreated patients die from shock and renal failure. A diet high in protein is important to avoid hypoproteinemia. Nursing care is especially important to avoid decubitus ulcers and hypostatic or aspiration pneumonia. Immunity follows recovery. Prevention includes the use of insect repellents, the wearing of protective clothing, frequent inspection of the body, and careful removal of wood or dog ticks. No vaccine is available. Care must be taken not to crush ticks, because infection may be acquired through skin abrasions. Also called **Mexican spotted fever, mountain fever, mountain tick fever, spotted fever.** Compare **murine typhus, rickettsialpox.** See also **boutonneuse fever, scrub typhus, typhus.**



Rocky Mountain spotted fever: typical rash
(Callen et al, 2000)

rocuronium /ro′ku-ro′ne-um/, a neuromuscular blocking agent used as an adjunct in general anesthesia to facilitate endotracheal intubation and as a skeletal muscle relaxant during surgery or mechanical ventilation. It is administered intravenously.

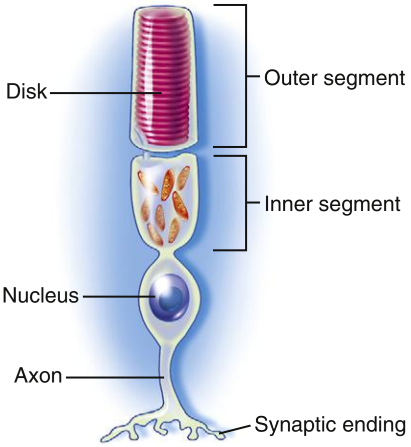
rocuronium bromide, a nondepolarizing neuromuscular blocking agent.

■ INDICATION: It is prescribed as an adjunct to general anesthesia in providing skeletal muscle relaxation.

■ CONTRAINDICATION: It should not be given to patients with a known hypersensitivity to the product.

■ ADVERSE EFFECTS: The side effects most often reported include nausea, vomiting, respiratory problems, arrhythmias, hiccups, injection site edema, and rash.

rod [AS, *rodd*], **1.** a straight cylindric structure. **2.** one of the tiny cylindric elements arranged perpendicular to the surface of the retina. Rods contain the chemical rhodopsin, which adapts the eye to detect low-intensity light and gives the rods a purple color. Each rod is 40 to 60 μm in length and about 2 μm thick and consists of a slender reactive outer segment and an inner granular segment. When bright light strikes a rod, rhodopsin rapidly breaks down; it reforms gradually in low-intensity light. Compare **cone.** See also **iodopsin, Jacob x membrane, rhodopsin.**



Rod

rodenticide poisoning /rōden′tisīd/ [L, *rodere,* to gnaw, *caedere,* to kill, *potio,* drink], a toxic condition caused by the ingestion of a substance intended for the control of rodent populations. See also **phosphorus poisoning, thallium poisoning, warfarin poisoning.**

rodent ulcer /rō′dənt/ [L, *rodere,* to gnaw, *ulcus,* ulcer], a slowly developing serpiginous ulceration of a basal cell carcinoma of the skin. See also **basal cell carcinoma.**

rod-monochromat /rod′ monəkrō′mət/, a person who is totally color-blind or who lacks retinal cone function.

rods and cones [AS, *rodd* + Gk, *konos*], the light-sensitive cells of the retina. The rods, under the visual purple pigment epithelium, are mainly located around the periphery of the retina. The cones receive color stimuli.

roentgen (R) /rent′gən, ren′jən/ [Wilhelm K. Roentgen, German physicist, 1845–1923], the quantity of x-radiation or gamma radiation that creates 1 electrostatic unit of ions in 1 mL of air at 0° and 760 mm of pressure. In radiotherapy or radiodiagnosis, the roentgen is the unit of the emitted dose. See also **radiation absorbed dose, rem.**

roentgen fetometry, the use of radiographic techniques to measure the fetus in utero.

roentgenologist. See **radiologist.**

roentgenology. See **radiology.**

roentgen ray. See **x-ray,** def. 1.

Roferon-A, a trademark for a parenteral antineoplastic *(interferon-alfa-2a)*.

Rogers, Martha E. [1914–1994], a nurse theorist who developed the Science of Unitary Human Beings, a nursing theory introduced in 1970. The Rogers theory has strong ties to the general systems theory, with elements of a developmental model. It considers four "building blocks": Energy Fields, Universe of Open Systems, Pattern and Organization, and Four Dimensionality. Energy Fields refers to conceptualization of humans and their environment as matter or energy evidenced by wave patterns. Open Systems refers to views of persons as open systems who interact continuously with the environment. Pattern and Organization describes the way Energy Fields emerge, characterized by wave patterns. Four Dimensionality has been interpreted as a form of clairvoyance in which there is a "transcendence of time-space interaction," or an ability to transcend time to see into the future.

Rohrer's constants, the constants in an empiric equation for airway resistance. It is expressed as $R = K_1 + K_2V$, where R is resistance, V is instantaneous volumetric flow rate, K_1 is a constant representing gas viscosity and airway geometry, and K_2 is a constant representing gas density and airway geometry.

Rokitansky's disease. See **Budd-Chiari syndrome.**

Rolando's fissure /rōlan′dōz/ [Luigi Rolando, Italian anatomist, 1773–1831; L, *fissura,* cleft], the central sulcus of the cerebrum.

Rolando's fracture [Luigi Rolando], a fracture of the base of the first metacarpal.

Rolando's gelatinous substance, the apical part of the posterior horn of the spinal cord's gray matter. It appears gelatinous because of its lack of myelinated nerve fibers. Also called **substantia gelatinosa.**

role [Fr, stage character], a socially expected behavior pattern associated with an individual's function in various social groups. Roles provide a means for social participation and a way to test identities for consensual validation by significant others, for example, roles within the family structure.

role ambiguity. See **role strain.**

role blurring, the tendency for professional roles to overlap and become indistinct when there is a shared body of knowledge among and between disciplines.

role change, a situation in which status is retained while role expectations change, as when a nurse moves from the role of a primary caregiver to that of an administrator.

role clarification, gaining the knowledge, information, and cues needed to perform a role.

role conflict, the presence of contradictory and often competing role expectations.

role enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a patient, significant other, and/or family to improve relationships by clarifying and supplementing specific role behaviors. See also **Nursing Interventions Classification.**

role incongruence. See **role strain.**

role model [Fr, *role,* stage character; L, *modus,* small copy], a person who knowingly or unknowingly inspires others to imitate his or her persona. The role model may be a real person, such as a parent, or a symbolic character, such as one depicted in movies or television programs.

role overload, a condition in which there is insufficient time in which to carry out all of the expected role functions.

role overqualification. See **role strain.**

role performance, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as congruence of an individual's role behavior with role expectations. See also **Nursing Outcomes Classification.**

role playing, a psychotherapeutic technique in which a person acts out a real or simulated situation as a means of understanding intrapsychic conflicts.

role-playing therapy. See **psychodrama.**

role reversal, the act of assuming the role of another person to appreciate how the person feels, perceives, and behaves in relation to himself or herself and to others.

role strain, stress associated with expected roles or positions, experienced as frustration. **Role ambiguity** is a type of role strain that occurs when shared specifications set for an expected role are incomplete or insufficient to tell the involved individual what is desired and how to do it. **Role incongruence** is role stress that occurs when an individual undergoes role transitions requiring a significant modification in attitudes and values. **Role overqualification** is a type of role stress that occurs when a role does not require full use of a person's resources.

Rolfing. See **structural integration.**

roll [OFr, *rolle*], intrinsic joint movements on an axis parallel to the articulating surface. The axis can remain stationary or move in a plane parallel to the joint surface.

roller bandage, a long, tightly wound strip of material that may vary in width. It is generally applied as a circular bandage wrapped around an extremity or the trunk.

roller clamp, a device, usually made of plastic, equipped with a small roller that may be rolled counterclockwise to close off primary IV tubing or clockwise to open it. The roller clamp may also be manipulated to increase and decrease the flow of the IV solution and is easily moved with the thumb, thus making it a one-handed convenience in the administration of IV therapy. Compare **screw clamp, slide clamp.**

rolling effleurage, a circular rubbing stroke used in massage to promote circulation and muscle relaxation, especially on the shoulder and buttocks. It is performed with the hand flat, the palm and closely held fingers acting as a unit. Compare **effleurage, pétrissage.**

ROM, **1.** abbreviation for **range of motion. 2.** abbreviation for **read-only memory. 3.** abbreviation for **rupture of membranes. 4.** abbreviation for *right otitis media.*

Roman chamomile, the dried flowers of *Chamaemelum nobile* (formerly *Anthemis nobilis*), used as a homeopathic preparation and in folk medicine, externally as a counterirritant and internally as a carminative.

Romano-Ward syndrome /rō·mä′nō wôrd/ [C. Romano, Italian physician, b. 1923; O.C. Ward, Irish physician, 20th century], an autosomal-dominant form of the long QT syndrome, characterized by syncope and sometimes ventricular fibrillation and sudden death. See also **long QT syndrome.**

Romberg sign /rom′bərg/ [Moritz H. Romberg, German physician, 1795–1873; L, *signum,* mark], an indication of loss of the sense of position in which the patient loses balance when standing erect, feet together, and eyes closed. Also called *Romberg test.*

Rondec-DM, a trademark for a fixed-combination drug containing an antihistamine **(carbinoxamine maleate),** an antitussive **(dextromethorphan hydrobromide),** and an adrenergic decongestant and bronchodilator **(pseudoepHEDrine hydrochloride).**

rongeur forceps /rôNzhur′, rôNzhœr′/ [Fr, *ronger,* to gnaw; L, *forceps,* pair of tongs], a kind of biting forceps that is strong and heavy, used for cutting bone. Also called *rongeur.*

R-on-T phenomenon, a cardiac event in which a ventricular stimulus causes premature depolarization of cells that have not completely repolarized. It is noted on the electrocardiogram as a ventricular depolarization falling somewhere within a T wave. The R-on-T phenomenon may result in ventricular tachycardia or ventricular fibrillation.

rooming-in, (in a hospital) a practice that allows mothers and newborn babies to share accommodations, remaining together in the hospital as they would at home rather than being separated. Also called **living-in unit.**

room temperature [AS, *rum* + L, *temperatura*], the air temperature as measured in a specific part of a room.

root /ro͞ot, ro͝ot/ [AS, *rot*], the lowest part of an organ or a structure by which something is firmly attached, such as the anatomical root of the tooth, which is covered by cementum. Also called *(Latin)* **radix.**

root canal, the entire inner area of the tooth consisting of the pulp chamber and pulp canal and ends at the apex. See **pulp canal.**

root canal file, a small, round metal hand instrument with tightly spiraled blades, used for cleaning and shaping a pulp canal.

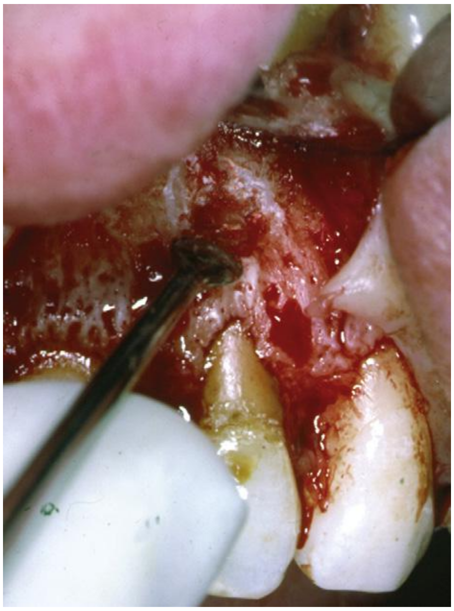
root canal filling, a material placed in the pulp canal of a tooth to seal the space previously occupied by the dental pulp. See also **canal obturation.**

root canal filling spreader, in root canal therapy, a tapered metal instrument used to compress gutta percha and sealer filling material against the sides of the canal to make room for additional gutta percha cones and sealer.

root canal therapy, that aspect of endodontics dealing with the treatment of diseases of the dental pulp, consisting of partial (pulpotomy) or complete (pulpectomy) extirpation of the diseased pulp, cleaning and sterilization of the empty root canal, enlarging and shaping of the canal to receive sealing material, and obturation of the canal with a nonirritating biologically inert hermetic sealing agent. Also called **pulp canal therapy.**

root caries, decay in the dentine and/or the cementum of a tooth.

root curettage, the debridement and planing of the root surface of a tooth with hand instruments and/or ultrasonic scalers to remove accretions and toxins to induce the development of healthy gingival tissues. Usually associated with periodontal disease. Also called **root planing.** See also **apical curettage, subgingival curettage.**



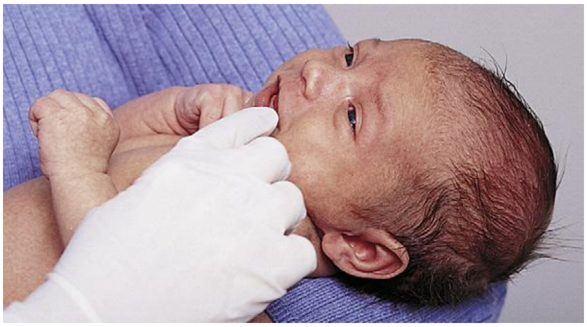
Preparation for root curettage

(Gutman, Dumsha, and Lovdahl, 2006)

root end cyst. See **radicular cyst.**

root furcation, **1.** the anatomical area at which the roots of a multirooted tooth divide. **2.** abnormal intraradicular resorption of bone in multirooted teeth, resulting from periodontal disease.

rooting reflex, a normal response in newborns when the cheek is touched or stroked along the side of the mouth to turn the head toward the stimulated side and begin to suck. The reflex disappears by 3 to 4 months of age but in some infants may persist until 12 months of age.



Elicitation of the rooting reflex

(Seidel et al, 2011)

root of the lung, the structures that pass between the lung and mediastinum and their sleevelike covering of mediastinal pleura. The root joins the medial surface of the lung at the hilum.

root planing. See **root curettage.**

root resection, root-end resection. See **apicoectomy.**

root resorption of teeth [AS, *rot* + L, *resorbere,* to suck back; AS, *toth*], destruction of the cementum or dentin of tooth roots due to osteoclastic activity. If only the apex of the root is affected, the root may become shortened and blunted. If the middle of the root is affected, the pulp canal will generally be penetrated. Root resorption may occur externally or internally within the tooth.

root retention, a technique that removes the crown of a root canal-treated tooth and retains enough of the root and gingival attachment to support a prosthesis.

root submersion, a root retention in which the tooth structure is reduced below the level of the alveolar crest and the soft tissue is allowed to heal over it. This technique is used to minimize residual alveolar ridge resorption.

ROP, abbreviation for *right occipitoposterior* fetal position.

ropinirole, an antiparkinsonian agent.

■ INDICATION: It is used to treat parkinsonism.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects are hemolytic anemia, leukopenia, and agranulocytosis. Other adverse effects include psychosis, hallucination, dystonia, depression, dizziness, constipation, dyspepsia, flatulence, rash, sweating, tachycardia, hypertension, hypotension, syncope, palpitations, blurred vision, impotence, urinary frequency, pharyngitis, rhinitis, sinusitis, bronchitis, and dyspnea. Common side effects include agitation, insomnia, nausea, vomiting, anorexia, dry mouth, and orthostatic hypotension.

ropivacaine, a local anesthetic.

■ INDICATIONS: It is used to produce peripheral nerve block, caudal anesthesia, central neural block, and vaginal block.

■ CONTRAINDICATIONS: Its use is prohibited in children less than 12 years of age, the elderly, those with severe liver disease, and those with known hypersensitivity to this drug.

■ ADVERSE EFFECTS: Life-threatening effects are convulsions, loss of consciousness, myocardial depression, cardiac arrest, arrhythmias, fetal bradycardia, status asthmaticus, respiratory arrest, and anaphylaxis. Other adverse effects are anxiety, restlessness, drowsiness, disorientation, tremors, shivering, bradycardia, hypotension, hypertension, nausea, vomiting, blurred vision, tinnitus, pupil constriction, rash, urticaria, allergic reactions, edema, burning, skin discoloration at the injection site, and tissue necrosis.

Rorschach test /rôr′shäk, rôr′shokh/ [Hermann Rorschach, Swiss psychiatrist, 1884–1922], a projective personality assessment test developed by Hermann Rorschach. It consists of 10 pictures of inkblots, five in black and white, three in black and red, and two multicolored, to which the subject responds by telling, in as many interpretations as is desired, what images and emotions each design evokes. Replies are evaluated according to whether the response is to the entire or only part of the image; whether color, shading, shape, or location of individual elements is significant; whether movement is seen; and the degree of complexity to which each interpretation is given. Scoring is primarily subjective and is based on both the subject's responses and the general reaction to the circumstances under which the test is administered. The test is designed to assess the degree to which intellectual and emotional factors are integrated in the subject's perception of the environment. See also **Holtzman inkblot technique.**

ROS, abbreviation for **review of systems.**

rosacea /rōzā′shē·ə/ [L, *rosaceus,* rosy], a chronic inflammatory disease seen in adults of all ages. It has two components: erythema and/or acneiform papules and pustules. It is associated with erythema, pustules, and telangiectasia, especially of the nose, forehead, and cheeks and ocular symptoms of conjunctivitis. See also **rhinophyma.**

rose fever [L, *rosa* + *febris,* fever], a common misnomer for seasonal allergic rhinitis caused by pollen, most frequently of grasses, that is airborne at the time roses are in bloom. Since rose pollen is not dispersed by the wind but is carried from flower to flower by insects, roses are not the cause of common spring and summer allergic reactions.

rose hips, an herbal product taken from a plant native to Europe and Asia, now grown widely in North America.

■ USES: It is used as a source of vitamin C and as a treatment for colds, fever, and mild infections. Much of vitamin C is, however, reportedly destroyed during the typical drying processes and storage of rose hips, and there are insufficient reliable data regarding efficacy for any of its uses.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation or in people with known hypersensitivity to this plant.

Rosenberg-Chutorian syndrome /rō′zən·berg cho͞o·tor′ē·ən/ [Roger N. Rosenberg, American physician, 20th century; Abe Milton Chutorian, American physician, b. 1929], a rare X-linked hereditary syndrome characterized by optic atrophy, progressive sensorineural hearing loss, and polyneuropathy.

Rosen method, a bodywork technique based on the premise that there is a connection between chronic muscular tension and suppressed emotions or trauma. Using gentle touch and verbal support and guided by careful attention to changes in muscle tension and breathing patterns, the therapist helps the patient to relax the muscular tension and so to bring the underlying repressed memories to the surface and release them.

Rosenmüller's organ. See **epoophoron.**

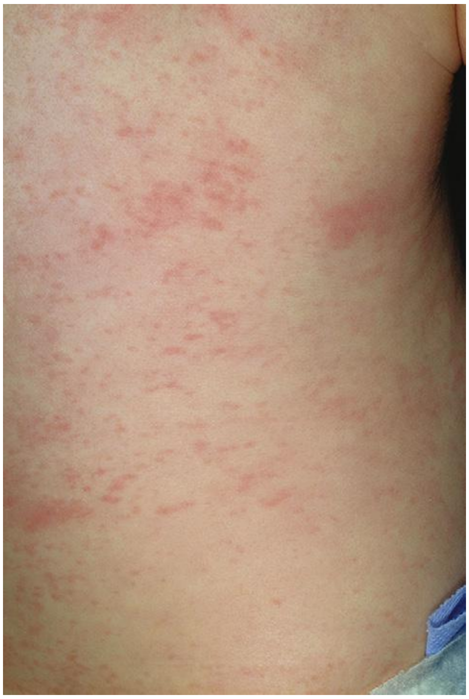
Rosenthal's disease, a deficiency of blood coagulation factor XI resulting in a systemic blood-clotting defect that may resemble classical hemophilia. Also known as *Rosenthal's syndrome*.

roseo-, prefix meaning rose colored, as a roseola rash.

roseola /rōzē′ələ/ [L, *roseus*], any rose-colored rash. See also **roseola infantum.**

roseola idiopathica, a skin eruption of symmetric reddish patches in a condition not associated with any other well-defined symptoms of disease.

roseola infantum, a benign viral endemic illness of infants and young children, caused by human herpesvirus 6 (of which there are two strains, A and B) and possibly by herpesvirus 7. It is characterized by abrupt, high, sustained or spiking fever, mild pharyngitis, and lymph node enlargement. Febrile seizures may occur. After 4 or 5 days the fever suddenly drops to normal, and a faint, pink, maculopapular rash appears on the neck, trunk, and thighs. The rash may last a few hours to 2 days. Diagnosis is based on high fever and the rash. Sequelae may occur as a result of the seizures. There is no specific therapy or vaccine. Acetaminophen is often used to try to control fever. Also called **exanthema subitum, sixth disease, Zahorsky's disease.**



Roseola infantum *(Paller and Mancinin, 2006)*

roseola symptomatica, a rose-colored eruption that occurs at the onset of a well-defined febrile illness.

Roseolovirus /ro′ze-o′lovi′rus/, a genus of herpesviruses closely related to the genus *Cytomegalovirus,* containing the single species human herpesvirus 6, which is the causal agent of roseola infantum.

rose spots [L, *rosa* + ME, *spotte*], small erythematous macules occurring on the upper abdomen and anterior thorax and lasting 2 or 3 days, characteristic of typhoid and paratyphoid fevers.

rosette /rōzet′/, **1.** any structure resembling a rose. **2.** a sporulating body of a malarial parasite.

rosette technique, a method of detecting antigens or antibodies on a cell surface using antibody- or antigen-coated particles, which cause erythrocytes to form a rosette pattern.

Rose-Waaler test. See **sheep red cell agglutination test.**

rosiglitazone, an oral antidiabetic.

■ INDICATION: It is used to treat stable type 2 diabetes mellitus.

■ CONTRAINDICATIONS: Lactation, diabetic ketoacidosis, and known hypersensitivity to thiazolidinediones prohibit its use. It is also contraindicated in children.

■ ADVERSE EFFECTS: Adverse effects include upper respiratory infection, sinusitis, anemia, back pain, diarrhea, edema, fatigue, headache, and hyperglycemia or hypoglycemia.

rosin /roz′in/, a solid oleo resin produced by steam distillation of balsam from various species of pine trees. After extraction of turpentine in the process, the rosin remains as an amber mass. It is used in plasters and ointments.

rost-, prefix meaning “a beak”: *rostellum, rostrad, rostriform.*

rostellum /rostel′əm/ [L, *rostrum,* beak], **1.** the anterior of a tapeworm scolex, commonly featuring hooklike jaws. **2.** tubular mouth parts of some insects.

rostral /ros′trəl/, beak-shaped. **—rostrum,** *n.*

rostrum /ros′trəm/ [L, beak], a beaklike projection, as the rostrum of the sphenoid bone.

rosuvastatin, an antilipemic.

■ INDICATIONS: This drug is used as an adjunct in primary hypercholesterolemia (types IIa and b), mixed dyslipidemia, elevated serum triglycerides, and homozygous low-density lipoprotein receptor disorder.

■ CONTRAINDICATIONS: Pregnancy, lactation, active liver disease, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include vomiting; leg, shoulder, or localized pain; insomnia; paresthesia; photosensitivity; rhinitis; sinusitis; bronchitis; and increased cough. Life-threatening side effects include liver dysfunction, myositis, rhabdomyolysis, thrombocytopenia, hemolytic anemia, and leukopenia. Common side effects include nausea, constipation, abdominal pain, flatus, diarrhea, dyspepsia, heartburn, asthenia, muscle cramps, arthritis, arthralgia, myalgia, headache, dizziness, rash, pruritus, and pharyngitis.

rot [AS, *rotian*], **1.** *v,* to decay. **2.** *n,* decomposition.

ROT, abbreviation for *right occipitotransverse* fetal position.

rot-, prefix meaning “turned, or to turn”: *rotate, rotatory, rotexion.*

rotameter. See **flowmeter.**

rotary nystagmus /rō′tərē/ [L, *rotare,* to rotate; Gk, *nystagmos,* nodding], a form of nystagmus in which the eyeball makes rotary motions around an axis.

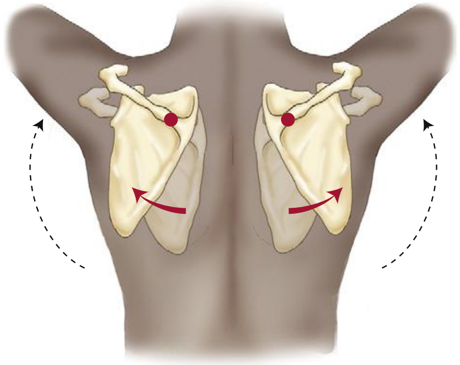
RotaTeq, a trademark for **rotavirus vaccine live oral.**

rotating tourniquet /rō′tāting/ [L, *rotare,* to rotate; Fr, *tourniquet,* garrote], one of four constricting devices used in a rotating order to pool blood in the extremities. The purpose is to relieve congestion in the lungs in the treatment of acute pulmonary edema. Use of the rotating tourniquet has declined with the development of vasodilating drugs and diuretics.

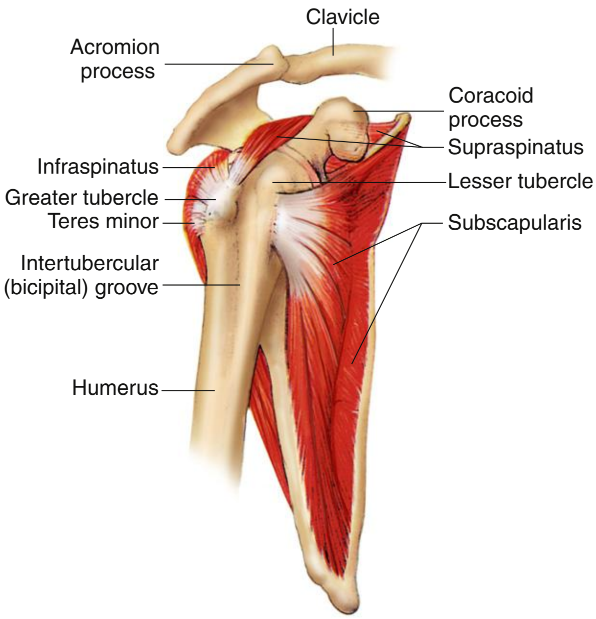
rotation /rōtā′shən/ [L, *rotare*], **1.** the gyration of a bone around its central axis, one of the four basic movements allowed by the various joints of the skeleton. The central axis may lie in a separate bone, as in the pivot formed by the dens of the axis around which the atlas turns. Some bones, such as the humerus, rotate around their own longitudinal axis. Alternatively, the axis of rotation may not be quite parallel to the long axis of the rotating bone, as in movement of the radius on the ulna during pronation and supination of the hand. Compare **angular movement, circumduction, gliding. 2.** a turning around an axis. **3.** the turning of the fetal head to descend through the pelvis during birth.

rotator /rō′tātər/ [L, *rotare,* to rotate], a muscle that rotates a structure around its axis, as the cervical, thoracic, and lumbar musculi rotatores, which function to extend and rotate the vertebral column toward the opposite side.

rotator cuff, a musculotendinous structure about the capsule of the shoulder joint, formed by the inserting fibers of the supraspinatus, infraspinatus, teres minor, and subscapularis muscles, which blend with the capsule and provide mobility and strength to the shoulder joint.



Upward rotation *(Muscolino, 2011)*



Rotator cuff *(Patton and Thibodeau, 2010)*

rotatores muscles, the deepest muscles of the transversospinales group. These small muscles are present throughout the length of the vertebral column but are best developed in the thoracic region. See also **multifidus, semispinalis muscles.**

rotavirus /rō′təvī′rəs/, a double-stranded ribonucleic acid virus that appears as a tiny wheel, with a clearly defined outer layer, or rim, and an inner layer of spokes. The virus replicates in the epithelial cells of the intestine and is a cause of acute gastroenteritis with diarrhea, particularly in infants. Rotavirus is the most common cause worldwide of severe diarrheal illness in children, with fecal-oral transmission. Various strains also infect domestic and wild animals. In the United States, infections tend to peak during the winter months. A licensed live virus vaccine is no longer recommended because of its association with a rare case of bowel obstruction (intussusception).

rotavirus diarrhea, diarrhea caused by a rotavirus, usually seen in children.

rotavirus gastroenteritis, viral gastroenteritis caused by a rotavirus infection, one of the most common causes of diarrhea in the United States. The virus is usually ingested in contaminated food or water. Young children are particularly susceptible and can suffer severe dehydration or even death.

rotavirus vaccine live oral, a live, oral vaccine that protects against rotavirus serotypes G1, G2, G3, G4, and P1.

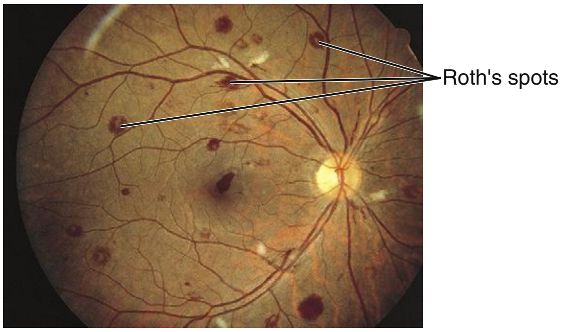
■ INDICATION: This drug is used to prevent rotavirus gastroenteritis in infants.

■ CONTRAINDICATIONS: Bone marrow and lymphatic disorders, immunodeficiency, administration of blood products within 6 weeks, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include runny nose, sore throat, ear infection, diarrhea, vomiting, wheezing, and coughing. Life-threatening side effects include gastroenteritis, urinary tract infection, pneumonia, and pyrexia.

Rothmund-Thomson syndrome /rot′mo͝ond tom′son/ [August von Rothmund, Jr., German physician, 1830–1906; Mathew Sidney Thomson, English dermatologist, 1894–1969], an autosomal-recessive syndrome, occurring principally in females, characterized by the presence of reticulated, atrophic, hyperpigmented, telangiectatic cutaneous plaques and often accompanied by juvenile cataracts; saddle nose; congenital bone defects; disturbances in the growth of hair, nails, and teeth; and hypogonadism. Also called **poikiloderma congenitale.**

Roth's spots /roth, rōt/ [Moritz Roth, Swiss physician and pathologist, 1839–1914], pale-centered oval hemorrhages on the retina, observed in several disorders but classically seen in bacterial endocarditis.



Roth's spots *(Swartz, 2009)*

rotigotine, an antiparkinson agent.

■ INDICATION: This drug is used to treat idiopathic Parkinson's disease.

■ CONTRAINDICATIONS: Defibrillation, MRI, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include drowsiness, hallucinations, headache, malaise, paresthesia, vertigo, confusion, dizziness, dyskinesia, fatigue, fever, insomnia, sudden sleep onset, edema, hypertension, sinus tachycardia, orthostatic hypotension, dyspepsia, anorexia, constipation, vomiting, xerostomia, weight gain, urinary incontinence, dermatitis, erythema, rash, pruritus, purpura, arthralgia, and back pain. A life-threatening side effect is anaphylaxis. A common side effect is nausea.

Rotokinetic treatment table /rō′tōkinet′ik/, a special bed equipped with an automatic turning device that completely immobilizes patients while rotating them from 90 to 270 degrees around a horizontal axis. For example, the Roto-Rest, Delta Bed rotates patients up to 124 degrees around a horizontal axis.

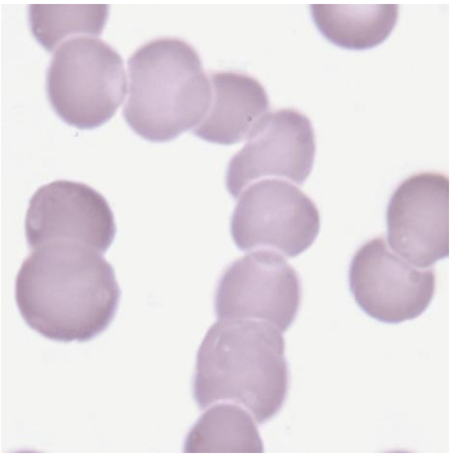
Rotor's syndrome /rō′tərs/, a rare condition of the liver inherited as an autosomal-recessive trait. It is similar to Dubin-Johnson syndrome but can be distinguished by the normal functioning of the gallbladder and lack of liver pigmentation. Jaundice occurs in childhood, caused by impaired biliary excretion. See also **Dubin-Johnson syndrome, hyperbilirubinemia of the newborn.**

rotoscoliosis /rō′təskō′lē·ō′sis/, a condition in which there is both lateral and rotational spinal deviation.

rotula. See **troche.**

roughage. See **dietary fiber.**

rouleaux /ro͞olō′/ *sing*. **rouleau** [Fr, cylinder], red cells in a microscopic roll or "stack-of-coins" formation that may be caused by abnormal proteins, as in multiple myeloma or macroglobulinemia. Compare **hemagglutination.** See also **erythrocyte sedimentation rate.**



Rouleaux *(Carr and Rodak, 2008)*

round foramen, one of a pair of rounded apertures in the greater wings of the sphenoid bone.

round ligament [L, *rotundus*, round, *ligare*, to bind], **1.** a curved fibrous band that is attached at one end to the fovea of the head of the femur and at the other end to the transverse ligament of the acetabulum. **2.** a fibrous cord extending from the umbilicus to the anterior part of the liver. It is the remnant of the umbilical vein. **3.** in the female, a fibromuscular band that extends from the anterior surface of the uterus through the inguinal canal to the labium majora. The structure is homologous to the spermatic cord in the male.

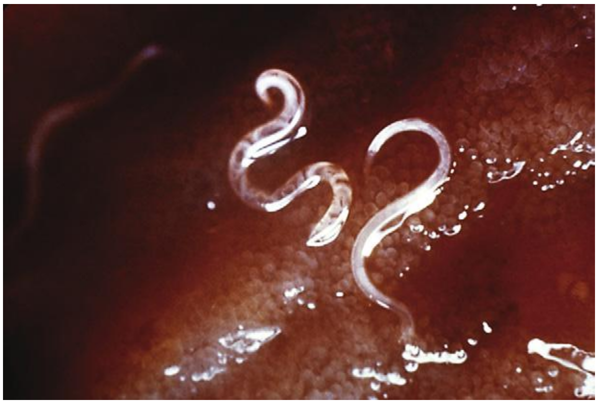
rounds, *(informal)* a teaching conference or a meeting in which the clinical problems encountered in the practice of nursing, medicine, or other service are discussed. Kinds of rounds include **grand rounds, nursing rounds, teaching rounds,** and **walking rounds.**

round window [L, *rotundus* + ONorse, *vindauga*], a round opening in the medial wall of the middle ear leading into the cochlea and covered by a secondary tympanic membrane. Also called **fenestra cochlea, fenestra rotunda.**

roundworm, any worm of the class Nematoda, including *Ancylostoma duodenale*, *Ascaris lumbricoides*, *Enterobius vermicularis*, and *Strongyloides stercoralis*.

Roussy-Lévy disease /ro͝osē′ lāvē′/ [Gustave Roussy, French pathologist, 1874–1948; Gabrielle Lévy, French neurologist, 1886–1935], an inherited cerebellar ataxia associated with muscle wasting of the extremities, absence of tendon reflexes, and foot deformities.

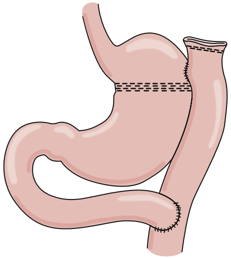
route of administration /ro͞ot, rout/ [Fr, *route*, course; L, *administrare*, to serve], (of a drug) any one of the body systems in which a drug may be administered, such as



Roundworms attached to the intestinal mucosa
(Courtesy Centers for Disease Control and Prevention)

intradermally, intrathecally, intramuscularly, intranasally, intravenously, orally, rectally, subcutaneously, sublingually, topically, or vaginally. Some medications can be given by only one route because absorption or maximum effectiveness occurs by that route only or because the specific substance is toxic or damaging when given by another route.

Roux-en-Y /ro͞o′ en wī′, ro͞o′ānēgrek′/ [César Roux, Swiss surgeon, 1857–1926], a treatment for morbid obesity consisting of surgical division of the small intestine to form two arms; the jejunum is anastomosed to a gastric pouch and the bypassed duodenum connects the pylorus with an end-to-side anastomosis into the lower jejunum.



Roux-en-Y *(Phipps et al, 2003)*

Roux-en-Y gastric bypass, a treatment for morbid obesity consisting of surgical division of the small intestine to form two arms. The jejunum is attached to a stoma into a gastric pouch, and the bypassed duodenum connects the pylorus with an end-to-side anastomosis into the lower jejunum.

Rovsing's sign /rov′singz/ [Nils T. Rovsing, Danish surgeon, 1862–1927], an indication of acute appendicitis in which pressure on the left lower quadrant of the abdomen causes pain in the right lower quadrant. See also **appendicitis.**

Royal College of Physicians (R.C.P.), a professional organization of physicians in the United Kingdom.

Royal College of Physicians and Surgeons of Canada (RCPSC), a national Canadian organization that recognizes and confers membership on certain qualified physicians and surgeons.

Royal College of Surgeons (R.C.S.), a professional organization of surgeons in the United Kingdom.

Royal free disease. See **postviral fatigue syndrome.**

Royer's syndrome. See **Prader-Willi syndrome.**

Roy, Sister Callista [b. 1939], a nursing theorist who introduced the adaptation model of nursing in 1970 as a conceptual framework for nursing curricula, practice, and research. In the Roy model the human is viewed as an adaptive system. Changes occur in the system in response to stimuli. If the change promotes the integrity of the individual, it is an adaptive response. Otherwise it is a maladaptive response. The theory provides two mechanisms for coping or adapting. One, a regulator mechanism, is concerned with neural, endocrine, and perception-psychomotor processes. The other, a cognator mechanism, is concerned with perception, learning, judgment, and emotion. Four modes for effecting adaptation of a system are physiological needs, self-concept, role function, and interdependence. The nurse achieves the goal of promoting the patient's adaptation in situations of health and sickness by manipulating stimuli. Nursing intervention is required when the coping mechanism of the patient loses effectiveness in illness.

Rozerem, a trademark for **ramelteon.**

RPF, abbreviation for **renal plasma flow.**

rpm, abbreviation for *revolutions per minute*.

RPR test, abbreviation for **rapid plasma reagin test,** a screening test for syphilis.

RQ, abbreviation for **respiratory quotient.**

RRA, abbreviation for **registered record administrator.**

-(r)rhage, suffix meaning a "rupture, an excessive fluid discharge": *hemorrhage, lymphorrhage, phleborrhage*.

-(r)rhagia, suffix meaning a "fluid discharge of excessive quantity": *lymphorrhagia, meningorrhagia, tracheorrhagia*.

-(r)rhagic, suffix meaning "a kind or condition of excessive fluid discharge": *hemorrhagic, lymphorrhagic, serohemorrhagic*.

-(r)rhaphy, -(r)rhaphia, suffix meaning a "suturing in place": *cysticorrhaphy, meningeorrhaphy, osteorrhaphy*.

-(r)rhea, -(r)rhoea, -(r)rhoeica, suffix meaning "fluid discharge, flow": *anarrhea, cystirrhea, laryngorrhea*.

-(r)rheic, -(r)rheal, -(r)rhetic, -(r)rhoeic, suffix meaning "fluid discharge": *cryptorrheic, diarrheic, pyorrheic*.

-(r)rhexis, suffix meaning a "rupture of a (specified) body part": *arteriorrhexis, cardiorrhexis, plasmarrhexis*.

-(r)rhine, suffix meaning "having a (specified sort of) nose": *leptorrhine, mesorrhine, platyrrhine*.

-(r)rhinia, suffix meaning "(condition of the) nose": *arrhinia, birrhinia, microrrhinia*.

-(r)rhoea, -(r)rhoeica. See **-(r)rhea.**

-(r)rhoeic, pertaining to an acid. See **-(r)rheic.**

-(r)rhythmia, suffix meaning "regularly occurring involuntary behavior or actions": *bradyrrhythmia, dysrrhythmia, tachyrrhythmia*.

R-R interval, the interval from the peak of one QRS complex to the peak of the next as shown on an electrocardiogram. It is used to assess the ventricular rate. See also **cardiac cycle.**

rRNA, abbreviation for **ribosomal RNA.**

RRT, abbreviation for **registered respiratory therapist.**

RSD, abbreviation for **reflex sympathetic dystrophy.**

RSNA, abbreviation for **Radiological Society of North America.**

RSV, RS virus, abbreviation for **respiratory syncytial virus.**

RT, **1.** abbreviation for **registered technologist. 2.** abbreviation for **respiratory therapy. 3.** abbreviation for **reverse transcriptase.**

RTA, abbreviation for **renal tubular acidosis.**

r.t.c., abbreviation for *return to clinic*, noted on the chart, usually followed by a date on which a subsequent appointment has been made for the patient.

Ru, symbol for the element **ruthenium.**

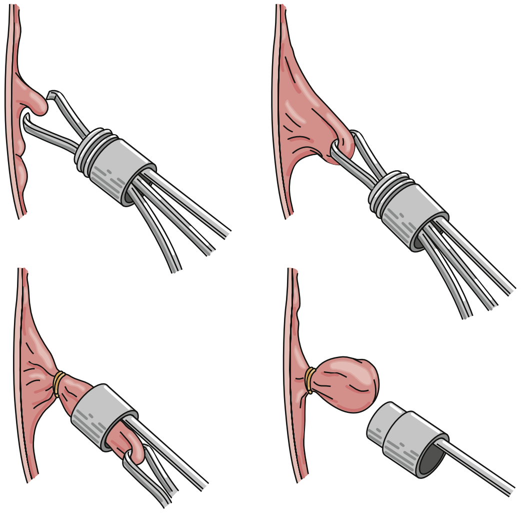
RU-486. See **mifepristone.**

rub [ME, *rubben,* to scrape], the movement of one surface moving over another, thereby producing friction, as when pleural membranes produce friction rub.

rub-, rube-, prefix meaning "red": *rubedo, rubella, rubor.*

rubber. See **condom.**

rubber-band ligation, a method of treating hemorrhoids by placing a rubber band around the hemorrhoidal part of the blood vessel, causing it to slough off after a period of time. The technique is used in some cases as an alternative to surgery. See also **ligation.**



Rubber-band ligation *(Monahan et al, 2007)*

rubber dam [ME, *rubben,* to scrape; AS, *demman,* to dam up], a thin sheet of synthetic rubber or natural latex rubber used to isolate one or more teeth during a dental procedure. See also **dam.**

rubber dam clamps forceps, a type of forceps with beaks designed to engage holes in a rubber dam clamp to facilitate its placement over teeth.

rubbing alcohol [ME, *rubben,* to scrape; Ar, *alkohl,* essence], a disinfectant for skin and instruments. It contains 70% isopropyl alcohol by volume, the remainder consisting of water and denaturants, with or without color or perfume. It may cause dryness of the skin. Rubbing alcohol is for external use only and is flammable.

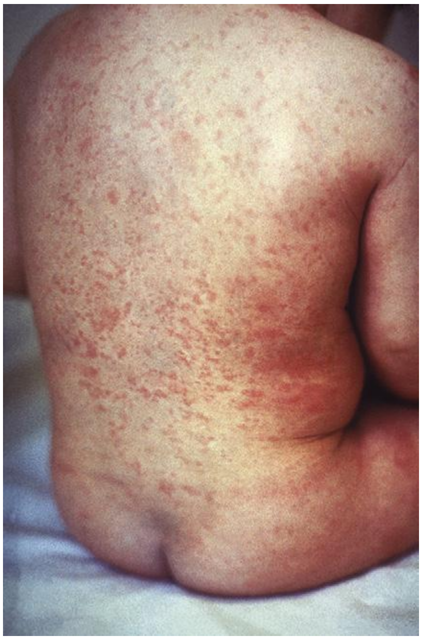
rubefacient /ro͞o′bəfā′shənt/ [L, *ruber,* red, *facere,* to make], **1.** *n,* a substance or agent that increases the reddish coloration of the skin. **2.** *adj,* increasing the reddish coloration of the skin.

rubefaction /ro͞o′bəfak′shən/ [L, *ruber,* red, *facer,* to make], a redness of the skin produced by a counterirritant.

rubella /ro͞obel′ə/ [L, *rubellus,* somewhat red], a contagious viral disease characterized by fever, symptoms of a mild upper respiratory tract infection, lymph node enlargement, arthralgia, and a diffuse fine red maculopapular rash. Rubella virus is a togavirus belonging to genus *Rubivirus.* It is most closely related to group A arboviruses. It is an undeveloped RNA virus that does not cross-react with other togaviruses. The virus is spread by droplet infection, and the incubation time is from 12 to 23 days. Also called **German measles, 3-day measles.** Compare **measles, scarlet fever.**

■ OBSERVATIONS: The symptoms usually last only 2 or 3 days except for arthralgia, which may persist longer or recur. One attack confers lifelong immunity. If a woman acquires rubella in the first trimester of pregnancy, fetal anomalies may result, including heart defects, cataracts, deafness, and mental retardation. An infant exposed to the virus in utero at any time during gestation may shed the virus for up to 30 months after birth. Complications of postnatal rubella are rare. Complications due to rubella infection occur more frequently in adults and include conjunctivitis, testalgia, orchitis, arthralgia or arthritis, encephalitis, and hemorrhagic manifestations.

■ INTERVENTIONS: The illness itself is mild and needs no special treatment. Live attenuated rubella vaccine is advised for all children to reduce chances of an epidemic and thus to protect pregnant women. The vaccine is not given to women already pregnant, and it is recommended that pregnancy be avoided for 3 months after the administration of rubella vaccine. Spread of the virus from a recently vaccinated individual rarely occurs. Immune serum globulin containing rubella antibodies may help prevent fetal infection in exposed susceptible pregnant women, but ordinary gamma globulin will not protect the fetus.



Rubella *(From the Center for Disease Control and Prevention Public Health Image Library, ID#712.)*

rubella and mumps virus vaccine, a suspension containing live attenuated mumps and rubella viruses.

■ INDICATIONS: It can be prescribed for immunization against rubella, but generally the trivalent mumps-measles-rubella vaccine is administered instead.

■ CONTRAINDICATIONS: Acute infection or known hypersensitivity to avian proteins prohibits its use. It is not given to a patient whose immune function is compromised or to a pregnant woman. It is not given for 3 months after the use of plasma, whole blood, or an immune serum globulin. Pregnancy is avoided for 3 months after immunization.

■ ADVERSE EFFECTS: Among the more serious adverse effects are mild to severe hypersensitivity reactions.

rubella antibody test, a blood test performed to detect immunity to rubella, particularly in pregnant women, and to diagnose rubella in infants.

rubella embryopathy, any congenital abnormality in an infant caused by maternal rubella in the early stages of pregnancy.

rubella panencephalitis. See **panencephalitis.**

rubella titer [L, *rubellus,* somewhat red; Fr, *titre,* standard], a serological test to determine a patient's state of immunity against rubella.

rubella virus, a togavirus that is the causal agent of rubella.

rubella virus vaccine, a suspension containing live attenuated rubella virus.

■ INDICATION: It is prescribed for immunization against rubella.

■ CONTRAINDICATIONS: Compromised immune function, fever, acute infection, untreated tuberculosis, or hypersensitivity to proteins of the animal of the vaccine prohibits its use. It is not given to pregnant women, nor is it given for 3 months after the use of plasma, whole blood, or immune serum globulin. Pregnancy should be avoided for 3 months after immunization.

■ ADVERSE EFFECTS: Among the most serious adverse effects are severe hypersensitivity reactions and local pain.

rubeola. See **measles.**

rubeola antibody test, a blood test to measure measles infection in patients who cannot be diagnosed clinically and to establish and document immunity. College students, health care workers, and pregnant women are among those in the commonly tested populations.

rubeosis /ro͞o′bē·ō′sis/, a red discoloration of the skin.

rubeosis iridis, the formation of abnormal blood vessels on the anterior of the iris. It may be associated with diabetes mellitus, retinal ischemia, and neovascular glaucoma.

ruber /roo′bər/, *(Latin)* red.

rubescent /ro͞obes′ənt/, reddening.

-rubicin, suffix for daunorubicin-type antineoplastic antibiotics.

rubidium (Rb) /ro͝obid′ē·əm/ [L, *rubidus,* reddish], a soft metallic element of the alkali metals group. Its atomic number is 37; its atomic mass is 85.47. Slightly radioactive, it is used in radioisotope scanning.

Rubinstein-Taybi syndrome /ro͞o′binstīn tā′bē/ [Jack Herbert Rubinstein, American pediatrician, 1925–2006; Hooshang Taybi, American radiologist, 1919–2006], a congenital condition characterized by mental and motor retardation; broad thumbs and great toes; short stature; characteristic facies, including high-arched palate and straight or beaked nose; various eye abnormalities; pulmonary stenosis; keloid formation in surgical scars; large foramen magnum; and abnormalities of the vertebrae and sternum.

Rubin's test [Isador C. Rubin, American gynecologist, 1883–1958], a test performed in the process of evaluating the cause of infertility to assess the patency of the fallopian tubes. Carbon dioxide gas (CO_2) is introduced into the tubes under pressure through a cannula inserted into the cervix. The CO_2 is passed through from a syringe connected to a manometer at pressures of up to 200 mm Hg. If the tubes are open, the gas enters the abdominal cavity, and the recorded pressure falls below 180 mm Hg. A high-pitched bubbling can be heard through the abdominal wall with the stethoscope as the gas escapes from the tubes. The patient may complain of shoulder pain from diaphragmatic irritation; an x-ray film will show free gas under the diaphragm. If the tubes are blocked, gas cannot escape from the tubes into the abdominal cavity; the pressure recorded on the manometer remains at 200 mm Hg. A tracing may be made to show tubal peristalsis, any leakage in the system, tubal spasm, or partial obstruction. After the test, the patient rests for 3 hours. Crampy pain, dizziness, nausea, and vomiting may occur; positioning with the pelvis higher than the head in genupectoral position or in Trendelenburg's position allows the gas to stay in the pelvis and gives some relief by avoiding diaphragmatic irritation. Also called **resistance-inducing factor test.**

rubivirus /ro͞o′bēvī′rəs/, a member of the togavirus family, which includes the rubella virus.

rubor /ro͞o′bôr/, redness, especially when accompanying inflammation.

rubratoxin /ro͞o′brətok′sin/, a mycotoxin produced on cereal grains by certain species of penicillin that can cause hepatotoxicity in cattle.

rubricyte /ro͞o′brisīt/ [L, *ruber,* red; Gk, *kytos,* cell], a nucleated red blood cell; the marrow stage in the normal development of an erythrocyte, synonymous with polychromatophilic normoblast.

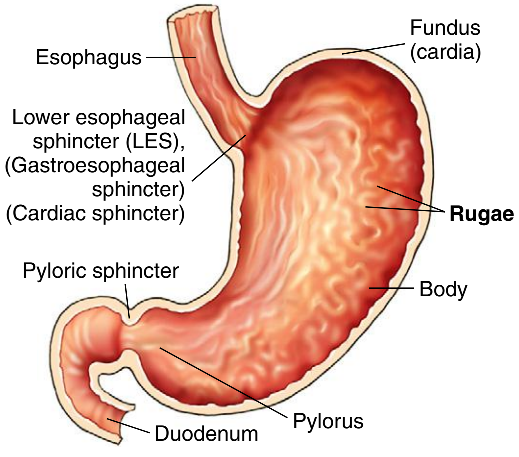
ructus. See **eructation.**

rudiment /ro͞o′dimənt/ [L, *rudimentum,* beginning], an organ or tissue that is incompletely developed or nonfunctional. **—rudimentary,** *adj.*

rudimentary /ro͞o′dimen′tərē/ [L, *rudimentum,* beginning], pertaining to something either vestigial or embryonic; undeveloped.

Ruffini's corpuscles /ro͞ofē′nēz/ [Angelo Ruffini, Italian anatomist, 1864–1929], a variety of oval-shaped, encapsulated nerve endings in the subcutaneous tissue, located principally at the junction of the dermis and the subcutaneous tissue. Ruffini's corpuscles consist of strong connective tissue sheaths enclosing nerve fibers with many branches that end in small knobs. Compare **Golgi-Mazzoni corpuscles, Krause's corpuscles, Pacini's corpuscles.**

ruga /ro͞o′gə/ *pl.* **rugae** [L, ridge], a ridge or fold, such as the rugae of the stomach, which are large folds in the mucous membrane of that organ.



Esophagus
Fundus (cardia)
Lower esophageal sphincter (LES), (Gastroesophageal sphincter) (Cardiac sphincter)
Rugae
Pyloric sphincter
Body
Duodenum
Pylorus

Rugae *(Shiland, 2010)*

rugae of vagina [L, *ruga,* ridge, *vagina,* sheath], the transverse ridges on the mucous membrane lining the vagina. They allow the vagina to stretch during childbirth. Many of the ridges disappear with the atrophy of menopause.

rugitus /ro͞o′jitəs/ [L, roaring], the rumbling sound of flatus in the intestines.

rugose /ro͞o′gōs/, wrinkled or corrugated. Also *rugous.*

RUL, abbreviation for *right upper lobe* of lung.

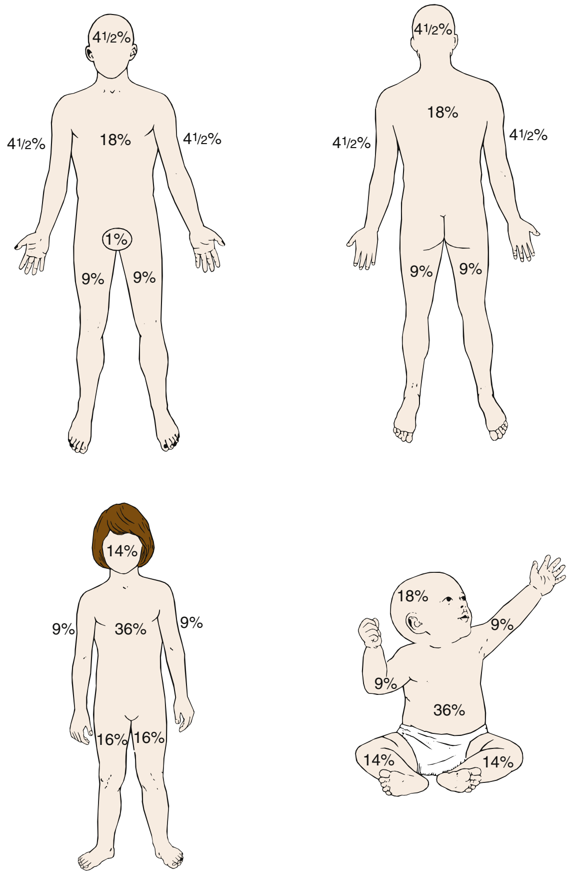
Ruland, Cornelia M., a nursing theorist who, with Shirley M. Moore, developed the Peaceful End of Life Theory, which asserts that nurses are integral to the creation of peaceful end of life care, which includes freedom from suffering, emotional support, closeness to and participation by significant others, and treatment with empathy and respect. The theory was developed from a standard of care created by expert nurses to manage the care of patients with terminal illness.

rule, a guide for conduct or action.

rule of bigeminy [L, *regula,* model, *bis,* double, *geminus,* twin], the tendency of a lengthened ventricular cycle to precipitate a premature ventricular complex.

rule of confidentiality, a principle that personal information about others, particularly patients, should not be revealed to persons not authorized to receive such information.

rule of nines, a formula for estimating the percentage of adult body surface covered by burns by assigning 9% to the head and each arm, twice 9% (18%) to each leg and the anterior and posterior trunk, and 1% to the perineum. This is modified in infants and children because of the proportionately larger head size.



Rule of nines

rule of outlet, an obstetric standard for determining whether the pelvic outlet will allow the passage of a fetus. It is calculated from the sum of the transverse and posterior sagittal diameters of the outlet, which must equal at least 15 cm.

rule of three, an arterial oxygen tension that is three times the value of the inspired oxygen concentration. It is regarded as an empiric guide to a temporarily acceptable minimal oxygenation or expression of clinical observation and has no scientific basis.

rum, a spirit distilled from fermented products of sugar cane, including molasses. It may contain up to 60% of ethyl alcohol by volume.

ruminant /ro͞o′minənt/ [L, *ruminare,* to chew again], pertaining to animals that chew their cud and to human infants that may regurgitate and reswallow a meal.

rumination /ro͞o′minā′shən/ [L, *ruminare,* to chew again], habitual regurgitation of small amounts of undigested food with little force after every feeding, a condition commonly seen in infants. It may be a symptom of overfeeding, of eating too fast, or of swallowing air. It has little or no clinical significance. More copious and forceful regurgitation may indicate a more serious condition such as an allergic intestinal reaction, an infectious disease, an obstruction of the intestinal tract, or a metabolic disorder. Also called **reflux.** See also **vomit.**

runner's high, a feeling of euphoria experienced by some cross-country runners and joggers as they near the end of a run. The feeling of elation is believed to be associated with the body's production of endorphins during physical stress.

Runyon classification system /run′yən/, a system of identifying mycobacteria on the basis of pigmentation and growth condition of the organisms. It includes group I, yellow-pigment photochromogens; group II, yellow-to-orange-to-red pigment scotochromogens; group III, white-to-tan nonphotochromogens; and group IV, rapid-growing saprophytes.

rupia /ro͞o′pē·ə/, a pustular eruption associated with secondary syphilis. It is characterized by encrusted ulcers resembling shells on darkly pigmented skin.

rupture /rup′chər/ [L, *rumpere,* to break], **1.** *n,* a tear or break in the continuity or configuration of an organ or body tissue, including instances when other tissue protrudes through the opening. See also **hernia. 2.** *v,* to cause a break or tear.

ruptured hymen, a hymen that has been torn as a result of injury, coitus, or surgery.

ruptured intervertebral disk. See **herniated disk.**

rupture of membranes (ROM) [L, *rumpere,* to break, *membrana*], the rupture of the amniotic sac, usually at the start of labor. It may be spontaneous or artificial.

rupture of uterus in pregnancy, a tear or break in the uterus because of trauma or other causes, possibly accompanied by displacement of the fetus and amniotic sac into the peritoneal cavity. The patient may experience acute pain because of tissue damage and irritation of the peritoneal tissues. Excessive loss of blood may be marked by hypotension, fluid volume deficit, and altered cardiac output.

RUQ, abbreviation for *right upper quadrant* of the lung.

Rural Clinics Assistance Act /ro͞o′rəl/, an act of the U.S. Congress that permitted the establishment of clinics in certain areas designated rural and underserved and in some inner cities. The clinics are designed to provide primary care through teams of physicians and nurse practitioners. The act is significant to nursing by being the first federal legislation to allow third-party reimbursement directly to nurses practicing in expanded roles.

rush /rush/, **1.** also called **high,** a pleasurable feeling experienced by users of recreational drugs following an injection of amphetamine or heroin. An amphetamine rush is described as an abrupt awakening, as distinguished from the drowsy drifting rush of heroin use. See also **flash. 2.** a strong wave of contractile activity that travels along the small intestine, usually as a result of irritation or distension.

Russell dwarf [Alexander Russell, twentieth century Scottish physician; AS, *dweorge*], a person affected with **Russell's syndrome,** a congenital disorder in which short stature is associated with various anomalies of the head, face, and skeleton and with varying degrees of mental retardation.

Russell's bodies [William Russell, Scottish physician, 1852–1940; AS, *bodig,* body], the mucoprotein inclusions found in globular plasma cells in cancer and inflammations. The bodies contain surface gamma globulins, derived from the condensation of internal cellular secretions. Also called **cancer bodies, fuchsin bodies.**

Russell-Silver dwarfism, Russell-Silver syndrome. See **Silver dwarf.**

Russell's periodontal index [Albert L. Russell, American dentist], a measure of the extent of periodontal disease in an individual that considers the amount of bone loss around the teeth and the degree of gingival inflammation. See **periodontal index.**

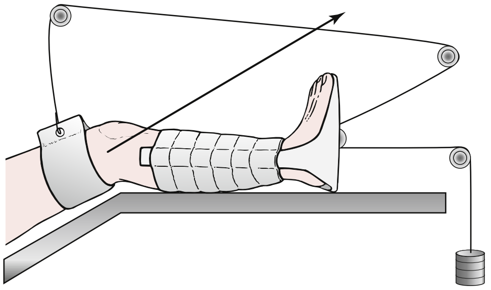
Russell's syndrome. See **Russell dwarf.**

Russell's traction [R. Hamilton Russell, Australian surgeon, 1860–1933; L, *trahere,* to pull along], a unilateral or a bilateral orthopedic mechanism that combines suspension and traction to immobilize, position, and align the lower extremities in the treatment of fractured femurs, hip and knee contractures, and disease processes of the hip and knee. Russell's traction is applied as adhesive or nonadhesive skin traction and uses a sling to relieve the weight of the lower extremities subjected to traction pull. A jacket restraint is often incorporated to help immobilize the patient. Compare **split Russell traction.**

Russian bath /rush′ən/, a hot steam bath followed by a cold plunge. Also called **sauna bath.**

rusts, microbes that are pathogens of plants, particularly cereal grains. They are also important human allergens.

rusty sputum /rus′tē/ [AS, *rust* + L, *sputum,* spittle], sputum that is reddish, indicative of blood or certain bacteria, such as pneumococcal bacteria, in pneumonia.



Russell's traction *(Lewis, Heitkemper, and Dirksen, 2004)*

ruthenium (Ru) /ro͞othē′nē·əm/ [Ruthenia, region of western Ukraine], a hard, brittle, metallic element. Its atomic number is 44, and its atomic mass is 101.07.

rutherfordium (Rf) [Sir Ernest Rutherford, British physicist, 1871-1937], a synthetic transuranic element. Its atomic number is 104, and its atomic mass is 261.

rutin /ro͞o′tin/, a bioflavonoid obtained from buckwheat and used in the treatment of capillary fragility.

Ruvalcaba's syndrome /ro͞o′väl·kā′bäz/ [R.H. Ruvalcaba, American physician, b. 1934], abnormal shortness of the metacarpal and metatarsal bones, hypogenitalism, and retardation of unknown cause present from birth in males. It is characterized by microcephaly, skeletal abnormalities, hypoplastic genitalia, and mental and physical retardation.

RV, abbreviation for **residual volume.**

RVC, abbreviation for *responds to verbal commands*.

R wave, the positive component of the QRS complex on an electrocardiogram. See also **QRS complex.**

rxn, RXN, symbol for drug reaction.

S

s, **1.** abbreviation for *second* in SI units. **2.** abbreviation for the Latin word *sinister,* “left.” **3.** abbreviation for **steady state.**

S, **1.** symbol for **sulfur.** **2.** symbol for *saturation of hemoglobin*. **3.** symbol for **siemens.**

s̄, s, symbol for the Latin *sine,* “without.”

S_1, the first heart sound in the cardiac cycle, occurring at the outset of ventricular systole. It is associated with closure of the mitral and tricuspid valves and is synchronous with the apical pulse. Auscultated at the apex, it is longer, and lower than the second sound (S_2), which follows it. The sound of the mitral valve is loudest at the apex of the heart, and that of the tricuspid valve is loudest at the left sternal border in the fourth intercostal space. See also ***lubb.***

S1, S2, . . ., symbols for **sacral nerves.**

S_2, the second heart sound in the cardiac cycle. It is associated with closure of the aortic and pulmonic valves at the outset of ventricular diastole. The second sound is louder and shorter than the first. The sound of the aortic valve is loudest on the right sternal border, and that of the pulmonic valve is most distinct on the left sternal border over the second intercostal space.

S_3, the third heart sound in the cardiac cycle. Normally, it is audible only in children and physically active young adults and usually disappears with age. In older people, it is an abnormal finding and usually indicates myocardial failure. It is heard with the bell of a stethoscope placed lightly over the apex of the heart with the patient lying down and facing left. A weak, low-pitched, dull sound, it is thought to be caused by vibrations of the ventricle walls when they are suddenly distended by blood from the atria. Also called **physiological third heart sound, ventricular gallop.**

S_4, the fourth heart sound in the cardiac cycle. It occurs late in diastole on contraction of the atria. Rarely heard in normal subjects, it indicates an abnormally increased resistance to ventricular filling, as in hypertensive cardiovascular disease, coronary artery disease, cardiomyopathy, and aortic stenosis. A left-sided fourth heart sound, it may be heard with the stethoscope’s bell at the apex of the heart during expiration. Also called **atrial gallop, physiological fourth heart sound.**

SA, **1.** abbreviation for **sinoatrial.** **2.** abbreviation for **surface area.** **3.** abbreviation for **surgeon’s assistant.**

saber-sheath trachea /sā′bər/, an abnormally shaped trachea caused by chronic obstructive pulmonary disease. The diameter of the posterior part of the trachea is increased while the lateral dimension is decreased.

saber shin, a sharp, anterior bowing of the tibia caused by hereditary syphilis.

Sabin-Feldman dye test /sā′bin feld′mən/ [Albert B. Sabin, American virologist, 1906–1993; H.A. Feldman, American epidemiologist, b. 1914; AS, *deag* + L, *testum,* crucible], a serological test for the diagnosis of toxoplasmosis that depends on the presence of specific antibodies that block the uptake of methylene blue dye by the cytoplasm of the *Toxoplasma* organisms.

Sabin vaccine. See **oral poliovirus vaccine.**

sac /sak/ [Gk, *sakkos,* sack], a pouch or a baglike organ, such as the abdominal sac of the embryo that develops into the abdominal cavity.

saccade /sakād′, sak′ədā′/ [Fr, *saccader,* to jerk], abrupt, rapid small movements of both eyes.

saccadic eye movement /sakad′ik/, an extremely fast voluntary movement of the eyes, allowing them to accurately refix on an object in the visual field.

sacchari-. See **saccharo-.**

saccharide /sak′ərīd′/, any of a large group of carbohydrates, including all sugars and starches. Almost all carbohydrates are saccharides. See also **carbohydrate, sugar.**

saccharin /sak′ərin/ [Gk, *sakcharon,* sugar], **1.** *n,* a white crystalline synthetic sweetening agent derived from coal tar. Although it is up to 500 times as sweet as sugar, it has no food value. **2.** *adj,* having a sweet taste, especially cloyingly sweet. Also called *saccharine* /-rīn, -rin/.

saccharo-, sacchari-, prefix meaning “sugar”: *saccharobiose, saccharorrhea, saccharosuria*.

saccharometabolism /sak′ərōmətab′əliz′əm/, the functioning of sugar within a living body.

Saccharomyces /sak′ərōmī′sēz/ [Gk, *sakcharon* + *mykes,* fungus], a genus of yeast fungi that causes such diseases as bronchitis, moniliasis, and pharyngitis.

saccharomycosis /sak′ərōmīkō′sis/ [Gk, *sakcharon* + *mykes* + *osis,* condition], infection with yeast fungi, such as the genus *Candida* or *Cryptococcus*.

saccular, pertaining to a pouch or shaped like a sac.

saccular aneurysm, a localized dilation of a small area of an artery, forming a saclike swelling or protrusion. It is usually caused by trauma. Also called **ampullary aneurysm, sacculated aneurysm.** Compare **fusiform aneurysm.**

sacculated /sak′yəlā′tid/ [L, *sacculus,* small bag], a condition of small sacs, pouches, or saclike dilations.

sacculated aneurysm. See **saccular aneurysm.**

sacculated pleurisy, inflammation of the pleura with exudate encapsulated in several locations by adhesions.

sacculation /sak′yo͞o·lā′shən/ [L, *sacculus*], the quality of being sacculated, or pursed out with little pouches. See also **sacculus.**

saccule /sak′yo͞ol/ [L, *sacculus*], a small bag or sac, such as the air saccules of the lungs. See also **sacculus.** **—saccular,** *adj*.

saccule of larynx. See **laryngocele.**

sacculus /sak′yo͝oləs/, *pl. sacculi,* a little sac or bag, especially the smaller of the two divisions of the membranous labyrinth of the vestibule, which communicates with the cochlear duct through the ductus reuniens in the inner ear. See also **saccule.**

Sachs’ disease. See **Tay-Sachs disease.**

SA conduction time, the time required for an impulse to travel from the sinus node to the atrial musculature. It is measured from the sinoatrial (SA) deflection in a SA nodal electrocardiogram to the beginning of the P wave in a bipolar record, or to the beginning of the high right atrial electrogram in a unipolar record.

sacral. See **sacrum.**

sacral agenesis. See **caudal regression syndrome.**

sacral bone, a composite bone formed by the fusion during maturation of five sacral vertebrae that were separate at birth. The sacrum forms the back of the pelvis.

sacral canal, an extension of the vertebral canal through the sacrum.

sacral foramen, any one of several openings between the fused segments of the sacral vertebrae in the sacrum through which the sacral nerves pass.

sacral kyphosis, the dorsally convex curve formed by the sacrum when seen from the side.

sacral micturition center, a center in the sacral spinal cord that contributes to control of the bladder and inhibition of tension of the urethral sphincters.

sacral nerves, the five segmental nerves from the sacral part of the spinal cord. The first four emerge through the anterior sacral foramina and the fifth from between the sacral foramen and the coccyx.

sacral node, a node in one of the seven groups of parietal lymph nodes of the abdomen and the pelvis, situated within the sacrum. The sacral nodes are located in relation to the middle and the lateral sacral arteries and receive lymphatics from the rectum and the posterior wall of the pelvis. Compare **lumbar node.** See also **lymph, lymphatic system, lymph node.**

sacral plexus, a network of motor and sensory nerves formed by the lumbosacral trunk from the fourth and fifth lumbar, and by the first, second, and third sacral, nerves. They converge toward the lower part of the greater sciatic foramen and unite to become a large, flattened band, most of which continues into the thigh as the sciatic nerve. Compare **lumbar plexus.** See also **lumbosacral plexus.**

sacral vertebra, one of the five segments of the vertebral column that fuse in the adult to form the sacrum. The ventral border of the first sacral vertebra projects into the pelvis. The bodies of the other sacral vertebrae are smaller than that of the first and are flattened and curved ventrally, forming the convex, anterior surface of the sacrum. The rudimentary spinous processes of the first several sacral vertebrae surmount the middle sacral crest, and the transverse processes of the sacral vertebrae form the lateral sacral crests. The sacral hiatus at the caudal end of the sacral canal develops from the incomplete growth of the spinous processes of the last two sacral vertebrae. The resultant widened aperture is used by anesthesiologists for the insertion of a needle to administer caudal analgesia. Compare **cervical vertebra, coccygeal vertebra, lumbar vertebra, thoracic vertebra.** See also **sacrum, vertebra.**

sacro-, prefix meaning “sacrum”: *sacrococcyx, sacroiliac, sacrolumbalis*.

sacrococcygeal /sā′krōkoksij′ē·əl/ [L, *sacer,* sacred; Gk, *kokkyx,* cuckoo’s beak], pertaining to the sacrum and the coccyx.

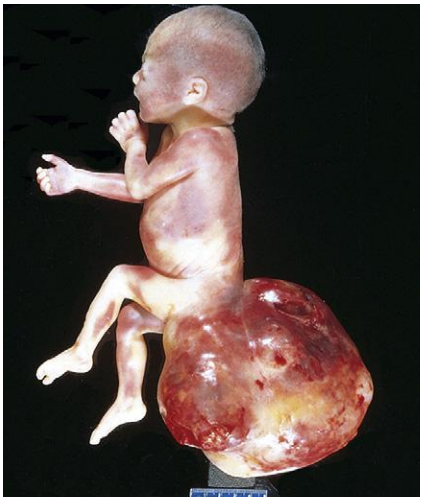
sacrococcygeal teratoma, a common tumor of newborns, found in the primitive pit. It may represent part of the blastopore of lower vertebrates.

sacroiliac /sā′krō·il′ē·ak/ [L, *sacer* + *ilium,* flank], pertaining to the part of the skeletal system that includes the sacrum and the ilium bones of the pelvis.

sacroiliac articulation, an immovable joint in the pelvis formed by the articulation of each side of the sacrum with an iliac bone.

sacroiliac joint, the joint formed by the sacrum and ilium where they meet on either side of the lower back. The tight joint allows little motion and is subject to great stress as the body’s weight pushes downward and the legs and pelvis push upward against the joint. The sacroiliac joint must also bear the leverage demands made by the trunk of the body as it turns, twists, pulls, and pushes. When these motions place an excess of stress on the ligaments binding the joint and on the connecting muscles (such as during weightlifting), strain may result.

sacroiliac ligament, one of the three ligaments that stabilizes each sacroiliac joint.



Sacrococcygeal teratoma
(Kumar et al, 2010)

sacroiliitis /sā′krō·il′ē·ī′tis/, an inflammation of the sacroiliac joint.

sacrolumbar. See **lumbosacral.**

sacrosciatic /sā′krōsī·at′ik/, pertaining to the sacrum and ischium.

sacrosidase /sakro′sidās/, an enzyme used as a substitute to replace the sucrase activity lacking in sucrase-isomaltase deficiency. It is administered orally.

sacrospinalis /sak′rōspīnal′is/ [L, *sacer* + *spina,* backbone], the superficial longitudinal muscle mass on either side of the vertebral column. It is sheathed in the fascia thoracolumbalis and arises in a broad, thick tendon from the sacrum, the ilium, and the lumbar vertebrae. It inserts into the ribs and into certain cervical vertebrae and is innervated by the branches of the dorsal primary divisions of the spinal nerves. It extends and flexes the vertebral column and the head, draws the ribs downward, and bends the trunk to the side. Also called **erector spinae,** *sacrospinal muscle*.

sacrospinous ligament, with the sacrotuberous ligament, an important architectural element of the walls of the true pelvis that links each pelvic bone to the sacrum and coccyx and converts two notches on the pelvic bones into foramina on the lateral pelvic walls.

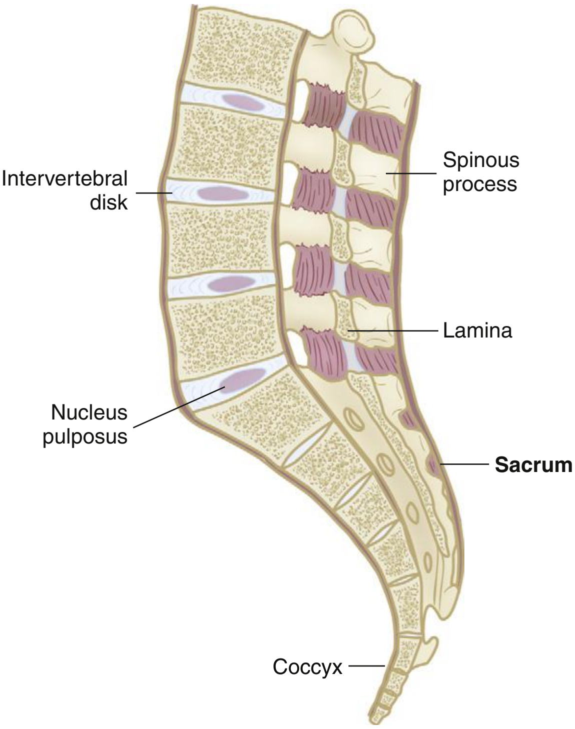
sacrum /sā′krəm, sak′rəm/ [L, *sacer,* sacred], the large, triangular bone at the dorsal part of the pelvis, inserted like a wedge between the two hip bones. The base of the sacrum articulates with the last lumbar vertebra, and its apex articulates with the coccyx. Various muscles attach to its spinal crest. The sacrum is shorter and wider in women than in men. **—sacral,** *adj*.

SAD. abbreviation for **seasonal affective disorder.**

saddle /sad′əl/ [AS, *sadol*], **1.** a support whose shape fits the contour of the object resting on it. **2.** a saddle-shaped structure or part. **3.** See **denture base.**

saddleback nose. See **saddle nose.**

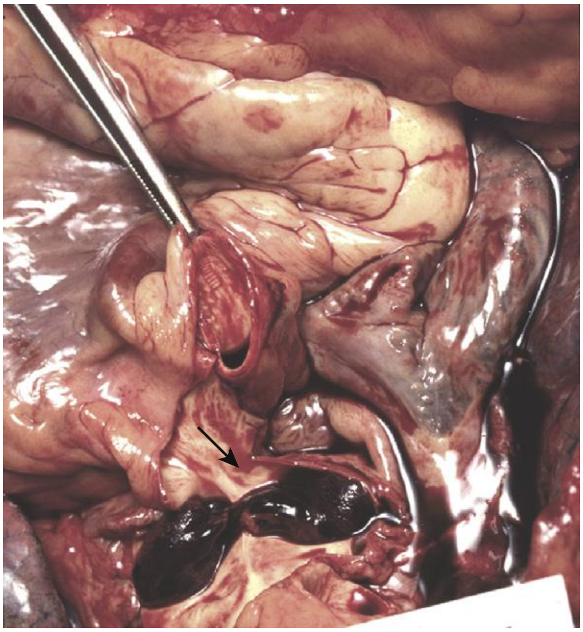
saddle block anesthesia [AS, *sadol* + Fr, *bloc* + Gk, *anaisthesia,* lack of feeling], a form of spinal nerve block in which the area of the body that would touch a saddle, were the patient sitting astride one, is anesthetized. It is performed by injecting a local anesthetic into the subarachnoid cerebrospinal fluid space while the patient is in the sitting position.



Sacrum *(Seidel et al, 2011)*

Saddle block anesthesia is common in some centers for anesthesia during childbirth. In today's obstetric anesthesia, epidural analgesia is most commonly given during labor. See also **obstetric anesthesia.**

saddle embolism, a thrombus that straddles a dividing blood vessel. Also called **straddling embolism.**



Saddle embolism *(Kumar et al, 2007/Courtesy Dr. Linda Margraf, Department of Pathology, University of Texas Southwestern Medical School)*

saddle joint, a synovial joint in which surfaces of contiguous bones are reciprocally concavoconvex. A saddle joint permits no axial rotation but allows flexion, extension, adduction, and abduction, as in the carpometacarpal joint of the thumb. Also called **articulatio sellaris.** Compare **condyloid joint, pivot joint.**

saddle nose [AS, *sadol* + *nosu*], a sunken nasal bridge caused by injury or disease and resulting in damage to the nasal septum. Also called **saddleback nose.**

sadism /sā′dizəm, sad′izəm/ [Marquis Donatien A.F. de Sade, French writer, 1740–1814], **1.** abnormal pleasure derived from inflicting physical or psychological pain or abuse on others; cruelty. **2.** also called **active algolagnia.** (in psychiatry) a psychosexual disorder characterized by the infliction of physical or psychological pain or humiliation on another person, either a consenting or a nonconsenting partner, to achieve sexual excitement or gratification. The condition is usually chronic, is seen predominantly in men, may result from conscious or unconscious motivations or desires, and, in severe cases, can lead to rape, torture, and murder. Kinds of sadism are **anal sadism** and **oral sadism.** Also called **sexual sadism.** Compare **masochism.** See also **algolagnia, sadomasochism. —***sadistic, adj.*

sadist /sā′dist/, a person who is afflicted with or practices sadism. Compare **masochist.**

sadomasochism /sā′dōmas′əkiz′əm/ [Marquis de Sade; Leopold von Sacher-Masoch, Austrian author, 1836–1895], a personality disorder characterized by traits of sadism and masochism. See also **algolagnia, masochism, sadism.**

sadomasochist /sā′dōmas′əkist/ [Marquis de Sade; Leopold von Sacher-Masoch], a person who practices sadomasochism.

Saethre-Chotzen syndrome /sā′trə·kot′zən/ [Haakon Saethre, Norwegian psychiatrist, 20th century; F. Chotzen, German psychiatrist, 20th century], an autosomal-dominant disorder characterized by acrocephalosyndactyly in which the syndactyly is mild and by hypertelorism, ptosis, and sometimes mental retardation. Also called **acrocephalosyndactyly,** *type III;* **Chotzen's syndrome.**

safe home environment, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as physical arrangements to minimize environmental factors that might cause physical harm or injury in the home. See also **Nursing Outcomes Classification.**

Safe home environment: equipment to help prevent falls *(Potter and Perry, 2007)*

safe period, the period during the menstrual cycle when conception is considered least likely to occur. It comprises approximately the 10 days after menstruation begins and the 10 days preceding menstruation. See also **contraception.**

safe sex, intimate sexual practices between partners who use condoms or other means to prevent the exchange of body fluids that transmit diseases. Although perfect safety is virtually impossible without abstinence, the known risks of infections by human immunodeficiency virus or other organisms transmitted through sexual contact can be reduced by safe sex practices.

safety director /sāf′tē/ [Fr, *sauver,* to save, *directeur,* manager], a member of a hospital staff whose activities are related to safety functions, such as fire prevention, environmental safety, and disaster planning activities. Also called *safety officer.*

safety glass, a hard, transparent material that resists shattering on impact. It usually is made as a sandwich of two sheets of glass with an intermediate layer of plastic. Safety glass may also be produced as a tempered material that breaks into rounded granules instead of sharp shards. Also called **shatterproof glass.**

safety glasses, impact-resistant lenses that protect the eyes from blows or other kinds of injury. Such lenses are usually made by tempering the glass, substituting plastic for glass, or laminating. Also called **polycarbonate glasses,** *safety lenses*.

safety system /sāf′te sis′tem/, **1.** a system designed to minimize hazards caused by human error. **2.** in respiratory therapy a system of connections designed to help prevent accidental interchanging of incorrect equipment or gases.

safe wandering, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as safe, socially acceptable moving about without apparent purpose in an individual with cognitive impairment. See also **Nursing Outcomes Classification.**

safflower oil /sef′lou·er/, a liquid fat containing polyunsaturated fatty acids, derived from the seeds of the safflower plant, *Carthamus tinctorius*. It is commonly mixed with other edible vegetable oils.

sagittal /saj′ətəl/ [L, *sagitta,* arrow], (in anatomy) pertaining to a suture or an imaginary line extending from the front to the back in the midline of the body or a part of the body, dividing into right and left parts.

sagittal axis, a hypothetical line through the mandibular condyle that serves as an axis for rotation of the mandible.

sagittal fontanel, a soft area located in the sagittal suture, halfway between the anterior and posterior fontanels. It may be found in some normal newborns and also in some with Down syndrome.

sagittal plane, the anteroposterior plane, or the section parallel to the median plane of the body. Compare **frontal plane, median plane, transverse plane.**

sagittal section, an anteroposterior cross section produced by slicing, laterally or through imaging techniques, a body or body part in a vertical plane parallel to the median plane.

sagittal sinus [L, *sagitta,* arrow, *sinus,* hollow], either of two venous sinuses of the dura mater. The superior venous sinus begins near the crista galli and drains backward to empty into a confluence of sinuses near the occipital area. The inferior venous sinus begins in the lower margin of the cerebral falx and follows the superior venous sinus, emptying into the straight sinus.

sagittal suture, the serrated connection between the two parietal bones of the skull, coursing down the midline from the coronal suture to the upper part of the lambdoidal suture.

sago spleen /sā′gō/, a form of amyloid spleen that mainly affects the malpighian bodies.

SaH, SAH, abbreviation for **subarachnoid hemorrhage.**

SAIN, abbreviation for **Society for Advancement in Nursing.**

Saint John's wort /sānt jonz wort/, any of various species of the genus *Hypericum*. *H. perforatum* is a medicinal herb, which is used as a mild antidepressant, sedative, and anxiolytic; it is also used topically for inflammation of the skin, contusions, myalgia, and first-degree burns.

Saint's triad [Charles F.M. Saint, twentieth-century South African radiologist], a group of three related conditions—cholelithiasis, diverticulosis, and hiatal hernia—occurring together.

Saint Vitus' dance /sānt vī′təs/, a motor nerve disorder characterized by irregular involuntary jerky movements of the limbs and facial muscles. Historically the condition was once confused with symptoms of a dance mania that reportedly was cured by a pilgrimage to the shrine of Saint Vitus; it is thought to be caused by sequence of rheumatic fever. See also **Sydenham's chorea.**

Sakati-Nyhan syndrome /sä′kä·tē·nī′han/ [Nadia Sakati, American pediatrician, 20th century; William Leo Nyhan, American pediatrician, b. 1926], an autosomal-dominant type of acrocephalopolysyndactyly characterized by hypoplastic tibias and deformed, displaced fibulas. Also called **acrocephalopolysyndactyly,** *type III*. See also **Carpenter's syndrome, Goodman's syndrome, Noack's syndrome.**

SAL, abbreviation for **sterility assurance level.**

sal-, -sal, combining form for salicylic acid derivatives.

salaam convulsion /säläm′/ [L, *convulsio,* cramp], a violent muscle spasm of the sternomastoid muscles marked by head bobbing or bowing. Also called **West's syndrome.**

salbutamol. See **albuterol.**

salicylate /səlis′əlāt/ [Gk, *salix,* willow, *hyle,* matter], any of several widely prescribed drugs derived from salicylic acid. Salicylates exert analgesic, antipyretic, and antiinflammatory actions. The most important is acetylsalicylic acid, or aspirin. Sodium salicylate also has been used systemically, and it exerts similar effects. Many of the actions of aspirin appear to result from its ability to inhibit cyclooxygenase, a rate-limiting enzyme in prostaglandin biosynthesis. Aspirin is used in a wide variety of conditions, and, in the usual analgesic dosage, it causes only mild adverse effects. Severe occult GI bleeding or gastric ulcers may occur with frequent use. Large doses taken over a long period can cause significant impairment of hemostasis. Occasionally an asthmalike reaction is produced in hypersensitive individuals. Because of the ready availability of aspirin, accidental and intentional overdosage is common. Symptoms of salicylate intoxication include tinnitus, GI disturbances, abnormal respiration, acid-base imbalance, and central nervous system disturbances. Fatalities have resulted from ingestion of as little as 10 grains of aspirin in adults or as little as 4 mL of methyl salicylate (oil of wintergreen) in children. In addition to aspirin and sodium salicylate, which are used systemically, methyl salicylate is used topically as a counterirritant in ointments and liniments. Methyl salicylate can be absorbed through the skin in amounts capable of causing systemic toxicity. Another salicylate, salicylic acid, is too irritating to be used systemically and is used topically as a keratolytic agent, for example, for removing warts. See also **salicylic acid.**

salicylated /səlis′ilā′tid/ [Gk, *salix,* willow, *hyle,* matter], pertaining to a chemical formed as a salt or ester of salicylic acid.

salicylate poisoning, a toxic condition caused by the ingestion of salicylate, most often in aspirin or oil of wintergreen. Intoxication is characterized by rapid breathing, vomiting, headache, irritability, ketosis, hypoglycemia, and, in severe cases, seizures and respiratory failure.

salicylazosulfapyridine. See **sulfasalazine.**

salicylic acid /sal′isil′ik/, a keratolytic agent.

■ INDICATIONS: It is prescribed in the treatment of hyperkeratotic skin conditions and as an adjunct in fungal infections.

■ CONTRAINDICATIONS: Diabetes, impaired circulation, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are skin inflammation and salicylism.

salicylism /sal′isil′izəm/ [Gk, *salix,* willow, *hyle,* matter, *ismos,* practice], a syndrome of salicylate toxicity. See also **salicylate poisoning.**

saline /sā′līn/ [L, *sal,* salt], **1.** pertaining to a substance that contains a salt or salts. **2.** pertaining to something that is salty or has the characteristics of common table salt. See also **hypertonic saline, hypotonic saline.**

saline cathartic [L, *sal,* salt; Gk, *katharsis,* cleansing], one of a large group of cathartics administered to achieve prompt, complete evacuation of the bowel. A watery semifluid evacuation usually occurs within 3 to 4 hours. The most common indication for the administration of any of these agents is preparation of the bowel for diagnostic examination. Various preparations, including magnesium sulfate, sodium phosphate, sodium sulfate, and several naturally occurring mineral waters, may be used to achieve catharsis. The palatability of, cost of, and adverse systemic reactions to the saline cathartics depend on the particular agent used and the dose of the agent given.

saline enema [L, *sal,* salt; Gk, *enienai,* to send in], a saltwater enema. Hypertonic saline enema is used to treat worm infestations by inducing peristalsis and evacuation. It may require 2 teaspoons of salt per 0.5 L of warm water, sometimes with magnesium sulfate added, instilled slowly, and retained as long as possible. A normal saline enema of 1 teaspoonful of salt per 0.5 L of water is instilled slowly and retained as long as possible to combat shock or replace lost fluids.

saline infusion, the therapeutic introduction of a physiological salt solution into a vein.

saline irrigation, the washing out of a body cavity or wound with a stream of salt solution, usually an isotonic aqueous solution of sodium chloride.

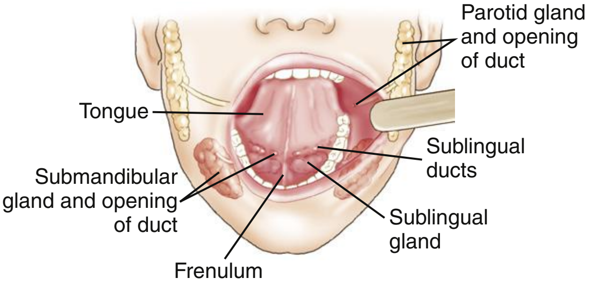
saline solution, a solution containing sodium chloride. Depending on the use, it may be hypotonic, isotonic, or hypertonic with body fluids.

saliva /səlī′və/ [L, spittle], the clear, viscous fluid secreted by the salivary and mucous glands in the mouth. Saliva contains water, mucin, organic salts, and the digestive enzyme ptyalin. It serves to moisten the oral cavity, to initiate the digestion of starches, and to aid in the chewing and swallowing of food. Approximately 1 to 1.5 L is produced per day. —*salivary, adj.*

salivary duct, any one of the ducts through which saliva passes. Kinds of salivary ducts are **Bartholin's duct, duct of Rivinus, parotid duct,** and **submandibular duct.**

salivary fistula, an abnormal communication from a salivary gland or duct to an opening in the mouth or on the skin of the face or neck.

salivary gland, any one of three pairs of glands secreting into the mouth, thus aiding the digestive process. The salivary glands are the parotid, the submandibular, and the sublingual. They are racemose structures consisting of numerous lobes subdivided into smaller lobules connected by dense areolar tissue, vessels, and ducts. The sublingual gland secretes mucus; the parotid gland, serous fluid; and the submandibular gland, both mucus and serous fluid. The lobules of the salivary glands are richly supplied with blood vessels and fine plexuses of nerves. The hilum of the submandibular gland contains Langley's ganglion of nerve cells.



Parotid gland and opening of duct
Tongue
Sublingual ducts
Submandibular gland and opening of duct
Sublingual gland
Frenulum

Salivary glands *(Leonard, 2009)*

salivary gland cancer, a malignant neoplastic disease of a salivary gland, occurring most frequently in a parotid gland. About 75% of tumors that develop in the salivary glands are benign, characteristically slow-growing painless mobile masses that are cystic or rubbery in consistency. In contrast, malignant tumors are rapid-growing, hard, lumpy, fixed, and frequently tender. Pain, trismus, and facial palsy may occur. Diagnostic measures include radiographic studies, with sialographic studies and mandibular and chest films to detect metastases, and cytological studies of saliva from Stensen's duct. Direct biopsies are not recommended. The most common malignant neoplasms are mucoepidermoid, adenoid cystic, solid, and squamous cell carcinomas. Treatment usually consists of surgical removal of the lobe containing a benign tumor and total parotidectomy with a radical neck dissection if the lesion is advanced. Radiotherapy is administered for residual, recurrent, or inoperable cancers, and chemotherapy may be palliative.

salivary gland nuclear imaging, a nuclear scan of the salivary glands to visualize inflammation, hypofunction, location and character of tumors, and duct obstruction.

saliva substitute. See **artificial saliva.**

salivation /sal′ivā′shən/, the process of saliva secretion by the salivary glands.

salivatory /sal′ivətôr′ē/ [L, *saliva,* spittle], stimulating the production of saliva. Also **sialogenous.**

Salk vaccine. See **poliovirus vaccine.**

sallow /sal′ō/ [ME, *salou,* dirty-gray], yellowish-gray in complexion.

salmeterol, a sympathomimetic, long-acting bronchodilator.

■ INDICATIONS: It is prescribed in the maintenance treatment of reversible bronchospasm associated with asthma (including nocturnal asthma) and chronic obstructive pulmonary disease and to prevent exercise-induced asthma.

■ CONTRAINDICATIONS: It should not be given to patients with allergy to any component of the drug formulation, when patients need a fast-onset inhaled beta-2 agonist for bronchodilation, or when patients have used MAO inhibitors within the past 2 weeks. The frequency of salmeterol administration should not be increased. Caution must be used when salmeterol is administrated to patients with conditions that have the potential to be exacerbated by sympathomimetic amines, including cardiovascular disease diabetes, prostatic hyperplasia, convulsions, thyrotoxicosis, and narrow-angle glaucoma.

■ ADVERSE EFFECTS: The side effects most often reported include changes in heart rhythm, muscle cramps or stiffness, parkinsonian-like symptoms, pallor, sweating, hives, and tingling of the skin.

salmon calcitonin. See **calcitonin.**

Salmonella /sal′mənel′ə/ [Daniel E. Salmon, American pathologist, 1850–1914], a genus of motile gram-negative rod-shaped bacteria that includes species causing typhoid fever, paratyphoid fever, and some forms of gastroenteritis. Salmonella species are widely distributed in animals, frequently producing disease that can be transmitted to humans. The most frequent manifestation of salmonella is food poisoning. See also **salmonellosis.**

Salmonella enteritidis [Daniel E. Salmon; Gk, *enteron,* intestine], a species of *Salmonella* causing food poisoning and gastroenteritis in humans.

***Salmonella* enteritis,** bacterial enteritis caused by species of *Salmonella*.

***Salmonella* gastroenteritis,** a type of gastroenteritis caused by species of *Salmonella*. Species causing this in humans include *S. choleraesuis* and *S. enteritidis* and usually enter the body in contaminated food. Symptoms include inflammation of the mucosa, nausea, vomiting, abdominal pain, and bloody diarrhea. A more virulent form can occur in immunocompromised patients, sometimes resulting in septicemia.

salmonellosis /sal′mənəlō′sis/ [Daniel E. Salmon; Gk, *osis,* condition], a form of gastroenteritis caused by ingestion of food contaminated with a species of *Salmonella*. It is characterized by an incubation period of 6 to 48 hours followed by sudden colicky abdominal pain; fever; and bloody, watery diarrhea. Nausea and vomiting are common, and abdominal signs may resemble those of acute appendicitis or cholecystitis. Symptoms usually last from 4 to 7 days, but diarrhea and fever may persist for up to 2 weeks. Dehydration may occur. There is no specific treatment. Antibiotics are usually not indicated unless disease has spread beyond the intestine. Adequate cooking, good refrigeration, and careful handwashing may reduce the frequency of outbreaks. See also **food poisoning, typhoid fever.**

salol camphor, a clear, oily mixture of two parts of camphor and three parts of phenyl salicylate, used as a local antiseptic.

Salonica fever. See **trench fever.**

salpingectomy /sal′pinjek′təmē/ [Gk, *salpinx,* tube, *ektomē,* excision], surgical removal of one or both fallopian tubes. It is performed for removal of a cyst or tumor, for excision of an abscess, or, if both tubes are removed, as a sterilization procedure or for tubal pregnancy. Often the operation is done with a hysterectomy or an oophorectomy. Either spinal block or general anesthesia may be given. Postoperatively the patient is instructed to avoid sharply flexing the thighs or the knees. Persistent low back pain or the presence of bloody or scanty urine indicates that a ureter may have been injured during surgery.

salpingemphraxis /salpinj′emfrak′sis/ [Gk, *salpinx,* tube, *emphraxis,* a stoppage], **1.** an obstruction of the eustachian tube of the ear. **2.** an obstruction of a fallopian tube.

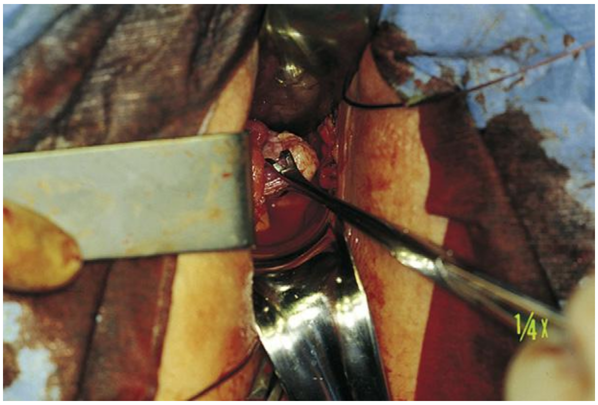
salpinges, salpingian. See **salpinx.**

salpingitis /sal′pinjī′tis/ [Gk, *salpinx* + *itis,* inflammation], **1.** an inflammation or infection of the fallopian tube. See also **pelvic inflammatory disease. 2.** inflammation of the eustachian tube.

salpingo-, prefix meaning “eustachian or fallopian tube”: *salpingocele, salpingolysis, salpingoplasty.*

salpingography /sal′ping·gog′rəfē/, a radiographic examination of the fallopian tube after injection of a radiopaque contrast medium.

salpingo-oophorectomy /-ō′əfôrek′təmē/, the surgical removal of a fallopian tube and an ovary.



Salpingo-oophorectomy *(Baggish and Karram, 2011)*

salpingo-oophoritis /-ō′əfôrī′tis/ [Gk, *salpinx,* tube, *oophoron,* ovary, *itis,* inflammation], an inflammation of a fallopian tube and associated ovary.

salpingopharyngeal fold, a small vertical fold that descends from the tubal elevation of the nasopharynx and overlies salpingopharyngeus muscle.

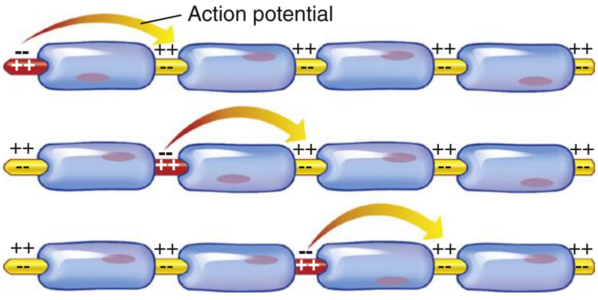
salpingostomy /sal′ping·gos′təmē/ [Gk, *salpinx* + *stoma,* mouth], the formation of an artificial opening in a fallopian tube to restore patency in a tube whose fimbriated opening has been closed by infection or by chronic inflammation or to drain an abscess or a fluid accumulation. A prosthesis may be inserted to maintain the patency of the fallopian tube and to direct the route of the ova to assist fertilization. Postoperatively the nurse cautions the patient against sharply flexing the thighs or the knees. Low back pain or scanty or bloody urine may indicate that a ureter has been injured during the procedure, requiring surgical intervention.

salpinx /sal′pingks/ *pl.* **salpinges** [Gk, tube], a tube, such as the fallopian or eustachian tube, the salpinx auditiva, or the salpinx uterina. **—salpingian,** *adj.*

salt /sôlt/ [L, *sal*], **1.** a compound formed by the chemical reaction of an acid and a base. Salts are usually composed of a metal cation and a nonmetal anion. **2.** sodium chloride (common table salt). **3.** a substance, such as magnesium sulfate (Epsom salt), used as a purgative.

saltation /saltā′shən/ [L, *saltare,* to dance], a mutation causing a significant difference in appearance between parent and offspring or an abrupt variation in the characteristics of a species. **—***saltatorial, saltatoric, saltatory* /sal′tətôr′ē/, *adj.*

saltatory conduction /sal′tətôr′ē/ [L, *saltare* + *conducere,* to lead together], impulse transmission that skips from node to node, providing rapid transmission.



Saltatory conduction

saltatory evolution, the appearance of a sudden change within a species, caused by mutation. The progression of a species by sudden major changes rather than by the gradual accumulation of minor changes. The phenomenon occurs predominantly in plants as a result of polyploidy. See also **emergent evolution.**

salt cake, anhydrous sodium sulfate; a technical grade of sodium sulfate used in detergents, dyes, soaps, and other industrial products. See also **sodium sulfate.**

salt depletion, the loss of salt from the body through excessive elimination of body fluids by perspiration, diarrhea, vomiting, or urination, without corresponding replacement. See also **electrolyte balance, heat exhaustion.**

salted plasma /sôl′tid/, a fluid part of blood that has been treated with sodium or magnesium sulfate to prevent coagulation. Also called *salted serum*.

Salter fracture. See **epiphyseal fracture.**

salt-free diet. See **low-sodium diet.**

salt-losing nephritis, a disorder characterized by abnormal kidney loss of sodium chloride, hyponatremia, azotemia, acidosis, dehydration, and vascular collapse. Causes include kidney tubule damage, endocrine dysfunction, and GI abnormality. Also called **salt-losing syndrome.**

salt-losing nephropathy, intrinsic renal disease causing abnormal urinary sodium loss in persons ingesting normal amounts of sodium chloride, accompanied by vomiting, dehydration, and vascular collapse. Also called **salt-losing nephritis.**

salt-losing syndrome. See **salt-losing nephritis.**

saltpeter /sôlt′pē′tər/ [L, *sal,* salt, *petra,* rock], common name for potassium nitrate, KNO_3, used in gunpowder, pickling substances, and medicines.

salt-poor diet [Gk, *diaita,* way of living], a diet providing 500 mg or less of sodium chloride daily. To ensure that the maximum salt intake does not exceed the limit, it is necessary to record the amount of dietary sodium chloride, including amounts contained in patient medications. Note: Some "salt-free" diets may contain as much as 1000 mg of sodium chloride per day.

salt substitute, a chemical compound for flavoring foods without adding sodium to the diet. Examples include potassium chloride, monopotassium glutamate, and glutamic acid.

salt wasting, inappropriate sodium excretion in the urine (natriuresis) with hyponatremia and hyperkalemia. See also **salt-losing nephritis.**

Saluron, a trademark for a thiazide diuretic **(hydroflumethiazide).**

salvage therapy /sal′vij/ [Fr, *sauver,* to save; Gk, *therapeia*, treatment], therapy administered to sites at which previous therapies have failed and the disease has recurred.

salve. See **ointment.**

samarium (Sm) /səmer′ē·əm/ [Colonel M. von Samarski, nineteenth-century Russian mine official], a metallic rare earth element. Its atomic number is 62; its atomic mass is 150.35.

SAMHSA, abbreviation for **Substance Abuse and Mental Health Services Administration**.

samarium Sm 153 lexidronam (Sm 153-EDTMP), samarium 153 complexed with ethylenediaminetetramethylenephosphonic acid, a bone-seeking diphosphonate complex that concentrates in areas of bone turnover. It is administered intravenously in the palliative treatment of patients with osteoblastic metastatic bone lesions.

sample [L, *exemplum*], (in research) a group or part of the whole that can be used to demonstrate characteristics of the whole. Kinds of samples include cluster, convenience, **random,** and **stratified.**

sanatorium. See **sanitarium.**

sanctuary site /sangk′cho͞o·er′ē/ [L, *sanctus,* sacred, *situs,* location], an area of the body that is poorly penetrated by pharmacological agents and therefore is a place in which tumor cells or infectious organisms can escape the effects of drug therapy. For example, because most drugs that are effective against the human immunodeficiency virus (HIV) do not cross the blood-brain barrier, the central nervous system provides an area in which HIV can avoid the effects of antiviral therapy and from which resistant virus can later emerge.

Sanctura, a trademark for **trospium.**

sand bath, the application of warm dry sand or of damp sand to the body.

sand flea. See **chigoe.**

sandfly fever. See **phlebotomus fever.**

Sandhoff's disease, a variant of Tay-Sachs disease that includes defects in the enzymes hexosaminidase A and B. It is characterized by a progressively more rapid course and is found in the general population, not a restricted population as is Tay-Sachs disease. Also called **gangliosidosis type II.** See also **Tay-Sachs disease.**

Sandoz Clinical Assessment—Geriatric, an examination of psychological function that is administered to elderly people to assist in the diagnostic process.

sand tumor. See **psammoma.**

sandwich generation, members of the middle generation who are trying to raise children and help aging parents at the same time.

sandwich technique, a method of identifying antibodies or antibody-synthesizing cells in a tissue preparation. A solution containing a specific antigen is applied to the preparation. If antibodies to the antigen are present in the tissue, they will bind to the antigen. Unbound antigen is washed away, and then a fluorochrome-labeled antibody specific for the antigen is added. The result is a complex of antigen sandwiched between antibodies, which can be detected by fluorescence microscopy.

Sanfilippo's syndrome /san·fi·lip′ōz/ [Sylvester J. Sanfilippo, American pediatrician, 20th century], four heterogeneous, biochemically distinct, but clinically indistinguishable, forms of mucopolysaccharidosis characterized biochemically by excretion of the mucopolysaccharide heparan sulfate in the urine and clinically by severe, rapid mental deterioration and relatively mild somatic symptoms. Onset is from 2 to 6 years of age; the head is large, height is normal, Hurler-like features are mild, and hirsutism is generalized; death usually occurs before 20 years of age. The four types are types A through D, each resulting from a different enzymatic defect.

sangui-, prefix meaning "blood": *sanguicolous, sanguiferous, sanguinolent*.

sanguine /sang′gwin/ [L, *sanguis,* blood], pertaining to abundant and active blood circulation, ruddy complexion, and an attitude full of vitality and confidence.

sanguineous /sang·gwin′ē·əs/ [L, *sanguis,* blood], pertaining to blood or containing blood, such as full-blooded. Also **sanguinous** /sang'gwinəs/.

sanguinopurulent /sang′gwinōpyo͝or′ələnt/, containing blood and pus.

sanguinous. See **sanguineous.**

sanies /sā′ni·ēz/, a thin, blood-stained purulent discharge from a wound or ulcer.

sanioserous, containing sanies and serum.

sanious /sā′nē·əs/, pertaining to or resembling sanies.

sanita-, prefix meaning "health": *sanitarium, sanitas, sanitation*.

sanitarian [L, *sanitas,* health], a health professional who is an expert in the science of public health.

sanitarium /san′iter′ē·əm/ [L, *sanitas,* health], a facility for the treatment of patients suffering from chronic mental or physical diseases, or the recuperation of convalescent patients. Also called *sanatorium.*

sanitary landfill /san′iterē/ [L, *sanitas,* health; AS, *land* + *fyllan,* to fill], a solid waste disposal site. It is usually a swamp area, ravine, or canyon where the waste is compacted by heavy machines and covered with earth.

sanitary napkin, a disposable pad of absorbent material, usually worn to absorb menstrual flow.

sanitation /san′itā′shən/ [L, *sanitas,* health], the science of maintaining a healthful, disease-free, and hazard-free environment.

sanitize /san′itīz/ [L, *sanitas,* health], to take action needed to clean the environment or a part of it, removing or reducing pathogenic microorganisms and their habitats.

San Joaquin fever. See **coccidioidomycosis.**

SA node, abbreviation for **sinoatrial node.** See **sinus node.**

Sanorex, a trademark for an anorexiant **(mazindol).**

Sansert, a trademark for a vasoconstrictor **(methysergide maleate).**

Santyl, a trademark for an enzyme **(collagenase).**

SaO_2, symbol for the percentage of oxygen *saturation of arterial blood.*

saphenous [Gk, *saphenes,* manifest], pertaining to certain anatomical structures in the leg, such as arteries, veins, or nerves.

saphenous nerve /səfē′nəs/ [Gk, *saphenes,* manifest; L, *nervus,* nerve], the largest and longest superficial branch of the femoral nerve, supplying the skin of the medial side of the leg and the skin over the patella. On the lateral side of the knee it joins branches of the lateral femoral cutaneous nerve to form the patellar plexus. One branch of the saphenous nerve below the knee supplies the ankle. Another branch below the knee supplies the medial side of the foot. See also **femoral nerve.**

saphenous vein. See **greater saphenous vein.**

sapo-, prefix meaning "soap": *sapogenin, saponaceous, sapotoxin.*

saponaceous /sap′ənā′shəs/ [L, *sapo,* soap], pertaining to soap.

saponification /sapon′ifikā′shən/ [L, *sapo,* soap, *facere,* to make], the production of soap.

saponified, pertaining to a substance chemically hydrolyzed into soaps or acid salts and glycerol by heating with an alkali.

saponin /sap′ənin/ [L, *sapo,* soap], a soapy material found in some plants, especially soapwort (bouncing bet) and certain lilies. It is used in demulcent medications to provide a sudsy quality. Saponins can cause cell lysis (e.g., hemolysis). Natural saponins have largely been replaced by synthetic preparations.

sapro-, prefix meaning "decay or putrefaction": *saprolite, saprophagus, saprophytes.*

saprogen /sap′rəjən/, a microscopic saprophyte.

saprophyte /sap′rəfīt/ [Gk, *sapros,* rotten, *phyton,* plant], an organism that lives on dead organic matter. —*saprophytic, adj.*

saquinavir, an antiviral.

■ INDICATIONS: It is used to treat HIV in combination with zidovudine and zalcitabine.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include buccal mucosa ulceration, headache, musculoskeletal pain, asthenia, and hyperglycemia. Common side effects are diarrhea, abdominal pain, nausea, paresthesia, and rash.

saralasin, a competitive antagonist of angiotensin. It is administered by IV injection to assess the role of the renin-angiotensin system in the maintenance of blood pressure. A decrease in blood pressure is expected in renin-dependent hypertension.

-sarc, suffix meaning "(specified type of) flesh": *ectosarc, endosarc, perisarc.*

sarco- /sär′kō-/, prefix meaning "flesh": *sarcoadenoma, sarcode, sarcolyte.*

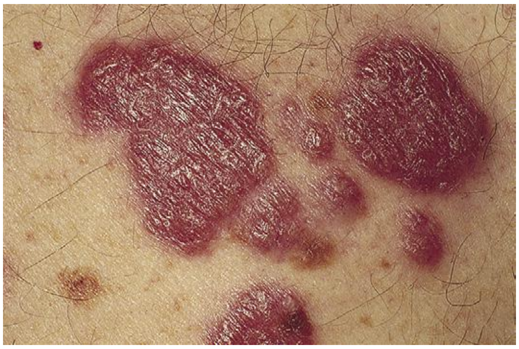
sarcoadenoma /-ad′ənō′mə/ [Gk, *sarx,* flesh, *aden,* gland, *oma,* tumor], a mixed tumor containing both glandular and connective tissue characteristics. Also called **adenosarcoma.**

sarcocarcinoma /-kär′sinō′mə/ [Gk, *sarx,* flesh, *karkinos,* crab, *oma,* tumor], a mixed tumor with characteristics of both sarcomas and carcinomas.

sarcodina. See **protozoa.**

sarcoidosis /sär′koidō′sis/ [Gk, *sarx,* flesh, *eidos,* form, *osis,* condition], a chronic disorder of unknown origin characterized by the formation of tubercles of nonnecrotizing epithelioid tissue. Common sites are the lungs, spleen, liver, skin, mucous membranes, and lacrimal and salivary glands, usually with involvement of the lymph glands. Diminished reactivity to tuberculin frequently accompanies the disorder. The lesions usually disappear over a period of months or years but may progress to widespread granulomatous inflammation and fibrosis. Also called *sarcoid of Boeck.*

sarcoidosis cordis, a form of sarcoidosis in which granulomatous lesions develop in the myocardium. Mild cases with few infiltrates are asymptomatic. In severe cases cardiac failure may result. See also **sarcoidosis.**



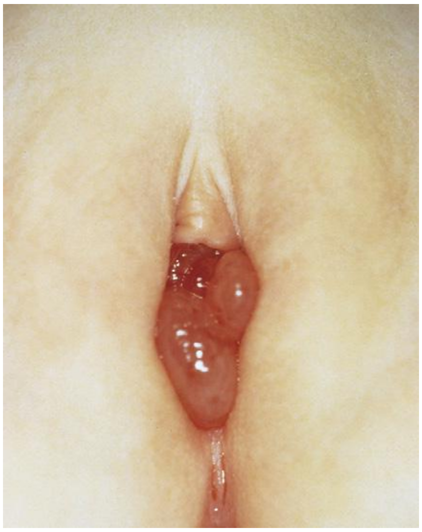
Sarcoidosis *(Callen et al, 2000)*

sarcolemma /-lem′ə/ [Gk, *sarx,* flesh, *lemma,* sheath], a membrane that covers smooth, striated, and cardiac muscle fibers.

sarcoma /särkō′mə/ *pl.* **sarcomas, sarcomata** [Gk, *sarx* + *oma,* tumor], a malignant neoplasm of the soft tissues arising in fibrous, fatty, muscular, synovial, vascular, or neural tissue, usually first manifested as a painless swelling. About 40% of sarcomas occur in the lower extremities, 20% in the upper extremities, 20% in the trunk, and the rest in the head, neck, or retroperineum. The tumor is composed of cells in a connective tissue matrix and may be highly invasive. Trauma probably does not play a role in the cause, but sarcomas may arise in burn or radiation scars. Small tumors may be managed by local excision and postoperative radiotherapy, but bulky sarcomas of the extremities may require amputation followed by irradiation for local control and combination chemotherapy to eliminate small foci or neoplastic cells. See specific sarcomas. —*sarcomatous, adj.*

-sarcoma, suffix meaning a "malignant tumor from connective tissue": *angiosarcoma, hemangiosarcoma, myelosarcoma*.

sarcoma botryoides /bot′rē·oi′dēz/, a tumor derived from primitive striated muscle cells, occurring most frequently in young children and characterized by a painful edematous polypoid grapelike mass in the upper vagina or on the uterine cervix or the neck of the urinary bladder. See also **rhabdomyosarcoma.**

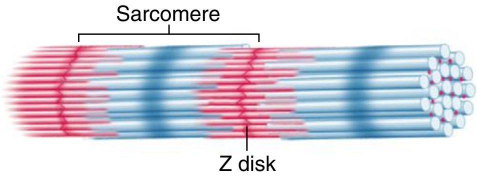


Sarcoma botryoides *(Kumar et al, 2010/Courtesy Dr. Michael Donovan, Children's Hospital, Boston, Massachusetts)*

sarcomagenesis /särkō′məjen′əsis/ [Gk, *sarx* + *oma* + *genesis*, origin], the process of initiating and promoting the development of a sarcoma. Compare **carcinogenesis, oncogenesis, tumorigenesis.** —*sarcomagenetic*, *adj*.

sarcomas, sarcomata. See **Sarcoma.**

sarcomere /sär′kōmir/ [Gk, *sarx* + *meros*, part], the smallest functional, contractive unit of a myofibril. Sarcomeres occur as repeating units, extending from one Z line to the next along the length of the myofibril.



Sarcomere *(Patton and Thibodeau, 2010)*

sarcopenia /-pē′nē·ə/ [Gk, *sarx*, flesh, *penia*, poverty], a loss of skeletal muscle mass that may accompany aging. Studies indicate that the loss of skeletal muscle for the average normally healthy person amounts to about 20% between about 30 and 70 years of age. The loss may accelerate as aging progresses. The muscle is replaced by fat, usually in a subtle way that is not noticed by the individual, as by padding areas of muscle loss with extra fat. Muscle-strengthening and -building exercises can prevent or reverse much of this problem.

sarcoplasm /sär′kōplaz′əm/ [Gk, *sarx*, flesh, *plassein*, to mold], the semifluid cytoplasm of muscle cells.

sarcoplasmic reticulum /-plas′mik/ [Gk, *sarx* + *plassein*, to mold; L, *reticulum*, little net], a network of tubules and sacs in skeletal muscle fibers that plays an important role in muscle contraction and relaxation by releasing and storing calcium ions. This network is analogous, but not identical, to the endoplasmic reticulum of other cells.

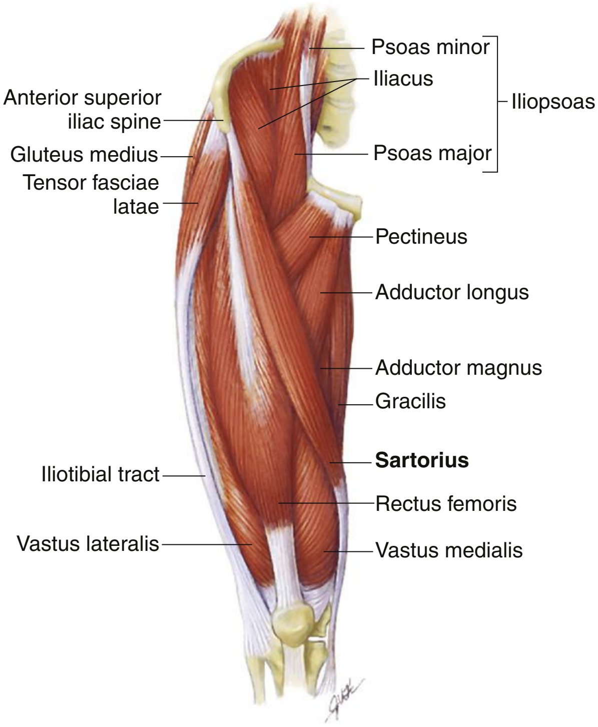
Sarcoptes scabiei /särkop′tēz skā′bē·ī/ [Gk, *sarx* + *koptein*, to cut; L, *scabere*, to scratch], the genus of itch mite that causes scabies. See also **Norwegian scabies.**

sarcosine /sär′kō·sēn/, an amino acid occurring as an intermediate in the metabolism of choline in the kidney and liver. It is normally not detectable in human blood or urine.

sarcosinemia, an inborn error of metabolism caused by a defect of the enzyme that breaks down sarcosine, resulting in elevated levels of sarcosine in the blood. Clinical manifestations include poor feeding in an infant with failure to thrive and developmental delays; however, no consistent clinical syndrome has been reported.

SARS, abbreviation for **severe acute respiratory syndrome.**

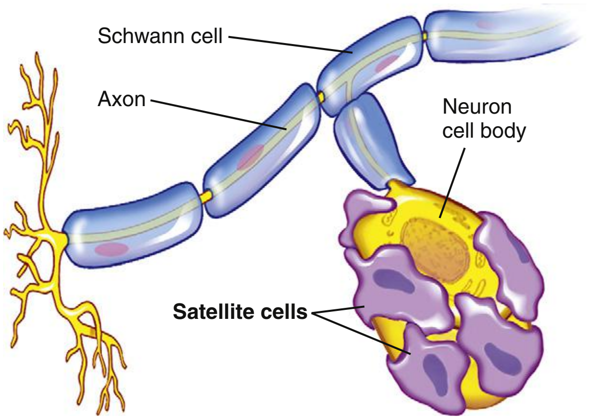
sartorius /särtôr′ē·əs/ [L, *sartor*, tailor], the longest muscle in the body, extending from the pelvis to the calf of the leg. It is a narrow ribbon-shaped muscle that arises from the anterior superior iliac spine, passes obliquely across the proximal anterior part of the thigh from the lateral to the medial side, and inserts into the tibia. It acts to flex the thigh and rotate it laterally and to flex the leg and rotate it medially. Compare **quadriceps femoris.**



Sartorius *(Patton and Thibodeau, 2010)*

satellite cells /sat′əlīt/ [L, *satelles*, attendant, *cella*, storeroom], glial cells (astrocytes) that form around damaged nerve cells and lie close to neuron bodies in the central nervous system.

satellite clinic [L, *satelles*, attendant; Gk, *kline*, bed], a health care facility usually operated under the auspices of a



Satellite cells

large institution but situated in a location some distance from the larger health center.

satellite virus, a strain of virus unable to replicate except in the presence of a helper virus. The satellite virus is considered to be deficient in coding for capsid formation.

satiety /sətī′ətē/, a state of being satisfied, as in the feeling of being full after eating.

satiety center, a locus of nerve tissue in the ventromedial nucleus of the hypothalamus that controls the appetite.

saturated /sach′ərā′tid/ [L, *saturare,* to fill], **1.** having absorbed or dissolved the maximum amount of a given substance, such as a solution in which no more of the solute can be dissolved. **2.** also called **saturated hydrocarbon.** An organic compound that contains the maximum number of hydrogen atoms so that only single bonds exist in the carbon chain, as in saturated fatty acids. Compare **unsaturated.**

saturated calomel electrode (SCE), a reference electrode commonly used in polarography and potentiometry.

saturated fatty acid, a fatty acid in which all of the carbon atoms in the hydrocarbon chain are joined by single bonds. They exist mostly as components of fats (triglycerides) or other lipids of animal origin. Foods rich in saturated fatty acids include beef, lamb, pork, veal, whole-milk products, butter, most cheeses, and a few plant products such as cocoa butter, coconut oil, and palm oil. Ordinary oleomargarine and hydrogenated shortenings also contain saturated fatty acids. A diet high in saturated fatty acids may contribute to a high serum cholesterol level and appears to be associated with an increased incidence of coronary heart disease in some populations. Compare **unsaturated fatty acid.**

saturated hydrocarbon. See **saturated.**

saturated solution, a solution in which the solvent contains the maximum amount of solute it can dissolve at a particular temperature. It is often expressed as the number of grams of solute that can dissolve in 100 mL of solution. See also **solute, solvent.**

saturation /sach′ərā′shən/ [L, *saturare,* to fill], **1.** a condition in which a solution contains as much solute as can remain dissolved. **2.** a measure of the degree to which oxygen is bound to hemoglobin, expressed as a percentage of the possible limit. **3.** a chemical compound in which all the valency bonds have been filled.

saturational cuing /sach′ərā′shənəl/, a treatment strategy for visuoconstructive disorders that involves presenting controlled verbal instruction on task analysis and sequence and presenting cues on spatial boundaries.

saturation index of hemoglobin [L, *saturare,* to fill, *index,* pointer], a measure of the amount of hemoglobin in a given amount of blood, compared with normal.

Saturday night palsy [Gk, *paralyein,* to be palsied]. See **radial nerve palsy.**

saturn-, prefix meaning "lead": *saturnine, saturnism, saturnotherapy.*

saturnine /sat′ərnīn/, pertaining to lead or lead poisoning.

saturnine tremor, a condition of involuntary muscle contractions in the extremities observed in patients with chronic lead poisoning.

satyr ear /sat′ər/, a congenital abnormality in which the helix of the auricle lacks the usual rolled contour and the tubercle is prominent.

satyriasis /sat′irī′əsis/ [Gk, *satyros,* lecherous, *osis,* condition], excessive, pathological, or uncontrollable sexual desire in the male. The cause may be psychological or organic. Also called **satyromania.** Compare **nymphomania.**

sauna bath /sô′nə/ [Finn, *sauna* + AS, *baeth*], a bath consisting of exposure to hot vapor to induce sweating, followed by rubbing or light beating of the skin. Also called **Finnish bath, Russian bath.**

saur-, prefix meaning "lizard, or reptile": *sauriasis, sauriderma, sauroid.*

saw palmetto, an herbal product harvested from the American dwarf palm.

■ USES: It is used to treat benign prostatic hypertrophy, and multiple studies have shown that it can improve the urinary symptoms.

■ CONTRAINDICATIONS: Saw palmetto should not be used without verification that the urinary symptoms are caused by benign prostatic hyperplasia rather than by prostate carcinoma. It should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity to this plant.

saxitoxin /sak′sitok′sin/, a powerful neurotoxin found in bivalve mollusks, including mussels, clams, and scallops. It is produced by certain species of dinoflagellates, which are consumed by the mollusks. Saxitoxin may cause a severe food intoxication in humans who eat the contaminated shellfish.

Sayre's jacket /serz/ [Lewis A. Sayre, American surgeon, 1820–1900; ME, *jaket*], a cast applied for support and immobilization in the treatment of certain abnormalities of the spinal column.

Sb, symbol for the element **antimony.**

SBE, **1.** abbreviation for **self-breast examination.** **2.** abbreviation for **subacute bacterial endocarditis.**

SBT, abbreviation for **Shorted Blessed Test.**

sc, **1.** abbreviation for the Latin *sine correctione,* "without correction." **2.** abbreviation for *subcutaneously.*

Sc, symbol for the element **scandium.**

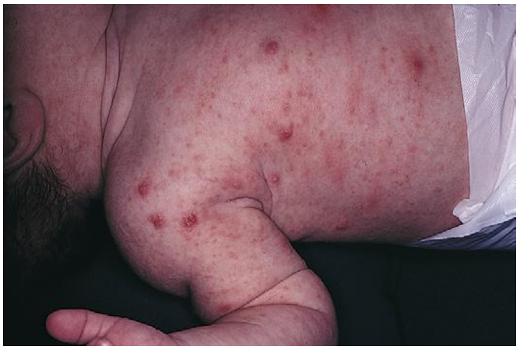
SCA, abbreviation for **sudden cardiac arrest.**

scab. See **eschar.**

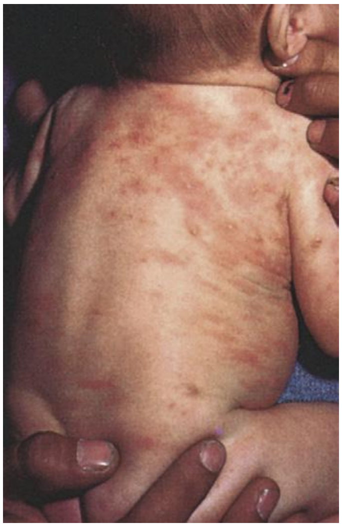
scabbard trachea /skab′ərd/, a flattening of the trachea caused by lateral compression by swellings or tumors.

scabicide /skab′isīd/ [L, *scabere,* to scratch, *caedere,* to kill], any one of a large group of drugs that destroy the itch mite, ***Sarcoptes scabiei.*** These drugs are applied topically in a lotion or cream-based preparation. All are potentially toxic and irritating to the skin. They are used with caution in treating children. Kinds of scabicides include **crotamiton** and **lindane.**

scabies /skā′bēz/ [L, *scabere,* to scratch], a contagious disease caused by ***Sarcoptes scabiei,*** the human itch mite, characterized by intense itching of the skin and excoriation from scratching. The mite, transmitted by close contact with infected humans or domestic animals, burrows into outer layers of the skin, where the female lays eggs. Two to 4 months after the first infection, sensitization to the mites and their products begins, resulting in a pruritic papular rash most common on the webs of fingers, flexor surfaces of wrists, and thighs. Secondary bacterial infection may occur. Diagnosis may be made by microscopic identification of adult mites, larvae, or eggs in scrapings of the burrows. All contacts are treated simultaneously with topical application of permethrin, crotamiton, or another scabicide. Oral antihistamines and salicylates reduce itching. It is also recommended that clothes and bedding be washed in hot water and dried in a hot dryer. A more severe form of scabies is observed in immunocompromised patients and is characterized by vesicles and thick crusts over the skin. This form is known as Norwegian scabies and is treated with Ivermectin.



Scabies *(Callen et al, 2000/Courtesy Dr. Steve Estes)*



Scabies rash in an infant *(Weston, Lane, and Morelli, 2007)*

scabietic /skā′bē·et′ik/ [L, *scabere,* to scratch], pertaining to scabies.

scabrities unguium /skabrish′i·ēz/, a very pronounced thickening and distortion of the nails, which separate from skin at the base.

scag, *slang.* heroin.

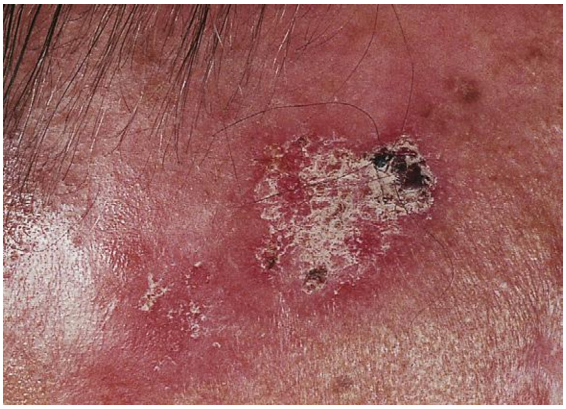
scala tympani. See **helicotrema.**

scala vestibuli. See **helicotrema.**

scald /skôld/ [L, *calidus,* hot], a burn caused by exposure of the skin to a hot liquid or vapor.

scalded skin syndrome. See **toxic epidermal necrolysis.**

scale [OFr, *escale,* husk], **1.** *n,* a small thin flake of keratinized epithelium. **2.** *v,* to remove encrusted material from the surface of a tooth.

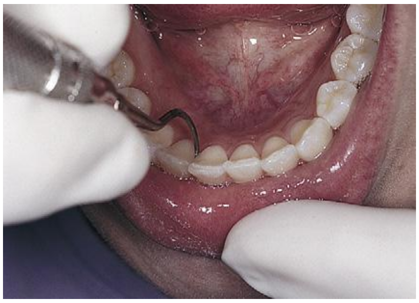


Scale of lupus erythematosus *(du Vivier, 2002)*

scalene /skā′lēn/ [Gk, *skalenos,* uneven], pertaining to one of the scalenous muscles.

scalenus /skālē′nəs/ [Gk, *skalenos*], one of a group of four muscles arising from the cervical vertebrae with insertions on the first or second rib.

scalenus anticus syndrome. See **Naffziger syndrome.**



Scaler *(Christensen, 2002)*

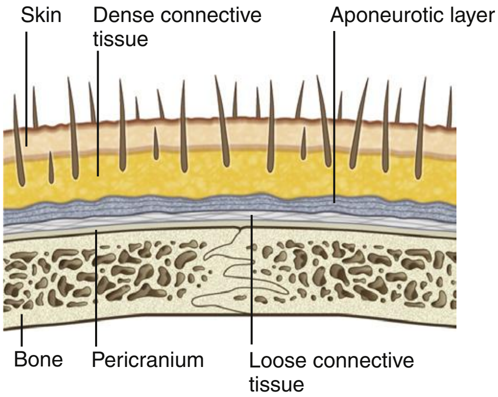
scaler /skā′lər/ [OFr, *escale,* husk], a dental hand instrument used to remove calculus from tooth surfaces. See also **scaling.**

scaling /skāl′ing/ [OFr, *escale,* husk], removal of plaque and calculus from the surface of a tooth by means of a scaler.

scalp [ME], the skin covering the head, not including the face and ears.

scalpel /skal′pəl/ [L, *scalprum,* knife], a small pointed knife with a convex edge. Some scalpels use interchangeable blades for specific surgical procedures, such as operating and amputating. Multiple kinds of scalpels are used; they are identified by number. Number 10 is the most common.

scalp medication, **1.** a cream, ointment, lotion, or shampoo used to treat dermatological conditions of the scalp. **2.** the application of a medication to the scalp. If a cream, ointment, or lotion is to be applied, a shampoo is usually given first. The hair is dried, combed, and parted in the middle. The medication is most often spread with the fingertips. After treatment the medication may need to be washed off



Layers of the scalp *(Drake, Vogl, and Mitchell, 2010)*

the scalp and hair with an alkaline shampoo. On occasion the affected area may be sharply circumscribed and may not require the scalpwide process.

scalp vein needle, a thin-gauge needle designed for use in the veins of the scalp or other small veins, especially in infants and children. Also called a **butterfly needle.**

scan. See **scanning.**

scandium (Sc) /skan′dē·əm/ [Scandinavia], a grayish metallic element. Its atomic number is 21; its atomic mass is 44.956.

scanner /skan′ər/ [L, *scandere,* to climb], equipment used for making a digital representation of an original photographic image or printed material. See also **scanning.**

scanning [L, *scandere,* to climb], a technique for carefully studying an area, organ, or system of the body by recording and displaying an image of the area. A concentration of a radioactive substance that has an affinity for a specific tissue may be administered intravenously to enhance the image. The liver, brain, and thyroid can be examined, tumors can be located, and function can be evaluated by various scanning techniques. See also specific scanning techniques. **—scan,** *n., v.*

scanning electron microscope (SEM), an instrument similar to an electron microscope in that a beam of electrons is used to scan the surface of a specimen. The beam is moved in a point-to-point manner over the surface of the specimen. These electrons are deflected, collected, accelerated, and directed against a scintillator. The large number of photons thus created are converted into an electric signal that, in turn, modulates the beam scanning the surface of the specimen. The image produced appears to be three-dimensional and lifelike. Compare **electron microscope, transmission scanning electron microscope.**

scanning electron microscopy (SEM), the technique using a scanning electron microscope on a specimen. See also **scanning electron microscope.**

scanning laser ophthalmoscope (SLO), an instrument for retinal imaging in which light from a low-power laser beam that scans the retina is reflected back to a sensor. The light detected by the sensor is used to create a full-color composite digital image.

scanning speech, abnormal speech characterized by a staccato-like articulation in which the words are clipped and broken because the person pauses between syllables.

scanography /skanog′rəfē/ [L, *scandere,* to climb; Gk, *graphein,* to record], a method of producing a radiograph of an internal body organ or structure by using a series of parallel beams that eliminate size distortion. The technique is applied most in long-bone radiography. See also **orthoroentgenography.**

scan path, distinct eye movement patterns.

scapegoating /skāp′gōting/ [ME, *escapen,* to escape, *goot*], the projection of blame, hostility, or suspicion onto one member of a group by other members to avoid self-confrontation.

scapho-, prefix meaning "boat-shaped": *scaphocephaly, scaphohydrocephaly, scaphoid.*

scaphocephaly /skaf′ōsef′əlē/ [Gk, *skaphe,* skiff, *kephale,* head], a congenital malformation of the skull in which premature closure of the sagittal suture results in restricted lateral growth of the head, giving it an abnormally long narrow appearance with a cephalic index of 75 or less. Also called **dolichocephaly, mecocephaly, scaphocephalis, scaphocephalism.** See also **craniostenosis.** **—***scaphocephalic, scaphocephalous, adj.*

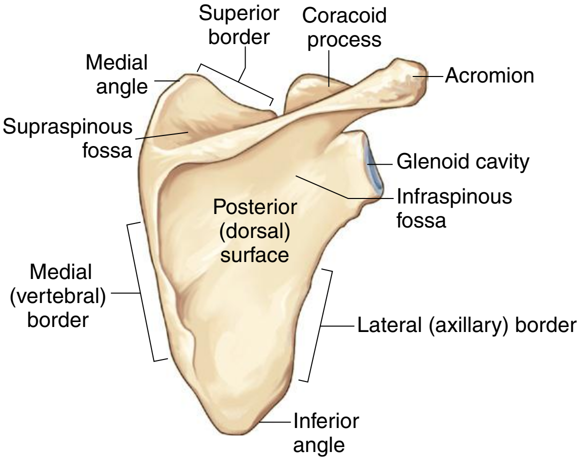
scaphoid /skaf′oid/ [Gk, *skaphe,* skiff, *eidos,* form], boat-shaped, such as the scaphoid bone of the wrist.

scaphoid abdomen, an abdomen with a sunken anterior wall.

scaphoid bone [Gk, *skaphe* + *eidos,* form; AS, *ban*], either of two similar proximal boat-shaped bones of the hand and the foot. The scaphoid bone of the hand is slanted at the radial side of the carpus and articulates with the radius, trapezium, trapezoideum, capitate, and lunate bones. The scaphoid bone of the foot is located at the medial side of the tarsus between the talus and cuneiform bones and articulates with the talus, the three cuneiform bones, and occasionally the cuboid bone. Also called **navicular bone.**

scaphoid megalourethra. See **urethral diverticulum.**

scapula /skap′yələ/, one of the pair of large flat triangular bones that forms the dorsal part of the shoulder girdle. It has two surfaces, three borders, three angles, and a prominent dorsal spine. The acromion of the scapula forms the summit of the shoulder. The coracoid process, resembling a raven's beak, accommodates the attachment of various muscles, including the pectoralis minor, and ligaments, including the trapezoid. Also called **shoulder blade.**



Posterior view of the right scapula
(Patton and Thibodeau, 2010)

-scapula, suffix meaning a "shoulder blade or a part of it": *mesoscapula, prescapula, proscapula.*

scapular line /skap′yələr/, an imaginary vertical line drawn through the inferior angle of the scapula.

scapular reflex, a contraction of the rhomboids and approximation of the scapulae when a stimulus is applied to the midline of the back between the scapulae.

scapulary /skap′yəler′ē/, a suspender for holding a body bandage in place.

scapulo-, prefix meaning "scapula or shoulder blade": *scapulodynia, scapulopexy.*

scapulocostal syndrome /-ōkos′təl/, a condition in which pain radiates from the upper or posterior shoulder area into the neck and back of the head, down the arm, and around the chest. There may also be a tingling in the fingers. The syndrome is associated with a change in the relationship between the shoulder blade and thorax.

scapulohumeral /-ōhyo͞o′mərəl/ [L, *scapula* + *humerus,* shoulder], pertaining to the area around the scapula and humerus.

scapulohumeral muscular dystrophy. See **Erb's muscular dystrophy.**

scapulohumeral reflex, a normal response to tapping the vertebral border of the scapula, resulting in adduction of the arm. Absence of the reflex may indicate a lesion in the region of the fifth cervical segment of the spinal cord.

scapus /skā′pəs/ [Gk, *skapos,* rod], a stem or shaft, such as the scapus penis or hair (pili).

scar. See **cicatrix.**

scarf skin, the epidermis, including the cuticle.

scarification /sker′ifikā′shən/ [L, *scarifare,* to scratch open], multiple superficial scratches or incisions in the skin, such as those made for the introduction of a vaccine. The term is erroneously used to mean "producing a scar."

scarify /sker′əfī/ [L, *scarifare*], to make multiple superficial incisions into the skin; to scratch. Vaccination against smallpox is achieved by scarifying the skin under a drop of vaccine. See also **scarification.**

scarlatina. See **scarlet fever.**

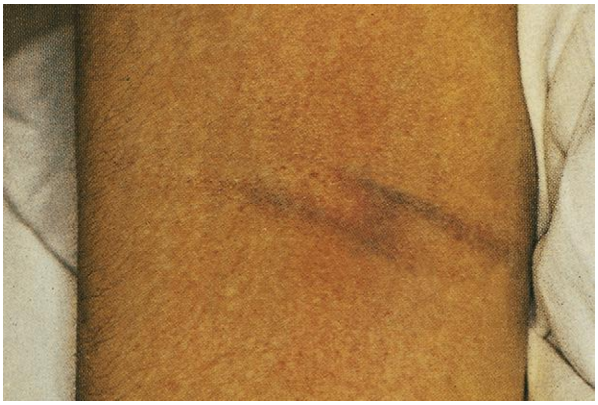
scarlatiniform /skär′lətē′nifôrm/ [It, *scarlattina* + L, *forma,* form], resembling the rash of **scarlet fever.**

scarlet fever /skär′lit/ [OFr, *escarlate* + L, *febris,* fever], an acute contagious disease of childhood caused by an erythrotoxin-producing strain of group A hemolytic *Streptococcus*. Also called **scarlatina.**

■ OBSERVATIONS: Signs and symptoms appear 1 to 3 days after exposure to the agent, starting with an abrupt high fever, chills, tachycardia, nausea, vomiting, headache, abdominal pain, malaise, and a sore throat. The tonsils become enlarged, reddened, and covered with patchy exudate. The pharynx is red and edematous. The tongue is coated and white with red, swollen papillae (white strawberry tongue) until the white coat sloughs off about the fourth day, leaving a red strawberry tongue and red punctate lesions on the palate. A rapidly erupting rash appears 1 to 2 days after the onset of the sore throat. The rash displays as pinhead-size red lesions, which rapidly cover the body except for the face. The rash concentrates in the axial folds, on the neck, and in the groin and lasts 4 to 10 days. The face is flushed on the cheeks with a circumoral pallor. After a week, desquamation and peeling begin on the palms and soles. Diagnosis is made from clinical signs and a positive Schultz-Charlton reaction skin test or a positive throat culture. Complications include otitis media; sinusitis; peritonsillar abscess; and severe, disseminated toxic or septic disease (fulminating scarlet fever), which may cause septicemia and hepatic damage.

■ INTERVENTIONS: Treatment is aimed at eradicating the streptococcal infection through administration of antibiotics. Antipyretics are given for fever, and analgesics are given for sore throat pain.

■ NURSING CONSIDERATIONS: Nursing measures are largely supportive and include bed rest during the febrile phase; adequate fluids; gargles, throat lozenges, and throat washes for sore throat; and room humidification for comfort. Respiratory precautions should be instituted until 24 hours after initiation of antibiotics because of the edema in the pharynx and tonsils. Environmentally imposed restraints are used until 24 hours after the initiation of antibiotics to reduce the spread of this communicable disease. Distractive techniques with appropriate developmental activities are used to relieve pain and social isolation. Careful handwashing techniques are used to decrease risk of infection.



Pastia's sign in scarlet fever
(Emond, Wellsby, and Rowland, 2003)

scarlet rash [OFr, *escarlate* + *rasche,* scurf], any scarlatina or rosy skin eruption that accompanies an infection, such as scarlet fever or German measles.

scarlet red, an azo dye that has been used to impart color to pharmaceutic preparations.

Scarpa's fascia, the thin, membranous deeper layer of fascia in the abdominal wall.

scatemia /skətē′mē·ə/ [Gk, *skatos,* feces, *haima,* blood], a toxemic condition caused by absorption of poisonous or harmful substances from the intestinal tract.

scato-, skato-, prefix meaning "dung or fecal matter": *scatophagy, scatophilia, scatoscopy.*

scatological /skatəloj′ik/, pertaining to scatology.

scatology /skatol′əjē/ [Gk, *skatos,* dung, *logos,* science], the science of feces. Also called **coprology.**

scattered radiation /skat′ərd/ [ME, *scateren,* to throw away; L, *radiare,* to emit rays], photons that move in a different direction than the incident photons that produced them, after the interaction of those incident photons. Also called **backscatter radiation.**

scattergram /skat′ərgram′/ [ME, *scateren* + Gk, *gramma,* record], a graph representing the distribution of two variables in a sample population. One variable is plotted on the vertical axis, the second on the horizontal axis. The scores or values of each sample unit are usually represented by dots. A scattergram demonstrates the degree or tendency with which the variables occur in association with each other.

scattering [ME, *scateren*], a change in the direction of photons caused by the interaction between photons and matter. In coherent scattering, an incident photon interacts with matter and excites an atom, causing it to vibrate. The vibration causes the photon to scatter. Also called **Thompson scattering, unmodified scattering.** In **Compton scattering** an incident photon interacts with an orbital electron, transferring some of its energy to that electron. The electron is ejected, and the photon is scattered.

scavenger cell /skav′ənjər/ [ME, *scavager* + L, *cella,* storeroom], a phagocytic cell that removes tissue debris and some invading pathogens. It may or may not be mobile.

scavenging system. See **gas-scavenging system.**

Sc.D., abbreviation for *Doctor of Science*.

SCE, abbreviation for **saturated calomel electrode.**

scel-, prefix meaning "leg": *scelalgia, scelotyrbe*.

-scelia, combining form meaning "(condition of the) legs": *macroscelia, polyscelia, rhaeboscelia*.

SCFA, abbreviation for **short-chain fatty acids.**

Schamroth window test /sham′rôth/, a test for clubbing of the fingers: the patient holds the fingers back to back against each other. There is normally a diamond-shaped space between the nailbeds and nails of the two fingers. If the space is missing, **clubbing** is present.

Schedule I, a category of drugs not considered legitimate for medical use. Among the substances so classified by the Drug Enforcement Agency are mescaline, lysergic acid diethylamide, heroin, and marijuana. Special licensing procedures must be followed to use these or other Schedule I substances.

Schedule II, a category of drugs considered to have a strong potential for abuse or addiction but that have legitimate medical use. Among the substances so classified by the Drug Enforcement Agency are morphine, cocaine, pentobarbital, oxycodone, alphaprodine, and methadone.

Schedule III, a category of drugs that have less potential for abuse or addiction than Schedule II or I drugs. Among the substances so classified by the Drug Enforcement Agency are glutethimide and various analgesic compounds containing codeine.

Schedule IV, a category of drugs that have less potential for abuse or addiction than those of Schedules I to III. Among the substances so classified by the Drug Enforcement Agency are chloral hydrate, chlordiazepoxide, meprobamate, and oxazepam.

Schedule V, a category of drugs that have a small potential for abuse or addiction. Among the substances so classified by the Drug Enforcement Agency are many commonly prescribed medications that contain small amounts of codeine or diphenoxylate. The specific drugs in Schedule V vary greatly from state to state.

Schedule for Affective Disorders and Schizophrenia, a semistructured interview administered by a professional and designed to yield diagnostic information about current and lifetime incidences of affective disorders and schizophrenia.

Schedule of Drugs [L, *scheda,* sheet of paper; Fr, *drogue*], a classification system that categorizes drugs by their potential for abuse. The schedule is divided into five groups: Schedules I to V. The assignment of drugs to the categories varies from state to state. Schedule I substances are not approved for medical use. All substances in Schedules II to V require a written prescription signed by a physician. Substances in Schedule V may or may not require a written prescription signed by a physician, depending on state law. Specific regulations for dispensing these substances vary from state to state and from institution to institution. See also **controlled substance, Controlled Substances Act,** specific schedules.

Scheie's syndrome /shāz/ [Harold Glendon Scheie, American ophthalmologist, 1909–1990], a relatively mild variant of **Hurler's syndrome**, a heritable mucopolysaccharide storage disease, characterized by corneal clouding, claw hand, involvement of the aortic valve, somewhat coarse facies with a broad mouth, genu valgum, and pes cavus. Stature, intelligence, and life span are normal.

schema /skē′mə/, an innate knowledge structure that allows a child to organize in his or her mind ways to behave in his or her environment.

schematic /skēmat′ik/, pertaining to a schema, model, or diagram representing, without absolute precision, a structure, strategy, or system. An anatomical chart is an example.

schematic eye, **1.** a simplified and enlarged illustration of the eye, featuring its anatomical details. **2.** a graphic illustration of the normal eye, with data for curvatures, indices of refraction, and distances between optical elements.

Scheuermann's disease /shoi′ərmonz/ [Holger W. Scheuermann, Danish surgeon, 1877–1960], an abnormal skeletal condition characterized by a fixed kyphosis that develops at puberty and is caused by wedge-shaped deformities of one or several vertebrae. The cause of the disease is unknown, but authorities have speculated that it may result from infection, inflammatory processes, aseptic necrosis, disk deterioration, mechanical influences, inadequate circulation during rapid growth, or disturbances of epiphyseal growth caused by protrusion of the intervertebral disk through deficient or defective cartilaginous plates. The most striking pathological feature of Scheuermann's disease is the presence of wedge-shaped vertebral bodies, seen on radiographic examination, that create an excessive curvature. Scheuermann's disease occurs most frequently in children between 12 and 16 years of age, with the onset at puberty, and the incidence is greater in girls than in boys. The onset is insidious and often associated with a history of unusual physical activity or participation in sports. The most frequent symptom is poor posture, with accompanying symptoms of fatigue and pain in the involved area. Tenderness and stiffness may also affect the area involved or the entire spinal column. In most affected individuals the kyphosis is within the thoracic vertebrae. If the disease is diagnosed at the onset, the associated posture may be corrected actively and passively. Otherwise, the associated posture becomes fixed within a period of 6 to 9 months. The most effective treatment of Scheuermann's disease is immobilization with a plaster cast or with a Milwaukee brace. The immobilization is continuous for 10 to 12 months, with additional immobilization at night for about the same length of time. Immobilization is usually supplemented with an exercise program that is continued after the immobilization is terminated. In adults persistent pain in the thoracic area may indicate a degenerative alteration secondary to this disease process, and spinal arthrodesis may be required to relieve the symptoms. Also called **adolescent vertebral epiphysitis, juvenile kyphosis.**

Schick test /shik/ [Bela Schick, Austrian-American physician, 1877–1967], a skin test formerly used to determine immunity to diphtheria in which dilute diphtheria toxin is injected intradermally. A positive reaction, indicating susceptibility, is marked by redness and swelling at the site of injection; a negative reaction, indicating immunity, is marked by absence of redness or swelling.

Schick test control [Bela Schick; L, *testum,* crucible; Fr, *controle,* check], a preparation used in carrying out the Schick skin test for determining diphtheria immunity.

Schilder's disease /shil′dərz/ [Paul F. Schilder, Austrian neurologist, 1886–1940], a group of progressive severe neurological diseases beginning in childhood. All are characterized by demyelination of the white matter of the brain, with muscle spasticity, optic neuritis, aphasia, deafness, adrenal insufficiency, and dementia. Many of the signs resemble those of multiple sclerosis. There is no known treatment. The cause may be viral or genetic. Also called **encephalitis periaxialis diffusa, Flatau-Schilder disease, progressive subcortical encephalopathy,** *Schilder's encephalitis*. See also **adrenoleukodystrophy.**

Schiller's test /shil′ərz/ [Walter Schiller, Austrian pathologist in the United States, 1887–1960], a procedure for indicating areas of abnormal epithelium in the vagina or on the cervix of the uterus as a guide in selecting biopsy sites for cancer detection. A potassium iodide or aqueous iodine solution is painted on the vaginal walls and cervix under direct visualization. Normal epithelium contains glycogen and stains a deep brown; abnormal epithelium, containing no glycogen, will not stain, and nonstaining sites may then be included in tissue biopsy samples. The test is not specific for malignancy, because inflammation, ulceration, and keratotic lesions also may not accept the iodine stain.

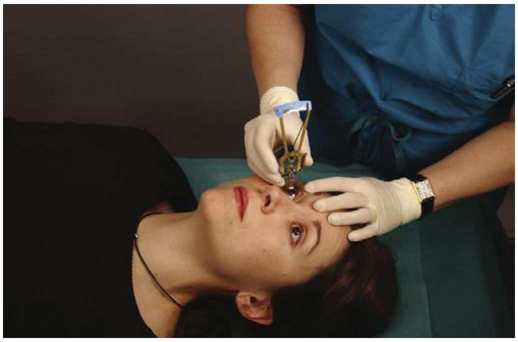
Schilling's leukemia. See **monocytic leukemia.**

Schilling test /shil′ing/ [Robert F. Schilling, American hematologist, b. 1919], a diagnostic test for pernicious anemia in which vitamin B_{12} tagged with radioactive cobalt is administered orally, and GI absorption is measured by determining the radioactivity of urine samples collected over a 24-hour period. Normal findings show excretion of 8% to 40% of radioactive vitamin B_{12} within 24 hours. In people with pernicious anemia, the ability to absorb vitamin B_{12} from the GI tract is reduced so that excretion of radioactive material in the urine is reduced. This test is rarely used today.

schindylesis /skin′dilē′sis/ [Gk, splintering], an articulation (synarthrosis) of certain bones of the skull in which a thin plate of one bone enters a cleft formed by the separation of two layers of another bone, such as the insertion of the vomer bone into the fissure between the maxillae and the palatine bones.

Schinzel-Giedion syndrome, a rare syndrome, probably of autosomal-recessive inheritance, of hydronephrosis, skeletal abnormalities, flattened midface, hypertrichosis, seizures, and profound growth and developmental retardation.

Schiötz' tonometer /shē·ets′/ [Hjalmar Schiötz, Norwegian ophthalmologist, 1850–1927; Gk, *tonos,* stretching, *metron,* measure], a tonometer used to measure intraocular pressure by observing the depth of indentation of the cornea made by the weighted plunger on the device after a topical anesthetic is applied.



Schiötz' tonometer *(Custalow, 2005)*

Schirmer's test [Otto W.A. Schirmer, German ophthalmologist, 1864–1917]. See **test for lacrimation.**

schisandra, an herb that is native to China, Russia, and Korea.

■ USES: It is used for GI disorders, for liver protection, and as a tonic and may have some efficacy.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity to this plant.

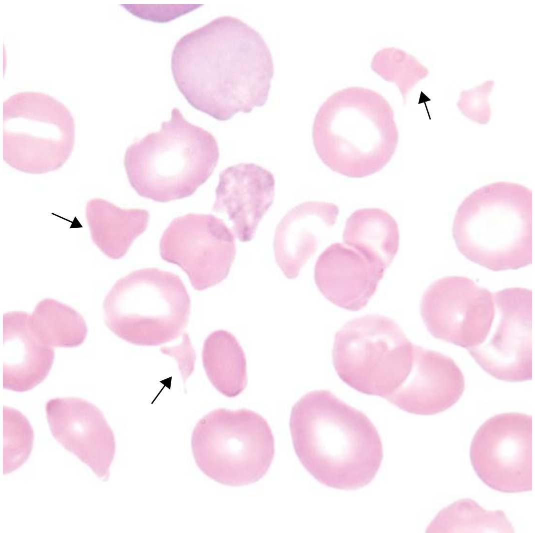
schisto-, prefix meaning "split, or cleft": *schistocelia, schistocephalus, schistomelia.*

schistocelia /shis′təsē′lyə/, a congenital fissure in the wall of the abdomen.

schistocoelia /shis′to-se′le-ah/, gastroschisis.

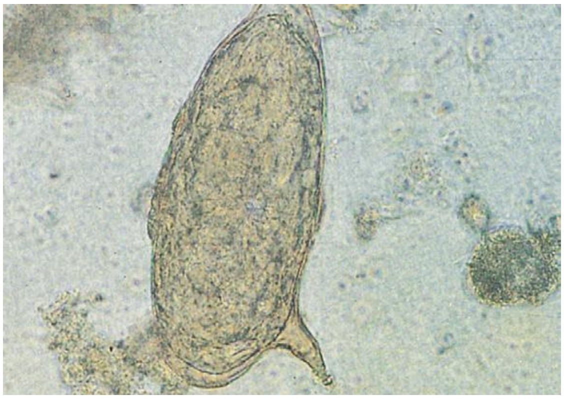
schistocystis /shis′təsis′tis/ [Gk, *schistos,* cleft, *kystis,* bag], a fissure in the bladder.

schistocyte /shis′təsīt/ [Gk, *schistos,* cleft, *kytos,* cell], an erythrocyte cell fragment characteristic of hemolysis or cell fragmentation associated with severe burns, microangiopathic hemolytic anemias, and intravascular coagulation. Also called **schizocyte.**



Schistocyte *(Carr and Rodak, 2008)*

Schistosoma /shis′təsō′mə/ [Gk, *schistos,* cleft, *soma,* body], a genus of blood flukes that may cause urinary, GI, or liver disease in humans and that requires fecal contamination of water and freshwater snails as intermediate hosts. *Schistosoma haematobium,* found chiefly in Africa and the Middle East, affects the bladder, ureter, and pelvic organs, causing painful frequent urination and hematuria. *S. japonicum,* found in Japan, the Philippines, and Eastern Asia, causes GI ulcerations and fibrosis of the liver. *S. mansoni,* found in Africa, the Middle East, the Caribbean, and tropical America, causes symptoms similar to those caused by *S. japonicum.* Also called ***Bilharzia.*** See also **schistosomiasis.**



***Schistosoma mansoni* egg** *(Murray et al, 2002)*

schistosome dermatitis. See **swimmer's itch.**

schistosomiasis /shis′təsōmī′əsis/ [Gk, *schistos* + *soma* + *osis,* condition], a parasitic infection caused by a species of fluke of the genus ***Schistosoma.*** It is transmitted to humans, the definitive host, by contact with water containing the infective stage of the parasite, the cercaria. A single fluke may live in one part of the body, depositing eggs frequently, for up to 20 years. The eggs are irritating to mucous membrane, causing it to thicken and become papillomatous. Symptoms depend on the part of the body infected. *Schistosoma* may be found in the bladder, rectum, liver, lungs, spleen, intestines, and portal venous system. Pain, obstruction, dysfunction of the affected organ, and anemia may result. Diagnosis requires morphological identification of the ova or the parasite. Depending on the species, treatment may be with praziquantel, oxamniquine, or metrifonate. Prevention is more effective. Proper disposal of human urine and feces, chlorination of water, and eradication of the intermediate host, the freshwater snail *Australorbis glabratus,* are totally effective. Second only to malaria in the number of people affected, schistosomiasis is particularly prevalent in the tropics and in Asia. Also called **bilharziasis.** See also **blood fluke, *Schistosoma.***

schistosomicide /shis′təsō′məsīd/ [Gk, *schistos* + *soma* + L, *caedere,* to kill], a drug destructive to schistosomes, blood flukes transmitted by snails to human hosts in many parts of Africa, Brazil, and Asia. Praziquantel, albendazole, niridazole, metrifonate, oxamniquine hycanthone hydrochloride, and various salts of antimony, including stibophen, are potent antischistosomal agents. **—***schistosomicidal, adj.*

schistothorax /-thôr′aks/, a congenital cleft in the wall of the thorax. Also called *schistosternia.*

schizencephaly /skiz′ensef′əlē/, an abnormal cleavage or other division of the brain tissues caused by maldevelopment.

schizo-, prefix meaning "divided, or related to division": *schizocephalia, schizogenesis, schizophrenia.*

schizoaffective disorder /skit′sō·afek′tiv/ [Gk, *schizein,* to split; L, *affectus,* state of mind, *dis,* opposite of, *ordo,* rank], a psychiatric disorder in which either a major depressive or manic episode develops concurrent with symptoms of schizophrenia and delusion or hallucination occur for a period without significant mood symptoms.

schizocyte. See **schistocyte.**

schizogenesis /skit′səjen′əsis/ [Gk, *schizein* + *genesis,* origin], reproduction by fission. *—schizogenetic, schizogenic, schizogenous, adj.*

schizogonic, schizogonous, a cell that divides by schizogony. See **schizont.**

schizogony, a form of asexual reproduction characteristic of certain protozoa, including sporozoa, in which daughter cells are produced by multiple fission of the nucleus of the parasite **(schizont)** followed by segmentation of the cytoplasm to form separate masses around each smaller nucleus.

schizogyria /skit′səjī′rē·ə/, the presence of wedge-shaped cracks in the convolutions of the brain.

schizoid /skit′soid, skiz′oid/ [Gk, *schizein,* to split, *eidos,* form], **1.** *adj,* characteristic of or resembling schizophrenia; schizophrenic. **2.** *n,* a person, not necessarily a schizophrenic, who exhibits the traits of a schizoid personality.

schizoid personality, a functioning but maladjusted person whose behavior is characterized by extreme shyness, oversensitivity, introversion, seclusiveness, and avoidance of close interpersonal relationships. See also **schizoid personality disorder, schizophrenia.**

schizoid personality disorder, a personality disorder *(DSM-IV)* characterized by a defect in the ability to form interpersonal relationships, as shown by emotional coldness and aloofness, withdrawn and seclusive behavior, and indifference to praise, criticism, and the feelings of others. The person is unable to express hostility and ordinary aggressive feelings and reacts to disturbing experiences with apparent detachment. The person neither desires nor enjoys personal relationships, prefers solitary activities, and has no close friends or confidants.

schizont /skitsənt/ [Gk, *schizein* + *genein,* to produce], **1.** reproduction by multiple fission. **2.** the multinucleated cell stage during the asexual reproductive phase in the life cycle of a sporozoon, such as the malarial parasite ***Plasmodium.*** Also called **agamont.** Compare **sporont.** See also **schizogony. —schizogonic, schizogonous,** *adj.*

schizonticide /skitson′təsīd/ [Gk, *schizein* + *on,* being; L, *caedere,* to kill], a substance that destroys schizonts. **—***schizonticidal, adj.*

schizophasia /skit′səfā′zhə, skiz′ə-/ [Gk, *schizein* + *phasis,* speech], the disordered, incomprehensible speech characteristic of some forms of schizophrenia. See also **word salad.**

schizophrenia /skit′səfrē′nē·ə, skiz′ə-/ [Gk, *schizein,* to split, *phren,* mind], any one of a large group of *DSM-IV* psychotic disorders characterized by gross distortion of reality, disturbances of language and cognitive function, withdrawal from social interaction, disorganization and fragmentation of thought, altered perception, and emotional reaction. The term *schizophrenia* denotes one of the fundamental characteristics of the patients, the splitting off of a part of the psyche. The part that splits off then dominates the psychic life of the patient, even though it may express behavior that is contrary to the original personality of the patient. Apathy and confusion; delusions and hallucinations; rambling or stylized patterns of speech, such as evasiveness, incoherence, and echolalia; withdrawn, regressive, and bizarre behavior; and emotional lability often occur. Most patients have both positive and negative psychotic symptoms. Positive symptoms include hallucinations; negative symptoms include anergia, flatness, and anhedonia. The condition may be mild or require prolonged hospitalization. No single cause of the disorder is known; genetic, biochemical, psychological, interpersonal, and sociocultural factors are usually involved. Although slowly progressive deterioration of the personality may occur, dementia is not an inevitable consequence of the disorder. There may be recovery in some cases, and there may be relapse marked by intermittent episodes that begin after prolonged remission. Formerly called **dementia praecox.**

■ OBSERVATIONS: Characteristics vary in type and severity, and onset may be sudden or insidious. Symptomatic periods may be episodic or continuous. Typical characteristics are divided into prodromal (pre/early), positive (excess/distortion of normal function), and negative (reduction /loss of normal function) symptoms. Prodromal symptoms include withdrawal, social isolation, reduced interest or initiative, elaborate speech, magical thinking, unusual perceptual experiences, and strange behaviors. Positive symptoms include psychosis as evidenced by distortions of thought content (delusions) and/or perceptual distortion (hallucinations) and disorganization evidenced by disorganized speech and behavior. Negative symptoms include restricted emotional expression (flattened affect), poverty of speech (alogia), apathy, decreased ability to experience pleasure (anhedonia), difficulty naming or describing emotions (alexithymia), and a lack of interest in social relationships. These symptoms often resemble depression. The various manifestations greatly impair the ability to function and interfere with work, relationships, and self-care, ultimately leading to social isolation. Deterioration in function is marked in the first 5 years, with a plateau effect later in the disease process. Suicide is the major cause of premature death in schizophrenics. Comorbid substance abuse is a significant problem for about 50% of individuals with schizophrenia and signals the likelihood of a poor outcome. Diagnosis is made primarily through careful clinical history and evaluation. Diagnostic criteria established by *DSM-IV* require two or more of the following: delusions, hallucinations, disorganized speech or behavior, catatonia, and negative symptoms for at least a month with evidence of prodromal manifestations or social, occupational, or self-care impairments for at least 6 months. A neurological exam may exhibit soft signs, such as astereognosis, agraphesthesia, dysdiadochokinesia, muscle twitching, increased eye blinks, impaired fine motor movements, or abnormal smooth pursuit eye movements. CT scan or MRI may reveal structural brain abnormalities; medial and superior lobe abnormalities may be seen with positive manifestations; and frontal, cortical, and ventricular system abnormalities may be seen with negative manifestations.

■ INTERVENTIONS: Hospital milieu is helpful for early disease stages to introduce and regulate antipsychotic medications. Crisis care is indicated for high-risk periods for harm (suicide and/or violence). Antipsychotics are used for control of delusions/hallucinations, and sedatives are administered for agitation. Medication compliance is a long-term focus of treatment. Antiparkinsonian agents are used to treat tardive dyskinesia, which may result from use of traditional neuroleptic drugs. Prevention efforts are focused on long-term antipsychotic drug prophylaxis for individuals who have had one schizophrenia episode.

■ NURSING CONSIDERATIONS: Significant social support is needed for most schizophrenic patients and their families. Support includes supportive psychotherapy, psychosocial skill training, vocational rehabilitation, occupational therapy for activities of daily living, and community support services to promote self-care. Specialized programs and structured, supervised living environments are needed for dual diagnosis patients (schizophrenia and substance abuse). Families may benefit from family therapy and respite care. Individual and family education are needed about the disease process, including psychosis identification, symptoms of relapse, and medication effects and side effects. The importance of long-term medication compliance is stressed. Instruction is needed in coping strategies to increase daily functioning. Information and referral to community support systems can aid individual and family coping (e.g., National Alliance for the Mentally Ill).

schizophrenic /skit′səfren′ik, skiz′ə-/, **1.** *adj*, pertaining to schizophrenia. **2.** *n*, a person with schizophrenia.

schizophreniform disorder /-fren′ifôrm/ [Gk, *schizein* + *phren* + L, *forma*, form], a *DSM-IV* psychiatric disorder exhibiting the same symptoms as schizophrenia but characterized by an acute onset with resolution in 4 weeks to 6 months.

schizophrenogenic /skit′səfren′əjen′ik, skiz′ə-/ [Gk, *schizein* + *phren* + *genein*, to produce], tending to cause or produce schizophrenia.

Schizotrypanum cruzi. See **Chagas' disease.**

schizotypal personality disorder /skit′sōtī′pəl/ [Gk, *schizein* + *typos*, mark; L, *personalis*, of a person, *dis*, opposite of, *ordo*, rank], a *DSM-IV* psychiatric disorder characterized by oddities of thought, perception, speech, and behavior that are not severe enough to meet the clinical criteria for schizophrenia. Symptoms may include magical thinking inconsistent with cultural norms, such as superstitiousness, belief in clairvoyance and telepathy, and bizarre fantasies; ideas of reference; recurrent illusions, such as sensing the presence of a force or person not actually present; social isolation; peculiar speech patterns, including ideas expressed unclearly or words used deviantly; and exaggerated anxiety or hypersensitivity to real or imagined criticism. See also **schizoid personality disorder, schizophrenia.**

Schlatter-Osgood disease, Schlatter's disease. See **Osgood-Schlatter disease.**

Schlemm's canal. See **canal of Schlemm.**

schlieren optics /shlir′ən/ [Ger, *schlieren*, ulcers, streaks], a system that observes the refractive index gradient in solutions containing macromolecules.

Schmidt's syndrome^1 /shmits/ [Adolf Schmidt, German physician, 1865–1918], paralysis on one side, affecting the vocal cord, the soft palate, the trapezius muscle, and the sternocleidomastoid muscle, resulting from a lesion in the brain. Also called **vagoaccessory syndrome.**

Schmidt's syndrome^2 [Martin Benno Schmidt, German pathologist, 1863–1949]. See **polyglandular autoimmune syndrome.**

Schneiderian carcinoma /shnīdir′ē·ən/, an epithelial malignancy of the nasal mucosa and paranasal sinuses.

Schoenhofer, Savina O., a nursing theorist who, with Anne Boykin, wrote *Nursing as Caring: A Model for Transforming Practice*, which postulates that caring is the end, not the means, of nursing.

Schönlein-Henoch purpura. See **Henoch-Schönlein purpura.**

school nurse practitioner (S.N.P.), a registered nurse who is qualified through satisfactory completion of a nurse practitioner program to serve as a nurse practitioner in a school system.

school phobia [AS, *scol* + Gk, *phobos*, fear], an extreme separation anxiety disorder of children, usually in the elementary grades, characterized by a persistent irrational fear of going to school or being in a school-like atmosphere. Such children are usually oversensitive, shy, timid, nervous, and emotionally immature and have pervasive feelings of inadequacy. They typically try to cope with their fears by becoming overdependent on others, especially the parents.

Schüffner's dots [Wilhelm A.P. Schüffner, German pathologist, 1867–1949], coarse pink or red granules seen in the red blood cells of patients with tertiary malaria. They are signs of *Plasmodium vivax* or *P. ovale* and are absent in blood cells of patients infected with other types of malaria.

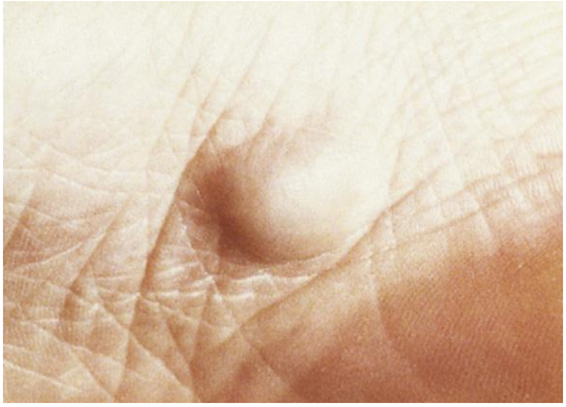
Schuller method, a technique for positioning a patient's head in a true lateral position to produce a radiographic image of the mastoid and petrous portions of the temporal bone as well as the temporomandibular joint of the side closest to the image receptor. Both temporomandibular joints are imaged with the mouth open and closed.

Schultz-Charlton phenomenon, a reaction that occurs when scarlet fever antitoxin or scarlet fever convalescent serum is injected into an area of the skin showing a bright red rash. A blanching of the skin at the site of the injection occurs. Serum from scarlet fever patients does not produce this reaction.

Schultze's mechanism, the delivery of a placenta with the fetal surfaces presenting.

Schwann cell /shwon/ [Theodor Schwann, German anatomist, 1810–1882], any of the cells of ectodermal origin that make up the neurilemma. They form the myelin sheath around peripheral nerve fibers.

schwannoma /shwonō′mə/ *pl. schwannomas, schwannomata* [Theodor Schwann; Gk, *oma*, tumor], a benign, solitary, encapsulated tumor arising in the neurilemma **(Schwann's sheath)** of peripheral, cranial, or autonomic nerves. Also called **neurilemmoma,** *Schwann cell tumor.*



Schwannoma on the sole of the foot *(du Vivier, 2002)*

schwannosis /shwonō′sis/ [Theodor Schwann; Gk, *osis,* condition], a condition of overgrowth of the neurilemma or sheath of Schwann.

Schwann's sheath. See **neurilemma.**

Schwartz bed. See **hyperextension bed.**

Schwartz-Jampel syndrome /shworts·jam′pəl/ [Oscar Schwartz, American pediatrician, b. 1919; Robert Steven Jampel, American ophthalmologist, b. 1926], an autosomal-recessive disorder characterized by myotonic myopathy, dwarfism, abnormal narrowness of the palpebral fissures in the horizontal direction, joint contractures, and flat facies. Also called **chondrodystrophic myotonia.**

Schwartzman-Sanarelli phenomenon /shvorts′man san′-ərel′ē/ [Gregory Schwartzman, American physician, b. 1896; Giuseppe Sanarelli, Italian bacteriologist, 1864–1940], a condition induced experimentally in the investigation of the role of coagulation in renal disease. Animals injected twice with a bacterial endotoxin experience massive disseminated intravascular coagulation with blood clots in the vessels of the kidneys. Also called *Schwartzman phenomenon.*

scia-. See **skia-.**

sciatic /sī·at′ik/ [Gk, *ischiadikos,* hip joint], pertaining to an area near the ischium, such as the sciatic nerve or the sciatic vein.

sciatica /sī·at′ikə/, an inflammation of the sciatic nerve, usually marked by pain and tenderness along the course of the nerve through the thigh and leg. It may result in a wasting of the muscles of the lower leg over time. Also called **sciatic neuritis.**

sciatic dislocation. See **dislocation of the hip.**

sciatic hernia, a protrusion of tissue through the greater sciatic notch.

sciatic nerve, a long nerve originating in the sacral plexus and extending through the muscles of the thigh, leg, and foot, with numerous branches.

sciatic neuritis. See **sciatica.**

sciatic scoliosis, lateral curvature of the spine caused by an asymmetric spasm of the spinal muscles, often resulting in a list to one side.

SCID, abbreviation for **severe combined immunodeficiency disease.**

SCID mouse, (*s*evere *c*ombined *i*mmuno*d*eficiency) a strain of mice lacking in T and B lymphocytes and immunoglobulins, either from inbreeding with an autosomal-recessive trait or from genetic engineering, used as a model for studies of the immune system.

science /sī′əns/ [L, *scientia,* knowledge], a systematic attempt to establish theories to explain observed phenomena and the knowledge obtained through these efforts. **Pure science** is concerned with the gathering of information solely for the sake of obtaining new knowledge. **Applied science** is the practical application of scientific theory and laws. See also **hypothesis, law, scientific method, theory.**

Science of Unitary Human Beings, a conceptual model and theory of nursing proposed by Martha Rogers in 1970. Its four basic concepts focus on the nature and direction of "unitary human development": (1) human and environmental energy fields, (2) complete and continuous openness of the energy fields, (3) human energy fields perceived as single waves that give identity to a field, and (4) "pandimensionality," a nonlinear domain without spatial or temporal attributes. See also **Rogers, Martha E.**

scientific method /sī′əntif′ik/, a systematic, ordered approach to the gathering of data and the solving of problems. The basic approach is the statement of the problem followed by the statement of a hypothesis. An experimental method is established to help confirm or negate the hypothesis. The results of the experiment are observed, and conclusions are drawn from observed results. The conclusions may tend to uphold or to refute the hypothesis.

scientific rationale, a reason, based on supporting scientific evidence, that a particular action is chosen.

scimitar sign /sim′ətər/, an arteriographic sign of encroachment on the popliteal or femoral lumen in adventitial cystic disease.

scimitar syndrome, a radiographic artifact caused by a congenital disorder in which the right lower pulmonary vein drains into the inferior vena cava. On a chest radiograph, the abnormal vessel configuration produces a scimitar-shaped shadow.

scintigram /sin′tigram′/ [L, *scintillare,* to sparkle; Gk, *gramma,* record], a recording of the radioactivity emitted by a tracer in an organism or organ system.

scintigraph /sin′tigraf′/, a photograph showing the distribution and intensity of radioactivity in various tissues and organs after the administration of a radiopharmaceutical.

scintillating scotoma /sin′tilā′ting/ [L, *scintillatio,* sparkling; Gk *skotos* dark, *oma* tumor], an abnormal area of the visual field that is positive and luminous, sometimes becoming hemianopic and appearing in a migraine aura.

scintillation detector /sin′tilā′shən/ [L, *scintillatio,* sparkling], **1.** a device that detects the light emitted by a crystal subjected to ionizing radiation. A photomultiplier tube in the detector converts the light into an electric signal that can be processed further. An array of scintillation detectors is used in a gamma camera. **2.** a device used to measure the amount of radioactivity in an area of the body.

scintillation scanning, the process that results in a scintiscan.

scintiscan /sin′tiscan′/, a photographic display of the distribution of a radiopharmaceutical within the body.

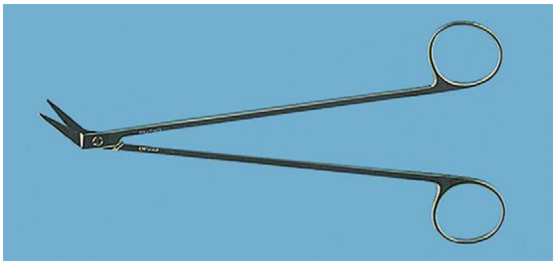
scirrho-, prefix meaning "hard, or related to a hard cancer or scirrhus": *scirrhoid, scirrhoma, scirrhosarca.*

scirrhous carcinoma /skir′əs/ [Gk, *skirrhos,* hard, *karkinos,* crab, *oma,* tumor], a hard, fibrous, particularly invasive tumor in which the malignant cells occur singly or in small clusters or strands in dense connective tissue. Also called **carcinoma fibrosum.** See also **breast cancer.**

scissor gait /siz′ər/ [L, *scindere,* to cut; ONorse, *gata,* way], a manner of walking cross-legged, as observed in spastic paraplegia.

scissor legs [L, *scindere,* to cut; ONorse, *leggr*], legs that are crossed because of a disorder of the adductor muscles of the thigh or a deformity of the hip.

scissors [L, *scindere,* to cut], a sharp instrument composed of two opposing cutting blades held together by a central pin on which the blades pivot. The most common dissecting scissors are the straight **Mayo,** for cutting sutures; the **Snowden-Pencer,** for deep, delicate tissue; the long curved **Mayo,** for deep, heavy, or tough tissue; the short curved **Metzenbaum,** for superficial, delicate tissue; and the long, blunt curved **Metzenbaum,** for deep, delicate tissue.



Potts-Smith cardiovascular scissors
(Tighe, 2012)

SCL, abbreviation for **soft contact lens.**

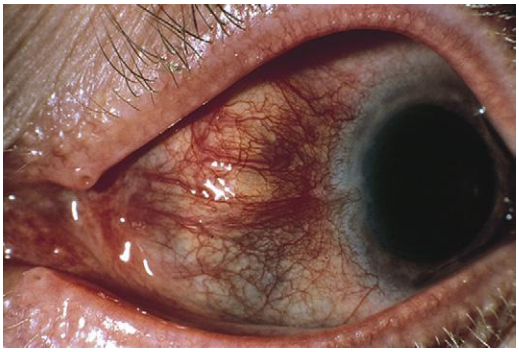
scler-. See **sclero-.**

sclera /sklir′ə/ [Gk, *skleros,* hard], the tough, inelastic white opaque membrane covering the posterior five sixths of the eyebulb. It maintains the size and form of the bulb and attaches to muscles that move the bulb. Posteriorly it is pierced by the optic nerve and, with the transparent cornea, makes up the outermost of three tunics covering the eyebulb.

scleredema /sklir′ədē′mə/ [Gk, *skleros* + *oidema,* swelling], an idiopathic skin disease characterized by nonpitting induration beginning on the face or neck and spreading downward over the body, sparing the hands and feet. There also may be tongue swelling, restriction of eye movements, and pericardial, pleural, and peritoneal effusions. Resolution occurs after several months, but recurrences are common. The condition often follows a streptococcal infection or an exanthem of childhood. There is no specific treatment. Compare **scleroderma.**

sclerema neonatorum /sklirē′mə/ [Gk, *skleros* + *neos,* new; L, *natus,* birth], a progressive generalized hardening of the skin and subcutaneous tissue of the newborn. It is usually a fatal condition that results from severe cold stress in severely ill premature infants subject to such life-threatening conditions as metabolic acidosis, hypoglycemia, GI or respiratory infection, or gross malformation. Also called **scleredema neonatorum, sclerema adiposum, scleroderma neonatorum.**

scleritis /sklirī′tis/ [Gk, *skleros,* hard, *itis,* inflammation], an inflammation of the sclera.

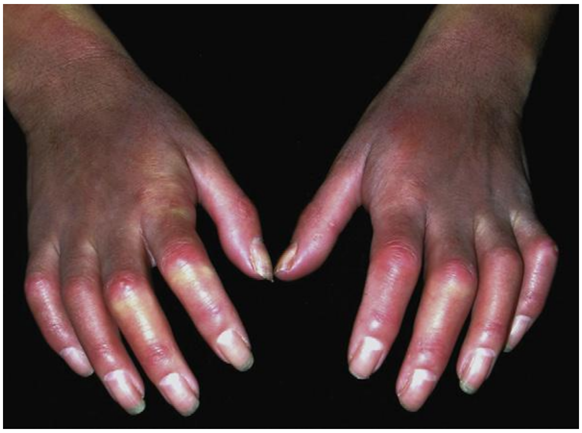


Nodular scleritis *(Swartz, 2009/Courtesy Karen Ann Klima, BA, CRA, COMT, The Johns Hopkins Center for Hereditary Eye Diseases, The Wilmer Eye Institute)*

scleroconjunctival /sklir′ōkon′jungktī′vəl/, pertaining to the sclera and conjunctiva.

sclerocornea /-kôr′nē·ə/, the cornea and sclera of the eye surface considered as a single layer.

sclerodactyly /sklir′ōdak′tilē/ [Gk, *skleros* + *daktylos,* finger], a musculoskeletal deformity affecting the hands of people with scleroderma. The fingers are fixed in a semiflexed position, with subcutaneous calcification and tightened skin to the wrist. The fingertips may be ulcerated.



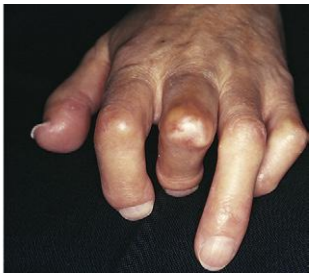
Sclerodactyly
(Firestein and Kelly, 2009)

scleroderma /sklir′ōdur′mə/ [Gk, *skleros* + *derma,* skin], chronic hardening and thickening of the skin caused by new collagen formation, with atrophy of pilosebaceous follicles. Scleroderma is most common in middle-aged women. It may occur in a localized form **(morphea)** or as a systemic disease **(systemic sclerosis). Progressive systemic sclerosis (PSS)** is a relatively rare autoimmune disease affecting the blood vessels and connective tissue. It is characterized by fibrous degeneration of the connective tissue of the skin, lungs, and internal organs, especially the esophagus, digestive tract, and kidneys.

■ OBSERVATIONS: The most common initial complaints are changes in the skin of the face and fingers. Raynaud's phenomenon occurs with a gradual hardening of the skin and swelling of the distal extremities. In the early stages the disease may be confused with rheumatoid arthritis or Raynaud's disease. As the disease progresses, deformity of the joints and pain on movement occur. Skin changes include edema and then pallor; then the skin becomes firm; finally it becomes slightly pigmented and fixed to the underlying tissues. At this stage the skin of the face is taut, shiny, and masklike, and the patient may have difficulty in chewing and swallowing. Patients with mild forms of scleroderma may live to 30 to 50 years of age. Those with cardiac, renal, pulmonary, or intestinal involvement may die at an earlier age. The usual indication that renal disease is present is the abrupt onset of severe arterial hypertension that does not respond to medication. Localized forms of scleroderma may occur; these cases are benign and appear only as small circumscribed patches on the skin. A biopsy of the lesion may be done to diagnose the condition. Radiographic examination of the lungs and GI tract may be diagnostic in the systemic form of the disease. Blood tests may reveal antinuclear antibodies.

■ INTERVENTIONS: There are no drugs to cure scleroderma; however, corticosteroids, immunosuppressants, antacids, and histamine receptor antagonists may be useful in treating the symptoms of the disease, and salicylates and mild analgesics are given to ease pain in the joints. Physical therapy slows the development of muscle contracture and resultant deformity and debility. Nephrectomy or renal transplantation may be performed.

■ NURSING CONSIDERATIONS: The nurse advises patients to use mild, nonalcoholic astringent soaps; to avoid extreme cold and activities that trigger pain; to wear gloves; to stop smoking; and to eat small, frequent meals. In the advanced stages of scleroderma patients often require help to eat, and mouth and skin care is particularly important. As patients become more helpless, there is a need for considerable emotional support.



Scleroderma *(Goldman et al, 2008)*

scleroderma heart, a heart condition characterized by interstitial myocardial fibrosis and thickening of the small blood vessels in progressive systemic sclerosis.

scleroderma neonatorum. See **sclerema neonatorum.**

sclerodermatitis /-dur′mətī′tis/, an inflammation, thickening, and hardening of the skin.

sclerokeratitis /-ker′ətī′tis/, an inflammation of the sclera and cornea.

-scleroma, suffix meaning an "induration, a hardening of the tissues": *laryngoscleroma, pharyngoscleroma, rhinoscleroma*.

scleromalacia perforans /sklir′ōməlā′shə/ [Gk, *skleros* + *malakia*, softening; L, *perforare*, to pierce], a condition of the eyes in which devitalization and sloughing of the sclera occur as a complication of rheumatoid arthritis. The pigmented uvea becomes exposed, and glaucoma, cataract formation, and detachment of the retina may result.

sclero-, scler-, sklero-, prefix meaning "hard," often used to show relationship to the sclera: *scleroadipose, sclerocorneal, scleroderma*.

sclerose /sklərōz′/ [Gk, *skleros*], to harden or to cause hardening. **—sclerotic,** *adj*.

sclerosing /sklirō′zing/ [Gk, *skleros*, hard], pertaining to the tissue changes or other factors involved in the progress of sclerosis.

sclerosing hemangioma [Gk, *skleros* + *haima*, blood, *angeion* vessel, *oma* tumor], a solid cellular tumorlike nodule of the skin or a mass of histiocytes, thought to arise from a hemangioma by the proliferation of endothelial and connective tissue cells.

sclerosing keratitis [Gk, *skleros*, hard, *keras*, horn, *itis*, inflammation], **1.** a form of corneal inflammation in which nodular infiltrates appear near the margin of the cornea in association with a ring of anterior scleritis. **2.** a form of corneal inflammation characterized by an opaque triangle in the deep layers of the cornea, with the base of the triangle near the sclerosing area.

sclerosing phlebitis [Gk, *skleros*, hard, *phleps*, vein, *itis*, inflammation], inflammation of a vein that has become hardened and obstructed.

sclerosing solution [Gk, *skleros* + L, *solvere*, to dissolve], a liquid containing an irritant that causes inflammation and resulting fibrosis of tissues. It may be used in cauterizing ulcers, arresting hemorrhage, and treating hemangiomas.

sclerosis /sklirō′sis/ [Gk, *skleros*, hard], a condition characterized by hardening of tissue resulting from any of several causes, including inflammation, the deposit of mineral salts, and infiltration of connective tissue fibers. **—sclerotic,** *adj*.

-sclerosis, suffix meaning "an abnormal hardening of the tissue": *atherosclerosis, arteriosclerosis, phlebosclerosis*.

sclerotherapy /-ther′əpē/ [Gk, *skleros*, hard, *therapeia*, treatment], the use of sclerosing chemicals to treat varicosities such as hemorrhoids or esophageal varices. The agent produces inflammation and later fibrosis and obliteration of the lumen.

sclerotic /sklirot′ik/ [Gk, *skleros*, hard], pertaining to induration or hardening.

sclerotomal pain distribution /-tō′məl/, the referral of pain from pain-sensitive tissues covering the axial skeleton along a sclerotomal segment.

sclerotome /sklir′ətōm/ [Gk, *skleros* + *temnein*, to cut], (in embryology) the part of the segmented mesoderm layer in the early developing embryo that originates from the somites and gives rise to skeletal tissue of the body, specifically the paired segmented masses of mesodermal tissue that lie on each side of the notochord and develop into the vertebrae and ribs. See also **somite.**

sclerotylosis /-tilō′sis/, an inherited condition of atrophic fibrosis of the skin. There is overgrowth of the nails and horny skin covering the palms of the hands and plantar surfaces of the feet. The disorder may be accompanied by cancer of the GI tract.

SCMC test, a test for cervical factor infertility. Fresh sperm is put both on a slide with cervical mucus and on a slide without mucus, and motility of the two sperm samples is assessed over time. If the sperm shows irregularities of motility through the mucus, there is cervical factor infertility. Also called *Kremer test, sperm–cervical mucus contact test*.

scoleces. See **scolex.**

scoleco-, prefix meaning "worm": *scolecoid, scolecoidectomy, scolecology*.

scolex /skō′leks/ *pl*. **scoleces** [Gk, worm], the headlike segment or organ of an adult tapeworm that has hooks, grooves, or suckers by which it attaches itself to the wall of the intestine.

scolio-, prefix meaning "twisted or crooked": *scoliodontic, scoliokyphosis, scoliosiometry*.

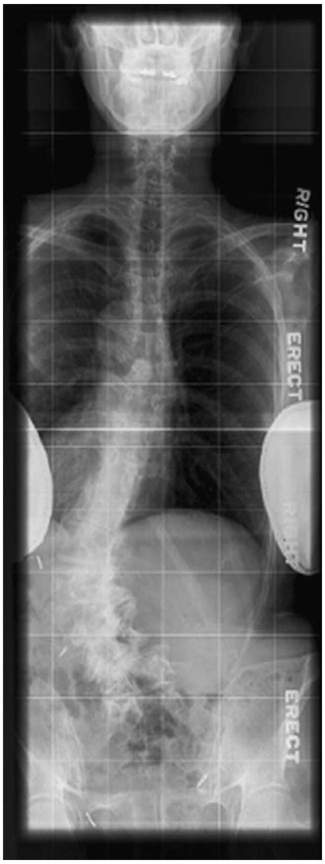
scoliokyphosis. See **kyphoscoliosis.**

scoliometer /skō′lē·om′ətər/ [Gk, *skoliosis*, curvature], a device for measuring the amount of abnormal curvature in the spine.

scoliosis /skō′lē·ō′sis/ [Gk, *skoliosis*, curvature], lateral curvature of the spine, a common abnormality of childhood, especially in females. Causes include congenital malformations of the spine, poliomyelitis, skeletal dysplasias, spastic paralysis, and unequal leg length. Unequal heights of hips or shoulders may be a sign of this condition. Early recognition and orthopedic treatment may prevent progression of the curvature. Treatment includes braces, casts, exercises, and corrective surgery. See also **congenital scoliosis, idiopathic scoliosis, kyphoscoliosis, kyphosis, lordosis, spinal curvature.**

scoliotic pelvis /skō′lē·ot′ik/ [Gk, *skoliosis*, curvature; L, *pelvis*, basin], an effect of scoliosis in which the sacrum bends to one side, distorting the pelvis.

scombroid /skom′broid/ [Gk, *scombros*, mackerel, *eidos*, form], pertaining to fish of the Scombridae and



Radiograph of the spine in scoliosis
(Evans, 2009)

Scomberesocidae families, which include skipjack, mackerel, bonito, and tuna.

scombroid poisoning, toxic effects of eating scombroid fish (such as bonito or tuna) that have begun bacterial decomposition after being caught. Scombroid fish contain large amounts of free histidine in the muscle tissue, which gives rise to toxic levels of histamine under conditions of histidine decarboxylation by any of a dozen species of bacteria. Scombroid poisoning is not limited to consumption of fresh fish; the problem also may affect commercially canned tuna. Symptoms, which usually last no more than 24 hours, include nausea, vomiting, diarrhea, epigastric pain, and urticaria.

scop-, prefix meaning "to examine, observe": *scopograph, scopometer, scopophilia*.

-scope, suffix meaning an "instrument for observation or a visual examination": *ciliariscope, episcope, pelviscope*.

scopolamine /skōpol′əmēn/ [Giovanni A. Scopoli, Italian naturalist, 1723–1788], an anticholinergic alkaloid obtained from the leaves and seeds of several solanaceous plants. It is a central nervous system depressant.

■ INDICATIONS: It is prescribed for prevention of motion sickness and as an antiemetic, a sedative in obstetrics, and a cycloplegic and mydriatic.

■ CONTRAINDICATIONS: Narrow-angle glaucoma, asthma, myasthenia gravis, obstruction of the genitourinary or GI tract, severe ulcerative colitis, and known hypersensitivity prohibit its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blurred vision, central nervous system effects, tachycardia, dry mouth, decreased sweating, and hypersensitivity reaction. Also called **hyoscine.** See also **transdermal scopolamine.**

scopophilia /skō′pəfil′ē·ə, skop′-/ [Gk, *skopein*, to look, *philein*, to love], **1.** sexual pleasure derived from looking at sexually stimulating scenes or at another person's genitals; voyeurism. **2.** a morbid desire to be seen; exhibitionism. Also called **scoptophilia.** —*scopophiliac, scopophilic, scoptophiliac,* **scoptophilic,** *adj., n.*

scopophobia /skō′pə-/ [Gk, *skopein* + *phobos*, fear], an anxiety disorder characterized by a morbid fear of being seen or stared at by others. The condition is commonly seen in schizophrenia. See also **phobia.**

scoptophilia, scoptophilic. See **scopophilia.**

-scopy, suffix meaning "observation or a visual examination": *bioscopy, stomachoscopy, thoracoscopy*.

-scorbic, suffix meaning "prevention or treatment of scurvy": *antiscorbic, ascorbic, glucoascorbic*.

-scorbutic, -scorbutical, suffix meaning "scurvy": *antiscorbutic, postscorbutic, scorbutic*.

scorbutic gingivitis /skôrbyo͞o′tik/ [NL, *scorbutus*, scurvy; L, *gingiva*, gum; Gk, *itis*, inflammation], an abnormal condition characterized by inflamed or bleeding gums and caused by vitamin C deficiency.

scorbutic pose, the characteristic posture of a child with scurvy, with thighs and legs semiflexed and hips rotated outward. The child usually lies motionless in a state of pseudoparalysis, avoiding voluntary movements of the extremities because of the pain that accompanies any motion. See also **scurvy.**

scorbutus. See **scurvy.**

scorpion sting /skôr′pē·on/ [Gk, *skorpios* + AS, *stingan*], a painful wound produced by a scorpion, an arachnid with a hollow stinger in its tail. The stings of many species are only slightly toxic, but some, including *Centruroides sculpturatus* (bark scorpion) of the southwestern United States, may inflict fatal injury, especially in small children. Initial pain is followed within several hours by numbness, nausea, muscle spasm, dyspnea, and convulsion. Anascorp, an antivenin, was approved for use in the United States in 2011. The antivenin has been available in Mexico for many years.

Scorpion *(Auerbach, 2007/Courtesy R. David Gaban)*

scoto-, prefix meaning "darkness": *scotodinia, scotogram, scotographic*.

scotoma /skōtō′mə/ *pl. scotomas, scotomata* [Gk, *skotos*, darkness, *oma*, tumor], a defect of vision in a defined area of the visual field in one or both eyes. A common prodromal symptom is a shimmering film appearing as an island in the visual field.

scotopic vision /skōtop′ik/ [Gk, *skotos,* darkness; L, *visio,* seeing], the ability of the eye to adjust for vision in darkness or dim light. See also **night vision.**

scout film, a preliminary radiographic film or image made before the administration of contrast material. Also called *scout image*.

scrapie /skrā′pē/, the first of the prion diseases to be recognized, occurring in sheep and goats and characterized by severe pruritus, muscular incoordination, and increasing debility ending in death.

scratch test [ME, *scratten* + L, *testum,* crucible], a skin test for identifying an allergen, performed by placing a small quantity of a solution containing a suspected allergen on a lightly scratched area of the skin. If a wheal forms within 15 minutes, allergy to the substance is indicated. Compare **patch test.**

screamer's nodule. See **vocal cord nodule.**

screening [ME, *scren*], **1.** a preliminary procedure, such as a test or examination, to detect the most characteristic sign or signs of a disorder that may require further investigation. **2.** the examination of a large sample of a population to detect a specific disease or disorder, such as hypertension.

screen memory [ME, *scren* + L, *memoria*], a consciously tolerable memory that replaces one that is emotionally painful to recall.

screw /skro͞o/ [MFr, *escroue*], a solid cylinder with a helical thread on its exterior surface, used to hold two objects together.

screw artery /skro͞o/, a coiled blood vessel in either the uterine mucosa or the retinal macula. Also called **spiral artery.**

screw clamp [OFr, *escroe,* screw; AS, *clam,* fastener], a device, usually made of plastic, equipped with a screw that can be manipulated to close and open the primary IV tubing for regulating the flow of IV solution. Turning the screw clockwise closes the tubing; turning it counterclockwise opens it. Different positions of the screw between the open and the closed positions allow the IV fluid to flow at different rates. Compare **roller clamp, slide clamp.**

scrib-, script-, prefix meaning "write": *scribble, scribomania, prescription*.

Scribner shunt [Belding S. Scribner, American physician, b. 1921], a type of arteriovenous bypass, used in hemodialysis, consisting of a special tube connection outside the body.

scripting /skrip′ting/, a technique of family therapy involving the development of new family transactional patterns.

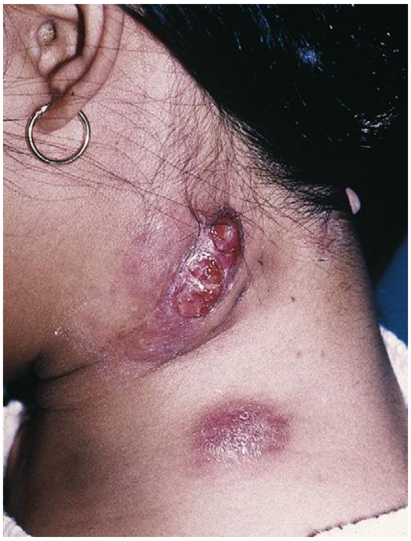
scrofula /skrof′yələ/ [L, *scrofa,* brood sow], *archaic*. a form of tuberculosis cutis with abscess formation, usually of the cervical lymph nodes.

scrofulous keratitis, inflammation of the conjunctiva. See **phlyctenular keratoconjunctivitis.**

scroll ear /skrōl/, a distortion of the ear in which the pinna is rolled forward.

scrotal /skrō′təl/, pertaining to the scrotum.

scrotal cancer, an epidermoid malignancy of the scrotum, characterized initially by a small sore that may ulcerate. The lesion occurs most frequently in elderly men who have been exposed to soot, pitch, crude oil, mineral oils, polycyclic hydrocarbons, or arsenic fumes from copper smelting. Treatment involves wide surgical excision of the tumor and resection of inguinal nodes. In the eighteenth century Sir Percival Pott associated scrotal cancer in chimney sweeps with exposure to soot. It was the first malignancy shown to be caused by an environmental carcinogen. Also called **chimney-sweeps' cancer, soot wart.**



Scrofula *(Stone and Gorbach, 2000)*

scrotal hernia, an inguinal hernia that has descended into the scrotum.

scrotal nuclear imaging, a nuclear imaging scan, usually done on an emergency basis, that is helpful in diagnosing patients with a sudden onset of unilateral testicular swelling and pain. It can differentiate unilateral testicular torsion from other causes of testicular pain, such as acute epididymitis.

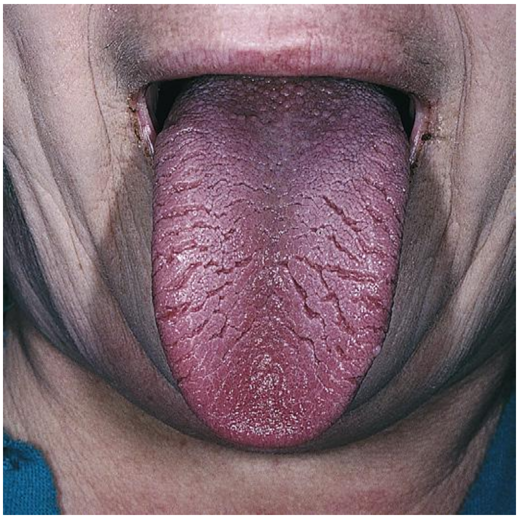
scrotal part of ductus deferens, the initial part of the ductus deferens, which is within the scrotum.

scrotal raphe, a line of union of the two halves of the scrotum. It is generally more highly pigmented than the surrounding tissue.

scrotal septum, an incomplete wall of connective tissue and smooth muscle that divides the scrotum into two compartments, each containing a testis.

scrotal swelling, the earliest enlargement of embryonic tissue that will become half of the scrotum.

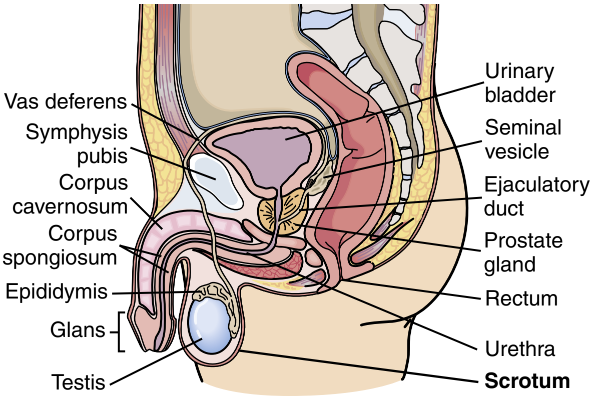
scrotal tongue, a seldom used term for a nonpathological condition in which the tongue is deeply furrowed and resembles the surface of the scrotum. See **fissured tongue.**



Scrotal tongue *(Callen et al, 2000)*

scrotal ultrasound, an ultrasound test of the scrotum and its contents to diagnose benign and malignant tumors, benign abnormalities such as testicular abscess and orchitis, and extratesticular lesions such as hydrocele, hematocele, and pyocele and to locate cryptorchid testicles.

scrotum /skrō′təm/, the pouch of skin containing the testes and parts of the spermatic cords. It is divided on the surface into two lateral parts by a ridge that continues ventrally to the undersurface of the penis and dorsally along the middle line of the perineum to the anus. In young, robust individuals the scrotum is short and corrugated and closely wraps the testes. In older people and debilitated individuals and in warm environments the scrotum becomes elongated and flaccid. The two layers of the scrotum are the skin and the dartos tunic. The skin is brownish and very thin, is usually wrinkled, and has thinly scattered kinky hairs. The dartos tunic is composed of a thin layer of unstriated muscular fibers around the base of the scrotum. The tunic projects an internal septum that divides the pouch into two cavities for the testes, extending between the scrotal ridge and the root of the penis. The scrotum is highly vascular and contains no fat. See also **testis. —scrotal,** *adj.*



Scrotum *(Sorrentino, 2012)*

scrub. See **surgical scrub.**

scrubbed team members [ME, *scrobben,* to scrub], the surgeons, physicians, nurses, and technicians who are scrubbed for surgical procedures in a sterile environment.

scrub itch. See ***Leeuwenhoekia australiensis.***

scrub nurse, a registered nurse who assists surgeons during operations.

scrub room, an operative area where surgeons and surgical teams use disposable sterile brushes and bactericidal soaps to wash and scrub their fingernails, hands, and forearms before performing or assisting in surgical operations. Scrub rooms and meticulous washing techniques improve the sterile environment of the operating room and reduce the risk of bacterial infection.

scrub typhus, an acute febrile disease caused by several strains of the species *Orientia tsutsugamushi* (formerly *Rickettsia tsutsugamushi*) and transmitted from infected rodents to humans by mites. It is found in Asia, India, northern Australia, and the western Pacific islands. The clinical course ranges from mild to severe and is characterized by a necrotic papule or black eschar at the site of the lesion caused by the bite of the small arachnid. Tender enlarged regional lymph nodes, fever, severe headache, eye pain, muscle aches, and a generalized rash usually occur. In severe cases the myocardium and the central nervous system may be involved. The DNA-PCR and indirect fluorescent antibody tests are useful in diagnosis. Treatment with antibiotics, such as chloramphenicol, doxycycline, or azithromycin, has reduced the mortality rate to nearly zero. Person-to-person transmission is not known to occur. No effective vaccine is available, and second attacks are common because of antigenic differences in various strains of rickettsiae. Prevention includes avoiding mite-infested terrain, reducing the rodent population, destroying scrub vegetation, and using insect repellents. Also called **Japanese flood fever, Japanese river fever, mite typhus, tropical typhus, tsutsugamushi disease.** Compare **Q fever, Rocky Mountain spotted fever, typhus.**

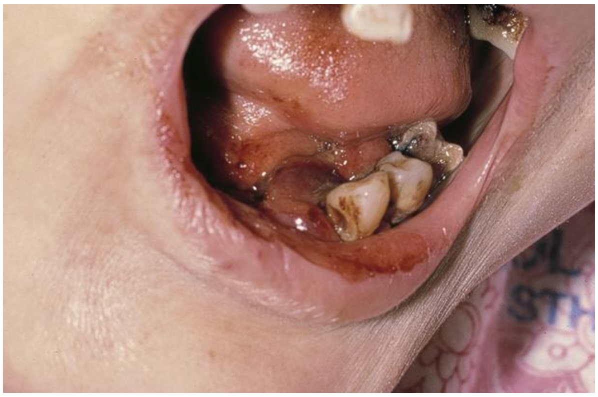
scruple /skro͞o′pəl/ [L, *scrupulus,* small stone], a measure of weight in the apothecaries' system equal to 20 grains or 1.296 g. See also **apothecaries' weight, metric system.**

sculpting /skulp′ting/, a technique of family therapy involving construction of a live family portrait that depicts family alliances and conflicts.

Sculptra, a trademark for *poly-L-lactic acid.*

Scultetus binder /skəltē′təs/ [Johann Schultes, German surgeon, 1595–1645], a many-tailed binder or bandage with an attached central piece. The tails are overlapped. The last two, tied or pinned, act to secure the others. A Scultetus binder may be opened or removed without moving the bandaged part of the body. Also called *Scultetus bandage.*

scurvy /skur′vē/ [Scand, *scurfa,* scabby], severe ascorbic acid deficiency. It is characterized by weakness; anemia; edema; spongy gums, often with ulceration and loosening of the teeth; a tendency to mucocutaneous hemorrhages; and induration of the muscles of the legs. Treatment and prophylaxis of the disease consist of administration of ascorbic acid and inclusion of fresh vegetables and fruits in the diet. Also called **scorbutus.** See also **ascorbic acid, citric acid, infantile scurvy.**



Scurvy *(White and Cox, 2006)*

scypho-, prefix meaning "a cup-shaped part": *scyphistoma, scyphozoan, scyphus.*

SD, **1.** abbreviation for **skin dose. 2.** abbreviation for **standard deviation.**

SDAT, abbreviation for **senile dementia-Alzheimer type.**

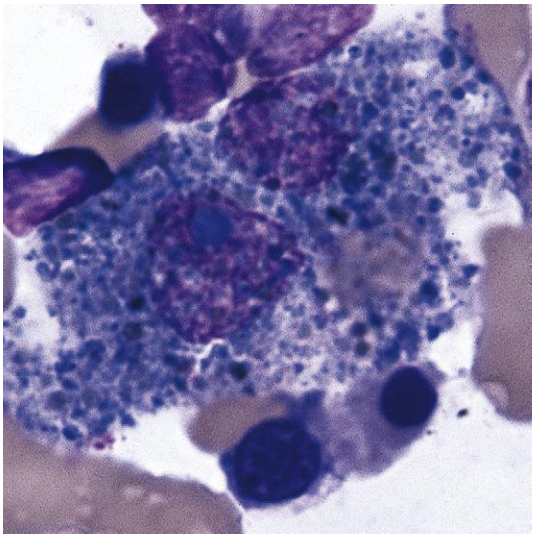
SDMS, abbreviation for *Society of Diagnostic Medical Sonographers.*

Se, symbol for the element **selenium.**

SE, abbreviation for **spin-echo.**

S.E., abbreviation for **standard error.**

sea-blue histiocyte syndrome, a condition of spleen enlargement and mild thrombocytopenia. Histiocytes in the bone marrow contain cytoplasmic granules that stain bright blue.



Sea-blue histiocyte *(Carr and Rodak, 2008)*

seaborgium (Sg) /sēbôr′gē·əm/ [Glenn T. Seaborg, American chemist and educator, 1912–1999], a synthetic radioactive element, with a half-life of 0.9 second. Its atomic number is 106; its atomic mass is 266. It was first synthesized in 1974 by scientists working independently in the United States and Russia.

sealant /sē′lənt/, an agent that protects against access from the outside or leakage from the inside. See also **dental sealant.**

sealed source [ME, *seel,* mark; Fr, *sourdre,* to spring], a source of radioactivity that is permanently encased in a container or bonding material to prevent leakage. Sealed sources, such as seeds, needles, and specially designed applicators, are used in the implantation of cesium-137, iodine-125, iridium-192, radium-226, and other radionuclides for the treatment of various malignant tumors.

sealer cement, a compound used in filling a pulp canal. It is applied as a plastic that fills depressions in the surface of the canal, solidifies after insertion, and helps close the apex of the root canal.

seal limbs. See **phocomelia.**

seasickness, a form of kinesia caused by traveling on an ocean or the sea. Also called **mal de mer.** Compare **air sickness, car sickness.** See also **kinesia.**

seasonal affective disorder (SAD) /sē′zənəl/, a *DSM-IV* mood disorder associated with the shorter days and longer nights of autumn and winter. Symptoms include lethargy, depression, social withdrawal, and work difficulties. The patients also consume excess amounts of carbohydrates, gaining weight. The symptoms recede in the spring, when days become longer. The condition is associated with the effect of light on melatonin secretion and is treated with light therapy for 5 to 6 hours per day.

seasonal allergic rhinitis, hay fever.

Seattle Foot /sē·at′əl/, a trademark for a stored-energy foot prosthesis that contains a plastic rod called a keel, which extends from the toe to the heel, where it turns upward toward the ankle. See also **keel, stored-energy foot.**

seatworm. See ***Enterobius vermicularis.***

sea urchin granuloma, a type of foreign body granuloma in which nodules of granulation tissue develop in the skin several months after contact with the silicate in the spines of a sea urchin.

sea urchin sting /ur′chin/ [AS, *sae* + *herichon,* hedgehog], an injury inflicted by any of a variety of sea urchins in which the skin is punctured and, in some species, venom released. A venomous sting is characterized by pain, muscular weakness, numbness around the mouth, and dyspnea. Immediate removal of the spines is necessary and may require the use of a local anesthetic. An antiseptic and a dressing are applied until the wound is healed. In all cases the broken spines cause local pain and irritation. Infection may result. See also **stingray.**

seawater bath [AS, *sae* + *waeter*], a bath taken in warm seawater or in saline solution.

seb-, prefix meaning “sebum”: *sebaceous, sebiferous, sebiparous.*

sebaceous /sibā′shəs/ [L, *sebum,* sweat], pertaining to sebum, the substance secreted by glands of the skin.

sebaceous cyst, a misnomer for an epidermoid cyst or a pilar cyst.

sebaceous epithelioma, a benign yellowish nodular tumor of sebaceous gland epithelium. It usually appears on the neck or face. It may resemble basal cell carcinoma but is composed mainly of baseloid and sebaceous cells.

sebaceous follicle [L, *sebum,* sweat, *folliculus,* small bag], a sebaceous gland that opens into a hair follicle.

sebaceous gland, one of the many small sacculated organs in the dermis. They are located throughout the body in close association with all types of body hair but are especially abundant in the scalp, face, anus, nose, mouth, and external ear. They are rare in the palms of the hands and the soles of the feet. Each gland consists of a single duct that emerges from a cluster of oval alveoli. The ducts from most sebaceous glands open into the hair follicles, but some open onto the skin surface, as in the labia minora and the free margin of the lips. The sebum secreted by the glands oils the hair and the surrounding skin, helps prevent evaporation of sweat, and aids in the retention of body heat. The sebaceous glands in the nose and face are large and lobulated and often swell with accumulated secretion. Compare **sudoriferous gland.**

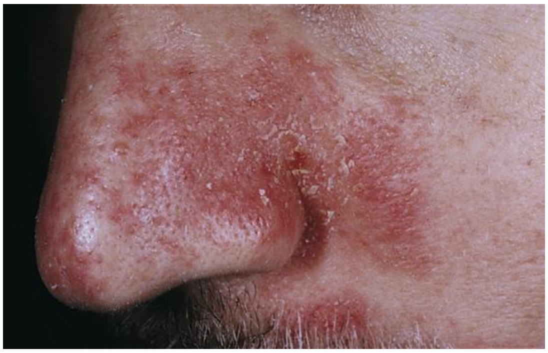
sebaceous horn, a solid tissue outgrowth from a sebaceous cyst.

seborrhea /seb′ərē′ə/ [L, *sebum* + Gk, *rhoia,* flow], any of several common skin conditions in which an overproduction of sebum results in excessive oiliness or scaling. Also spelled **seborrhoea.** See also **seborrheic blepharitis, seborrheic dermatitis.** —*seborrheic, adj.*

seborrhea capitis [L, *sebum,* sweat; Gk, *rhoia,* flow; L, *caput,* the head], seborrhea of the scalp. See also **cradle cap.**

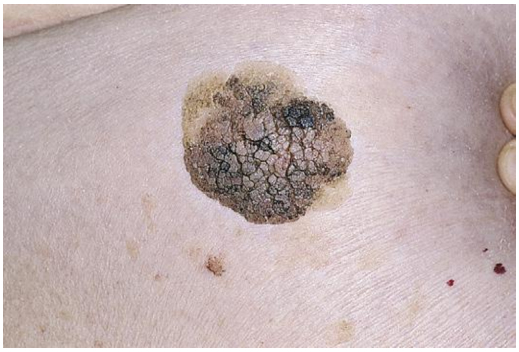
seborrheic blepharitis, a form of seborrheic dermatitis in which the eyelids are erythematous and the margins are covered with a granular crust.

seborrheic dermatitis, a common chronic inflammatory skin disease characterized by greasy scales and yellowish crusts. Common sites are the scalp, eyelids, eyebrows, face, external surfaces of the ears, axillae, central chest, breasts, groin, and gluteal folds. In some people seborrheic dermatitis is associated with paralysis agitans, diabetes mellitus, malabsorption disorders, epilepsy, or an allergic reaction to gold or arsenic. Treatment includes selenium sulfide shampoos, topical and oral corticosteroids, topical antibiotics, proper therapy for any underlying systemic disorder, and avoidance of sweating and external irritants. Kinds of seborrheic dermatitis include **cradle cap, dandruff,** and **seborrheic blepharitis.**



Seborrheic dermatitis *(Courtesy Department of Dermatology, School of Medicine, University of Utah)*

seborrheic keratosis, a benign, well-circumscribed, slightly raised, tan to black, warty lesion of the skin of the face, neck, chest, or upper back. The macules are loosely covered with a greasy crust that leaves a raw pulpy base when removed. Itching is common. Treatment includes curettage, electrodesiccation, or cryotherapy. Also called **acanthoma verrucosa seborrheica,** *seborrheic wart*.



Seborrheic keratosis *(Callen et al, 2000)*

seborrhoea. See **seborrhea.**

sebum /sē′bəm/ [L, grease], the oily secretion of the sebaceous glands of the skin, composed of keratin, fat, and cellular debris. Combined with sweat, sebum forms a moist oily acidic film that is mildly antibacterial and antifungal and protects the skin against drying. **—sebaceous,** *adj*.

Seckel's syndrome, a congenital disorder characterized by a proportionate short stature; a proportionately small head with jaw hypoplasia, large eyes, and a beaklike protrusion of the nose; mental retardation; and various other skeletal, cutaneous, and genital defects. People with the disorder are sometimes referred to as **nanocephalic dwarfs.**

seclusion^1 /siklo͞o′zhən/ [L, *secludere*, to isolate], (in psychiatry) the isolation of a patient in a special room to decrease stimuli that might be causing or exacerbating the patient's emotional distress. The room is free from objects that the patient might use to cause self-harm or to harm others.

seclusion^2**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as solitary containment in a fully protective environment with close surveillance by nursing staff for purposes of safety or behavior management. See also **Nursing Interventions Classification.**

secobarbital sodium /sek′obär′bital/, a barbiturate sedative-hypnotic.

■ INDICATIONS: It is prescribed in the treatment of insomnia and agitation and as an anticonvulsant and preoperative sedative.

■ CONTRAINDICATIONS: Impaired liver function or known hypersensitivity to this drug or to any barbiturate prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are central nervous system and respiratory depression, hypersensitivity reactions, and paradoxical excitement. Kidney damage may result from the polyethylene glycol that is used as a diluent in injectable preparations of the drug.

Seconal, a trademark for a sedative-hypnotic **(secobarbital sodium).**

secondary /sek′ənder′ē/ [L, *secundus*, second], second in importance or in occurrence or belonging to the second order of sophistication or development, such as a secondary health care facility or secondary education.

secondary allergen, an agent that induces allergic symptoms in a person through cross-sensitivity with an agent to which the person is hypersensitive.

secondary amenorrhea. See **amenorrhea.**

secondary amputation, amputation performed after suppuration has begun after severe trauma. An area is left open for drainage, and antibiotics are given. Compare **primary amputation.**

secondary amyloidosis. See **amyloidosis.**

secondary analysis, the study of a problem by using previously compiled data.

secondary antibody response, a rapid production of antibodies in response to an antigen in an individual who was exposed previously to the same antigen. Also called **booster response.**

secondary apnea, an abnormal condition in which respiration is absent and will not begin again spontaneously. Resuscitation is initiated immediately with artificial ventilation. Blood gases are analyzed, and oxygen, cardiac massage, and medication specific to the underlying cause may be administered. Secondary apnea may result from any event that severely impedes the absorption of oxygen by the bloodstream. Compare **primary apnea.**

secondary areola, a second ring appearing around the areola of the breast during pregnancy that is more pigmented than the areola before pregnancy.

secondary biliary cirrhosis, an abnormal hepatic condition characterized by obstruction of the bile duct with or without infection. It involves periportal inflammation with progressive fibrosis, destruction of parenchymal cells, and nodular degeneration. Compare **primary biliary cirrhosis.**

secondary bronchial buds, outgrowths of the primary bronchial buds, three on the right side and two on the left, which give rise to the lobes of the lungs and further branch to form the tertiary bronchial buds.

secondary bronchus. See **bronchus.**

secondary care, the provision of a specialized medical service by a physician specialist or a hospital on referral by a primary care physician.

secondary caries. See **dental caries, recurrent caries.**

secondary dementia, dementia resulting from another, concurrent form of psychosis. See also **dementia.**

secondary dental caries, dental caries developing in a tooth already affected by the condition. Often a new cavity forms adjacent to or beneath the restorative filling of an old cavity. Compare **primary dental caries.**

secondary dentition, the set of 32 teeth that appears during and after childhood and usually lasts until old age. In each jaw they include four incisors, two canines, four premolars, and six molars. The secondary teeth start to develop in the ninth week of fetal life with the thickening of the epithelium along the line of the future jaw. The permanent first molar in the lower jaw calcifies just after birth, the incisors and the canines approximately 6 months later, the premolars during the second year, the second molar at about the end of the second year, and the third molar at about the twelfth year. The secondary teeth erupt first in the lower jaw, beginning with the first molars in about the sixth year and followed by the two central incisors in about the seventh year, the two lateral incisors in about the eighth year, the first premolars in about the ninth year, the second premolars in about the tenth year, the canines between the eleventh and the twelfth years, the second molars between the twelfth and the thirteenth years, and the third molars between the seventeenth and twenty-fifth years. The eruption of each secondary tooth in the upper jaw lags only slightly behind that of the corresponding tooth in the lower jaw. The third molars in many people are badly oriented or so deeply buried in bone that they must be surgically removed. In some individuals, one or all four of the third molars may not develop completely. Also called **permanent dentition, permanent teeth, secondary teeth.** Compare **primary dentition.** See also **tooth.**

Secondary dentition *(Bird and Robinson, 2012)*

secondary diabetes. See **iatrogenic diabetes mellitus.**

secondary disease, any disorder of bodily functions that follows or results from an earlier injury or medical episode.

secondary distal RTA. See **distal renal tubular acidosis.**

secondary drive. See **drive,** def. 1.

secondary dysmenorrhea. See **inflammatory dysmenorrhea.**

secondary enuresis [L, *secundus,* second; Gk, *enourein,* to urinate], enuresis in an older child who has demonstrated bedtime control for a year or more. It is typically the result of psychological stress but also may be an early sign of an organic disorder, such as diabetes mellitus.

secondary fissure, a fissure between the uvula and the pyramid of the cerebellum.

secondary fracture. See **neoplastic fracture.**

secondary gain, an indirect benefit, usually obtained through an illness or debility. Such gains may include monetary and disability benefits, personal attention, or escape from unpleasant situations and responsibilities. Compare **primary gain.**

secondary gangrene [L, *secundus,* second; Gk, *gaggraina*], a form of gangrene in which putrefaction follows the primary tissue necrosis, generating malodorous, toxic products.

secondary gestation [L, *secundus,* second, *gestare,* to bear], a pregnancy in which the ovum becomes displaced from its original site of implantation but continues development at a different location.

secondary glandular failure, the deficiency of a hormone secreted by a particular gland or gland atrophy caused by absence of a stimulus from another gland, as when a pituitary disorder results in hypogonadism.

secondary health care, an intermediate level of health care that includes diagnosis and treatment, performed in a hospital having specialized equipment and laboratory facilities.

secondary hemorrhage [L, *secundus,* second; Gk, *haima,* blood, *rhegnynai,* to burst forth], a hemorrhage that develops 24 hours or more after the original injury or surgery. It is often caused by an infection.

secondary host. See **intermediate host.**

secondary hydrocephalus [L, *secundus,* second; Gk, *hydor,* water, *kephale,* head], hydrocephalus that develops after an injury, hemorrhage, or infection, such as syphilis or meningitis.

secondary hyperaldosteronism, excessive production of aldosterone caused by an extraadrenal disorder, such as heart failure, kidney disease, cirrhosis, or hypoproteinemia.

secondary hypertension, elevated blood pressure associated with any of several primary diseases, such as renal, pulmonary, endocrine, and vascular diseases. Compare **essential hypertension.** See also **hypertension.**

secondary hypertrophic osteoarthropathy. See **clubbing.**

secondary immunodeficiency, a loss of immunity caused by a disease process or toxic effect of medication rather than by a failure or defect in T or B lymphocytes.

secondary infection, an infection by a microorganism that follows an initial infection by another kind of organism.

secondary infertility, infertility in a patient who has previously conceived.

secondary intention. See **intention.**

secondary iritis [L, *secundus,* second; Gk, *iris,* rainbow, *itis,* inflammation], an inflammation of the iris secondary to another disorder, for example, ankylosing spondylitis or ulcerative colitis.

secondary lymphoid organ, a source of effector lymphocytes, such as the spleen, lymph nodes, or tonsils.

secondary nutrient, a substance that acts as a stimulant to activate the flora of the GI tract to synthesize other nutrients.

secondary occlusal traumatism, occlusal stress that affects previously weakened periodontal structures. The stress may not be excessive for normal tissues but can be damaging to the weakened structures.

secondary oocyte, an oocyte in the period between the first and second maturation division. It is derived from a primary oocyte shortly before ovulation by a division that splits off the first polar body. If fertilized, it divides into an ootid and the second polar body. Otherwise, it perishes. In humans, it is a round cell about 0.1 mm in diameter and consists of protoplasm that contains some yolk enclosed by a thin cell wall, the vitelline membrane. It is surrounded by the zona pellucida and corona radiata.

secondary parkinsonism, a disease of the nervous system caused by degeneration of neurons in the corpus striatum that receive dopaminergic input from the substantia nigra. Unlike idiopathic parkinsonism, the disease does not respond to the administration of levodopa.

secondary peritonitis [L, *secundus,* second; Gk, *peri* + *tenein,* to stretch, *itis,* inflammation], inflammation of the peritoneum caused by the spread of infection from neighboring tissue.

secondary pneumonia [L, *secundus,* second; Gk, *pneumon,* lung], pneumonia that develops during the course of another disease, such as diphtheria or tularemia.

secondary polycythemia [L, *secundus,* second; Gk, *polys,* many, *kytos,* cell, *haima,* blood], a form of polycythemia that develops as a result of oxygen deprivation from a disorder such as a pulmonary or cardiac disease.

secondary port, a control device for regulating the flow of a primary and a secondary IV solution. It consists of a Y-shaped plastic apparatus that attaches to the primary IV tubing and allows the primary and secondary IV solutions to flow separately or to flow simultaneously. Compare **piggyback port.**

secondary prevention, a level of preventive medicine that focuses on early diagnosis, use of referral services, and rapid initiation of treatment to stop the progress of disease processes or a handicapping disability.

secondary proximal renal tubular acidosis. See **proximal renal tubular acidosis.**

secondary radiation, radiation that results from the scattering of primary x-rays. Secondary radiation often accounts for fogging of radiographic film.

secondary relationships, relationships with those who provide or accept services, or with acquaintances and friends, as distinguished from family members and intimate friends.

secondary sensation. See **synesthesia.**

secondary sequestrum, a piece of dead bone that partially separates from sound bone during the process of necrosis but may be pushed back into position. Compare **primary sequestrum.**

secondary sex characteristic, any of the external physical characteristics of sexual maturity secondary to hormonal stimulation that develop in the maturing individual. These characteristics include adult distribution of hair and development of the penis or breasts and the labia.

secondary shock, a state of physical collapse and prostration caused by numerous traumatic and pathological conditions. It develops over time after severe tissue damage and may merge with primary shock, accompanied by various signs, such as weakness, restlessness, low body temperature, low blood pressure, cold sweat, and reduced urinary output. Blood pressure drops progressively in this state, and death may occur within a relatively short time after onset unless appropriate treatment intervenes. Secondary shock is often associated with heat stroke, crushing injuries, myocardial infarction, poisoning, fulminating infections, burns, and other life-threatening conditions. The pathological characteristics of this state reflect changes in the capillaries, which become dilated and engorged with blood. Petechial hemorrhages develop in the serous membranes, edema swells the soft tissues, and the vital organs undergo degenerative changes. Compare **hemorrhagic shock, primary shock.**

secondary symptom. See **symptom.**

secondary syphilis. See **syphilis.**

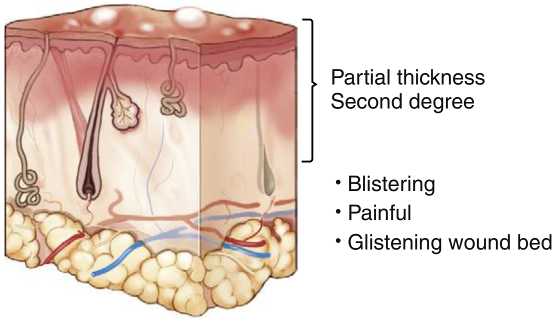
secondary teeth. See **secondary dentition.**

secondary thrombocytosis. See **thrombocytosis.**

second cranial nerve. See **optic nerve.**

second cuneiform bone. See **intermediate cuneiform bone.**

second-degree burn, a burn that affects the epidermis and the dermis, classified as **superficial** or deep, according to the depth of injury. The superficial type involves the epidermis and the papillary dermis and is characterized by pain, edema, and the formation of blisters; it heals without scarring. The deep type extends into the reticular dermis, is pale and anesthetic, and results in scarring.



Second-degree burn *(NAEMT, 2011)*

second filial generation (F_2), the offspring produced by the mating of two members of the F_1 generation or, broadly, by the crossing of any two heterozygous strains.

secondhand smoke, tobacco smoke from the burning end of a cigarette, cigar, or pipe that is inhaled by nonsmokers. The American Heart Association estimated in 2001 that secondhand smoke was implicated in the deaths of 37,000 to 40,000 nonsmokers each year from heart disease and lung cancer. See also **passive smoking.**

second-look operation, a second operation performed within 24 hours of the first to ensure that the first was sufficient and that no further debridement is needed. It is common in cases in which ascertaining whether the bowel is dead or ischemic during the first operation is difficult.

second messenger, a chemical substance inside a cell that carries information farther along the signal pathway from the internal part of a membrane-spanning receptor embedded in the cell membrane. It may be in the form of an enzyme's product or ion fluxes. Ca2+, nitric oxide, and cAMP are common examples.

second opinion [L, *secundus* + *opinari,* to suppose], a patient privilege of requesting an examination and evaluation of a health condition by a second physician to verify or challenge the diagnosis by a first physician. The situation is most likely to arise when an examination by a first physician results in a recommendation for surgery or experimental treatment.

second-order change, a change that alters the system itself.

second-order kinetics, a chemical reaction in which the rate of the reaction is determined by the concentration of two chemical reactants involved or the square of the concentration of one chemical reactant. Also called *second-order reaction*. See also **kinetics.**

second-set rejection, failure of an organ or tissue graft in a host who is already immune to the histocompatibility antigens of the graft because of a previous graft with the same antigens.

second sight, **1.** an improvement in near vision that may develop in aging as a result of increasing refractivity of the lens nucleus related to development of a nuclear sclerotic cataract. **2.** an early increase in the index of refraction of the lens, resulting in a decrease in hyperopia and an increase in myopia. **3.** clairvoyance, precognition. See also **senopia.**

second stage of labor [L, *secundus,* second; OFr, *estage* + L, *labor,* work], the period of childbirth from full dilation of the cervix to delivery of the fetus.

secretagogue /sikrē′təgog′/, any agent that induces exocrine, endocrine, or paracrine secretion.

secrete. See **secretion.**

secretin /sikrē′tin/ [L, *secernere,* to separate], a digestive hormone that is produced by the S cells lining the duodenum and jejunum when protein of partially digested food enters the intestine from the stomach. It stimulates the pancreas to produce a fluid high in salts but low in enzymes. Secretin has a limited stimulating effect on the production of bile. See also **pancreas.**

secretin-cholecystokinin test, (for pancreatic function) a combination of the secretin test and the cholecystokinin test, measuring pancreatic secretion volume and secretion of bicarbonate, amylase, lipase, and trypsin. Also called *secretin-pancreozymin test.*

secretin test, a test of pancreatic function after stimulation with the hormone secretin. The test measures the volume and bicarbonate concentration of pancreatic secretions. Normal volume findings are 2 to 4 mL/kg body weight HCO_3 (bicarbonate): 90 to 130 mEq/L. A lower than normal volume suggests an obstructing malignancy or cystic fibrosis. Reduced bicarbonate and amylase concentration is usually diagnostic of chronic pancreatitis.

secretion /sikrē′shən/ [L, *secernere,* to separate], **1.** the release of chemical substances manufactured by cells of glandular organs. **2.** a substance released or eliminated. **—secrete,** *v,* **secretory,** *adj.*

secretoinhibitory /sikrē′tō·inhib′itôr′ē/ [L, *secernere,* to separate, *inhibere,* to restrain], pertaining to a function of inhibiting secretion.

secretor /sikrē′tər/, **1.** a person who releases A, B, or AB blood group antigens into saliva, gastric juice, or other exocrine secretions. **2.** the autosomal-dominant allele that determines this trait.

secretor factor, a substance that triggers the release of ABO blood group antigens into exocrine secretions.

secretory. See **secretion.**

secretory component, a glycopeptide that is attached to immunoglobulin A (IgA). It is necessary for the secretion of IgA into mucosal spaces.

secretory component deficiency, a failure of GI epithelial cells to produce secretory component, a glycopeptide occurring in secretory immunoglobulin A (IgA). It causes a lack of IgA in external secretions, such as tears, saliva, and colostrum, although serum IgA is normal.

secretory cyst. See **retention cyst.**

secretory duct [L, *secernere*], (of a gland) a small duct that has a secretory function and joins with an excretory duct.

secretory IgA, a dimer of class A immunoglobulins, the principal agents of mucosal immunity. IgA is the only immunoglobulin isotype that can pass through mucosal membranes to reach the lumen of internal organs.

secretory immune system, the part of the immune system that secretes immunoglobulins, primarily immunoglobulin A, onto mucosal surfaces.

secretory phase, the phase of the menstrual cycle after the release of an ovum from a mature ovarian follicle. The corpus luteum, stimulated by luteinizing hormone (LH), develops from the ruptured follicle. It secretes progesterone, which stimulates the development of the glands and arteries of the endometrium, causing it to become thick and spongy. In a negative-feedback response to the increased level of progesterone in the blood, the secretion of LH from the pituitary decreases. In the absence of an embryo and its secretion of chorionic gonadotropin, the secretory phase ends. The corpus luteum involutes, progesterone levels fall, and menstruation occurs. Also called **luteal phase, progestational phase.** Compare **menstrual phase, proliferative phase.**

sect-, -sect, combining form meaning "to cut": *dissect, section, sector.*

section /sek′shən/ [L, *sectio,* a cutting], **1.** *n,* a cut surface or slice of tissue. **2.** *v,* the act of cutting tissue.

sectional arch wire /sek′shənəl/ [L, *sectio,* a cutting, *arcus,* bow; AS, *wir*], a wire attached to only a few teeth, usually on one side of a dental arch or in the anterior segment of the arch, to cause or guide orthodontic tooth movement.

sectional denture. See **partial denture.**

sectional impression [L, *sectio,* a cutting + *imprimere,* to press into], a dental impression that is made in sections.

sector scan /sek′tər/, an ultrasound scan in which the transducer or ultrasound beam is rotated through an angle and the center of rotation is near or behind the surface of the transducer.

Sectral, a trademark for a beta-adrenergic blocking agent **(acebutolol).**

secund-, prefix meaning "second, or following": *secundigravida, secundina, secundine.*

secundigravida /səkund′dəgrav′idə/ [L, *secundus,* second, *gravidus,* pregnancy], a woman who is pregnant for the second time. Also called **gravida.**

secundines /səkun′dīnz/ [L, *secundus*], the placenta, umbilical cord, and membranes of afterbirth.

secundipara /sek′əndip′ərə/ [L, *secundus* + *parere,* to bear], a woman who has borne two viable children in separate pregnancies.

security enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as intensifying a patient's sense of physical and psychological safety. See also **Nursing Interventions Classification.**

SED, abbreviation for **skin erythema dose.** See **threshold dose.**

sedation /sidā′shən/ [L, *sedatio,* soothing], an induced state of quiet, calmness, or sleep, as by means of a sedative or hypnotic medication.

sedation management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administration of sedatives, monitoring of the patient's response, and provision of necessary psychological support during a diagnostic or therapeutic procedure. See also **Nursing Interventions Classification.**

sedative /sed′ətiv/ [L, *sedatio,* soothing], **1.** *adj,* pertaining to a substance, procedure, or measure that has a calming effect. **2.** *n,* an agent that decreases functional activity, diminishes irritability, and allays excitement. Some sedatives have a general effect on all organs; others principally affect the activities of the heart, stomach, intestines, nerve trunks, respiratory system, or vasomotor system. See also **sedative-hypnotic.**

sedative bath, the immersion of the body in water for a prolonged period, used especially as a calming procedure for agitated patients.

sedative filling, a temporary filling material, containing agents such as eugenol (also called oil of cloves) to soothe pulpal pain, used to restore missing tooth structure until definitive treatment can be rendered.

sedative-hypnotic, a drug that reversibly depresses the activity of the central nervous system, used chiefly to induce sleep and to allay anxiety. Barbiturates, benzodiazepines, and other sedative-hypnotics have diverse chemical and pharmacological properties that share the ability to depress the activity of all excitable tissue, especially the arousal center in the brainstem. Sedative-hypnotics are used in the treatment of insomnia, acute convulsive conditions, and anxiety states and in facilitation of the induction of anesthesia. Although sedative-hypnotics have a soporific effect, they may interfere with rapid eye movement sleep associated with dreaming and, when administered to patients with fever, may act paradoxically and cause excitement rather than relaxation. Sedative-hypnotics may interfere with temperature regulation, depress oxygen consumption in various tissues, and produce nausea and skin rashes. In elderly patients they may cause dizziness, confusion, and ataxia. Drugs in this group have a high potential for abuse that often results in physical and psychological dependence. Treatment of dependence involves gradual reduction of the dosage because abrupt withdrawal frequently causes serious disorders, including convulsions. Acute reactions to an overdose of a sedative-hypnotic may be treated with an emetic, activated charcoal, gastric lavage, and measures to maintain airway patency. BusPIRone, zolpidem and zaleplon are among the newer nonbarbiturate-nonbenzodiazepine sedative-hypnotic drugs. See also **barbiturate, benzodiazepine derivative.**

sedentary /sed′ənter′ē/ [L, *sedentarius,* sitting], pertaining to a condition of inaction, such as work or recreation that can be performed in the sitting posture.

sedentary living [L, *sedentarius* + AS, *lif*], a pattern of daily living that requires a minimum amount of physical effort.

sediment /sed′imənt/ [L, *sedimentum,* settling], a deposit of relatively insoluble material that settles to the bottom of a container of liquid.

sedimentation /sed′iməntā′shən/ [L, *sedimentum,* settling], the deposition of insoluble materials to the bottom of a liquid. The process may be accelerated by centrifugation.

sedimentation rate (SR) [L, *sedimentum* + *ratum,* rate], the settling rate of red blood cells in a vertical column of anticoagulated whole blood. It is used to monitor inflammatory or malignant disease and to aid in the detection and diagnosis of inflammatory diseases, such as tuberculosis. The test is nonspecific and often unreliable. See also **erythrocyte sedimentation rate.**

sed. rate, *(informal)* erythrocyte sedimentation rate.

Seeing Eye dog. See **guide dog.**

segment /seg′mənt/ [L, *segmentum,* piece cut off], a component, part, or part of a structure, such as a lobe of the liver or part of the intestine.

segmental bronchus /segmen′təl/ [L, *segmentum,* piece cut off], a secondary bronchus branching from a primary bronchus to a tertiary bronchus.

segmental buds, tertiary bronchial buds.

segmental fracture, a bone break in which several large bone fragments separate from the main body of a fractured bone. The ends of the fragments may pierce the skin, as in an open fracture, or may be contained within the skin, as in a closed fracture.

segmental reflex [L, *segmentum* + *reflectere,* to bend back], a reflex that involves a pathway through only a single segment of the spinal cord.

segmental resection, a surgical procedure in which a part of an organ, gland, or other body part is excised, such as a segmental resection of a part of an ovary performed to diminish the gland's hormonal secretion by decreasing the amount of secretory tissue in the gland.

segmental spinal artery, feeder arteries that enter the intervertebral foramina at every level. They arise predominantly from the vertebral and deep cervical arteries in the neck, the posterior intercostal arteries in the thorax, and the lumbar arteries in the abdomen. They give rise to anterior and posterior radicular arteries and segmental medullary arteries.

segmentation /seg′məntā′shən/ [L, *segmentum* + *atio,* process], **1.** the division of an animal body into repeating, similar sections, such as somites or metameres. **2.** the division of a zygote into blastomeres; cleavage.

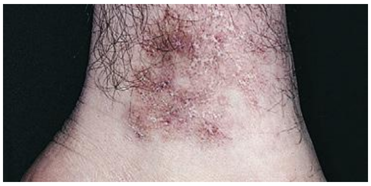
segmentation cavity. See **blastocoele.**

segmentation cell. See **blastomere.**

segmentation method, a technique for filling tooth pulp canals in which a preselected gutta-percha cone is cut into segments. The tip segment is sealed into the apex of a root, and the other segments are usually warmed and condensed against the tip with a plugger. More cone segments are then added until the canal is filled.

segmentation nucleus, the nucleus that results from the fusion of male and female pronuclei in a fertilized ovum. Its formation is the final stage in fertilization and initiates the first cleavage of the zygote. Also called **cleavage nucleus.**

segmented hyalinizing vasculitis /segmen′tid/, a chronic relapsing inflammatory condition of the blood vessels of the lower legs associated with nodular or purpuric skin lesions that may become ulcerated and leave scars. Also called **livedo vasculitis.**



Segmented hyalinizing vasculitis *(Callen et al, 2000)*

segmented neutrophil, a neutrophil with a segmented nucleus. Segments are connected by thin nuclear membrane filaments.

segments of spinal cord. See **spinal cord.**

segregation, the separation of paired alleles during meiosis so that members of each pair of alleles appear in different gametes. See also **Mendel's laws.**

Seitelberger's disease. See **infantile neuroaxonal dystrophy.**

seizure /sē′zhər/ [Fr, *saisir,* to seize], a hyperexcitation of neurons in the brain leading to abnormal electric activity that causes a sudden, violent involuntary series of contractions of a group of muscles. It may be paroxysmal and episodic, as in a seizure disorder, or transient and acute, as after a head concussion. A seizure may be clonic or tonic; focal, unilateral, or bilateral; or generalized or partial. Also called **convulsion.**

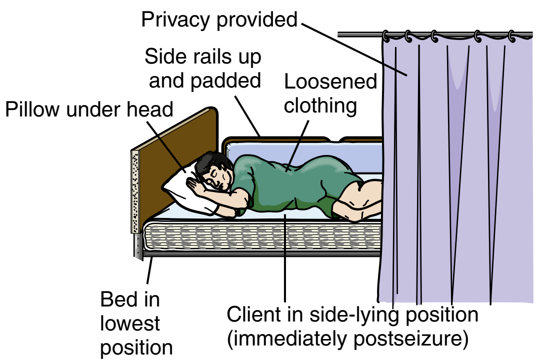
seizure control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to reduce or minimize the occurrence of seizure episodes. See also **Nursing Outcomes Classification.**

seizure management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as care of a patient during a seizure and the postictal state. See also **Nursing Interventions Classification.**

seizure precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention or minimization of potential injuries sustained by a patient with a known seizure disorder. See also **Nursing Interventions Classification.**

seizure threshold, the amount of stimulus necessary to produce a convulsive seizure. All humans can have seizures if the provocation is sufficient.

selection /silek′shən/ [L, *seligere,* to choose], **1.** the act or product of choosing. **2.** the process by which various



Privacy provided
Side rails up and padded
Loosened clothing
Pillow under head
Bed in lowest position
Client in side-lying position (immediately postseizure)

Seizure precautions *(Perry, Potter, and Elkin, 2012)*

factors or mechanisms determine and modify the reproductive ability of individuals with specific genotypes within a population, thus influencing evolutionary change. Kinds of selection are **artificial selection, natural selection,** and **sexual selection.**

selective absorption. See **differential absorption.**

selective abstraction /silek′tiv/ [L, *seligere,* to choose], a type of cognitive distortion in which focus on one aspect of an event negates all other aspects.

selective angiography, a radiographic procedure that allows selective visualization of the aorta, the major arterial systems, or a particular vessel. It is performed after a few milliliters of a radiopaque contrast medium has been injected through a percutaneous catheter. The patient is observed for signs of sensitivity to the contrast medium, including chills, tremor, and shortness of breath. After the procedure the catheter is withdrawn, and pressure is placed on the puncture site to prevent bleeding. Blood pressure is checked every 15 minutes for 2 hours.

selective estrogen receptor modulator (SERM), an agent that activates some estrogen receptors but not others, thereby having estrogen-like effects on target tissues without affecting other tissues that have estrogen receptors.

selective grinding, any modification of the occlusal forms of the teeth to improve occlusion and tooth function, produced by grinding at selected places.

selective IgA deficiency, a familial or acquired disorder characterized by a lack of serum and secretory immunoglobin A (IgA). The IgA-deficient patient may appear normal or asymptomatic and is diagnosed by demonstration of less than 5 mg/dL of IgA in serum. Patients have an increased risk of respiratory, GI, and urogenital infections.

selective immunoglobulin deficiency, a condition characterized by inadequate levels of one of the major classes of immunoglobulins.

selective inattention, the screening out of unwanted stimuli, particularly the part of a message the listener does not want to hear.

selectively permeable. See **semipermeable.**

selective mutism, a mental disorder of childhood characterized by continuous refusal to speak in social situations by an individual who is able and willing to speak to selected persons.

selective neuronal necrosis, a widespread destruction of neurons caused by hypoxic or ischemic events. Only a fraction of the neurons in a given region are destroyed, selected apparently at random.

selective serotonin reuptake inhibitor (SSRI), an antidepressant drug that blocks reuptake of serotonin without blocking reuptake of other biogenic amines such as norepinephrine and dopamine. Advantages over tricyclic antidepressant drugs include fewer anticholinergic side effects (dry mouth, blurred vision, urinary retention) and fewer antihistaminic side effects (sedation, weight gain).

selectivity /sil′ektiv′itē/ [L, *seligere*], **1.** the capacity factor ratios of two substances measured under identical chromatographic conditions. **2.** the ratio of isomeric reaction products formed in a reaction where more than one product may be formed. Also called chromatographic selectivity, **separation factor.**

selectivity coefficient, the degree to which an ion-selective electrode responds to a particular ion with respect to a reference ion.

selenious acid /sĕ-le′ne-us/, monohydrated selenium dioxide, a source of elemental selenium. It is administered intravenously.

selenium (Se) /silē′nē·əm/ [Gk, *selene,* moon], a metalloid element of the sulfur group. Its atomic number is 34, and its atomic mass is 78.96. Selenium occurs mainly in iron, copper, lead, and nickel ores in the form of metallic selenides. One of the chief commercial sources is the flue dust produced by the burning of pyrites to make sulfuric acid. Selenium occurs as a trace element in foods, and research continues to determine the most effective daily allowances for different age groups. Dietary experts say that the estimated safe, adequate intake of selenium for infants 6 months of age is 0.04 mg, for adults 0.05 to 0.2 mg. Although selenium deficiency can result in liver problems and degeneration of muscles in some animals, in humans its need has not yet been clearly defined. The bright orange insoluble powder selenium sulfide is used externally in the control of seborrheic dermatitis, dandruff, and other forms of dermatosis. Selenium sulfide, used as a lotion, is used in some therapeutic shampoos as 2.5% of selenium sulfide in a detergent vehicle; it is sold without prescription as a 1% detergent suspension in a scented detergent vehicle. Adverse effects may include conjunctivitis if the preparation enters the eyes, increased oiliness or dryness of the hair, and orange tinting of gray hair. The antidandruff effectiveness of selenium sulfide is thought to stem from its antimitotic activity and its residual adherence to the hair after shampooing. Normal skin absorbs very little of the drug, but inflamed or damaged skin absorbs it readily. Selenium is used in the nuclear medicine compound selenomethionine for diagnosing parathyroid tumors. The element is also used as a photoconductive layer of xeroradiographic plates. Burns and dermatitis venenata may result from prolonged skin contact.

selenium sulfide, an antidandruff and antiseborrheic medication. See also **selenium.**

■ INDICATIONS: It is prescribed for dandruff and for seborrheic dermatitis of the scalp and for treatment of tinea versicolor.

■ CONTRAINDICATIONS: Acute scalp inflammation or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are dermatitis after prolonged skin contact and keratitis after accidental conjunctival contact.

selenoid cells. See **crescent bodies.**

self *pl.* *selves* /selvz/ [AS], **1.** the total essence or being of a person; the individual. **2.** those affective, cognitive, and spiritual qualities that distinguish one person from another; individuality. **3.** a person's awareness of his or her own being or identity; consciousness; ego. See also **personality.**

self-acceptance [AS, *self* + L, *accipere,* to take], the recognition and acceptance of one's own qualities and limitations.

self-actualization, (in humanistic psychology) the fundamental tendency toward the maximum realization and fulfillment of one's human potential. In Maslow's hierarchy of needs, self-actualization is the highest need.

self-alien. See **ego-dystonic.**

self-alienation. See **depersonalization.**

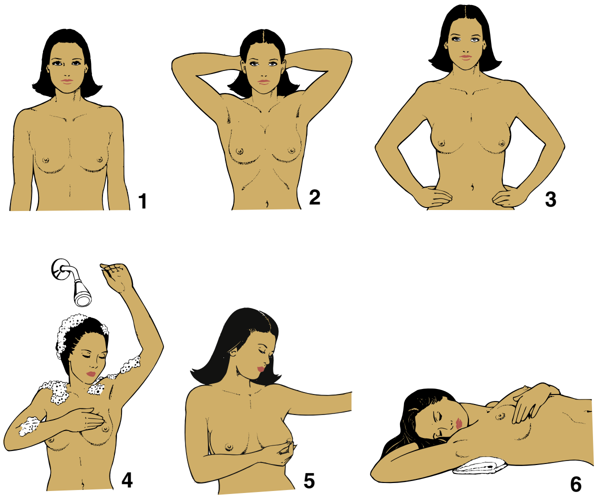
self-anesthesia, self-administered inhalation anesthesia in which whiffs of anesthetic gas are inhaled from a handheld breathing device controlled by the patient. This form of anesthesia is most common in England.

self-antigen. See **autoantigen.**

self-awareness enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a patient to explore and understand his/her thoughts, feelings, motivations, and behaviors. See also **Nursing Interventions Classification.**

self-breast examination (SBE), a procedure in which a woman examines her breasts and their accessory structures for evidence of change that could indicate a malignant process. The SBE is usually performed 1 week to 10 days after the first day of the menstrual cycle, when the breasts are smallest and cyclic nodularity is least apparent. Self-examination is encouraged during all phases of a woman's adult life; a woman who regularly and carefully performs the examination is better able to detect small abnormalities than is a woman who is not familiar with her own breasts. The techniques are similar to those of the examination of the breast as performed in the health assessment or physical examination. Also called **breast self-examination (BSE).** See also **breast examination.**

self-care, **1.** the personal and medical care performed by the patient, usually in collaboration with and after instruction by a health care professional. The patient's need for assistance and ability to develop a higher level of self-care must be evaluated in forming any nursing care plan. Maximal self-care appropriate to the condition and to the patient is often the ultimate goal of nursing care. Occupational therapy services also help restore, develop, or maintain the skills necessary to permit physically and mentally disabled people to perform the daily living tasks of self-care. **2.** the health care by laypeople of their families, their friends, and themselves, including identification and evaluation of symptoms, medication, and treatment. Self-care is self-limited, voluntary, and wholly outside professional health care systems but may include consultation with a physician or other health care professional as a resource. **3.** personal care accomplished without technical assistance, such as eating, washing, dressing, using the telephone, and attending to one's own elimination, appearance, and hygiene. The goal of rehabilitation medicine is maximal personal self-care.



Self-breast examination *(Seidel et al, 2006)*

self-care: activities of daily living (ADL), a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to perform the most basic physical tasks and personal care activities independently with or without an assistive device. See also **Nursing Outcomes Classification.**

self-care assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting another to perform activities of daily living. See also **Nursing Interventions Classification.**

self-care assistance: bathing/hygiene, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting patient to perform personal hygiene. See also **Nursing Interventions Classification.**

self-care assistance: dressing/grooming, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a patient with clothes and appearance. See also **Nursing Interventions Classification.**

self-care assistance: feeding, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a person to eat. See also **Nursing Interventions Classification.**

self-care assistance: IADL, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting and instructing a person to perform instrumental activities of daily living (IADL) needed to function in the home or community. See also **Nursing Interventions Classification.**

self-care assistance: toileting, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting another with elimination. See also **Nursing Interventions Classification.**

self-care assistance: transfer, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a patient with limitation of independent movement to learn to change body location. See also **Nursing Interventions Classification.**

self-care: bathing, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to cleanse one's own body independently with or without an assistive device. See also **Nursing Outcomes Classification.**

self-care: dressing, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to dress oneself independently with or without an assistive device. See also **Nursing Outcomes Classification.**

self-care: eating, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to prepare and ingest food and fluid independently with or without an assistive device. See also **Nursing Outcomes Classification.**

self-care: grooming, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to maintain kempt appearance. See also **Nursing Outcomes Classification.**

self-care: hygiene, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to maintain one's own personal cleanliness and kempt appearance independently with or without an assistive device. See also **Nursing Outcomes Classification.**

self-care: instrumental activities of daily living (IADL), a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to perform activities needed to function in the home or community independently with or without an assistive device. See also **Nursing Outcomes Classification.**

self-care: nonparenteral medication, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to administer oral and topical medications to meet therapeutic goals independently with or without an assistive device. See also **Nursing Outcomes Classification.**

self-care: oral hygiene, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to care for one's own mouth and teeth independently with or without an assistive device. See also **Nursing Outcomes Classification.**

self-care: parenteral medication, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to administer parenteral medications to meet therapeutic goals independently with or without an assistive device. See also **Nursing Outcomes Classification.**

self-care status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to perform basic personal care activities and instrumental activities of daily living. See also **Nursing Outcomes Classification.**

self-care theory, a model, central to Dorothea Orem's concept of nursing, used to provide a conceptual framework for nursing care directed to self-care by the client to the greatest degree possible. The model requires an assessment of the client's capability for self-care and need for care. The need for care includes biophysical and psychosocial needs and the specific needs that are the result of the illness. See also **Orem, Dorothea.**

self-care: toileting, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to toilet one's self independently with or without an assistive device. See also **Nursing Outcomes Classification.**

self-catheterization, a procedure performed by a patient to empty the bladder by inserting a catheter into the urethra. The procedure is recommended for patients who cannot empty the bladder completely but can retain urine for 2 to 4 hours at a time and who have mental cognition, some manual dexterity, and the ability to insert a catheter into the urethra. This is generally a clean rather than a sterile procedure.

■ METHOD: Necessary equipment consists of a pan or toilet, two 14 French catheters, a water-soluble lubricant, soap, water, and a clean washcloth and towel; women usually require a magnifying mirror initially to identify the urethral meatus, and men may prefer to perform the procedure sitting on a low stool rather than on a toilet. Women are taught to perform self-catheterization initially in a semi-Fowler's position, using a pan, but later they generally can carry out the procedure sitting on or standing over a toilet. The patient is instructed to clean the urinary meatus and labia or glans penis with soap and water, to grasp the catheter about 2 inches from the tip, and to lubricate the tip before it is gently inserted into the meatus: Women insert about 1½ to 2 inches of the catheter, and men insert 8 inches, or until the urine flows. Urine is allowed to flow into the pan or toilet until the bladder is empty. The catheter is then removed, washed in soap and water, thoroughly rinsed, dried by rolling it in a clean towel, and placed in a clean plastic or paper bag for the next self-catheterization.

■ INTERVENTIONS: The nurse teaches the procedure and ensures that the patient understands its purpose and the need to perform it at designated times, as well as the importance of forcing fluids up to 3000 mL daily unless contraindicated. The nurse makes certain that the patient is able to identify the urinary meatus and perform the procedure.

■ OUTCOME CRITERIA: Regular self-catheterization by the patient who cannot empty the bladder allows the person to work and participate in the normal activities of daily living and to prevent kidney infection and other renal disorders.

self-concept, the composite of ideas, feelings, and attitudes that a person has about his or her own identity, worth, capabilities, and limitations. Such factors as the values and opinions of others, especially in the formative years of early childhood, play an important part in the development of the self-concept.

self-confrontation, a technique for behavior modification that depends on a patient's recognition of and dissatisfaction with inconsistencies in his or her own values, beliefs, and behaviors, or between his or her own personal system and that of a significant other.

self-conscious, **1.** the state of being aware of oneself as an individual entity that experiences, desires, and acts. **2.** a heightened awareness of oneself and one's actions as reflected by the observations and reactions of others; socially ill at ease. —*self-consciousness, n.*

self-curing resin, any plastic resin that can be polymerized by the addition of an activator and a catalyst without the use of external heat. It is used in dental restorations and repairs. Also called **activated resin, autopolymer resin, cold-curing resin, quick-cure resin.**

self-defeating personality disorder, a personality characterized by a type of behavior that inhibits the individual from achieving his or her own desires and goals. It is characterized by involvement in situations that continuously lead to failure, rejection, and loss even when other options for involvement are available. Also called **masochistic personality.**

self-destructive behavior, any behavior, direct or indirect, that if uninterrupted will ultimately lead to the death of the individual.

self-diagnosis, the diagnosis of one's own health problems, usually without direction or assistance from a physician.

self-differentiation, specialization and diversification of a tissue or body part resulting solely from intrinsic factors.

self-direction of care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as care recipient actions taken to direct others who assist with or perform physical tasks and personal health care. See also **Nursing Outcomes Classification.**

self-disclosure, the process by which one person lets his or her inner being, thoughts, and emotions be known to another. It is important for psychological growth in individual and group psychotherapy.

self-efficacy enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the strengthening of an individual's confidence in his/her ability to perform a health behavior. See also **Nursing Interventions Classification.**

self-esteem[1], the degree of worth and competence one attributes to oneself. See also **self-concept.**

self-esteem[2], a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal judgment of self-worth. See also **Nursing Outcomes Classification.**

self-esteem enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a patient to increase his/her personal judgment of self-worth. See also **Nursing Interventions Classification.**

self-fulfilling prophecy, a principle that states that a belief in or the expectation of a particular resolution is a factor that contributes to its fulfillment.

self-healing squamous epithelioma, an inherited condition of skin tumors that appear on the head and resolve spontaneously after a few months, leaving deep-pitted scars. The tumors resemble squamous carcinoma or keratoacanthoma.

self-help group, a group of people who meet to improve their health through discussion and special activities. Characteristically, self-help groups are not led by a professional. Compare **group therapy.**

self-hypnosis [AS, *self* + Gk, *hypnos,* sleep], the process of putting oneself into a trancelike state by autosuggestion, such as concentration on a single thought or object. Some subjects are more susceptible than others.

self-hypnosis facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as teaching and monitoring the use of a self-initiated hypnotic state for therapeutic benefit. See also **Nursing Interventions Classification.**

self-ideal, a perception of how one should behave based on certain personal standards. The standard may be either a carefully constructed image of the kind of person one would like to be or merely a number of aspirations, goals, or values one would like to achieve. See also **ego ideal.**

self-image, the total concept, idea, or mental image one has of oneself and of one's role in society; the person one believes oneself to be.

self-insurance, a system whereby hospitals or health professionals may, in lieu of commercial insurance, assume financial responsibility for their liability.

self-insured. See **self-insurance.**

self-limited, (of a disease or condition) tending to end without treatment.

self-limited disease [AS, *self* + L, *limes,* boundary, *dis,* not; Fr, *aise,* ease], a disease restricted in duration by its own pattern of characteristics and not by other influences.

self-management approach, a treatment approach in which patients assume responsibility for their behavior, changing their environment, and planning their future.

self-modification assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as reinforcement of self-directed change initiated by the patient to achieve personally important goals. See also **Nursing Interventions Classification.**

self-monitoring of blood glucose (SMBG), the use of a glucose meter to enable a patient to recognize glycemic variations. Most self-monitoring systems use the chemical reaction between glucose oxidase and glucose as a basis for measurement. Some devices depend on hydrogen peroxide, which is a product of the same reaction.

self-mutilation restraint, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to refrain from intentional self-inflicted injury (non-lethal). See also **Nursing Outcomes Classification.**

self-other, a concept that characterizes people who believe that the source of power is within the self as opposed to those who believe that it is in others. See also **locus of control.**

self-radiolysis, a process in which a compound is damaged by radioactive decay products originating in an atom within the compound.

self-recognition, the ability of the body's immune system to recognize self-identifying antigens on the body's own cells.

self-regulation, a plan for patients to eliminate health risk behaviors. It includes self-monitoring, self-evaluation, and self-reinforcement.

self-reinforcing adaptation, (in occupational therapy) a therapeutic technique in which each successful stage of adjustment stimulates the next, more complex step.

self-responsibility, a concept of holistic health by which individuals assume responsibility for their own health.

self-responsibility facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as encouraging a patient to assume more responsibility for his/her own behavior. See also **Nursing Interventions Classification.**

self-retaining catheter, an indwelling urinary catheter that has a double lumen. One channel allows urine to drain from the bladder into a collecting bag; the other has a balloon at the bladder end and a diaphragm at the other end. Several centimeters of air or sterile water is injected through the diaphragm to fill the balloon in the bladder and hold the catheter in place. To remove the catheter, the water or air is withdrawn through the diaphragm. See also **Foley catheter.**

self-stimulation, a system in which patients control their pain by manipulating an electric source of nerve stimulation.

self-system, the organization of experiences that acts as a protective mechanism against anxiety.

self-theory, a personality theory that uses one's self-concept in integrating the function and organization of the personality. See also **humanistic psychology.**

self-threading pin, a screwlike pin placed into a hole (which is slightly smaller in diameter than the pin) drilled in tooth dentin to improve the retention of a restoration.

self-tolerance, the absence of an immune response directed against a person's own tissue antigens.

self-transcendence, the ability to focus attention on doing something for the sake of others, as opposed to self-actualization, in which doing something for oneself is an end goal. See also **altruism.**

Self-Transcendence Theory. See **Reed, Pamela G.**

sellar diaphragm, a dural partition consisting of a small horizontal shelf of meningeal dura mater that covers the hypophysial fossa in the sella turcica of the sphenoid bone. Also called **diaphragma sellae.**

sella turcica /sel′ə tur′sikə/ [L, *sella,* seat, *turcica,* Turkish], a transverse depression crossing the midline on the superior surface of the body of the sphenoid bone and containing the pituitary gland.

Sellick's maneuver. See **cricoid pressure.**

Selsun, a trademark for an antidandruff and antiseborrheic **(selenium sulfide).**

Selzentry, a trademark for **maraviroc.**

SEM, abbreviation for **scanning electron microscope.**

semantics /siman′tiks/ [Gk, *semantikos,* significant], the study of language with special concern for the meanings of words or other symbols.

-seme, suffix meaning "(one) having an orbital (cephalometric) index of less than 84, more than 89, or in between" as specified by the prefix: *megaseme, mesoseme, microseme*.

semeio-, prefix meaning "sign or symptom": *semeiography, semeiology, semeiotic*.

semen /sē′mən/ [L, seed], the thick, whitish secretion of the male reproductive organs discharged from the urethra during ejaculation. It contains spermatozoa in their nutrient plasma as well as secretions of the prostate, seminal vesicles, and other glands. Also called **seminal fluid, sperm. —seminal,** *adj*.

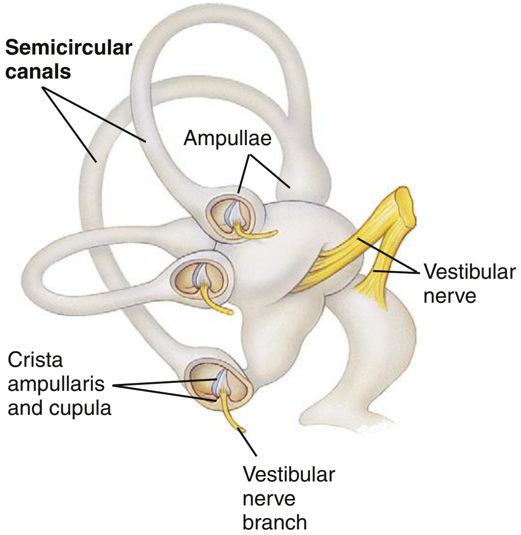
semen analysis, a fluid analysis that is one of the most important aspects of the fertility workup. This test involves measuring freshly collected semen for volume, counting the sperm, evaluating sperm motility, and studying sperm morphology.

semi- /sem′ē-/, prefix meaning "one half": *semicoma, semisupination, semivalent*.

semiautomatic external defibrillator /sem′ē·ô′təmat′ik/, a portable apparatus used to restart a heart that has stopped. It is programmed to analyze cardiac rhythms automatically and indicate to a health care professional when to deliver a defibrillating shock.

semicanal /-kənal′/, **1.** a canal with an opening on one side. **2.** a deep groove on the edge of a bone that accommodates part of an adjoining bone.

semicircular canal /-sur′kyələr/ [L, *semi-,* half, *circulare,* to go around, *canalis,* channel], any of three bony fluid-filled loops in the osseous labyrinth of the internal ear, associated with the sense of balance. The posterior, superior, and lateral canals, all about 0.8 mm in diameter and perpendicular to each other, open into the cochlea. The posterior canal is the longest.



Semicircular canals *(Thibodeau and Patton, 2007)*

semicircular duct, one of three ducts that make up the membranous labyrinth of the inner ear. See also **membranous labyrinth.**

semicoma. See **coma.**

semicomatose /-kō′mətōs/ [L, *semi,* half; Gk, *koma,* deep sleep], pertaining to a condition of stupor from which a patient can be aroused. See also **coma, Glasgow Coma Scale.**

semiconductor /-kənduk′tər/, a solid crystalline substance whose electric conductivity is intermediate between that of a conductor and that of an insulator. An **n-type semiconductor** has loosely bound electrons that are relatively free to move about inside the material. A **p-type semiconductor** is one with holes, or positive traps, in which electrons may be bound. The holes may appear to migrate through the material.

semiconscious /-kon′shəs/, an impaired state of consciousness, characterized by obtundation, stupor, or hypersomnia, from which a patient can be aroused only by energetic stimulation.

semiflexion /-flek′shən/, a limb position midway between full flexion and full extension.

semi-Fowler's position /-fou′lərz/ [L, *semi,* half; George R. Fowler, American surgeon, 1848–1906], placement of a patient in an inclined position, with the upper half of the body raised by elevating the head of the bed approximately 30 to 45 degrees.

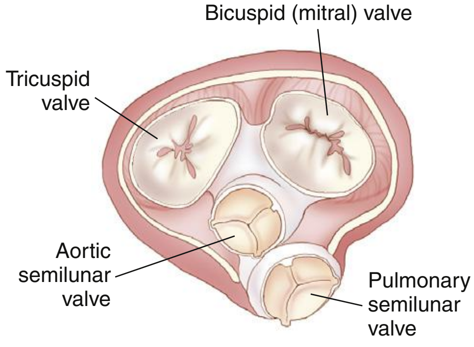
semihorizontal heart /-hôr′əzon′təl/, an electric "position" of the heart that lies between the horizontal and intermediate positions when the QRS axis is 0 degrees.

semilunar bone. See **lunate bone.**

semilunar fold of the conjunctiva, a fold of membrane that extends laterally from the lacrimal caruncle. It has a concave free border directed to the cornea. In some individuals it contains smooth muscular fibers. Also called **plica semilunaris conjunctivae.**

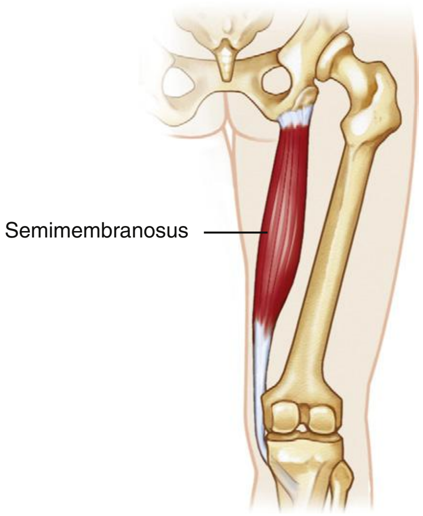
semilunar hiatus, the deep semilunar groove anterior and inferior to the bulla of the ethmoid bone. The anterior ethmoidal cells, the maxillary sinus, and sometimes the frontonasal duct drain through it via the ethmoid infundibulum.

semilunar valve /-lo͞o′nər/ [L, *semi* + *luna,* moon, *valva,* folding door], **1.** a valve with half-moon–shaped cusps, such as the aortic valve and the pulmonary valve. **2.** any one of the cusps constituting such a valve. **3.** simple cuplike valves found in the venous and lymphatic vessels. See also **heart valve, mitral valve, tricuspid valve.**



Semilunar valves *(Leonard, 2009)*

semimembranosus /-mem′brənō′səs/ [L, *semi* + *membrana,* membrane], one of three posterior femoral muscles. Situated at the back and medial side of the thigh, it originates in a thick tendon attached to the tuberosity of the ischium and inserts into the horizontal groove on the medial condyle of the tibia. The tendon of insertion passes some fibers laterally and upward to insert on the lateral condyle of the femur and form part of the oblique popliteal ligament behind the knee. The tendon of insertion forms one of the two medial hamstrings. The muscle is innervated by several branches of the tibial part of the sciatic nerve, containing fibers from the fifth lumbar and the first two sacral nerves. The muscle functions to flex the leg, to rotate it medially after flexion, and to extend the thigh. Compare **biceps femoris, hamstring muscle, semitendinosus.**



Semimembranosus

semimembranous /-mem′brənəs/ [L, *semi,* half, *membrana*], pertaining to a muscle or other tissue that is partly membrane or fascia, such as the semimembranous hamstring muscle.

seminal. See **semen.**

seminal crest, a prominent portion of the urethral crest on which is the opening of the prostatic utricle and, on either side of it, the orifices of the ejaculatory ducts.

seminal duct /sem′inəl/ [L, *semen,* seed, *ducere,* to lead], any duct through which semen passes, such as the vas deferens or the ejaculatory duct.

seminal emission [L, *semen,* seed, *emittere,* to send out], a discharge of semen.

seminal fluid. See **semen.**

seminal fluid test, any of several tests of semen to detect abnormalities in a male's reproductive system and to determine fertility. Some common factors considered are seminal fluid liquefaction time and spermatic quantity, morphological characteristics, motility, volume, and pH. Normal values in some of these tests are as follows: sperm count, 60 million/mL to 150 million/mL of seminal fluid; pH, higher than 7 (7.7 average); ejaculation volume, 1.5 mL to 5.0 mL; and motility, 60% of sperm.

seminal vesicle, either of the paired saclike glandular structures posterolateral to the urinary bladder in the male and functioning as part of the reproductive system. Each sac is pyramidal in shape and convoluted in appearance and at the anterior extremity becomes constricted into a narrow straight duct that joins the vas deferens to form the ejaculatory duct. The seminal vesicles produce a fluid that is added to the secretion of the testes and other glands to form the semen.

seminal vesicle cyst, a cyst in the wall of a seminal vesicle. It may be congenital and associated with other urinary tract anomalies or acquired, such as a result of obstruction of the vesicle.

seminal vesiculitis, inflammation of a seminal vesicle.

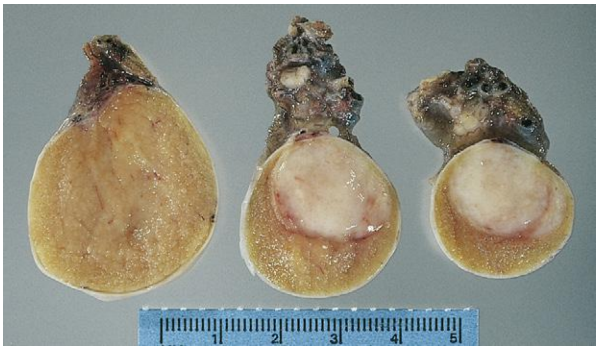
semination /sem′inā′shən/, the introduction of semen into the female genital tract.

seminiferous /sem′inif′ərəs/ [L, *semen* + *ferre,* to bear], transporting or producing semen, such as the tubules of the testis.

seminiferous cords, the primordia of the seminiferous tubules, derived from the gonadal cords of the testis.

seminiferous tubules [L, *semen,* seed, *ferre,* to bear, *tubulus*], long, threadlike tubes packed in areolar tissue in the lobes of the testes.

seminoma /sem′inō′mə/ *pl. seminomas, seminomata* [L, *semen* + *oma,* tumor], a malignant tumor of the testis. It is the most common testicular tumor and is believed to arise from the seminiferous epithelium of the mature or maturing testis. The two types are classic, or typical, and spermatocytic; anaplastic seminoma is a variant of the classic type. Compare **dysgerminoma.**



Seminoma *(Kumar, Cotran, and Robbins, 2003)*

semiparametric statistics /sem′ē·par′ə·met′rik/ [L, *semi,* half + Gk, *para,* to, at, or from the side of + *metron,* measure], statistical methodology that combines both parametric and nonparametric elements. It is used for estimating population parameters when a function is unknown, e.g., the distribution function of a random variable that has not been observed.

semipermeable /-pur′mē·əbəl/ [L, *semi,* half, *permeare,* to pass through], pertaining to a membrane that allows the passage of some molecules but prevents the passage of others. Also **selectively permeable.**

semipermeable membrane [L, *semi* + *permeare,* to pass through], a membrane that prevents the passage of some substances but allows the passage of others based on differences in the size, charge, or lipid-solubility of the substances.

semiprone /-prōn′/ [L, *semi,* half, *pronus,* leaning forward], lying on one's side, with the thigh on the upper side flexed against the abdomen and the arm on the lower side extended back. See also **Sims' position.**

semiprone side position. See **Sims' position.**

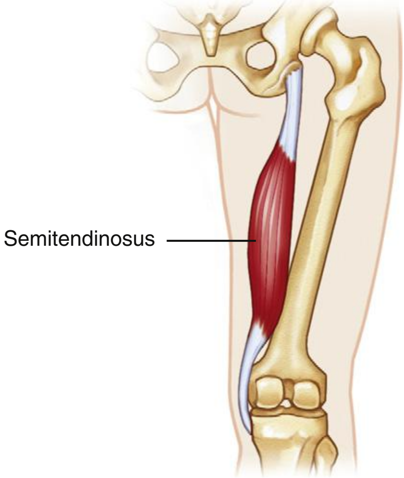
semirecumbent /-rikum′bənt/, in a reclining position.

semispinalis muscles, the most superficial collection of muscle fibers in the transversospinales group. They are found in the thoracic and cervical regions and attach to the occipital bone at the base of the skull.

semisupine /-səpīn′/, pertaining to a posture that is between a midposition and the supine position.

semisynthetic /-sinthet′ik/ [L, *semi,* half; Gk, *synthesis,* putting together], pertaining to a natural substance that has been partially altered by chemical manipulation.

semitendinosus /sem′iten′dinō′səs/ [L, *semi* + *tendere,* to stretch], one of three posterior femoral muscles of the thigh, remarkable for the great length of the tendon of insertion. It is a fusiform muscle located in the posterior and medial part of the thigh, arising from the tuberosity of the ischium. It ends just distal to the middle of the thigh in a long round tendon that crosses the semimembranosus and curves around the medial condyle of the tibia and inserts into the medial surface of the tibia. It functions to flex the leg, to rotate it medially after flexion, and to extend the thigh. Compare **biceps femoris, hamstring muscle, semimembranosus.**



Semitendinosus

semivertical heart /-vur′tikəl/, an electric "position" of the heart that lies between the intermediate and vertical positions when the QRS axis is 60 degrees.

Semmelweis, Ignaz Phillip, Hungarian physician (1818-1865) He was born in Buda and educated at the universities of Pest and Vienna. Semmelweis recognized a high rate in puerperal fever and hypothesized that the infection was carried from patient to patient by the physicians. He instituted preventative measures, such as cleansing of the hands with chlorinated lime. He met fierce opposition from his contemporaries and rejection of his theory. He is now considered the pioneer of asepsis in obstetrics.

Semprex-D, a trademark for a fixed combination drug containing an antihistamine and a decongestant **(acrivastine** with **pseudoepHEDrine hydrochloride).**

sender [AS, *sendan,* to send], in communication theory, the person by whom a message is encoded and sent.

seneciosis /senes′ē·ō′sis/, a toxic reaction to the ingestion of plants of the genus *Senecio,* which are used to make bush tea. The poison causes liver damage, particularly in malnourished patients. Common *Senecio* species include ragwort and life root, both used in herbal remedies.

senescence /sənes′əns/ [L, *senescere,* to grow old], the state of being old.

senescent /sənes′ənt/ [L, *senescere,* to grow old], pertaining to aging or growing old. See also **senile. —senescence,** *n.*

senescent cell antigen, an antigen that appears on old red blood cells that bind immunoglobulin G autoantibodies. It is also found on lymphocytes, platelets, and neutrophils.

Sengstaken-Blakemore tube [Robert W. Sengstaken, American neurosurgeon, b. 1923; Arthur H. Blakemore, American surgeon, 1897–1970], a thick catheter having a triple lumen and two balloons, used to produce pressure by balloon tamponade to arrest hemorrhaging from esophageal varices. Attached to a tube, one balloon is inflated in the stomach and exerts pressure against the upper orifice. Similarly attached, another longer and narrower balloon exerts pressure on the walls of the esophagus. The third tube is used for withdrawing gastric contents.

senile /sē′nīl/ [L, *senilis,* aged], pertaining to or characteristic of old age or the process of aging. See also **aging. —senility,** *n.*

senile angioma. See **cherry angioma.**

senile arteriosclerosis, hardening of the arteries associated with aging.

senile cataract, a kind of cataract, associated with aging, in which an opacity forms in the crystalline lens of the eye. See also **cataract.**

senile dementia, dementia occurring in older persons, usually over the age of 65. Because most cases are due to Alzheimer's disease, the term is sometimes used as a synonym for *dementia of the Alzheimer type, late onset.*

senile dementia–Alzheimer type (SDAT), **1.** dementia occurring in older persons, usually over the age of 65, resulting from Alzheimer's disease. **2.** See **senile dementia.**

senile dental caries, tooth decay occurring in a person of advanced age. It is usually characterized by cavity formation in or around the cementum layer and root surfaces. See also **dental caries.**

senile involution, a pattern of retrograde changes occurring with advancing age and resulting in the progressive shrinking and degeneration of tissues and organs.

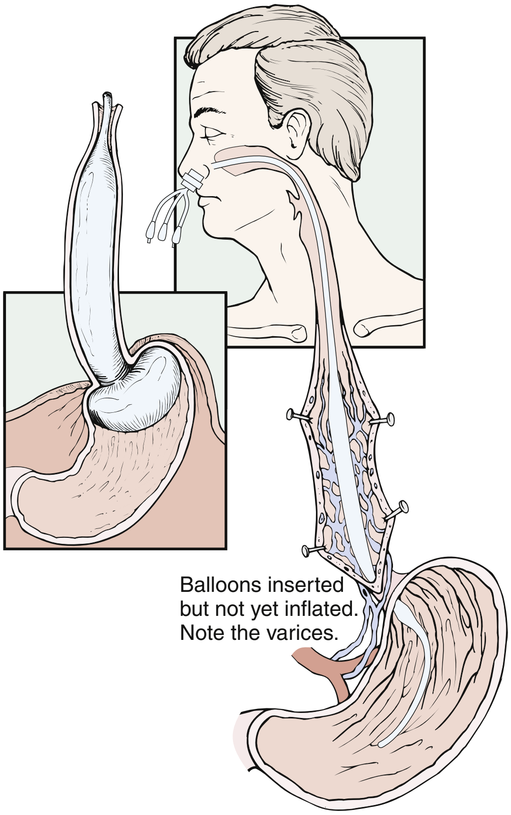
senile keratosis. See **actinic keratosis.**

senile nanism, dwarfism associated with progeria.

senile purpura, bruising associated with advanced age. See **purpura senilis.**

senile tremor [L, *senilis,* aged, *tremor,* shaking], a tremor associated with aging.

senile vaginitis [L, *senilis,* aged, *vagina,* sheath, *itis,* inflammation], a condition of atrophy of the vagina resulting from the postmenopausal loss of estrogen secretion.



Balloons inserted but not yet inflated. Note the varices.

Sengstaken-Blakemore tube *(Lewis et al, 2007)*

senile wart. See **actinic keratosis.**

senility /sinil′itē/ [L, *senilis,* aged], the general state of reduced mental and physical vigor associated with aging.

senior centers /sē′nyər/, community agencies for older adults. The centers offer nutritional, recreational, educational, health, and legal services. Funding is often through older Americans Act.

Senior Companion Program, a service that offers personal assistance and peer support to homebound and chronically ill older people.

senior patient, in the United States, a Medicare beneficiary enrolled in a health maintenance organization.

senna, an herbal product taken from several *Cassia* species found across the world.

- ■ USE: It is used as a laxative.
- ■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation, in children less than 12 years of age (unless prescribed by physician), or in those with known hypersensitivity to this product. Senna is also prohibited in those with intestinal obstruction, ulcerative colitis, GI bleeding, appendicitis, acute surgical abdomen, nausea, vomiting, or congestive heart failure.

Sennetsu fever /sə·net′so͞o/, a febrile disease occurring in Japan and Malaysia, caused by the bacterium *Ehrlichia sennetsu.* Symptoms include headache, nausea or vomiting, lymphocytosis, and postauricular and posterior lymphadenopathy. The vector of this disease is unknown; however, infection may occur from ingestion of raw fish.

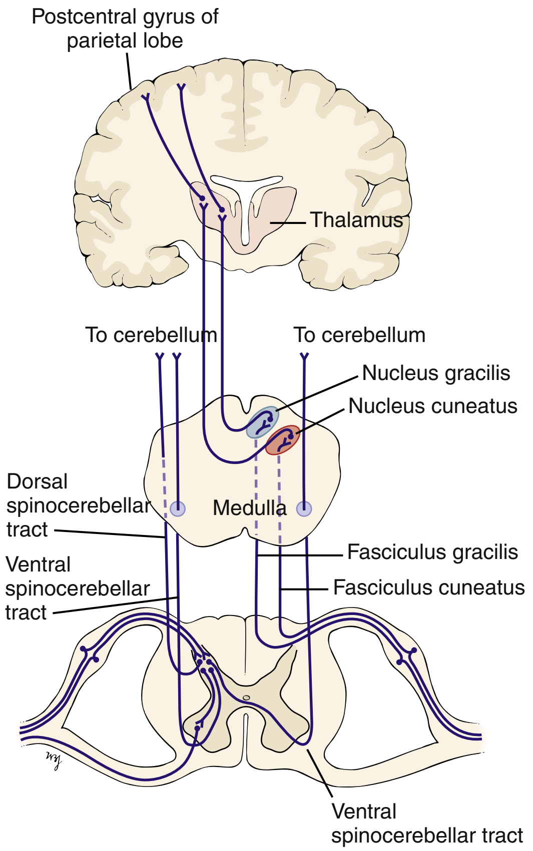
senopia /senō′pē·ə/ [L, *senex,* old man, *opsis,* vision], an improvement in the near vision of the aged caused by the myopia associated with increasing lenticular nuclear sclerosis. This type of sclerosis commonly leads to the development of nuclear cataracts. Also called **genontopia, second sight.**

sens-, prefix meaning "perception or feeling": *sensation, sensimeter, sensitinogen*.

sensate /sen′sāt/, capable of perceiving sensory stimuli.

sensate focus technique, a therapeutic program for the treatment of erectile dysfunction in males.

sensation /sensā′shən/ [L, *sentire,* to feel], **1.** a feeling, impression, or awareness of a body state or condition that results from the stimulation of a sensory receptor site and transmission of the nerve impulse along an afferent fiber to the brain. Kinds of sensation include **delayed sensation, epigastric sensation, primary sensation, referred sensation,** and **subjective sensation. 2.** a feeling or an awareness of a mental or emotional state, which may or may not result in response to an external stimulus.



Postcentral gyrus of parietal lobe
Thalamus
To cerebellum
To cerebellum
Nucleus gracilis
Nucleus cuneatus
Dorsal spinocerebellar tract
Medulla
Fasciculus gracilis
Ventral spinocerebellar tract
Fasciculus cuneatus
Ventral spinocerebellar tract

Pathways of sensation *(Swartz, 2009)*

sense [L, *sentire,* to feel], **1.** *n,* the faculty by which stimuli are perceived and conditions outside and within the body are distinguished and evaluated. The major senses are sight, hearing, smell, taste, touch, and pressure. Other senses include hunger; thirst; pain; temperature; proprioception; and spatial, temporal, and visceral sensations. **2.** *n,* the ability to feel; a sensation. **3.** *n,* the capacity to understand; normal mental ability. **4.** *v,* to perceive through a sense organ. **5.** *adj,* pertaining to the sense strand of a nucleic acid. Compare **antisense.**

sense strand, the strand of a double-stranded nucleic acid that encodes the product. In DNA it is the strand that encodes the RNA, having thus the same base sequence except changing T for U in the RNA. Compare **antisense strand.** Also called **coding strand.**

sensibility /sen′sibil′itē/, the ability to perceive sensations and impressions, both physical and psychological.

sensible /sen′sibəl/, **1.** capable of sensation. **2.** possessing reason or judgment. **3.** capable of being perceived.

sensible perspiration [L, *sensibilis,* perceptible], loss of body fluid through the secretory activity of the sweat glands in a quantity sufficient to be observed. Compare **insensible perspiration.**

Sensipar, a trademark for **cinacalcet.**

sensitive /sen′sitiv/ [L, *sentire,* to feel], **1.** able to perceive and transmit a sensation or stimulus. **2.** affected by low concentrations of antimicrobial drugs, said of microorganisms. **3.** abnormally susceptible to a subject, such as a drug or foreign protein.

sensitive volume [L, *sentire* + *volumen,* paper roll], the part of an object from which a magnetic resonance signal is preferentially acquired because of strong magnetic field inhomogeneity elsewhere. This preferential acquisition can be enhanced by the use of a shaped radiofrequency field that is strongest in the sensitive volume.

sensitivity /sen′sitiv′itē/ [L, *sentire*], **1.** capacity to feel, transmit, or react to a stimulus. **2.** susceptibility to a substance, such as a drug or an antigen. See also **allergy, hypersensitivity. 3.** the lowest level of a substance that can be detected by a laboratory test procedure. **—diagnostic sensitivity, sensitive,** *adj.*

sensitivity test, a laboratory method for testing the effectiveness of antibiotics. It is usually done on organisms known to be potentially resistant to antibiotic therapy in vitro. A report of a "resistant" finding means the antibiotic is not effective in inhibiting the growth of a pathogen, whereas use of an effective antibiotic results in a "sensitive" report. See also **antibiotic sensitivity test.**

sensitivity training group, a group that offers members a supportive atmosphere in which to experiment with and alter behavior patterns and interpersonal reactions. Sensitivity training focuses on learning what occurs during group interactions, testing and refining new behavioral responses in light of the reactions they evoke, and applying those responses to situations outside the group setting. Also called **T group.** See also **encounter group, psychotherapy.**

sensitization /sen′sitīzā′shən/ [L, *sentire* + Gk, *izein,* to cause], **1.** reaction in which specific antibodies develop in response to an antigen. Allergic reactions result from excess sensitization to a foreign protein. Sensitization can be induced by immunization, in which a pathogen that has been made noninfectious is introduced into the body. See also **active sensitization. 2.** a photodynamic method of destroying microorganisms through the use of substances, such as fluorescent dyes, that absorb light and emit energy at wavelengths destructive to the organisms. **3.** nontechnical. anaphylaxis. **—***sensitize, v.*

sensitized /sen′sitīzd/, pertaining to tissues that have been made reactive to antigens. See also **allergy.**

sensitized vaccine [L, *sentire,* to feel, *vaccinus,* of a cow], a vaccine that is prepared by suspending microorganisms in their own homologous immune serum.

sensitometric curve. See **characteristic curve.**

sensor /sen′sər/, an apparatus designed to react to physical stimuli, such as temperature, light, or movement.

sensoriglandular /sen′sərēglan′dyələr/, pertaining to the reflexive secretion by glands triggered by sensory stimulation of a nerve.

sensorimotor /sen′sərēmō′tər/ [L, *sentire,* to feel, *moveo,* to move], pertaining to both sensory and motor nerve functions.

sensorimotor phase [L, *sentire* + *moveo,* to move], the developmental phase of childhood, encompassing the period from birth to 2 years of age, according to piagetian psychology.

sensorimotor therapy, therapy designed to enhance the integration of reflex phenomena and the emergence of voluntary motor behaviors concerned with posture and locomotion.

sensorimuscular /-mus′kyələr/, pertaining to contraction of muscles triggered by sensory stimulation.

sensorineural /sen′sərēno͝or′əl/ [L, *sentire,* to feel; Gk, *neuron,* nerve], pertaining to sensory nerves.

sensorineural hearing loss, a form of hearing loss in which sound is conducted normally through the external and middle ear but a defect in the inner ear or auditory nerve results in hearing loss. Sound discrimination may or may not be affected. Amplification of the sound with a hearing aid will help many people with sensorineural hearing loss; if a person demonstrates an intolerance to loud noises, the hearing aid must be adjusted properly to prevent discomfort. Compare **conductive hearing loss.**

sensorium /sensôr′ē·əm/, in psychology, the part of the consciousness that includes the special sensory perceptive powers and their central correlation and integration in the brain. A clear sensorium conveys the presence of a reasonably accurate memory together with a correct orientation for time, place, and person. Sensorium may be clouded in certain stages of delirium.

sensorivasomotor /-vā′zōmō′tər/, pertaining to the contraction or dilation of a blood vessel in response to a sensory stimulus.

sensory /sen′sərē/ [L, *sentire* to feel], **1.** pertaining to sensation. **2.** pertaining to a part or all of the body's sensory nerve network.

sensory apraxia. See **ideational apraxia.**

sensory area [L, *sentire,* to feel, *area,* space], the regions of the cerebral cortex that receive impulses from sensory nerves, including the thalamic, nucleic, and parietal lobes.

sensory-based language, the use of nonverbal behavior in neurolinguistic communication. Examples include puzzled expressions, scowling, and finger pointing.

sensory deficit, a defect in the function of one or more of the senses.

sensory deprivation [L, *sentire* + ME, *depriven,* to deprive; L, *atio,* process], an involuntary loss of physical awareness caused by detachment from external sensory stimuli. Such deprivation often results in psychological disorders, such as panic, mental confusion, depression, and hallucinations. Sensory deprivation may be associated with various handicaps and conditions, such as blindness, heavy sedation, and prolonged isolation.

sensory end organ [L, *sentire,* to feel; AS, *ende* + Gk, *organon,* instrument], any of the specialized nerve endings devoted to detection of specific environmental stimuli, such as smell, sight, hearing, temperature, or touch.

sensory function, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which an individual correctly senses skin stimulation, sounds, proprioception, taste and smell, and visual images. See also **Nursing Outcomes Classification.**

sensory function: cutaneous, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which stimulation of the skin is correctly sensed. See also **Nursing Outcomes Classification.**

sensory function: hearing, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which sounds are correctly sensed. See also **Nursing Outcomes Classification.**

sensory function: proprioception, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which position and movement of the head and body are correctly sensed. See also **Nursing Outcomes Classification.**

sensory function: taste and smell, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which chemicals inhaled or dissolved in saliva are correctly sensed. See also **Nursing Outcomes Classification.**

sensory function: vision, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which visual images are correctly sensed. See also **Nursing Outcomes Classification.**

sensory integration, the organization of sensory input for use, a perception of the body or environment, an adaptive response, a learning process, or the development of some neural function.

sensory integrative dysfunction, a disorder or irregularity in brain function that makes sensory integration difficult.

sensory integrative therapy, therapy that involves sensory stimulation and adaptive responses to it according to a child's neurological needs. Treatment usually involves full body movements that provide vestibular, proprioceptive, and tactile stimulation. It usually does not include desk activities, speech training, reading lessons, or training in specific perceptual or motor skills. The goal is to improve the brain's ability to process and organize sensations.

sensory modulation, interpreting and filtering sensory information.

sensory nerve, a nerve consisting of afferent fibers that conduct sensory impulses from the periphery of the body to the brain or spinal cord via the dorsal spinal roots.

sensory neuropathy, neuropathy or polyneuropathy of sensory nerves.

sensory nucleus of trigeminal nerve, a collection of nerve cells in the pons that serves as the main nucleus for reception of tactile fibers of the trigeminal area.

sensory overload, a condition in which an individual receives an excessive or intolerable amount of sensory stimuli, as in a busy hospital or clinic or an intensive care unit. The effects of sensory overload are similar to those of sensory deprivation, including confusion and hallucination.

sensory pathway [L, *sentire,* to feel; AS, *paeth* + *weg*], the route followed by a sensory nerve impulse from an end organ to a reflex center in the brain or spinal cord.

sensory-perceptual overload. See **sensory overload.**

sensory processing, means by which the brain receives, detects, and integrates incoming sensory information for use in producing adaptive responses to one's environment.

sensory receptor [L, *sentire,* to feel, *recipere,* to receive], a specialized nerve ending that, when stimulated, initiates an afferent or sensory nerve impulse.

sensory root [L, *sentire,* to feel], the proximal end of a dorsal afferent nerve as it is attached to the spinal cord.

sensory threshold [L, *sentire,* to feel; AS, *therscold*], the point at which increasing stimuli trigger the start of an afferent nerve impulse. Absolute threshold is the lowest point at which response to a stimulus can be perceived.

sensual /sen′sho͞o·əl/ [L, *sensualis*], pertaining to a great interest in sex, food, or other sense-satisfying topics.

sentient /sen′shənt/ [L, *sentire,* to feel], possessing sensitivity or powers of sensation and perception.

sentinel gland /sen′tinəl/ [Fr, *sentinelle* + L, *glans,* acorn], a node or growth that is associated with the presence of a nearby tumor or ulcer. An example is a supraclavicular node with cancer cells that have metastasized from an undiscovered primary cancer.

sentinel lymph node biopsy, dissection of the first lymph node in the chain of lymph nodes to catch metastatic tumor cells from a primary breast tumor or melanoma.

sentinel node. See **Virchow's node.**

sentinel node biopsy, biopsy of a sentinel node (the first lymph node to receive lymphatic drainage from a malignant tumor). The node is identified as follows: a dye and a radioactive substance injected into the body cause certain nodes to "light up" like sentinels, indicating that they are the most appropriate ones for examination. They are detected by both the light created by the dye and the radioactive substance that is monitored by a gamma camera. If the sentinel nodes do not contain malignant cells, the necessity for removal of more distal nodes is essentially eliminated. Also called **intraoperative lymphatic mapping.**

Seoul virus /sōl/, a virus of the genus *Hantavirus* that causes mild to moderately severe epidemic hemorrhagic fever in Asia, primarily Korea and Japan. Several species of rats are the natural hosts. See also **epidemic hemorrhagic fever.**

SEP, abbreviation for **somatosensory evoked potential.**

separating spring /sep′ə·rāt·ing/ [L, *separare,* to separate; AS, *springan,* to jump], a spring placed between the teeth to obtain separation.

separating wire, a brass wire threaded between two teeth having tight contact in an effort to wedge them slightly apart before fitting a band in the application of an orthodontic appliance.

separation agent /sep′ərā′shən/, a reagent used to separate bound and free tracers in radioassay.

separation anxiety [L, *separare,* to separate, *atio,* process], fear and apprehension caused by separation from familiar surroundings and significant people. The syndrome occurs commonly in an infant separated from its mother or mothering figure or approached by a stranger. In a separation crisis the child goes through three distinct states. The protest stage is marked by loud cries, which can last for several days and during which the child is inconsolable. In the second phase the child stops crying and becomes depressed as a result of increasing hopelessness, grief, and mourning. The third stage is one of detachment or denial, in which the child outwardly appears to have adjusted.

separation factor. See **selectivity.**

separator /sep′ə·rā·tər/ [L, *separare,* to separate], **1.** a device for separating or moving opposing structures away from each other. **2.** a device or instrument for wedging teeth apart, especially proximal teeth having tight contact, as for the examination of proximal surfaces, for finishing a restoration, or before banding in orthodontic therapy. Also called **space maintainer.**

s-EPO, abbreviation for *serum erythropoietin.*

seps-, prefix meaning "decay": *sepsin, sepsis, sepsometer.*

sepsis /sep′sis/ [Gk, *sepein,* to become putrid], infection; contamination. Compare **asepsis.** **—septic,** *adj.*

-sepsis, suffix meaning "decay caused by a (specified) cause or of a (specified) sort": *colisepsis, endosepsis, typhosepsis.*

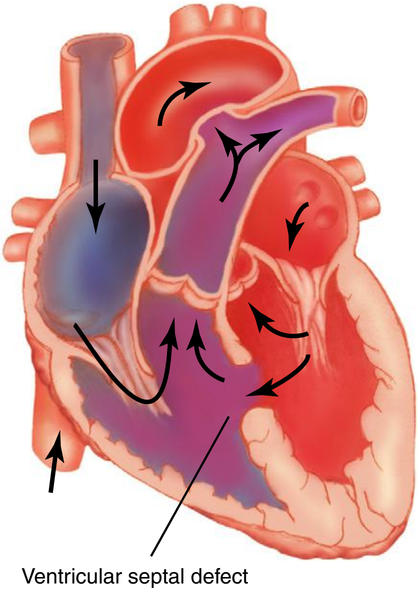
sept-, **1.** prefix meaning "nasal septum": *septectomy, septometer, septotomy.* **2.** prefix meaning "seven": *septigravida, septipara, septivalent.*

septa. See **septum.**

septal /sep′təl/ [L, *saeptum,* enclosure], pertaining to a septum.

septal cartilage. See **nasal cartilage.**

septal defect [L, *saeptum,* fence, *defectus,* failure], a defect in the wall separating the left and right sides of the heart. Depending on the size and the site of the defect, various amounts of oxygenated and deoxygenated blood mix, causing a decrease in the amount of oxygen carried in the blood to the peripheral tissues. The defect is usually congenital. Kinds of septal defects are **atrial septal defect** and **ventricular septal defect.**



Ventricular septal defect *(James and Ashwill, 2007)*

septate /sep′tāt/, pertaining to a structure divided by a septum.

septi-, prefix meaning "seven."

septic. See **sepsis.**

-septic, suffix meaning "decay of a sort or associated with a (specified) cause": *aseptic, colyseptic, uroseptic.*

septic abortion [Gk, *septikos,* putrid], spontaneous or induced termination of a pregnancy in which the mother's life may be threatened because of the invasion of germs into the endometrium, myometrium, and beyond. The woman requires immediate and intensive care, massive antibiotic therapy, evacuation of the uterus, and often emergency hysterectomy to prevent death from overwhelming infection and septic shock. Compare **infected abortion.** See also **illegal abortion, induced abortion.**

septicaemia. See **septicemia.**

-septicaemia. See **-septicemia.**

septic arthritis, an acute form of arthritis characterized by bacterial inflammation of a joint caused by the spread of bacteria through the bloodstream from an infection elsewhere in the body or by contamination of a joint during trauma or surgery. The joint is stiff, painful, tender, warm, and swollen. The diagnosis is confirmed by bacteriological identification of an organism in a specimen obtained by aspiration of the joint. Parenteral antibiotics are given to prevent destruction of the joint and are continued for several weeks after inflammation has resolved. Repeated aspiration of the joint or surgical incision and drainage may be performed to relieve pressure on it. Physical therapy as the joint heals is helpful to restore it to full range of motion. Also called **acute bacterial arthritis.**

septicemia /sep′tisē′mē·ə/ [Gk, *septikos* + *haima,* blood], systemic infection in which pathogens are present in the circulating blood, having spread from an infection in any part of the body. It is diagnosed by culture of the blood and is vigorously treated with antibiotics. Characteristically, septicemia causes fever, chill, hypotension, prostration, pain, headache, nausea, or diarrhea. Also spelled **septicaemia.**

Also called **blood poisoning.** Compare **bacteremia.** See also **septic shock. —septicemic,** *adj.*

-septicemia, -septicaemia, suffix meaning "(condition of the) blood caused by virulent microorganisms": *pyosepticemia, streptosepticemia.*

septicemic. See **septicemia.**

septicemic plague /sep′tisē′mik/, a rapidly fatal form of bubonic plague in which septicemia with meningitis occurs before buboes have had time to form. Compare **bubonic plague, pneumonic plague.** See also **plague, *Yersinia pestis.***

septic fever, an elevation of body temperature associated with infection by pathogenic microorganisms or in response to a toxin secreted by a microorganism.

septic infarct [Gk, *septikos,* putrid; L, *infarcire,* to stuff], an infected segment of dead tissue.

septic shock, a form of shock that occurs in septicemia when endotoxins or exotoxins are released from certain bacteria in the bloodstream, occasionally caused by the presence of fungi or viruses in the blood. These toxins cause vasodilation, resulting in a dramatic fall in blood pressure. Fever, tachycardia, increased respiration rate, and confusion or coma also may occur. Septic shock is usually preceded by signs of severe infection, often of the genitourinary or GI system. The causative bacterium is most frequently gram-negative. Antibiotics, vasopressors, and IV fluids and volume expanders are usually given. In some cases, treatment with monoclonal antibodies may be considered. Kinds of septic shock include **toxic shock syndrome** and **bacteremic shock.** Compare **hypovolemic shock.** See also **shock.**

septic sore throat [Gk, *septikos,* putrid; AS, *sar* + *throte*], a severe throat infection, usually caused by a streptococcus strain, resulting in fever and marked exhaustion.

septivalent. See **heptavalent.**

septooptic dysplasia /sep′tō·op′tik dis·plā′zhə/, a congenital syndrome of hypoplasia of the optic disc with other ocular abnormalities, absence of the septum pellucidum, and hypopituitarism leading to growth deficiency. Also called **de Morsier's syndrome.**

septoplasty /sep′tō·plas′tē/ [L, *saeptum,* septum; Gk, *plassein,* to form], surgical reconstruction of the nasal septum.

septorhinoplasty /sep′tōrī′nəplas′tē/ [L, *saeptum,* fence], the surgical correction of defects in the nasal septum.

septostomy /septos′təmē/, the creation of an opening in a septum by surgery.

Septra, a trademark for the antibacterial cotrimoxazole (a 1:5 mixture of the antibacterials **trimethoprim** and **sulfamethoxazole).**

septum /sep′təm/ *pl.* **septa** [L, *saeptum,* enclosure], a partition or wall, such as the interatrial septum that separates the atria of the heart.

septum pellucidum. See **transparent septum.**

septuplet /septup′lit/ [L, *septuplum,* group of seven], any one of seven children born of a single pregnancy.

sequela /sikwē′lə/ *pl. sequelae* [L, *sequi,* to follow], any abnormal condition that follows and is the result of a disease, treatment, or injury, such as paralysis after poliomyelitis, deafness after treatment with an ototoxic drug, or scar formation after a laceration.

sequence /sē′kwəns/ [L, *sequi,* to follow], an order of arrangement of objects or events, as the sequence of peptides in a protein molecule.

sequential chemotherapy, chemotherapy in which several agents are administered one at a time rather than concurrently to optimize dosage and increase patient tolerance.

sequential imaging, a diagnostic procedure used to study physiological processes by means of a series of closely timed images of the rapidly changing distribution of a radioactive tracer within the body.

sequential line imaging, the construction of a magnetic resonance image from successive lines through the object.

sequential pacing. See **pacing.**

sequential plane imaging, the construction of a magnetic resonance image from successive planes through the object. The planes may be selected by oscillation of gradient magnetic fields or by selective excitation.

sequential point imaging, the construction of a magnetic resonance image from successive point positions in the object.

sequester /sikwes′tər/ [L, *sequestare,* to lay aside], to detach, separate, or isolate, such as patient sequestration to prevent the spread of an infection.

sequestered antigens hypothesis, a proposed explanation for autoimmunity that stresses the relationship between antigen exposure, immunogenic cells, and body cells. It maintains that immunological tolerance depends on a certain degree of contact between immunological cells and body cells and on a certain degree of antigen exposure. The hypothesis holds that certain sequestered antigens in the brain, the lenses of the eye, and spermatozoa are isolated from the circulation of the blood and the lymph and therefore do not contact the cells of the immune system. When body tissues are damaged, the sequestered antigens are suddenly exposed to the immune system, which treats them as foreign, triggering an autoimmune reaction. Compare **forbidden clone hypothesis.**

sequestered edema, edema localized in the tissues surrounding a newly created surgical wound.

sequestra. See **sequestrum.**

sequestration /sē′kwestrā′shən/ [L, *sequestare,* to lay aside], **1.** the isolation of a patient or group of patients. **2.** a method of controlling hemorrhage of the head or trunk by isolating fluid in the arms and legs from the general circulation. **3.** allowing blood from the systemic circulation to perfuse a nonfunctioning part of a lung.

sequestrum /sikwes′trəm/ *pl.* **sequestra** [L, a deposit], a fragment of dead bone that is partially or entirely detached from the surrounding or adjacent healthy bone.

sequestrum forceps, a forceps with small, powerful teeth used for extracting necrotic or sharp fragments of bone from surrounding tissue.

sequoiasis /sikwoi′əsis/ [sequoia (tree) + Gk, *osis,* condition], a type of hypersensitivity pneumonitis common among workers in sawmills where redwood is processed. The antigens are the fungus *Pullularia pullulans* and species of the genus *Graphium,* found in moldy redwood sawdust. Characteristics of the acute disease include chills, fever, cough, dyspnea, anorexia, nausea, and vomiting. Symptoms of the chronic disease include productive cough, dyspnea on exertion, fatigue, and weight loss.

Ser, abbreviation for the amino acid **serine.**

sera. See **serum.**

Ser-Ap-Es, a trademark for a fixed-combination antihypertensive drug containing a diuretic **(hydrochlorothiazide)** and antihypertensives **(reserpine** and **hydrALAZINE hydrochloride).**

Serax, a trademark for a benzodiazepine **(oxazepam).**

serendipity /ser′əndip′itē/ [Serendip, author Horace Walpole's mythic land of pleasant surprises], the act of accidental discovery. A number of important medications have been created through serendipity, such as the discovery of antidepressant activity in iproniazid, which was originally developed to treat tuberculosis.

Serentil, a trademark for a phenothiazine antipsychotic **(mesoridazine).**

Serevent, a trademark for a long-acting sympathomimetic bronchodilator **(salmeterol).**

serial /sir′ē·əl/ [L, *series,* row], pertaining to a succession, arrangement, or order of items.

serial casting, the process of using a sequence of casts to progressively correct a deformity.

serial determination [L, *series,* row, *determinare,* to limit], a laboratory test that is repeated at stated intervals, as in a series of repeated tests for cardiac enzymes in blood samples taken from a patient with suspected myocardial infarction.

serial dilution, a laboratory technique in which a substance, such as blood serum, is decreased in concentration in a series of proportional amounts. In antibody analysis, for example, a serum sample may be distributed in a series of tubes so that each has one half of the amount of the previous tube in the series, resulting in titers of 1:5, 1:10, 1:20, and so on.

serial extraction, a program of selective extraction of primary and sometimes secondary teeth over a period of time, with the objective of relieving crowding and of facilitating the eruption of remaining teeth into improved positions. Close supervision of ensuing eruption is essential because the closing over of spaces is common. Comprehensive orthodontic treatment should almost always be initiated during or after eruption for space management, control of tipping induced by the procedure, and correction of other problems.

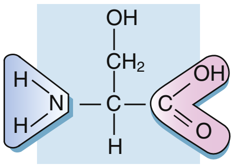
serial processing, a specific order of information handled by various computer work centers. Information proceeds sequentially through each of the centers or processes.

serial section [L, *series,* in a row, *sectio*], one of a number of consecutive slices of tissue.

serial speech, overlearned speech involving a series of words, such as counting or reciting of days of the week.

series /sir′ēs/ *pl.* **series** [L, in a row], a chain of objects or events arranged in a predictable order, such as the series of stages through which a mature blood cell develops.

serine (Ser) /ser′ēn/, a nonessential amino acid found in many proteins in the body (e.g., casein, vitellin). It is synthesized from glycine or threonin and a precursor of the amino acids purine, cysteine, and others. It can be found in urine. See also **amino acid, protein.**



Chemical structure of serine

serine protease inhibitor, serine proteinase inhibitor. See **serpin.**

SERM, abbreviation for **selective estrogen receptor modulator.**

sermorelin /ser′mo-rel′in/, a synthetic peptide corresponding to a portion of growth hormone-releasing hormone, used as the acetate salt in treatment of growth hormone deficiency in prepubertal children. It is administered subcutaneously.

Sernylan, a trademark for a long-discontinued veterinary anesthetic **(phencyclidine hydrochloride),** now used illicitly as a euphoric called **PCP.**

sero- /sir′ō-/, prefix meaning "blood serum": *seroculture, serogenesis, serolin.*

seroconversion /- kənvur′zhən/ [L, *serum,* whey, *conversio,* turned about], a change in serological test results from negative to positive as antibodies develop in reaction to an infection or vaccine.

serodiagnosis /-dī′əgnō′sis/ [L, *serum,* whey; Gk, *dia,* through, *gnosis,* knowledge], the use of serological tests in the diagnosis of disease.

serofibrinous pericarditis /-fī′brinəs/ [L, *serum,* whey, *fibra,* fibrin; Gk, *peri,* near, *kardia,* heart, *itis,* inflammation], a form of fibrinous pericarditis marked by a serous exudate.

serofibrinous pleurisy, an inflammation of the pleura with a watery effusion and accumulation of fibrin on the pleural membranes.

serogroup /sēr′o-gro͞op/, **1.** a group of bacteria containing a common antigen, sometimes including more than one serotype, species, or genus. This is an unofficial designation, used in the classification of certain genera of bacteria, such as *Leptospira, Salmonella, Shigella,* and *Streptococcus.* **2.** a group of viral species that are closely related antigenically.

seroimmunity /sir′ō·imyo͞o′nitē/, immunity conferred by administration of an antiserum.

serological /-loj′ik/ [L, *serum,* whey; Gk, *logos,* science], pertaining to the branch of medicine concerned with the study of blood sera.

serological diagnosis /siroloj′ik/ [L, *serum,* whey; Gk, *dia,* through, *gnosis,* knowledge], a diagnosis that is made through laboratory examination of antigen-antibody reactions in the serum. Also called **immunodiagnosis, serum diagnosis.**

serological test [L, *serum,* whey, *testum,* crucible], any diagnostic test made with serum.

serologist /sirol′əjist/ [L, *serum,* + Gk, *logos,* science], a bacteriologist or medical technologist who prepares or supervises the preparation and testing of sera used to diagnose and treat diseases and to immunize people against infectious diseases. Also called an **immunologist**.

serology /sirol′əjē/ [L, *serum* + Gk, *logos,* science], the branch of laboratory medicine that studies blood serum for evidence of infection by evaluating antigen-antibody reactions in vitro. Also called **immunology. —serologic,** *serological, adj.*

seroma /sirō′mə/, a lump or swelling caused by an accumulation of serum within a tissue or organ.

Seromycin, a trademark for a tuberculostatic **(cycloSERINE).**

seronegative /-neg′ətiv/ [L, *serum,* whey, *negare,* to deny], a serological test with negative results.

seropositive /-pos′itiv/ [L, *serum,* whey, *positivus*], a serological test with positive results.

seroprevalence /-prev′ələns/, the overall occurrence of a disease within a defined population at one time, as measured by blood tests. An example is human immunodeficiency virus seroprevalence.

seroprophylaxis /-prō′filak′sis/, the administration of a serum to prevent disease.

seropurulent /-pyo͝or′ələnt/, containing serum and pus.

seroreversion /sēr′o-rever′zhun/, spontaneous or induced conversion from a seropositive to a seronegative state.

serosa /sirō′sə/ [L, *serum*], any serous membrane, such as the tunica serosa that lines the walls of body cavities and secretes a watery exudate.

serosanguineous /sir′ōsang·gwin′ē·əs/, **1.** (of a discharge) thin and red. **2.** composed of serum and blood. Also **serosanguinous** /sir′ōsang·gwinəs/.

serotonin /ser′ətō′nin, sir′-/ [L, *serum* + Gk, *tonos,* tone], a naturally occurring derivative of tryptophan found in platelets and in cells of the brain and the intestine. Serotonin is released from platelets on damage to the blood vessel walls. It acts as a potent vasoconstrictor. Serotonin in intestinal tissue stimulates the smooth muscle to contract. In the central nervous system, it acts as a neurotransmitter. Lysergic acid diethylamide interferes with the action of serotonin in the brain. The normal concentration of serotonin in the urine is 0.05 to 0.2 μg/mL. Also called **5-hydroxytryptamine.**

serous /sir′əs/ [L, *serum,* whey], pertaining to, resembling, or producing serum.

serous fluid [L, *serum* + *fluere,* to flow], a fluid that has the characteristics of serum.

serous membrane, one of the many thin sheets of tissue that line closed cavities of the body, such as the pleura lining the thoracic cavity, the peritoneum lining the abdominal cavity, and the pericardium lining the sac that encloses the heart. Between the visceral layer of serous membrane covering various organs and the parietal layer lining the cavity containing these organs is a potential space moistened by serous fluid. The fluid reduces the friction of the structures covered by the serous membrane, such as the lungs, which move against the thoracic walls in respiration. Compare **mucous membrane, skin, synovial membrane.**

serovaccination /-vak′sinā′shən/, a technique for producing mixed immunity in which a person is first injected with a serum to establish passive immunity and then vaccinated to produce active immunity.

serpent ulcer /sur′pənt/ [L, *serpens,* snake], an ulceration of the skin that heals in one area while extending to another. Also called **serpiginous ulcer.**

serpin /ser′pin/, any of a superfamily of inhibitors of serine endopeptidase (serine proteinase), found in plasma and tissue. All are similarly structured single-chain glycoproteins, although each one acts specifically on particular endopeptidases. Among their targets are serine proteinases involved in coagulation, complement activation, fibrinolysis, inflammation, and tissue remodeling. The serpins include alpha$_1$-antitrypsin, antithrombin III, alpha$_2$-antiplasmin, C1 inhibitor, and plasminogen activator inhibitor 1. Also called **serine protease inhibitor** or **serine proteinase inhibitor.**

-serpine, suffix for *Rauwolfia* alkaloid derivatives.

serrate /ser′āt/, having an edge with notches or sawlike teeth. —*serrated, adj.*

serrated suture /ser′ātid/, a suture with sawlike edges, such as most of the sagittal suture.

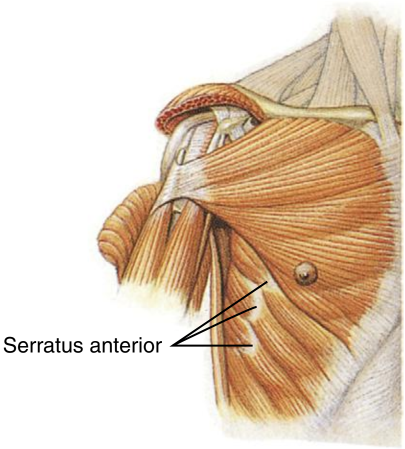
Serratia /serā′shə/ [L, *serra,* saw teeth], a genus of opportunistic motile, gram-negative bacilli from the family Enterobacteriaceae tribe Klebsielleae capable of causing infection in humans, including bacteremia, pneumonia, and urinary tract infections. *Serratia* organisms are frequently acquired in hospitals. See also **nosocomial infection.**

serratus anterior /serā′təs/ [L, *serra,* saw teeth], a thin muscle of the chest wall extending from the ribs under the arm to the scapula. Arising from the outer surface and upper border of the first eight or nine ribs, it inserts into the medial angle, the vertebral border, and the inferior angle of the scapula. It acts to rotate the scapula and to raise the shoulder, as in full flexion and abduction of the arm. Compare **pectoralis major, pectoralis minor, subclavius.**

serratus posterior, muscles in the intermediate group of back muscles that elevate and depress the ribs. They are innervated by segmental branches of anterior rami of intercostal nerves.

Sertoli cell /sertō′lē/ [Enrico Sertoli, Italian histologist, 1842–1910; L, *cella,* storeroom], one of the supporting elongated cells of the seminiferous tubules of the testes. It functions to nourish the developing spermatocytes.

Sertoli-cell–only syndrome [Enrico Sertoli], a form of male sterility in which only Sertoli cells are present in the seminiferous tubules of the testes. Germinal epithelium is absent, resulting in azoospermia.



Serratus anterior
(Patton and Thibodeau, 2010)

Sertoli-Leydig cell tumor. See **arrhenoblastoma.**

sertraline /ser′trah-lēn/, a selective serotonin reuptake inhibitor administered orally in the form of hydrochloride salt as an antidepressant and as a treatment for obsessive-compulsive disorder and panic disorder.

serum /sir′əm/ *pl.* **sera** [L, whey], **1.** the fluid portion of blood that remains subsequent to in-vitro clotting. Unlike plasma, serum lacks fibrinogen and several of the coagulation proteins. **2.** any clear watery fluid that has been separated from its more solid elements, such as the exudate from a blister. **3.** a vaccine or toxoid prepared from the serum of a hyperimmune donor for prophylaxis against a particular infection or poison.

serum albumin, a major protein in blood plasma. It is important in maintaining the osmotic pressure of the blood. Normal value is 3.5 to 5.0 g/dL.

serumal calculus. See **calculus.**

serum bank, a facility for the storage of aliquots of blood serum. The samples are used mainly for medical research.

serum carnosinase deficiency, an autosomal-recessive aminoacidopathy of carnosine metabolism, characterized by urinary excretion of carnosine and accumulation of homocarnosine in the cerebrospinal fluid. This deficiency may cause myoclonic seizures, severe mental retardation, and spasticity.

serum C-reactive protein. See **C-reactive protein.**

serum creatinine level, the concentration of creatinine in serum, used as a diagnostic sign of renal impairment.

serum diagnosis. See **serological diagnosis.**

serumfast /sir′əmfast′/, **1.** resistant (as bacteria) to the destructive effects of sera. **2.** having (as a serum) little or no change in antibody titer.

serum globulin [L, *serum,* whey, *globulus,* small globe], one of a group of proteins in blood serum with antibody qualities. The various types of serum globulins, designated alpha, beta, and gamma, have different specific properties.

serum glutamic-oxaloacetic transaminase (SGOT). See **aspartate aminotransferase.**

serum glutamic pyruvic transaminase. See **alanine aminotransferase.**

serum hepatitis. See **hepatitis B.**

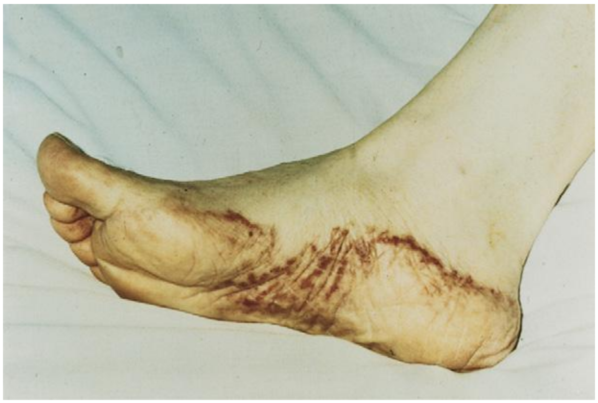
serum neuritis, a neurological disorder, usually including the cervical nerves or brachial plexus, occurring 2 to 8 days after the injection of a foreign protein.

serum osmolality [L, *serum,* whey; Gk, *ōsmos,* impulse], a measure of the osmotic concentration of blood serum, expressed as the number of osmoles of solute per kilogram of plasma water.

serum protein [L, *serum,* whey; Gk, *proteios,* first rank], any of the proteins in blood serum. See also **serum globulin.**

serum shock, a life-threatening reduction in blood volume and blood pressure caused by the injection of an antitoxic or other foreign serum.

serum sickness, an immunological disorder that may occur 2 to 3 weeks after the administration of an antiserum. It is caused by an antibody reaction to an antigen in the donor serum. The condition is characterized by fever, splenomegaly, swollen lymph nodes, skin rash, and joint pain. Treatment is symptomatic and supportive and may include corticosteroids. See also **angioedema, antigen-antibody reaction, Arthus reaction.**



Cutaneous eruptions due to serum sickness

(Hoffman et al, 2009)

serum urea nitrogen. See **blood urea nitrogen.**

service dog, a dog trained to aid disabled persons with such tasks as opening or closing doors, picking up dropped items, or pulling a wheelchair.

service of process /sur′vis/ [L, *servus,* a slave, *processus,* going forth], (in law) the delivery of a writ, summons, or complaint to a defendant. Once delivered or left with the party for whom it is intended, it is said to have been served. The original of the document is shown; a copy is served. Service of process gives reasonable notice to allow the person to appear, testify, and be heard in court.

servomechanism /sur′vōmek′əniz′əm/, a control system in which feedback is used to correct errors in another system. A biological example is the mechanism that controls the size of the pupil of the eye as the intensity of light changes.

Serzone, a trademark for an antidepressant drug **(nefazodone hydrochloride).**

sesame oil /ses′əmē/, a liquid fat derived from the seeds of the plant *Sesamum indicum*. The seeds are demulcent and have a laxative effect. Both seeds and oil are used as food flavorings. The oil is also used in skin lotions, as an emollient.

sesamoid /ses′əmoid/ [Gk, *sesamon,* sesame, *eidos,* form], nodular objects having the shape and size of sesame seeds. See also **sesamoid bone.**

sesamoid bone [Gk, *sesamon,* sesame, *eidos,* form], any one of numerous small round bony masses embedded in certain tendons that may be subjected to compression and tension. The largest sesamoid bone is the patella, which is embedded in the tendon of the quadriceps femoris at the knee.

sesqui-, prefix meaning "one and one half": *sesquibasic, sesquibo, sesquihora*.

sessile /ses′əl/ [L, *sessilis,* sitting], **1.** in biology, attached by a base rather than by a stalk or a peduncle, such as a leaf that is attached directly to its stem. **2.** permanently connected. **3.** in dentistry, a structure or lesion whose base is flattened and spread out over an area of tissue. Compare **pedunculated.**

set, **1.** *n,* a predisposition to behave in a certain way. **2.** *v,* to reduce a fracture by moving the bones back into a normal position.

set-, prefix meaning "bristle": *setaceous, setiferous, seton*.

setaceous /sētā′shəs/, having or resembling bristles.

setback, the surgical treatment of a bilateral cleft of the palate.

seton /sē′ton/, thread, gauze, or other material passed through subcutaneous tissue or a cyst to create a sinus or fistula.

settlement [AS, *setlan,* to put in place], (in law) an agreement made between parties to a suit before a judgment is rendered by a court.

setup [AS, *settan,* to set, *up,* on high], **1.** an arrangement of artificial teeth on a trial denture base. **2.** a laboratory procedure in which teeth are removed from a plaster cast and repositioned in wax. It is used as a diagnostic procedure and in creation of a mold for a positioner appliance.

sevelamer /sĕvel′ahmer/, a phosphate binder used as the hydrochloride salt to reduce serum phosphorus concentrations in hyperphosphatemia associated with end-stage renal disease. It is administered orally.

7-day fever. See **field fever.**

seventh cranial nerve. See **facial nerve.**

severe acute respiratory syndrome (SARS), an infectious respiratory illness first reported in Asia and characterized by fever over 38° C (100.4° F), dry cough, and breathing difficulties, often accompanied by headache and body aches. It is believed to be caused by a strain of coronavirus, and severity ranges from mild illness to death. The infection appears to be spread by close contact with infected individuals, by inhalation of droplet nuclei containing the organism, or by contact with infected body fluids.

■ OBSERVATIONS: The incubation period appears to range from 2 to 10 days. Early signs are rapid onset of fever (greater than 38° C or 100.4° F), headache, chills, rigors, and achiness. Upper respiratory symptoms (e.g., runny nose and sore throat) are unlikely. After a period of 3 to 7 days, lower respiratory symptoms, such as shortness of breath and a dry cough, develop. Nausea, vomiting, and diarrhea are seen in about 25% of cases. In the next 7 days, mild cases show an abatement of symptoms; about 20% of patients show a progressive respiratory deterioration with severe dyspnea, hypoxemia, and ARDS. More than half of these patients require mechanical ventilation. Patients with progressive deterioration are at high risk of respiratory failure and death. High initial levels of lactate dehydrogenase and absolute neutrophil counts and an age greater than 60 years appear to be predictors of severe disease and death. Diagnosis is made using clinical exam and clinical history using criteria established by the CDC.

Early illness: Presence of two or more of the following features: fever (might be subjective), chills, rigors, myalgia, headache, diarrhea, sore throat, or rhinorrhea.

Mild to moderate illness: History of fever equal to 38° C (100.4° F) and one or more symptoms of lower respiratory tract illness (cough, dyspnea, and shortness of breath).

Severe illness: Radiographic evidence of pulmonary infiltrates or ARDS or autopsy findings consistent with pathological conditions of pneumonia or ARDS without identifiable cause and no alternative diagnosis.

Possible exposure: Travel to location with recent transmission of SARS up to 10 days before symptom appearance and/or close contact with a person with respiratory illness and history of travel.

Likely exposure: Close contact with person with confirmed SARS and/or close contact with a person with respiratory illness for whom a chain of transmission can be linked to a confirmed case of SARS 10 days before appearance of symptoms. Laboratory tests to detect SARS-CoV are being refined so lab criteria are changing. The following are general criteria for lab confirmation: detection of serum antibody to SARS-CoV by a test validated by CDC (e.g., enzyme immunoassay), or isolation in cell culture of SARS-CoV, or detection of SARS-CoV RNA by a reverse transcription polymerase chain reaction test validated by CDC and confirmed in a reference laboratory.

■ INTERVENTIONS: Immediate isolation (droplet, contact, and respiratory) is required for anyone suspected of having SARS. All suspected cases should be reported to the local public health authorities/state health department and the CDC. Treatment is largely supportive and includes rest, humidification, hydration, nutritional support, and oxygen. Analgesics are used for pain. Tracheostomy and/or mechanical ventilation may be indicated to improve respiratory function. There are indications that pulsed steroids may shorten course of disease. In vitro tests are being conducted with interferon and have shown promise. Various vaccines are currently being developed and tested in animal and human trials.

■ NURSING CONSIDERATIONS: Nursing is aimed at maintaining respiratory function, hydration, and nutritional status and containing the disease. Vigilance is necessary to monitor for early signs or symptoms among persons in close contact with SARS cases. Education is focused on isolation procedures for patients, family, and staff.

severe combined immunodeficiency disease (SCID) /sivēr′/ [L, *servus,* slave], an abnormal condition characterized by the complete absence or marked deficiency of B cells and T cells, with the consequent lack of humoral and cell-mediated immunity. The disease occurs as an X-linked recessive disorder affecting only males and as an autosomal-recessive disorder affecting both males and females. It results in a pronounced susceptibility to infection and is usually fatal. The precise cause of SCID is not known, but research indicates that the disease may be caused by a cytogenic dysfunction of the embryonic stem cells that normally differentiate into B cells and T cells. The affected individual consequently has a very small thymus and little or no protection against infection.

■ OBSERVATIONS: Pronounced susceptibility to infection usually becomes obvious 3 to 6 months after birth, when maternal immunoglobulin reserves begin to diminish. Diagnosis is difficult because B cell immunity dysfunction is hard to detect in any individual until 5 months after birth, when immunoglobulin levels should reach a low point. Infants with SCID commonly fail to thrive and have a variety of complications, such as sepsis, watery diarrhea, persistent pulmonary infections, and common viral infections that are often fatal. Some infants with SCID have mild infections and low-grade fevers that last for several months while the infant uses maternal immunoglobulin stores. These conditions generally become fatal when maternal antibodies are totally depleted. Some of the more obvious symptoms after the infant has used most of the maternal immunoglobulin stores are cyanosis, rapid respirations, and normal chest sounds with an abnormal chest radiographic picture. Maternal immunoglobulin G (IgG) is persistent, and gram-negative infections usually do not appear until after the sixth month of life. Normal infants less than 5 months of age have very small amounts of IgM and IgA, and normal IgG levels reflect only maternal IgG. The combination of several symptoms may confirm the diagnosis of SCID, including the absence or severe reduction of T cell and B cell immunity; a lymph node biopsy result that shows no lymphocytes, plasma cells, or lymphoid follicles; and no skin reaction to swabbing with dinitrochlorobenzene. Most infants with SCID die from severe infection within 1 year after birth.

■ INTERVENTIONS: Treatment of SCID seeks to develop the immune system and to prevent infection. The only satisfactory treatment available to correct immunodeficiency is histocompatible bone marrow transplantation, but that may cause a graft-versus-host reaction, thus increasing the risk of infection and fatal consequences. Maintained enclosure in a completely sterile environment has prolonged the life of some infants with SCID, but this option is not successful if the infant has already had recurring infections.

■ NURSING CONSIDERATIONS: Supportive treatment is the primary approach in caring for the SCID patient. The nurse tries to promote an encouraging atmosphere of growth and development while providing the parents with emotional support in the face of the nearly inevitable early death of their child. The infant must remain in strict protective isolation and benefits from diligent nursing attention, frequent parental visits, and gifts of toys, which should be the kind that can be easily sterilized.

severity of pitting scale, a common clinical practice in assessment to assign a positive number for the severity of pitting edema in the lower extremities as follows: +1 = a normal foot and leg contour with a barely perceptible pit; +2 = fairly normal lower extremity contours with a moderately deep pit; +3 = obvious foot and leg swelling with a deep pit; +4 = severe foot and leg swelling that distorts the normal contours with a deep pit.

Sever's disease. See **calcaneal epiphysitis.**

Sevin, a trademark for carbaryl, a widely used carbamate insecticide that causes reversible inhibition of cholinesterase. Although less toxic than parathion, carbaryl, when concentrated, may produce skin irritation and systemic poisoning characterized by nausea, vomiting, cramps, diarrhea, diaphoresis, excessive salivation, dyspnea, weakness, loss of coordination, and slurred speech. Large doses may cause coma and death. Carbaryl on the skin is promptly removed by washing with water. Treatment of systemic poisoning includes the immediate IV or intramuscular injection of 1 to 4 mg of atropine sulfate, the administration of artificial respiration and oxygen, gastric lavage, and IV isotonic saline solution to correct dehydration.

sex [L, *sexus,* sex], **1.** a classification of male or female based on many criteria, among them anatomical and chromosomal characteristics. Compare **gender. 2.** coitus.

sex-, prefix meaning "six": *sexdigitate, sexivalent, sextan.*

sex cell, germ cell. Also called **sexual cell.**

sex chromatin, a densely staining mass within the nucleus of all nondividing cells of normal mammalian females. It represents the heterochromatin of the inactivated X chromosome. Examination of cells obtained by amniocentesis for the presence of sex chromatin is a technique used for determining the sex of a baby before birth. Sex chromatin is also found as a drumstick-shaped mass attached to one of the nuclear lobes in polymorphonuclear leukocytes in normal females. Also called **Barr body.** See also **Lyon hypothesis.**

sex chromosome, a chromosome that determines the sex of individuals; it carries genes that transmit sex-linked traits and conditions. In humans and other mammals there are two distinct sex chromosomes, designated X and Y, which appear in females as XX and in males as XY. Compare **autosome.**

sex chromosome mosaic, an individual or organism whose cells contain variant chromosomal numbers involving the X or Y chromosomes. Such variations occur in most of the syndromes associated with sex chromosome aberrations, primarily Turner's syndrome, and may be caused by nondisjunction of the chromosomes during the second meiotic division of gametogenesis or by some error in chromosome distribution during cell division of the fertilized ovum. Sex chromosome mosaics often have sexual abnormalities, but because of the sex hormones the overall phenotype is uniform and not mosaic in external characteristics, as in certain animals and insects. Also called **sex mosaic.** See also **intersexuality.**

sex-controlled. See **sex-influenced.**

sex determination [L, *sexus,* sex, *determinare*], the process of identifying the sex of an individual on the basis of the presence of the XY chromosome combination in the cells of genetic males or Barr bodies in the cells of genetic females or of secondary sexual characteristics and skeletal variations.

sex deviant, a person whose sexual interests differ markedly from what is accepted as the norm. See also **paraphilia.**

sex factor. See **F factor.**

sex hormone, any of the androgens, estrogens, or related steroid hormones produced mainly by the testes, ovaries, and adrenal cortices.

sex-hormone–binding globulin (SHBG), a protein produced by the liver that binds testosterone and estradiol in the plasma. It has a greater affinity for testosterone. The plasma concentration of SHBG is influenced by liver cirrhosis, hyperthyroidism, obesity (in women), malnutrition, and estrogens.

sexidigitate /sek′sidij′itāt/ [L, *sex,* six], having six digits on one or both hands or feet.

sex-influenced, pertaining to an autosomal genetic trait, such as pattern baldness or gout, that is expressed in both homozygotes and heterozygotes in one sex but only homozygotes in the other sex. Also called **sex-controlled.**

sexism /sek′sizəm/, a belief that one sex is superior to the other and that the superior sex has endowments, rights, prerogatives, and status greater than those of the inferior sex. Sexism results in discrimination in all areas of life and acts as a limiting factor in educational, professional, and psychological development. —*sexist, n., adj.*

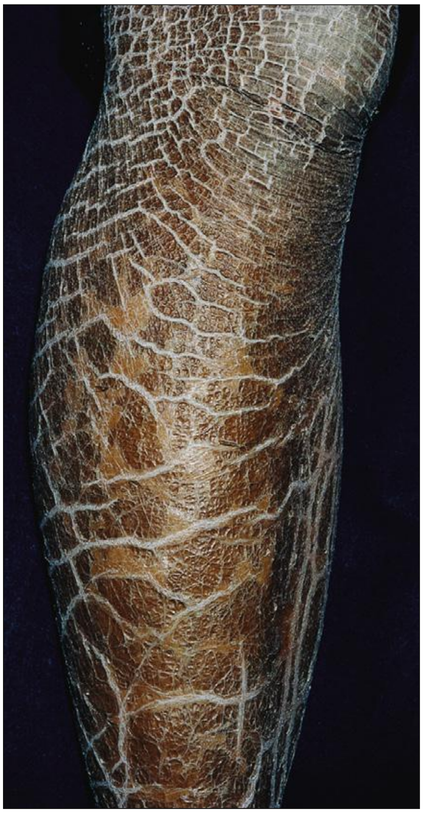
sexivalent. See **hexavalent.**

sex-limited, pertaining to an autosomal genetic trait that is expressed in only one sex, although the alleles for it may be carried by both sexes. Such traits are typically influenced by hormonal or environmental conditions.

sex-linked, pertaining to genes carried on the sex chromosomes, particularly the X chromosome, or to the traits they control. See also **sex-linked disorder, X-linked inheritance, Y-linked.** —*sex linkage, n.*

sex-linked disorder, any disease or abnormal condition that is determined by the sex chromosomes or by a defective gene on a sex chromosome. Sex-linked disorders may involve a deviation in the number of either the X or Y chromosomes, as occurs in Turner's syndrome and Klinefelter's syndrome, most occurrences of which are a result of nondisjunction during meiosis. Such aberrations in the number of sex chromosomes do not produce the severe clinical effects that are associated with autosomal aberrations, although they usually cause some degree of mental deficiency. Other sex-linked disorders are transmitted by single-gene defects carried on the X chromosome. X-linked dominant conditions, such as hypophosphatemic vitamin D–resistant rickets, are rare, and males are more seriously affected than females. In inheritance patterns, X-linked dominant conditions are transmitted by affected males to all of their daughters but none of their sons, by affected heterozygous females to one half of their children regardless of sex, and by affected homozygous females to all of their children. More common are X-linked recessive conditions, such as color blindness, ocular albinism, the Xg blood types, hemophilia, Duchenne muscular dystrophy, and inborn errors of metabolism. Such conditions are always transmitted by females. Those predominantly affected are males because they have only one X chromosome, and all of its genes, whether recessive or dominant, are expressed. Occasionally, females heterozygous for X-linked recessive disorders show varying degrees of expression, but never as severe as those of affected males. There are no known clinically significant traits or conditions associated with the genes on the Y chromosome; their only known function is to trigger the development of male characteristics.

sex-linked ichthyosis, a congenital skin disorder characterized by large, thick dry scales with dark color covering the neck, scalp, ears, face, trunk, and flexor surfaces of the body, such as the folds of the arms and the backs of the knees. It is transmitted by females as an X-linked recessive trait and appears only in males. The condition is managed by topical applications of emollients and the use of keratolytic agents to facilitate removal of the scales. Also called **X-linked ichthyosis.** See also **ichthyosis.**



Sex-linked ichthyosis

(James, Berger, and Elston, 2006)

sex mosaic. See **sex chromosome mosaic.**

sex ratio, the proportion of male-to-female progeny, a relationship that varies with the stage of life. The distribution at birth is usually 106 boys to 100 girls, but the ratio shifts in adulthood, so that, because men have a lower life expectancy, the proportion of females is greater. The ratio may also vary with the effects of a particular disease or trait.

sex role, the expectations held by society regarding what behavior is appropriate or inappropriate for each sex.

sex surrogate [L, *sexus* + *surrogare,* substitute], in sex therapy, a professional substitute trained to help the patient overcome inhibitions. Also called **surrogate partner.**

sextuplet /seks′tup′lit/ [L, *sex,* six], one of six children born of a single pregnancy.

sexual /sek′sho͞o·əl/, pertaining to sex.

sexual abuse, the sexual mistreatment of another person by fondling, rape, or forced participation in unnatural sex acts or other perverted behavior. Victims tend to experience a traumatic feeling of loss of control of themselves.

sexual asphyxia, accidental strangulation by ligature that occurs in an attempt to induce mild cerebral hypoxia during sexual activity for the purpose of enhancing orgasmic pleasure.

sexual assault, the forcible perpetration of an act of sexual contact on the body of another person, male or female, without his or her consent. Legal criteria vary among different communities.

sexual assault testing, a series of tests performed on sexual assault victims that includes testing of vaginal secretions of women for sperm and of cervical secretions and/or blood for sexually transmitted diseases.

sexual aversion disorder, a persistent or extreme aversion to or avoidance of all or nearly all genital sexual contact with a partner.

sexual cell. See **sex cell.**

sexual counseling, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of an interactive helping process focusing on the need to make adjustments in sexual practice or to enhance coping with a sexual event/disorder. See also **Nursing Interventions Classification.**

sexual disorder, **1.** any disorder involving sexual functioning, desire, or performance. **2.** [*DSM-IV*] any such disorder that is caused at least in part by psychological factors. Such a disorder characterized by a decrease or other disturbance of sexual desire is called a **sexual dysfunction,** and that characterized by unusual or bizarre sexual fantasies, urges, or practices is called **paraphilia.** Also called **psychosexual disorder, psychosexual dysfunction.**

sexual dwarf, an adult dwarf whose genital organs are normally developed.

sexual dysfunction, a disorder, condition, mental state or disease that interferes with sexual response in a man, woman or couple.

sexual fantasy, mental images of an erotic nature that can lead to sexual arousal.

sexual functioning, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as integration of physical, socioemotional, and intellectual aspects of sexual expression and performance. See also **Nursing Outcomes Classification.**

sexual generation. See **sexual reproduction.**

sexual harassment, an aggressive, sexually motivated act of physical or verbal violation of a person over whom the aggressor has some power. Sexual harassment in the workplace is illegal because it represents an abridgment of the victim's right to equal opportunity, privacy, and freedom from assault.

sexual health [L, *sexus* + AS, *haelth*], a condition defined by the World Health Organization as freedom from sexual diseases or disorders and a capacity to enjoy and control sexual behavior without fear, shame, or guilt.

sexual history, in a patient record, the part of the patient's personal history concerned with sexual function and dysfunction. A sexual history is particularly important in gathering data from a patient who has a disease of the reproductive tract, who experiences sexual dysfunction, or who requests contraception, abortion, or sterilization. The extent of the history varies with the patient's age and condition and the reason for securing the history. A short sexual history is recommended as part of every complete physical examination. The therapist needs a detailed sexual history to understand the patient's complaint and to plan treatment. It may include the age at onset of sexual intercourse, the kind and frequency of sexual activity, and the satisfaction derived from it.

sexual hormones, chemical substances produced in the body that cause specific regulatory effects on the activity of reproductive organs.

sexual identity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as acknowledgment and acceptance of one's own sexual identity. See also **Nursing Outcomes Classification.**

sexual intercourse. See **coitus.**

sexuality /sek′sho͞o·al′itē/, **1.** the sum of the physical, functional, and psychological attributes that are expressed by one's gender identity and sexual behavior, whether or not related to the sex organs or to procreation. **2.** the genital characteristics that distinguish male from female.

sexually deviant personality /sek′sho͞o·əlē′/, a sexual behavior that differs significantly from what is considered normal for a society. Either the quality or the object of the sexual drives may be at variance with the accepted cultural norms for adults.

sexually transmitted disease (STD), an infectious disease usually acquired by sexual intercourse or genital contact. These diseases are among the most common communicable diseases, and the incidence has risen in recent years despite improved methods of diagnosis and treatment. Historically, the five venereal diseases were gonorrhea, syphilis, chancroid, granuloma inguinale, and lymphogranuloma venereum. To these have been added scabies, herpes genitalis and anorectal herpes and warts, pediculosis, trichomoniasis, genital candidiasis, molluscum contagiosum, hepatitis B, human papillomavirus infection, nonspecific urethritis, chlamydial infections, cytomegalovirus, and human immunodeficiency virus. Also called **venereal disease (VD).** See also specific diseases.

sexually transmitted disease culture, a microscopic examination or blood test used to detect the presence of sexually transmitted diseases, such as gonorrhea, chlamydia, genital herpes, syphilis, hepatitis, and AIDS. Cervical cultures are usually done for women, and urethral cultures for men; rectal and throat cultures are done for people who have engaged in anal and oral intercourse.

sexual mores, socially acceptable sexual behavior, usually based on fixed morally binding customs governing sexual behaviors that are harmful to others or the group, such as rape, incest, and sexual abuse of children.

sexual orientation, the clear, persistent desire of a person for affiliation with one sex rather than the other. Also called *sexual preference*. See also **heterosexual, homosexuality.**

sexual reassignment, a change in the gender identity of a person by legal, surgical, hormonal, or social means.

sexual reflex, in males, a reflex in which tactile or cerebral stimulation results in penile erection, priapism, or ejaculation. Also called **genital reflex.**

sexual reproduction [L, *sexus,* sex, *re* + *producere,* to produce], replication of an organism by the formation of gametes. Generally this requires the fusion of male spermatozoa and female ova. Parthenogenesis is an exception. Also called **sexual generation, syngenesis.**

sexual response cycle, the four phases of biological sexual response: excitement, plateau, orgasm, and resolution.

sexual sadism. See **sadism.**

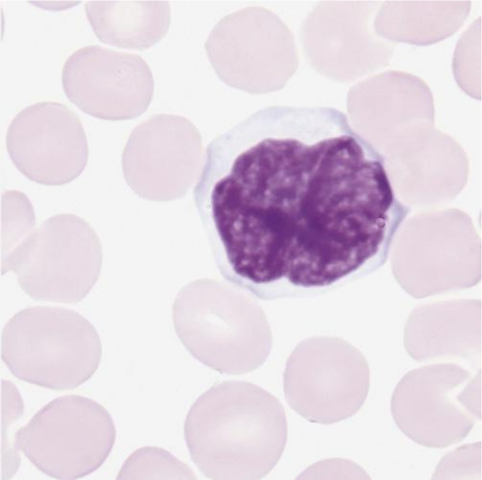
sexual selection, the selection of mates on the basis of the attraction of or preference for certain traits, such as coloration or behavior patterns, so that eventually only those particular traits appear in succeeding generations. It explains the wide variety of sexual characteristics among the various species.

sexual tasks, specific skills learned in various phases of development in the life cycle continuum to allow an adult to function normally in the sexual realm.

sexual therapist, a health care professional with specialized knowledge, skill, and competence in assisting individuals who experience sexual difficulties.

sexual therapy, a type of counseling that aids in the resolution of pathological conditions so that a healthy sexuality can be maintained.

Sézary syndrome /sāzärē′/ [A. Sézary, French dermatologist, 1880–1956], a condition of generalized exfoliating erythroderma, lymphadenopathy, and abnormal circulating T cells. The patient experiences pruritus, alopecia, edema, and nail and pigment changes.



Sézary syndrome *(Carr and Rodak, 2008)*

S_f, abbreviation for *Svedberg flotation unit*.

sfc, abbreviation for *spinal fluid count*.

SFD, abbreviation for *small for dates*. See **small for gestational age infant.**

Sg, symbol for the element **seaborgium.**

SGA, abbreviation for *small for gestational age*. See **small for gestational age infant.**

SGOT, abbreviation for **serum glutamic oxaloacetic transaminase.** See **aspartate aminotransferase.**

SGPT, abbreviation for **serum glutamic pyruvic transaminase.** See **alanine aminotransferase.**

shadow /shad′ō/ [AS, *sceadu*], in psychology, an archetype that represents the unacceptable aspects and components of behavior.

shadowcasting, a technique for enhancing the visualization of a contoured microscopic specimen, in which a chemical film is deposited on it, making it more visible in relief.

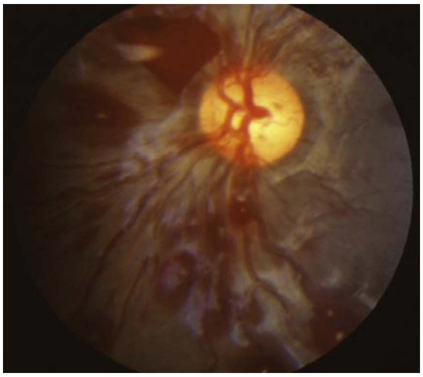
shadow cells. See **ghost cells.**

shadow test. See **retinoscopy.**

shaft, an elongated cylindrical object, such as a long bone between the epiphyses.

shaggy chorion. See **villous chorion.**

shaken baby syndrome, a condition of whiplash-type injuries, ranging from bruises on the arms and trunk to retinal hemorrhages, rib fractures, coma, or convulsions, as observed in infants and children who have been violently shaken. This form of child abuse often results in intracranial bleeding from tearing of cerebral blood vessels.



Shaken baby syndrome: retinal hemorrhages
(Seidel, 2006/Courtesy Daniel Garibaldi, M.D., The Wilmer Ophthalmological Institute, The Johns Hopkins University and Hospital, Baltimore, Maryland)

shakes /shāks/, a popular term for the rigor, tremors, or shivering that occurs in intermittent fever or after drug withdrawal.

shake test, a qualitative test for fetal lung maturity. It is more rapid than determination of the lecithin/sphingomyelin ratio. Also called **foam test.**

shaking palsy. See **parkinsonism.**

shallow breathing /shal′ō/ [ME, *schalowe,* little depth], a respiration pattern marked by slow, shallow, and generally ineffective inspirations and expirations. It is usually caused by drugs and indicates depression of the medullary respiratory center.

shamanism, a form of healing that incorporates personal healing, transformation, and regeneration through access to a “higher power.” Sickness, disease, and illness are indicators that the individual is out of balance and in disharmony within the essential nature. Success can be achieved if people are, first, willing to take responsibility for the creation of the disease and, second, open to nonphysical realities of life and willing to engage with their inner spirit and their higher selves. This type of healing has been effective for sexual dysfunction, chronic fatigue syndrome, mental health concerns, and obesity and other eating disorders.

shank, **1.** the tibia. **2.** the part of a device that connects the functional part to a handle.

shaping [AS, *scieppan,* to shape], a procedure used for conditioning a person undergoing behavior therapy to develop new behavioral responses. Initially, any act remotely resembling the desired behavior is reinforced. Gradually, the criterion is made more stringent until the desired response is attained.

shared governance, an organizational framework proposed by Tim Porter-O’Grady that provides for the full use of nursing resources. This system is designed to reflect the professional character of the participants in the nursing organization and to promote certain positive behaviors and practices. The purpose of shared governance is the establishment of a system in which staff participate fully in all activities that have an impact on their work and their ultimate goal of meaningful patient care.

shared paranoid disorder [AS, *scearan,* to shear], a psychopathological condition characterized by identical manifestations of the same mental disorder, usually ideas, in two closely associated or related people. Also called **folie à deux.**

shared services, administrative, clinical, or other service functions that are common to two or more hospitals or other health care facilities and that are used jointly or cooperatively by them.

shark skin. See **dyssebacea.**

Sharpey's fiber [William Sharpey, Scottish anatomist, 1802–1880], any of the many collagenous bundles of fibers of the periodontal ligament that become embedded in the cementum during its formation.

sharps, any needles, scalpels, or other articles that could cause wounds or punctures to personnel handling them. See also **needlestick injuries.**

Sharps container *(Perry, Potter, and Elkin, 2012)*

shatterproof glass. See **safety glass.**

shaving stroke [AS, *scafan,* to shave, *strican,* to stroke], a phase of the working stroke of a periodontal curet, used for smoothing or planing a tooth or tooth root surface.

SHBG, abbreviation for **sex-hormone–binding globulin.**

SHCC, abbreviation for **Statewide Health Coordinating Committee.**

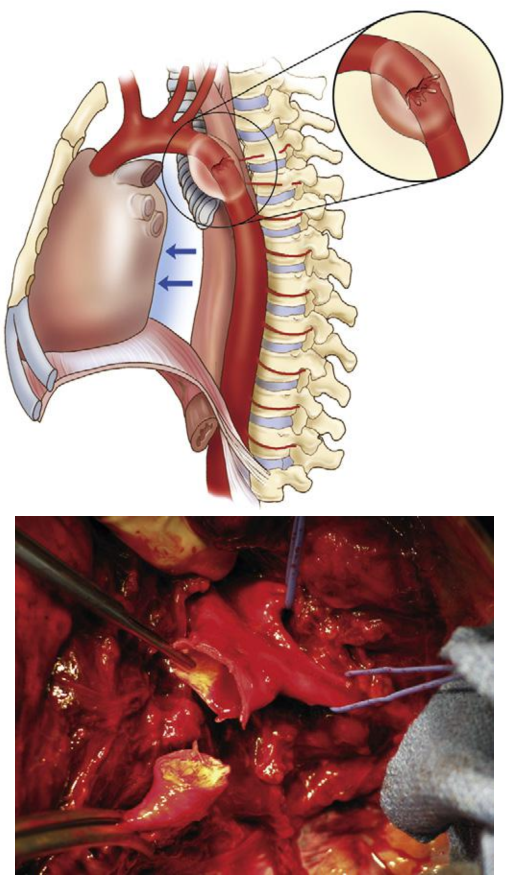
SHEA, abbreviation for *Society for Healthcare Epidemiology of America*.

shear /shir/ [AS, *scearan,* to cut], an applied force or pressure exerted against the surface and layers of the skin as tissues slide in opposite but parallel planes.

shearling /shir′ling/, a sheepskin placed on a bed to help prevent **pressure ulcers.**

sheath /shēth/ [AS, *scaeth*], a tubular structure that surrounds an organ or any other part of the body, such as the sheath of the rectus abdominis muscle or the sheath of Schwann, which covers various nerve fibers.

sheath of Schwann [Theodor Schwann, German anatomist, 1810–1882; AS, *scaeth*], a neurilemma sheath of nucleated cells enclosing a nerve fiber.



Torn aorta caused by shearing force *(NAEMT, 2011)*

Sheehan's syndrome [Harold L. Sheehan, English pathologist, 1900–1988], a postpartum condition of pituitary necrosis and hypopituitarism after circulatory collapse resulting from uterine hemorrhaging. Lactation may not develop, and loss of pubic and axillary hair may occur.

sheep cell test [AS, *sceap* + L, *cella,* storeroom, *testum,* crucible], a method that mixes human blood cells with the red blood cells of sheep to determine the absence or the deficiency of human T lymphocytes. When mixed with human blood cells, the red blood cells of sheep cluster around the human T lymphocytes and form characteristic rosettes. An electron microscope is used to identify the rosettes. An absence or a decrease in the number of rosettes indicates a deficiency or absence of T cells. The sheep cell test is used to diagnose several diseases, such as DiGeorge's syndrome, that decrease or destroy the cellular immunity provided by T cells.

sheep red cell agglutination test. See **sheep cell test.**

sheet /shēt/ [AS, *scēte*], **1.** a rectangular piece of cotton, linen, etc. for a bed covering. **2.** any structure resembling such a covering.

sheet bath [AS, *scēte* + *baeth*], the application of wet sheets to the body, used primarily as an antipyretic procedure.

sheet wadding, stretchable sheets of cotton padding used to cover the skin before a cast is applied. The stretching allows for some extremity edema without the cast becoming too tight.

shelf [AS, *scylf*], a flat, hard anatomical structure that resembles a ridge or platform.

shell [AS, *scell*], **1.** a hard outer protective covering that encloses material. **2.** a principal energy level occupied by an electron in an atom.

shellfish poisoning [AS, *scell* + *fisc*], a toxic neurological condition that results from eating clams, oysters, or mussels that have ingested the toxin-producing protozoa commonly called the **red tide.** The characteristic symptoms appear within a few minutes and include nausea, light-headedness, vomiting, and tingling or numbness around the mouth, followed by paralysis of the extremities and, possibly, respiratory paralysis. Saxitoxin, the causative agent, is not destroyed by cooking. However, the severity of the illness is diminished if the water used in cooking is not consumed. See also ***Gonyaulax catenella,*** **venerupin poisoning.**

shell shock [AS, *scell* + Fr, *choc*], any of a number of mental disorders, ranging from extreme fear to dementia, commonly attributed to the noise and concussion of exploding shells or bombs but actually a traumatic reaction to the stress of combat. See also **combat fatigue, posttraumatic stress disorder.**

shell teeth, a type of dental dysplasia in which the teeth have large pulp chambers, insufficient coronal dentin, and, usually, no roots.

sheltered workshop [ME, *sheltrun,* body of guards; AS, *werc* + *sceoppa,* stall], a facility or program, either for outpatients or for residents of an institution, that provides vocational experience in a controlled working environment. The workshop also offers related vocational rehabilitation services, such as job interview training, to people with physical or mental disabilities.

Shiatsu, a Japanese form of acupressure involving finger pressure at specific points on the body, mainly for the purpose of balancing energy in the body.

shield [AS, *scild*], a material for preventing or reducing the passage of charged particles or radiation. A shield may be designated by the radiation it is intended to absorb, such as a gamma ray shield, or by to the kind of protection it is intended to give, such as a background, biological, or thermal shield. Lucite and aluminum can be used for beta-radiation shields, but lead is required for gamma ray shields.

shift [AS, *sciftan,* to divide], **1.** (in nursing) the particular hours of the day during which a nurse is scheduled to work. The day shift is usually 7:00 AM to 3:00 PM or 8:00 AM to 4:00 PM. The evening shift is usually 3:00 PM to 11:00 PM or 4:00 PM to 12:00 midnight, and the night shift the remaining hours. The evening shift is also called "relief," presumably because nurses originally worked 12-hour shifts and the evening and night shift was thought to be relief for the day nurse. Many innovations in staffing practice currently allow variations on the traditional 5-day, 40-hour week, such as nurses electing to work a shorter week, preferring longer hours for fewer days. **2.** an abrupt change in an analytic system that continues at the new level.

shift report, a nursing intervention from the Nursing Interventions Classification (NIC) defined as exchanging essential patient care information with other nursing staff at change of shift. See also **Nursing Interventions Classification.**

shift to the left, in hematology, a predominance of immature leukocytes noted in a differential white blood cell count. It is usually indicative of an infection or inflammation. The term derives from the Arneth classification, a graph of blood components in which immature cell frequencies appear on the left side of the graph.

Shigella /shigel′ə/ [Kiyoshi Shiga, Japanese bacteriologist, 1870–1957], a genus of gram-negative pathogenic bacteria that causes gastroenteritis and bacterial dysentery, such as ***Shigella dysenteriae.*** It is also associated with hemolytic uremic syndromes. See also **shigellosis.**

Shigella dysenteriae, a species of the bacterial family Enterobacteriaceae that causes a severe form of dysentery in humans. The *dysenteriae* species of *Shigella* is most common in Asia and is particularly virulent. Also called *S. shigae.*

***Shigella* enteritis,** bacterial enteritis caused by the *Shigella* infection of bacillary dysentery.

***Shigella* gastroenteritis,** bacterial gastroenteritis caused by the *Shigella* infection of bacillary dysentery.

shigellosis /shig′əlō′sis/ [Kiyoshi Shiga, Gk, *osis,* condition], an acute, highly contagious bacterial infection of the bowel with a low infectious dose (as few as 180 organisms), characterized by diarrhea, abdominal pain, and fever. It is transmitted by hand-to-mouth contact with the feces of individuals infected with bacteria of a pathogenic species of the genus *Shigella.* Damage is caused by invasion of bacteria (which is dependent on a plasmid-mediated virulence factor) and production of the enterotoxin Shiga toxin. These organisms may be carried in the stools of asymptomatic people for up to several months and may be spread through contact with contaminated objects, food, or flies, especially in poor, crowded areas. The disease occurs in isolated outbreaks in the United States but is endemic in underdeveloped areas of the world. It is especially common and usually most severe in children. Diagnosis is made by isolating and identifying *Shigella* in a specimen of stool. The likelihood of encountering or engendering antibiotic-resistant organisms is very high. Therefore the preferred treatment for shigellosis is supportive, and the major goal is prevention of dehydration. Antimicrobials are given if the disease is severe or if the likelihood of further transmission is great. Antidiarrheal agents should be avoided. Isolation and strict handwashing precautions are instituted. Shigellosis infections must be reported to the public health department. Also called **bacillary dysentery.**

shim, a thin tapered piece of material used to fill a gap.

shim coils, current-carrying coils that are used in magnetic resonance to improve the magnetic field homogeneity.

shin bone. See **tibia.**

shingles. See **herpes zoster.**

shin splints [AS, *scinu,* shin; ME, *splinte*], lower-leg pain caused by strain of the long flexor muscle of the toes during strenuous athletic activity, such as running. In many instances, shin splints are the result of inadequate training. Treatment usually involves rest and exercise therapy. Surgery is sometimes necessary.

shipyard eye. See **epidemic keratoconjunctivitis.**

Shirodkar's operation /shir′odkärz′/ [N.V. Shirodkar, Indian obstetrician, 1900–1971], a surgical procedure called a cerclage in which the cervical canal is closed by a purse-string suture embedded in the uterine cervix encircling the canal. It is performed to correct an incompetent cervix that has failed to retain previous pregnancies. Under spinal block or general anesthesia, a 5-mm–wide band of nonabsorbable material is buried beneath the mucosa of the cervix and pulled in a purse-string manner to close the cervix. The band may be left in place permanently, in which case subsequent deliveries are by cesarean section. Occasionally, a temporary cerclage is done, sewing in the band and leaving the ends exposed in the vagina. The band is then removed before labor and vaginal delivery. Postoperatively, infection or vaginal fistula may occur. If labor begins with the suture in place, the suture is removed promptly or the infant is delivered by cesarean section, before the uterus ruptures.

shivering /shiv′əring/, involuntary contractions of muscles, mainly of the skin, in response to the chilling effect of low temperatures. Shivering may also occur at the onset of a fever when the body's heat balance is disturbed.

shock [Fr, *choc*], an abnormal condition of inadequate blood flow to the body's tissues, with life-threatening cellular dysfunction. The condition is usually associated with inadequate cardiac output, hypotension, oliguria, changes in peripheral blood flow resistance and distribution, and tissue damage. Causal factors include hemorrhage, vomiting, diarrhea, inadequate fluid intake, or excessive fluid loss, resulting in hypovolemia. Kinds of shock include **anaphylactic shock, cardiogenic shock, hypovolemic shock, neurogenic shock,** and **septic shock.**

■ OBSERVATIONS: Hypovolemic shock is the most common kind of shock. There is decreased blood flow with a resulting reduction in the delivery of oxygen, nutrients, hormones, and electrolytes to the body's tissues and a concomitant decreased removal of metabolic wastes. Pulse and respirations are increased. Blood pressure may decline after an initial slight increase. The patient often shows signs of restlessness and anxiety, an effect related to decreased blood flow to the brain. There also may be weakness, lethargy, pallor, and a cool, moist skin. As shock progresses, the body temperature falls, respirations become rapid and shallow, and the pulse pressure (the difference between systolic and diastolic blood pressures) narrows as compensatory vasoconstriction causes the diastolic pressure to be elevated or maintained in the face of a falling systolic blood pressure. Urinary output is reduced. Hemorrhage may be apparent or concealed, although other factors, such as vomiting or diarrhea, may account for the deficiency of body fluids.

■ INTERVENTIONS: Fluid volume must be restored quickly so that there can be a rapid return of oxygenated blood to the perfusion-deprived tissues. Supplemental oxygen should be administered. Blood volume is expanded with IV fluids, such as a lactated Ringer's solution or a 5% dextrose in normal saline solution. Packed red blood cells, plasma, and plasma substitutes are also given for shock of hemorrhagic origin. Metabolic acidosis may result from anaerobic metabolism.

■ NURSING CONSIDERATIONS: After vital functions are restored and diagnosis has been made, the patient in shock must be monitored continuously until recovery is assured. The patient should remain flat in bed, but the lower extremities can be raised to improve venous return (modified Trendelenburg's position). The Trendelenburg position should be avoided because it tends to push the abdominal organs against the diaphragm and increases the work of breathing. Position changes should be made slowly. Vasoactive drugs may be ordered when the blood volume is adequate. The patient's skin color, temperature, vital signs, intake and output, pulse oximetry, and level of consciousness should be monitored closely.

shock liver. See **hepatic ischemia.**

shock lung. See **adult respiratory distress syndrome.**

shock management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of the delivery of oxygen and nutrients to systemic tissue with removal of cellular waste products in a patient with severely altered tissue perfusion. See also **Nursing Interventions Classification.**

shock management: cardiac, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of adequate tissue perfusion for a patient with severely compromised pumping function of the heart. See also **Nursing Interventions Classification.**

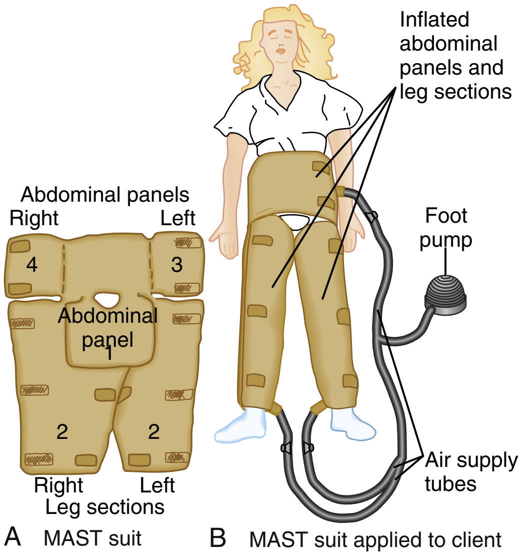
shock management: vasogenic, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of adequate tissue perfusion for a patient with severe loss of vascular tone. See also **Nursing Interventions Classification.**

shock management: volume, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of adequate tissue perfusion for a patient with severely compromised intravascular volume. See also **Nursing Interventions Classification.**

shock prevention, a nursing intervention from the Nursing Interventions Classification (NIC) defined as detecting and treating a patient at risk for impending shock. See also **Nursing Interventions Classification.**

shock therapy [Fr, *choc* + GK, *therapeia*], a psychotherapeutic procedure for treating depression and other severe disorders by producing an epileptiform convulsion in the patient. The shock is induced by delivering an electric current through the brain under controlled conditions, using an anesthetic and close monitoring. See also **electroconvulsive therapy.**

shock trousers, a rarely used pneumatic garment designed to produce pressure on the lower part of the body, thereby preventing the pooling of blood in the legs and abdomen. They were also used in emergencies in the treatment of hemorrhagic shock. Shock trousers are contraindicated in patients with pulmonary edema, cardiogenic shock, increased intracranial pressure, or eviscerations.



A MAST suit B MAST suit applied to client

Shock trousers *(Black and Hawks, 2005)*

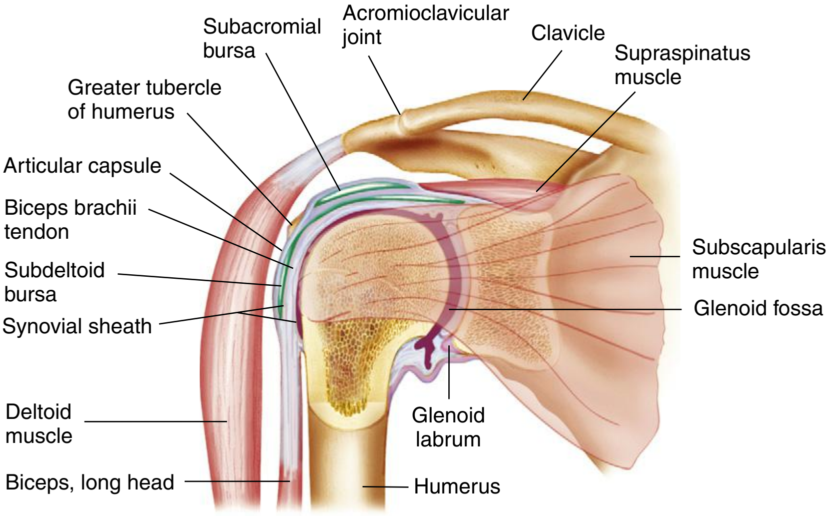
shoulder joint, the ball and socket articulation of the humerus with the scapula. The joint includes eight bursae and five ligaments, including the glenoidal labrum that deepens the articular cavity and protects the edges of articulating bones. It is the most mobile joint in the body. Also called **humeral articulation.**

shock-wave lithotripsy. See **extracorporeal shock-wave lithotripsy.**

shoe cookies. See **navicular pads.**

short-acting [AS, *sceort* + L, *agere,* to do], pertaining to or characterizing a therapeutic agent, usually a drug, with a brief period of effectiveness, generally beginning soon after the substance or measure is administered.

short-acting insulin, a clear preparation of regular (crystalline zinc) insulin with an immediate (15 to 30 minutes) onset of action that reaches a peak of action in 2 to 4 hours. The duration of action is 6 to 8 hours. There is considerable variation in individual patients and with different doses in



Shoulder joint *(Seidel et al, 2011)*

the same patient. Therefore these data should be considered only as rough guidelines. Also called **rapid-acting insulin.** Compare **intermediate-acting insulin, long-acting insulin.** See also **insulin.**

shortage area /shôr′tij/ [AS, *sceort* + L, *acticum,* process], a geographic area, county as a census tract, or area designated by the federal government as being undersupplied with certain kinds of health care services. A shortage area may be eligible for aid under certain federal programs, including the National Health Service Corps or the Rural Clinics Assistance Act.

short-arm cast, an orthopedic cast applied to immobilize the hand or wrist, incorporating the hand below the wrist. The short-arm cast is used in treating fractures, for maintaining postoperative positioning, and for correcting or maintaining the correction of deformities of the hand and the wrist. Compare **long-arm cast.** See also **cast.**

short below-knee (BK) amputation, transtibial amputation in which the division is in the proximal third of the tibia. See also **long below-knee amputation.**

short bones, bones that occur in clusters and usually permit movement of the extremities, such as the carpals and tarsals.

short-bowel syndrome [AS, *sceort* + OFr, *boel* + Gk, *syn,* together, *dromos,* course], a loss of intestinal surface for absorption of nutrients caused by the surgical removal of a section of bowel. Treatment is with parenteral nutrition in the acute phase.

short central artery, a branch from the precommunical part of the anterior cerebral artery.

short-chain fatty acids (SCFA), those fatty acids having a chain length up to roughly 6 carbon atoms long. They are produced by bacterial anaerobic fermentation, particularly of dietary carbohydrates, in the large intestine. They are readily absorbed and are metabolized in the liver and muscle tissues, producing energy.

short-course tuberculosis chemotherapy, a 6-month treatment regimen for patients with tuberculosis who would otherwise continue to receive medications for at least 18 to 24 months after sputum has a negative finding for tubercle bacilli. The short course requires a combination of four drugs: isoniazid, rifampin, pyrazinamide, and either ethambutol or streptomycin.

Shorted Blessed Test (SBT), a short screening test measuring orientation and memory and designed to assess cognitive impairment. The test can be used to detect early cognitive changes associated with Alzheimer's disease or other disorders characterized by dementia.

short-gut syndrome, **1.** any of the malabsorption conditions resulting from massive resection of the small bowel, the degree and kind of malabsorption depending on the site and extent of the resection. It is characterized by diarrhea, steatorrhea, and malnutrition. **2.** a congenital disorder in which an infant's intestine is too short or underdeveloped to allow normal food digestion. The child is maintained on parenteral nutrition until the intestine grows, develops further, or is replaced by surgical transplantation. A small child who becomes dependent on parenteral feeding may have to be taught chewing and swallowing processes when the short-gut syndrome is eventually corrected.

shorting [AS, *sceort*], the fraudulent practice of dispensing a quantity of drug less than that called for in the prescription and of charging for the quantity specified in the prescription. See also **kiting.**

short-leg cast, an orthopedic cast used for immobilizing fractures in the lower extremities from the toes to the knee. The short-leg cast is also used for treating severe sprains and torn soft tissue of the ankle, for maintaining postoperative positioning and immobilization of the foot and the ankle, and for correcting or maintaining the correction of deformities of the foot or the ankle. Compare **long-leg cast.** See also **cast.**

short-leg cast with walker, an orthopedic cast with rubber walkers on the bottom. It immobilizes the leg from the toes to the knee and allows the patient to walk.

Short Portable Mental Status Questionnaire, a 10-item questionnaire used to screen older adults for cognitive impairment. It tests orientation, remote and recent memory, practical skills, and mathematical ability.

short-PR-normal-QRS syndrome. See **Lown-Ganong-Levine syndrome.**

short sight, shortsightedness. See **myopia.**

short stature [AS, *sceort,* short; L, *statura,* man's height], a body height that is less than 70% of the average for a population of the same age, culture, gender, and other peer factors.

short-term memory, memory of recent events, generally the first to be affected in Alzheimer's disease.

short-wave diathermy [AS, *sceort* + *wafian* + Gk, *dia* + *therme,* heat], a method of providing heat deep in the body by short-wave electric currents. The high-frequency short-wave uses wavelengths of 3 to 30 meters. It is used to treat chronic arthritis, bursitis, sinusitis, and other conditions.

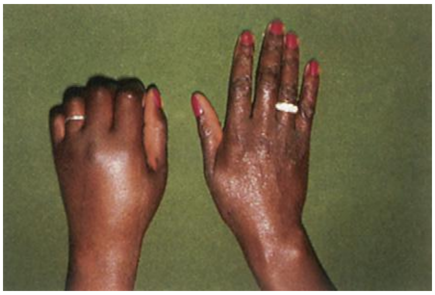
shotgun therapy [AS, *scot* + ME, *gonne* + Gk, *therapeia,* treatment], *(informal)* any treatment that has a wide range of effects and that therefore can be expected to correct an abnormal condition even though the particular cause is unknown. Shotgun therapy may cause more than an acceptable rate of side effects and is rarely desirable or necessary.

shoulder [AS, *sculder*], the junction of the clavicle, scapula, and humerus where the arm attaches to the trunk of the body.

shoulder blade. See **scapula.**

shoulder girdle [AS, *sculder* + *gyrdel*], a partial arch at the top of the trunk formed by the scapula and clavicle.

shoulder-hand syndrome, a neuromuscular condition characterized by pain and stiffness in the shoulder and arm, limited joint motion, swelling of the hand, muscle atrophy, and decalcification of the underlying bones. The condition occurs most commonly after myocardial infarction.



Shoulder-hand syndrome *(Moll, 1997)*

shoulder presentation [AS, *sculder* + L, *praesentare,* to show], the part of the fetus that occupies the center of the birth canal when the presentation is associated with a transverse or oblique lie.

shoulder spica cast, an orthopedic cast used to immobilize the trunk of the body to the hips, the wrist, and the hand. It incorporates a diagonal shoulder support between the hip and arm parts. The shoulder spica cast is used in the treatment of shoulder dislocations and injuries and in the positioning and immobilization of the shoulder after surgery.

shoulder subluxation. the separation of the humeral head from the glenoid cavity, resulting in strain on the soft tissues surrounding the shoulder joint.

show. See **vaginal bleeding.**

Shprintzen's syndrome. See **velocardiofacial syndrome.**

shreds [AS, *screade,* piece cut off], glossy filaments of mucus in the urine, indicating inflammation in the urinary tract. Also called **mucous shreds.**

Shulman's syndrome. See **eosinophilic fasciitis.**

shunt [ME, *shunten*], **1.** to redirect the flow of a body fluid from one cavity or vessel to another. **2.** a tube or device implanted in the body to redirect a body fluid from one cavity or vessel to another. See also **left-to-right shunt, right-to-left shunt.**

shu points /sho͞o/, acupressure points.

Shy-Drager syndrome /shī′ drā′gər/ [G. Milton Shy, American neurologist, 1919–1967; Glenn A. Drager, American physician, b. 1917], a rare progressive neurological disorder of young and middle-aged adults. It is characterized by orthostatic hypotension, bladder and bowel incontinence, atrophy of the iris, anhidrosis, tremor, rigidity, incoordination, ataxia, and muscle wasting. Treatment includes drug therapy to control motor symptoms and to maintain adequate blood pressure. Antigravity stockings may prevent pooling of blood in the lower extremities. See also **orthostatic hypotension.**

Shy-Magee syndrome. See **central core disease.**

Si, symbol for the element **silicon.**

SI, abbreviation for *Systèeme International d'Unités,* the French name for the **International System of Units.**

SIADH, abbreviation for **syndrome of inappropriate antidiuretic hormone secretion.**

sial-. See **sialo-.**

sialadenitis /sī′əlad′ənī′tis/, inflammation of one or more of the salivary glands. Also called **sialoadenitis.**

sialated, a substance that has reacted with sialic acid or its derivatives.

sialemesis /sī′ələmē′sis/, vomiting of saliva, or vomiting associated with excessive salivation.

-sialia, suffix meaning "(condition of the) saliva": *asialia, oligosialia, polsialia.*

sialic acid /si-al′ik/, any *N*-acyl derivative of neuraminic acid. Various ones are found in polysaccharides, glycoproteins, and glycolipids.

sialidase, an enzyme of the hydrolase class that catalyzes the cleavage of glucosidic linkages between a sialic acid residue and a hexose or hexosamine residue at the nonreducing terminal of oligosaccharides in glycoproteins, glycolipids, and proteoglycans. Deficiency of it is an autosomal-recessive trait and is seen in sialidosis and galactosialidosis. See also **neuraminidase.**

sialidosis /sī′əlidō′sis/, a neuronal storage disease of children caused by a deficiency of the enzyme sialidase (neuraminidase). The condition is characterized by a cherry-red spot on the macula, progressive myoclonus, and seizures. There are two types. Type 1 patients have normal physical features and beta-galactosidase levels. Type 2 patients also have short stature, bony abnormalities, and beta-galactosidase deficiency.

sialo-, sial-, prefix meaning "saliva or the salivary glands": *sialoaerophagy, sialoangitis, sialostenosis.*

sialoadenitis. See **sialadenitis.**

sialogenous. See **salivatory.**

sialogogue /sī·al′əgog′/ [Gk, *sialon,* saliva, *agogos,* leading], anything that stimulates, promotes, or produces the secretion of saliva.

sialogram /sī·al′əgram′/ [Gk, *sialon,* saliva, *gramma,* record], a radiographic image of the salivary glands and ducts.

sialography /sī·əlog′rəfē/ [Gk, *sialon* + *graphein,* to record], the radiographic examination of the salivary glands after injection of a radiopaque contrast medium. —*sialographic, adj.*

sialolith /sī·al′əlith/ [Gk, *sialon* + *lithos,* stone], a calculus formed in a salivary gland or duct.

sialolithiasis /-lithī′əsis/, a pathological condition in which one or more calculi, or stones, are formed in a salivary gland.

sialorrhea /sī·al′ərē′ə/ [Gk, *sialon* + *rhoia,* flow], an excessive flow of saliva that may be associated with various conditions, such as acute inflammation of the mouth, mental retardation, mercurialism, pregnancy, teething, alcoholism, or malnutrition. Also called **hypersalivation, ptyalism.**

Siamese twins /sī′əmēz/ [Chang and Eng, conjoined twins born in Siam (now Thailand) in 1811], conjoined, equally developed twin fetuses produced from the same ovum. The severity of the condition ranges from superficial fusion, such as of the umbilical vessels, to that in which the heads or complete torsos are united and several internal organs are shared. With modern surgical techniques, most Siamese twins can be successfully separated. See also **conjoined twins.**

sib [AS, *sibb,* kin]. See **sibling.**

Siberian ginseng, an herb harvested from a shrub found throughout the world, primarily in Russia and China.

■ USES: It is used to improve appetite; to improve circulation; and to treat memory loss, hypertension, insomnia, rheumatism, heart ailments, diabetes, and headache. It can be efficacious in some instances.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation, in children, in those with known hypersensitivity to this product or other ginsengs, or in those with hypertension. Do not use Siberian ginseng for more than 90 days without a rest period.

Siberian tick typhus /sībir′ē·ən/ [Siberia], a mild acute febrile illness seen in north, central, and east Asia, caused by *Rickettsia sibirica,* transmitted by ticks. It is characterized by a diffuse maculopapular rash, headache, conjunctival inflammation, and a small ulcer or eschar at the site of the tick bite. Siberian tick typhus is considered to be a mild form of spotted fever and rarely exhibits further complications. Treatment with chloramphenicol or tetracycline is associated with an excellent prognosis. Also called **North Asian tick typhus.** See also ***Rickettsia,*** **typhus.**

sibilant /sib′ilənt/ [L, *sibilare,* to hiss], a hissing sound or one in which the predominant sound is /s/.

sibilant rhonchus. See **wheeze** (def. 1).

sibling /sib′ling/ [AS, *sibb,* kin], **1.** *n,* also called *(informal)* **sib.** One of two or more children who have both parents in common; a brother or sister. The number, age differences, sex, and birth order of siblings can greatly affect the childhood environment and relationships within a family, which also may include step-siblings and half-siblings. Sibling rivalry and jealousy are common in firstborn children, especially when there is a 2- to 4-year difference in age. In general, sibling relationships help teach the child important social patterns and moral values, such as competitiveness, loyalty, and sharing. **2.** *adj,* pertaining to a brother or sister.

sibling support, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a sibling to cope with a brother's or a sister's illness/chronic condition/disability. See also **Nursing Interventions Classification.**

sibship /sib′ship/ [AS *sibb,* kin, *sceppan,* to shape], **1.** the state of being related by blood. **2.** a group of people descended from a common ancestor who are used as a basis for genetic studies. **3.** brothers and sisters considered as a group.

sibutramine, an appetite suppressant.

■ INDICATIONS: It is used to treat obesity in conjunction with other treatments.

■ CONTRAINDICATIONS: The following factors prohibit its use: known hypersensitivity to this drug, hypothyroidism, anorexia nervosa, severe hepatic/renal disease, uncontrolled hypertension, cerebrovascular accident, history of coronary artery disease, congestive heart failure, arrhythmias, pregnancy, and lactation.

■ ADVERSE EFFECTS: Tachycardia is a life-threatening effect of this drug. Other adverse effects include headache, insomnia, seizures, stimulation, drowsiness, dizziness, nervousness, emotional lability, hypotension, palpitations, vasodilation, anorexia, constipation, dry mouth, taste aberration, nausea, increased appetite, dysmenorrhea, laryngitis, pharyngitis, rhinitis, sinusitis, rash, and sweating.

sic [L], thus.

sicc-, prefix meaning "dry": *siccative, siccolabile, siccostabile.*

sicca complex /sik′ə/, abnormal dryness of the mouth, eyes, or other mucous membranes. The condition is seen in patients with Sjögren's syndrome, sarcoidosis, amyloidosis, and deficiencies of vitamins A and C.

siccant /sik′ənt/ [L, *siccus,* dry]. See **desiccant.**

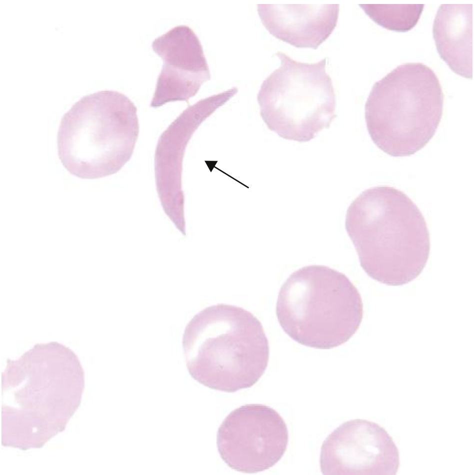
sick, experiencing symptoms of physical illness, such as nausea, aches and pains, dizziness, weakness, blurred vision, or malaise.

sick building syndrome, a condition characterized by fatigue, headache, dry eyes, and respiratory complaints affecting workers in certain buildings with limited ventilation. The symptoms seem to be caused by a combination of chemical agents in low concentrations rather than a specific irritant.

sick cell syndrome, a condition characterized by idiopathic hyponatremia in patients with either acute or chronic illness.

sick euthyroid syndrome, a nonthyroidal condition characterized by abnormalities in hormone levels and function test findings related to the thyroid gland. The condition occurs in patients with severe systemic disease.

sickle cell [AS, *sicol,* crescent; L, *cella,* storeroom], an abnormal crescent-shaped red blood cell containing hemoglobin S, characteristic of sickle cell anemia. Also called *drepanocyte.*

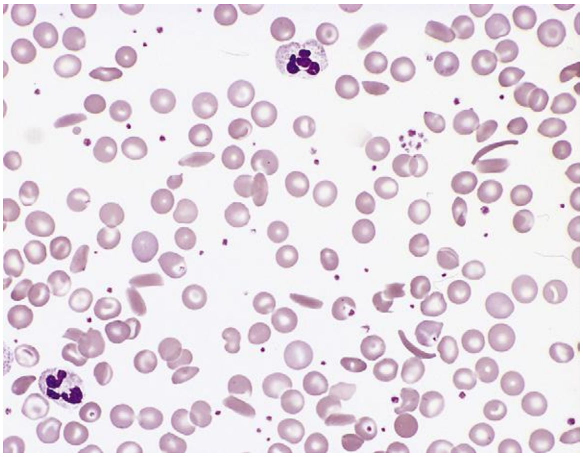


Sickle cell *(Carr and Rodak, 2008)*

sickle cell anemia, a severe, chronic, hemoglobinopathy that occurs in people homozygous for hemoglobin S (Hb S). The abnormal hemoglobin crystallizes and distorts the erythrocytes. Sickle cell anemia is characterized by crises of joint pain, thrombosis, and fever and by chronic anemia, with splenomegaly, lethargy, and weakness. See also **congenital nonspherocytic hemolytic anemia, hemoglobin C disease, dactylitis, elliptocytosis, hemoglobin S, sickle cell crisis.**

sickle cell crisis, an acute episodic condition that occurs in children with sickle cell anemia. The crisis may be vasoocclusive, resulting from the aggregation of misshapen erythrocytes, or anemic, resulting from bone marrow aplasia, increased hemolysis, folate deficiency, or splenic sequestration of erythrocytes. See also **hemoglobin S, sickle cell anemia.**

■ OBSERVATIONS: Painful vasoocclusive crisis is the most common of the sickle cell crises. It is usually preceded by an upper respiratory or GI infection without an exacerbation of anemia. The clumps of sickled erythrocytes obstruct blood



Sickle cell anemia: peripheral blood smear

(Kumar et al, 2007/Courtesy Dr. Robert W. McKenna, Department of Pathology, University of Texas Southwestern Medical School)

vessels, resulting in occlusion, ischemia, and infarction of adjacent tissue. Characteristics of this kind of crisis are leukocytosis; acute abdominal pain from visceral hypoxia; painful swelling of the soft tissue of the hands and feet (hand-foot syndrome); and migratory, recurrent, or constant joint pain, often so severe that movement of the joint is limited. Persistent headache, dizziness, convulsions, visual or auditory disturbances, facial nerve palsies, coughing, shortness of breath, and tachypnea may occur if the central nervous system or lungs are affected. Other problems associated with vasoocclusion include priapism, hematuria, and retinopathy. Anemic crisis is characterized by a dramatic, rapid drop in hemoglobin levels resulting from various causes. Aplastic crisis resulting in severe anemia occurs because red blood cell production is diminished by acute viral, bacterial, or fungal infection. Megaloblastic anemia (another form of anemic crisis) results from folic acid deficiency during periods of accelerated erythropoiesis. Severe anemia between crises is not common unless a generalized state of malnutrition exists. Hyperhemolytic crisis, characterized by anemia, jaundice, and reticulocytosis, results from glucose-6-phosphate dehydrogenase deficiency or occurs as a reaction to multiple transfusions. Acute sequestration crisis, which occurs in young children 6 months to 5 years of age, results when large quantities of blood suddenly accumulate in the spleen, causing massive splenic enlargement, severe anemia, shock, and, ultimately, death. Susceptibility to infection is a common problem of young children with sickle cell anemia and may be greatly increased during periods of crisis. Systemic infection and septicemia from pneumococcus or *Haemophilus influenzae* are not uncommon and may be rapidly fatal. In older children, local infection, especially osteomyelitis, rather than generalized septicemia is frequently a complicating factor.

■ INTERVENTIONS: Therapy consists of immediate transfusion of packed red blood cells in the acute anemic crisis and alleviation of severe abdominal and joint pain with analgesics or narcotics as needed in vasoocclusive crisis. Short-term oxygen therapy, hydration by oral or IV means, electrolyte replacement to counteract metabolic acidosis resulting from hypoxia, and antibiotics to treat any existing infection may be necessary. Pneumococcal and meningococcal vaccine is recommended for children between 2 and 5 years of age because they are highly susceptible to infection. Partial exchange transfusions are often mandatory in life-threatening crises, such as when sickling occurs in the vessels of the brain or lungs, and may be used as a preventive technique; multiple transfusions, however, increase the risk of hepatitis, hemosiderosis, and transfusion reactions. Oral anticoagulants have been used to relieve the pain of vasoocclusion, but these increase the risk of bleeding. Priapism, a painful condition frequently seen in vasoocclusive crisis, may be treated by aspirating the corpora cavernosa. In children with recurrent splenic sequestration, splenectomy may be a lifesaving procedure. The process is not routinely recommended because surgery increases the risk of acidosis and hypoxia from anesthesia, and, in time, the spleen usually atrophies through progressive fibrotic changes. Infarction of tissue in any organ is a potential hazard in sickle cell crisis, and special management and treatment are warranted by the specific site of damage. Typical complications include uremia (requiring renal transplantation or hemodialysis), chronic functional pulmonary impairment, aseptic necrosis of the hip, and microvascular occlusion that may lead to venous thrombosis.

■ NURSING CONSIDERATIONS: The primary concern of the nurse during a crisis is to initiate procedures that reduce sickling. Foremost is prevention of tissue deoxygenation and resulting hypoxia by maintaining bed rest to minimize energy expenditure and oxygen use, although some exercise is necessary to promote circulation. Hydration and electrolyte balance are essential. A complete record of fluid intake and output is maintained, and adequate therapy is calculated accordingly. Serum sodium level is monitored closely to prevent hyponatremia. Oxygen is given in severe anoxia, although prolonged administration depresses bone marrow activity and thus aggravates anemia. Management of pain in vasoocclusion is often difficult and may require experimentation with various drugs and schedules before the patient receives adequate relief. The application of warmth is often soothing; cold is contraindicated because it enhances vasoconstriction and sickling. The nurse constantly monitors the child's condition for splenomegaly, infection, evidence of shock or cerebrovascular accident, hypervolemia, transfusion reaction, or increasing anemia. An important aspect of nursing care is the continued emotional support of parents whose child has a chronic illness that is potentially fatal.

sickle cell dactylitis [AS, *sicol* + L, *cella,* storeroom; Gk, *daktylos,* finger, *itis,* inflammation], a painful inflammation of one or more fingers caused by an attack of sickle cell anemia.

sickle cell–hemoglobin C disease. See **hemoglobin SC disease.**

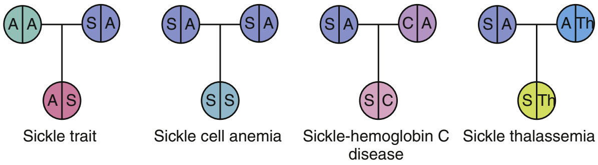
sickle cell–hemoglobin D disease. See **hemoglobin SD disease.**

sickle cell hepatopathy, the liver damage that accompanies sickle cell disease, caused especially by vascular occlusion and ischemia, sequestration, and cholestasis.

sickle cell test, a blood screening to detect sickle cell disease and sickle cell trait.

sickle cell thalassemia, a double heterozygous anemia in which the genes for sickle cell and for thalassemia are both inherited. A mild form and a severe form may be identified, depending on the degree of suppression of beta-chain synthesis by the thalassemia gene. In the mild form, synthesis is only partially suppressed, and the red blood cells may contain from 25% to 35% normal hemoglobin A, along with a greater concentration of hemoglobin S. The clinical course is relatively mild. In the severe form, beta-chain synthesis is completely suppressed and only hemoglobin S appears in the red blood cells. The clinical course is generally as severe as in homozygous sickle cell anemia. See also **hemoglobinopathy, hemoglobin S, hemoglobin SC disease.**

sickle cell trait, the heterozygous form of sickle cell anemia, characterized by the presence of both hemoglobin S and hemoglobin A in the red blood cells. Anemia and the other signs of sickle cell anemia do not occur. People who have the trait are informed of and counseled about the possibility of having an infant with sickle cell disease if both parents have the trait. See also **hemoglobin S.**



Sickle cell inheritance pattern

sickling, the development of sickle-shaped red blood cells, as in sickle cell anemia.

sick role [AS, *seoc* + Fr, stage character], a behavior pattern in which a person adopts the symptoms of a physical or mental disorder to be cared for, sympathized with, and protected from the demands and stresses of life.

sick sinus syndrome (SSS) [AS, *seoc* + L, *sinus,* hollow], a complex of arrhythmias associated with sinus node dysfunction. The condition may result from a variety of cardiac diseases, ranging from cardiomyopathies to inflammatory myocardial disease. It is most commonly related to either intermittent sinoatrial (SA) block or inadequate SA conduction. SSS is characterized by severe sinus bradycardia, either alone, alternating with tachycardia, or accompanied by atrioventricular block. The most common symptoms are lethargy, weakness, light-headedness, dizziness, and syncope. The severity of symptoms is related to the duration of the asystolic period. Elderly patients with episodes of near-syncope associated with a history of palpitations are most likely to be symptomatic. Accurate diagnosis requires electrocardiography. At present the only treatment is the implantation of a permanent pacemaker.

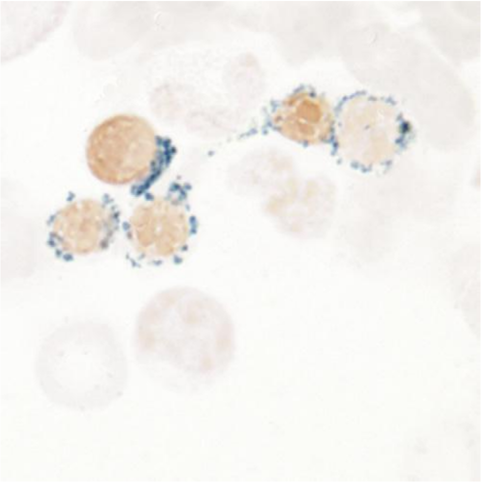
SICU, abbreviation for *surgical intensive care unit*.

SID, abbreviation for **source-to-image-receptor distance.**

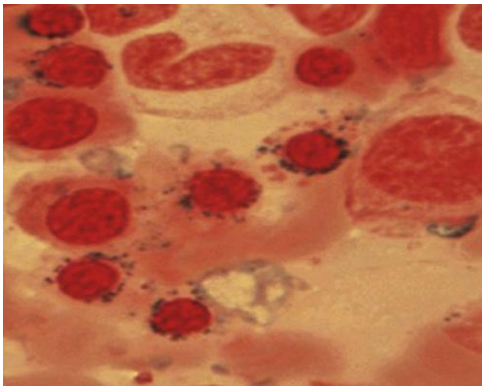
side effect [AS, *side* + L, *effectus*], any reaction to or consequence of a medication or therapy. This can be an effect carried beyond the desired limit, such as hemorrhaging from an anticoagulant, or a reaction unrelated to the primary object of the therapy, such as an anaphylactic reaction to an antibiotic. Usually, although not necessarily, the effect is undesirable and may manifest itself as nausea, dry mouth, dizziness, blood dyscrasias, blurred vision, discolored urine, or tinnitus.

sidero-, prefix meaning "iron": *siderocyte, siderofibrous, sideropenic*.

sideroblastic anemia /sid′ərōblas′tik/ [Gk, *sideros,* iron, *blastos,* germ], a heterogeneous group of chronic normocytic or slightly macrocytic anemias characterized by decreased erythropoiesis. The red blood cells contain a perinuclear ring of iron-stained granules. Sideroblastic anemia is an acquired disorder and the cause is not understood. Treatment may include extract of liver, pyridoxine, folic acid, and blood transfusion. Also spelled *sideroblastic anaemia*. Compare **iron deficiency anemia, siderosis.**



Sideroblast *(Carr and Rodak, 2008)*



Sideroblastic anemia
(Gilbert-Barness, 2007)

siderocyte /sid′ərōsīt′/ [Gk, *sideros,* iron, *kytos,* cell], an abnormal erythrocyte in which particles of nonhemoglobin iron are visible as siderotic granules, also called **Pappenheimer bodies.**

sideropenia /sid′ərōpē′nē·ə/, an abnormally low level of serum iron.

sideropenic dysphagia. See **Plummer-Vinson syndrome.**

siderosis /sid′ərō′sis/ [Gk, *sideros* + *osis,* condition], **1.** a variety of pneumoconiosis caused by the inhalation of iron dust or particles. **2.** the introduction of color in any tissue caused by the presence of excess iron. **3.** an increase in the amount of iron in the blood. See also **hemochromatosis, hemosiderosis, sideroblastic anemia.**

siderotic granules /sid′ərot′ik/, inclusion bodies seen in the red blood cells of splenectomy patients and in cases of abnormal hemoglobin synthesis, sideroblastic anemia and hemolytic anemia. The granules contain iron, which takes a Prussian blue stain. Also called **Pappenheimer bodies.**

siderotic splenomegaly, an enlarged spleen associated with fibrosis and an excessive accumulation of iron and calcium. The condition is seen in sickle cell disease and hematochromatosis.

side-to-side anastomosis. See **anastomosis.**

SIDS, abbreviation for **sudden infant death syndrome.**

SIECUS /sē′kəs/, abbreviation for *Sex Information and Education Council of the United States*.

siemens (S) /sē′mens/ [Ernst Werner von Siemens, German electric inventor, 1816–1892], a unit of electric conductance of a body with a resistance of 1 ohm, allowing 1 ampere of current to flow per volt applied.

sievert (Sv) /sē′vərt/ [R.M. Sievert, twentieth-century Swedish physicist], a measure of radiation dose. The sievert has the same units as the gray and is equal to the absorbed dose times the quality factor, which compares the health consequences of that type of radiation with those of x-rays. The rem bears the same relationship to the rad as the sievert does to the gray.

sig., abbreviation for the Latin *signetur,* "let it be labeled (according to prescription)."

sigh. See **periodic deep inspiration.**

sight /sīt/ [AS, *gesiht*], **1.** the special sense that enables the shape, size, position, and color of objects to be perceived; the faculty of vision. It is the principal function of the eye. **2.** that which is seen.

sigma /sig′mə/, Σ, σ, and s, the eighteenth letter of the Greek alphabet.

Sigma Theta Tau International /sig′mə thā′tə tou′/, an international honor society for nurses. Registered nurses and student nurses are invited to join on the basis of academic achievement or contributions to nursing.

sigmoid /sig′moid/ [Gk, *sigma,* the letter S, *eidos,* form], **1.** *adj,* pertaining to an S shape. **2.** *n,* the sigmoid colon.

sigmoid-, prefix meaning "sigmoid colon"; the section of the colon shaped like the Greek letter sigma: *sigmoidoscope, sigmoidectomy.*

sigmoid colon, the part of the colon that extends from the one descending colon in the pelvis to the juncture of the rectum. Also called **sigmoid flexure.**

sigmoid cystoplasty, augmentation cystoplasty using an isolated segment of the sigmoid colon for the graft.

sigmoidectomy /sig′moidek′təmē/ [Gk, *sigma* + *eidos* + *ektomē,* excision], excision of the sigmoid flexure of the colon, most commonly performed to remove a malignant tumor. A large percentage of cancers of the lower bowel occur in the sigmoid colon.

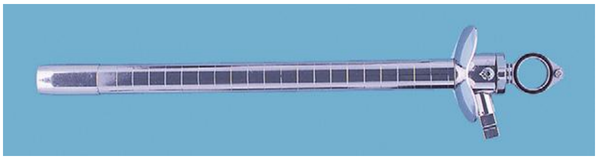
sigmoid flexure. See **sigmoid colon.**

sigmoiditis /sig′moidī′tis/, an inflammation of the sigmoid colon.

sigmoid mesocolon /mez′ōkō′lən/ [Gk, *sigma* + *eidos* + *mesos,* middle, *kolon*], a fold of peritoneum that connects the sigmoid colon with the pelvic wall, forming a curved line of attachment with the apex of the curve located at the division of the left common iliac artery. The fold is continuous with the iliac mesocolon and ends in the median plane over the rectum at the level of the third sacral vertebra. Between the two layers of the fold are the sigmoid and the superior rectal vessels. Compare **mesentery proper, transverse mesocolon.**

sigmoid notch, a concavity on the superior surface of the mandibular ramus between the coronoid and condyloid processes.

sigmoidoscope /sigmoi′dəskōp′/ [Gk, *sigma* + *eidos* + *skopein,* to look], an instrument used to examine the lumen of the sigmoid colon. It consists of a tube and a light, allowing direct visualization of the mucous membrane lining the colon. Compare **proctoscope.**



Sigmoidoscope *(Tighe, 2012)*

sigmoidoscopy /sig′moidos′kəpē/, the inspection of the rectum and sigmoid colon by the aid of a sigmoidoscope.

sigmoidostomy /sig′moidos′təmē/, the surgical creation of an anus in the pelvic colon.

sigmoid volvulus, a type of colonic volvulus consisting of twisting of an elongated section of sigmoid colon on its mesenteric axis. It is usually seen in the elderly.

sign /sīn/ [L, *signum,* mark], an objective finding as perceived by an examiner, such as a fever, a rash, the whisper heard over the chest in pleural effusion, or the light band of hair seen in children after recovery from kwashiorkor. Many signs accompany symptoms. For example, erythema and a maculopapular rash are often seen with pruritus. Compare **symptom.**

signal-average electrocardiogram (SAECG), an electrocardiographic study, usually performed on patients with unexplained loss of consciousness or suspected arrhythmias, in which hundreds of QRS complexes are collected, filtered, and analyzed to discover the presence or absence of certain abnormalities in the conducting system of the ventricle.

signal molecule /sig′nəl/ [L, *signum,* mark], a hormone, neurotransmitter, or other agent that transfers information from one cell or organ to another. Examples include steroid hormones, insulin, and growth factors. A photon may have a similar effect on a retinal receptor.

signal node. See **Virchow's node.**

signal symptom. See **symptom.**

signal-to-noise ratio (SNR), the number used to describe the relative contributions to a detected signal of the true signal and random superimposed signals or "noise."

signature /sig′nəchər/ [L, *signare,* (sig) to mark], in pharmacy, a part of a prescription containing instructions to the patient about dosage and manner and frequency of administration.

signe de journal. See **thumb sign.**

significance /signif′ikəns/ [L, *significare,* to signify], **1.** in research, the statistical probability that a given finding may have occurred by chance alone. The conventional standard for attributing significance is a finding that occurs fewer than 5 times in 100 by chance alone ($p < .05$). **2.** the importance of a study in developing a practice or theory, as in nursing practice.

significance level, the probability of incorrectly rejecting the null hypothesis when such a hypothesis is tested. See also **type I error.**

significant other /signif′ikənt/, a person who is considered by an individual as being special and as having an effect on that individual.

sign language [L, *signum* + *lingua,* tongue], a form of communication often used with and among deaf people, consisting of hand and body movements. Many variations exist, including American Sign Language (ASL). Other forms of manual communication are Signed English and finger spelling. Compare **body language.**

sign-off. See **logoff.**

sign-on. See **login.**

silanization /sil′ənizā′shən/, (in chromatography) the chemical process of converting the SiOH moieties of a stationary form to the ester form.

sildenafil, an erectile agent.

■ INDICATION: It is used to treat erectile dysfunction.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Common side effects include headache, flushing, dizziness, dyspepsia, nasal congestion, urinary tract infection, abnormal vision, diarrhea, and rash.

silence, **1.** absence of noise. **2.** a state of producing no detectable signs or symptoms.

silent disease /sī′lənt/ [L, *silens* + *dis* + Fr, *aise,* ease], a disease or other disorder that produces no clinically obvious signs or symptoms. See also **subclinical.**

silent ischemia [L, *silere,* to be silent], an asymptomatic form of myocardial ischemia that may damage the heart muscle. Ischemia is most likely to occur during the first 6 hours after a person awakens in the morning. It is triggered by mental arousal in more than 75% of patients. In contrast, cardiac ischemia accompanied by anginal pains is usually triggered by physical exertion.

silent mutation, an alteration in a DNA sequence that does not result in an amino acid change in a polypeptide.

silent myocardial infarction, an interruption in blood flow to the coronary arteries without the usual signs and symptoms of a heart attack. Such infarctions may be associated with diabetes.

silent peritonitis [L, *silere* + Gk, *peri* + *teinein,* to stretch, *itis,* inflammation], a case of peritonitis that develops without clinical signs or symptoms.

silhouette sign /sil′o͞o·et′/, a radiographic artifact caused by an infiltrate that obscures the demarcating line between lung segments.

silica (SiO_2) /sil′i·kə/ [L, *silex,* flint], silicon dioxide, an inorganic compound occurring in nature as agate, sand, amethyst, flint, quartz, and other stones. It is one of the major constituents of dental porcelain and a common filler in resin composites. In granular form, it serves as a dental abrasive and polishing agent. See also **silicosis.**

silica gel /sil′ikə/, a coagulated form of hydrated silica, used as an absorbent of gases and as a dehydrating agent.

silicate cement /sil′i·kāt/ [L, *silex,* flint + *caementum,* rough stone], a dental cement that is translucent and porcelainlike when set; formerly used for esthetic temporary and semipermanent restorations of anterior teeth.

silicic acid /silis′ik/, hydrated silicon dioxide. It is used in thin-layer and column chromatography.

silico-, prefix meaning "silica or quartz": *silicosis, silicosiderosis, silicotuberculosis.*

silicon (Si) /sil′ikon/ [L, *silex,* flint], a nonmetallic element, second to oxygen as the most abundant of the elements in the earth's crust. Its atomic number is 14, and its atomic mass is 28.09. It occurs in nature as silicon dioxide and in silicates. The silicates are used as detergents, corrosion inhibitors, adhesives, and sealants. Elemental silicon is used in metallurgy and in transistors and other electronic components. About 60% of the rocks in the earth's crust contain silicon, and silica dust is associated with many mining operations. Protracted inhalation of silica dust can cause silicosis, which increases the susceptibility to other pulmonary diseases.

silicone /sil′ikōn/ [L, *silex,* flint], any of a large group of inert polymers. Silicones are water-repellent and stable at high temperature. They are useful in medicine as adhesives, lubricants, and sealants. They are used in glass chromatography and in coating of glassware for blood collection because they help reduce platelet loss. They are also used as a substitute for rubber, especially in prosthetic devices. Elastomeric silicone, or silicon rubber, is biologically inert. See also **silicone-gel breast implant.**

silicone-gel breast implant, a type of implant used in reconstructive surgery of the breast and made with synthetic polymers. The implants have been associated with adverse effects on the immune system as well as distorted and painful breasts caused by leakage of the silicone into surrounding tissues. However, a number of statistical studies have not established such a cause-and-effect relationship.

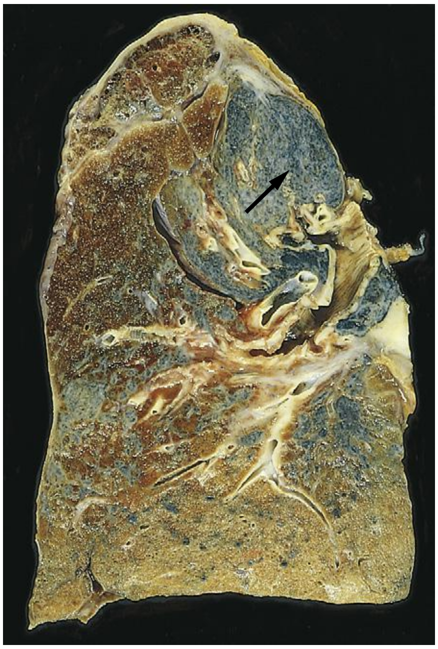
silicone-hydrogel lens, a soft contact lens made of a polymer that contains silicone, which is permeable to oxygen, so that large amounts of oxygen are transmitted to the cornea. Such lenses contain less water than traditional soft lenses and so are more resistant to dehydration and less prone to harbor bacteria and protein deposits. Some are designed to be worn continuously for extended periods, up to 30 days for some types.

silicone oil, any of various fluid silicone polymers. Some are injected into the vitreous of the eye to serve as a vitreous substitute during or after certain ophthalmological surgical procedures, such as to prevent the recurrence of retinal detachment.

silicone septum, a vascular access device used in IV therapy. It consists of a silicone partition that covers the port chamber housed in the metal or plastic body of an implanted infusion port.

silicophosphate cement /sil′i·kō·fos′fāt/, a mixture of silicate and zinc phosphate cements, formerly used as temporary filling material and for cementation of orthodontic bands, indirect restorations, and porcelain jacket crowns.

silicosis /sil′ikō′sis/, a lung disorder caused by continued long-term inhalation of the dust of an inorganic compound, silicon dioxide, which is found in sands, quartzes, flints, and many other stones. Silicosis is characterized by the development of nodular fibrosis in the lungs. In advanced cases, severe dyspnea may develop. The incidence of silicosis is highest among industrial workers exposed to silica powder in manufacturing processes; in those who work with ceramics, sand, or stone; and in those who mine silica. Also called **grinder's disease, quartz silicosis.** See also **chronic obstructive pulmonary disease, inorganic dust.**



Silicosis *(Kumar et al, 2007/Courtesy Dr. John Godleski, Brigham and Women's Hospital)*

silk suture [AS, *seolc* + L, *sutura,* seam], a braided fine suture material, usually used to close incisions, wounds, and cuts in the skin. It is not absorbed by the body and is removed after approximately 7 days.

silo filler's disease /sī′lō/ [Fr, *ensilotage,* ensilage; AS, *fyllan,* to fill], a rare acute respiratory condition seen in agricultural workers who have inhaled nitrogen oxide as they work with fermented fodder in closed, poorly ventilated areas such as silos. Characteristically, symptoms of respiratory distress and pulmonary edema occur several hours after exposure. Loss of consciousness may occur. Observation in the hospital and respiratory assistance often are required. The condition is rarely fatal.

Silvadene, trademark for an antibacterial (sulfadiazine silver).

silver (Ag) [AS, *seolfor*], a whitish precious metal occurring mainly as a sulfide. Its atomic number is 47; its atomic mass is 107.88. It is quite soft and is usually alloyed with small amounts of copper to increase its durability. Silver dissolves readily in nitric acid and is used extensively to produce silver halides used in photographic emulsions. It is frequently associated in small amounts with the ores of zinc, copper, and lead and is used extensively as a component of amalgams of dental fillings and in many medications, especially antiseptics and astringents. Some antiseptics containing silver are mild silver protein and strong silver protein, preparations that render silver colloidal in the presence of protein. Mild silver protein contains 19% to 23% silver. Strong silver protein contains 7.5% to 8.5% silver. Both preparations are used externally as antiseptics and do not have irritating properties. Silver nitrate is used externally as an antiseptic and astringent, especially in the prevention of ophthalmia neonatorum. It is also used as a lubricant on the bearings of radiography tubes, and silver halides are used in x-ray films. Silver picrate, an ionizable salt of silver, is used in the treatment of trichomoniasis and moniliasis of the vagina.

silver amalgam [AS, *seolfor* + Gk, *malagma*], an alloy of silver, tin, copper, mercury, and zinc used in dentistry to fill prepared tooth cavities. See **amalgam.**

silver cone method, a technique for filling tooth pulp canals. It is outdated because the silver corrodes over time which permits apical fluid leakage and root canal failure. Retreatment of the root canal is necessary.

Silver dwarf [Henry K. Silver, twentieth-century American pediatrician], a person who has **Silver's syndrome,** a congenital disorder in which short stature is associated with lateral asymmetry; various anomalies of the head, face, and skeleton; and precocious puberty.

silver-fork fracture. See **Colles' fracture.**

Silverman-Anderson score, a system of assessing the degree of respiratory distress.

silver nitrate ($AgNO_3$), a topical antiseptic.

■ INDICATIONS: A 1% solution was traditionally prescribed for the prevention of gonococcal ophthalmia in newborns, but povidone iodine is now usually used because it is less expensive and has a broader spectrum of action. Stronger concentrations can also be used on wet dressings for cauterizing wounds, removal of granulation tissue and warts, and prophylaxis following burns.

■ CONTRAINDICATION: Known sensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are severe local inflammation, burns, and argyria, and staining.

silver salts poisoning, a toxic condition caused by the ingestion of silver nitrate, characterized by discoloration of the lips, vomiting, abdominal pain, dizziness, and convulsions.

Silver's syndrome. See **Silver dwarf.**

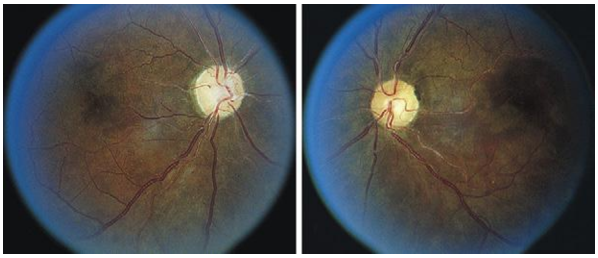
silver sulfadiazine, a topical antibiotic.

■ INDICATIONS: It is prescribed to prevent or treat infection in second- and third-degree burns.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug, to silver, or to sulfonamides prohibits its use. It is not given in the last weeks of pregnancy or to newborn or premature infants.

■ ADVERSE EFFECTS: Among the most serious adverse effects are rash, fungal infection, neutropenia, and kernicterus.

silver-wire arteries, retinal arterioles that appear as white tubes containing a red fluid when viewed through an ophthalmoscope. The condition occurs as replacement fibrosis associated with hypertension continues and the vessel wall obscures the blood column.



Silver-wire arteries *(Albert et al, 2008)*

simethicone /simeth′ikōn/, an antiflatulent that helps the gases to dissolve in liquid by decreasing the surface tension of gas bubbles.

■ INDICATION: It is prescribed to disperse gas pockets in the GI tract.

■ CONTRAINDICATIONS: There are no significant contraindications other than hypersensitivity to the medication.

■ ADVERSE EFFECTS: There are no significant adverse effects.

simian crease /sim′ē·ən/ [L, *simia,* ape; ME, *creste,* crest], a single crease across the palm produced from the fusion of proximal and distal palmar creases, seen in congenital disorders, such as Down syndrome. Also called **simian line.**

simian-human immunodeficiency virus, a chimeric, engineered virus with the envelope of human immunodeficiency virus and the cytoplasm and nucleus of simian immunodeficiency virus (SIV). It is used in animal models because it is a better mimic of HIV than SIV is.

simian immunodeficiency virus (SIV), a lentivirus that produces an acquired immunodeficiency syndrome-like disease in nonhuman primates. The cytopathological changes caused by SIV are similar to those caused by the human immunodeficiency virus (HIV). SIV also shares with HIV a group of genes lacking in other retroviruses, and animals infected with either virus experience a similar decrease in the number of $CD4^+$ lymphocytes.

simian line. See **simian crease.**

simian virus 40 (SV40), a vacuolating virus isolated from the kidney tissue of rhesus monkeys. SV40 produces malignancy in human and newborn hamster kidney cells and tumors when inoculated into newborn hamsters.

simil-, prefix meaning "like": *Similac, similimum.*

Similac preparations, a trademark for a group of commercial modified milk products that are prepared especially for infant feeding. They are made from a nonfat base of cow's milk supplemented with such substances as lactose, coconut and soy oils, and monosaccharides and disaccharides and are fortified with vitamins and minerals. The ratio of the various nutrients, such as iron or one of the other minerals, is altered in the different preparations to accommodate infants with particular nutritional requirements or nutritional problems, such as nephrogenic diabetes insipidus. The formulas are packaged in both powder and liquid forms.

similia similibus curantur, a homeopathic rule that medication able to produce symptoms in a healthy person will also remove similar symptoms occurring as an expression of disease. See also **homeopathy.**

Simmonds' disease. See **panhypopituitarism, postpubertal panhypopituitarism.**

simplate bleeding time test, a blood test for determining how quickly platelets form a plug when an incision is made in the skin. Platelet plug formation is the first step in clotting and, if slower than 8 minutes, indicates platelet deficiency or the effect of a drug, such as aspirin. Also called **template bleeding time test.**

simple, **1.** describing something composed of only one or a minimum number of parts or elements. **2.** not involved or complicated.

simple angioma [L, *simplex,* not mixed], a tumor consisting of a network of small vessels or distended capillaries surrounded by connective tissue.

simple astigmatism [L, *simplex,* not mixed; Gk, *a* + *stigma,* point], **1.** simple myopic astigmatism in which one principal meridian is in focus on the retina and the other in front of it. **2.** simple hyperopic astigmatism in which one meridian is focused on the retina and the other behind it.

simple bone cyst, a benign empty lesion within bone which can result from hemorrhage caused by trauma, inadequate venous drainage of interstitial fluid, disturbance of local bone growth, ischemic bone marrow necrosis, or alteration of bone metabolism resulting in osteolysis. Radiographic or dental imaging of this lesion appears as radiolucent scallops around the roots of teeth. The patient may or may not report a history of trauma to the area. Also called *hemorrhagic bone cyst, idiopathic bone cyst,* or **traumatic bone cyst.**

simple cavity, a cavity that involves only one surface of a tooth.

simple diarrhea [L, *simplex,* not mixed; Gk, *dia* + *rhein,* to flow], a form of diarrhea in which the loose stools contain normal feces.

simple dislocation [L, *simplex,* not mixed, *dis* + *locare,* to place], displacement of a joint without a penetrating wound.

simple figure-eight roller arm sling, a sling prepared by placing the patient in a supine or sitting position with the affected arm flexed and adjacent to the chest. The open sling fits under the arm and over the chest. The bandage is fixed with a single turn toward the uninjured side around the arm and chest, crossing the elbow above the external epicondyle. In the next step, the bandage is drawn forward under the tip of the elbow, after making a second turn that overlaps two thirds of the first. Then the bandage is pulled upward along the flexed arm to the base of the neck on the uninjured side. Finally, the bandage is drawn down over the scapula and across the chest and arm, overlapping and continuing in a figure-eight pattern.

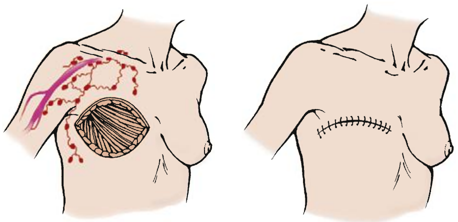
simple fission. See **binary fission.**

simple fracture. See **closed fracture.**

simple glaucoma [L, *simplex,* not mixed; Gk, *glaucoma,* cataract], chronic open-angle glaucoma without complications but with visual field loss and optic atrophy.

simple goiter [L, *simplex,* not mixed, *guttur,* sore throat], a goiter not accompanied by signs or symptoms of hyperthyroidism.

simple mastectomy, a surgical procedure in which a breast is completely removed and the underlying muscles and adjacent lymph nodes are left intact, performed to remove small malignant neoplasms of the breast or as a palliative measure to remove an ulcerated carcinoma in advanced breast cancer. It also may be done prophylactically when the patient has severe fibrocystic disease and a strong family history of breast cancer. Compare **modified radical mastectomy, radical mastectomy.** See also **mastectomy.**



Simple mastectomy *(Ignatavicius and Workman, 2010)*

simple meningitis. See **sterile meningitis.**

simple periodontal pocket. See **periodontal pocket.**

simple phobia, an anxiety disorder characterized by a persistent, irrational fear of specific things, such as animals, dirt, light, or darkness. Compare **social phobia.** See also **phobia.**

simple protein, a protein that yields amino acids as the only or chief product of hydrolysis. The class includes albumins, globulins, glutelins, alcohol-soluble proteins, albuminoids, histones, and protamines. See also **complex protein.**

simple reflex [L, *simplex,* not mixed, *reflectere,* to bend back], a reflex with a motor nerve component that involves only one muscle. See also **reflex arc.**

simple stomatitis [L, *simplex* + Gk, *stoma,* mouth, *itis,* inflammation], a simple inflammation of the mucous membranes of the mouth with redness, swelling, and an excess of mucus. Also called **catarrhal stomatitis.**

simple sugar, a monosaccharide, such as glucose.

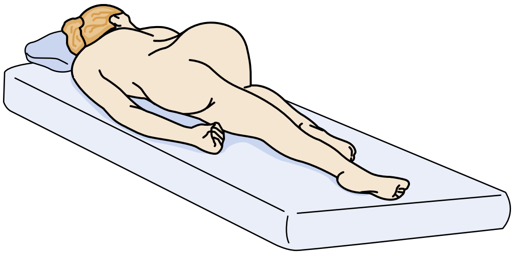
simple tubular gland, one of the many multicellular glands with only one duct and a tube-shaped part, such as various glands within the epithelium of the intestine.

simple vulvectomy. See **vulvectomy.**

Simplexvirus /sim′pleksvi′rus/, the herpes simplex virus, a genus of herpesviruses that causes herpes simplex. Species pathogenic in humans include human herpesvirus 1 and human herpesvirus 2.

Simpson forceps. See **obstetric forceps.**

Sims' position [James M. Sims, American gynecologist, 1813–1883], a position in which the patient lies on the side with the knee and thigh drawn upward toward the chest. The chest and abdomen are allowed to fall forward. Left Sims' is the position of choice for administering enemas or conducting rectal examinations. Also called **semiprone side position.**



Sims' position *(Monahan et al, 2007)*

Sims' recumbent position, a variant of the Sims' position in which the patient lies on the left side in a modified left lateral position, with the upper leg flexed at hip and knees, the lower leg straight, and the upper arm resting in a flexed position on the bed.

simulation /sim′yəlā′shən/ [L, *simulare,* to imitate], a method of representing the actions of one system by those of another, as a computer program that represents the actions of something in the real world. Simulation enables a computer to explore situations that might be too expensive, dangerous, or time-consuming in real life.

simultanagnosia /sī′multan′agnō′zhə/, a visual disorder in which a person actually perceives only one element of a picture or object at a time and is unable to absorb the whole. See also **Balint's syndrome.**

sin-, sinus-, prefix meaning "hollow, cavity, or to curve": *sinography, sinuses, sinusotomy.*

sinap-, prefix meaning "mustard": *sinapine, sinapiscopy, sinapism.*

sinciput /sin′siput/ [L, half a head], the anterior or upper part of the skull. See also **bregma.**

Sinemet, a trademark for a fixed-combination drug containing a peripheral dopa decarboxylase inhibitor **(carbidopa)** and an antiparkinsonian **(levodopa)** that can enter the central nervous system.

Sinequan, a trademark for a tricyclic antidepressant **(doxepin hydrochloride).**

sinew /sin′yo͞o/ [ME, *sinewe*], the tendon of a muscle, such as the thick, flattened tendon attached to the short head of the biceps brachii. See also **tendon.**

singer's nodule. See **vocal cord nodule.**

single-blind study [L, *singulus,* one by one; AS, *blind* + L, *studere,* to be busy], an experiment in which the person collecting data knows whether the subject is in the control group or the experimental group, but subjects do not. See also **double-blind study.**

single-cell gel electrophoresis, a type of gel electrophoresis used to detect the genotoxic potential of environmental hazards, such as radiation, heavy metals, and toxic chemicals. Such agents may cause breaks in the nuclear DNA of cells. When such a cell is lysed and exposed to electrophoresis that denatures its DNA, the damaged DNA moves toward the electric field, making a formation like the tail of a comet. Also called **comet assay.**

single-chain antigen-binding (SCAB) protein, a polypeptide that joins an antibody's light chain variable region to the antibody heavy chain variable region. SCABs are used as biosensors, in chemical separations, and in the treatment of cancers and heart disease.

single component insulin [L, *singulus* + *componere,* to bring together, *insula,* island], any highly purified insulin with less than 10 ppm of proinsulin. See also **insulin, proinsulin.**

single footling breech. See **footling breech.**

single-locus probe (SLP), a sequence of labeled DNA or RNA that can be used to identify a region of DNA tandem repeats found in the genome only once. It may be used in resolving cases of disputed parentage.

single nucleotide polymorphism (SNP), a genetic polymorphism between two genomes that is based on deletion, insertion, or exchange of a single nucleotide.

single-parent family, a family consisting of only the mother or the father and one or more dependent children.

single-photon emission computed tomography (SPECT), a variation of computed tomography in which the ray sum is defined by the collimator holes on the gamma-ray detector rotating around the patient. SPECT units usually consist of large crystal gamma cameras mounted on a gantry that permits rotation of the camera around the patient. Multiple detectors are used to reduce the imaging time.

single room occupant (SRO), a single person, usually an elderly individual, who lives alone in a single room of a low-cost hotel or apartment building.

single sweep scan, an ultrasonic scan that is completed in a single sweep of the sensing device across the area being examined.

single system ureterocele, a ureterocele involving the ureter of a collecting system that is not double. It is usually orthotopic, intravesical, and seen in adults.

singleton /sing′gəlton/, an offspring born alone.

singlet state /sing′glit/, a state of an atom or molecule in which all electrons have paired spins.

singultus. See **hiccup.**

sinister /sin′istər/ [L], **1.** left, at the left side, at the left hand. **2.** ominous, potentially dangerous; threatening.

sinistral /sinis′trəl/ [L, *sinister,* left], relating to the left side.

sinistrality. See **left-handedness.**

sinistro-, prefix meaning "left, or related to the left side": *sinistrocardia, sinistrophobia, sinistrotorsion.*

sinoatrial (SA) /sī′nō·ā′trē·əl/ [L *sinus,* hollow, *atrium,* hall], pertaining to the sinus node and atrium. Also called **sinoauricular.**

sinoatrial (SA) block [L, *sinus,* hollow, *atrium,* hall; Fr, *bloc*], a conduction disturbance in the heart during which an impulse formed within the sinus node is blocked or delayed from depolarizing the atria. There are two types of SA block. Type I (SA Wenckebach) is characterized on the electrocardiogram by group beating, shortening of P-P intervals, and pauses that are less than twice the shortest cycle. The P-R intervals are not affected unless there is also an atrioventricular conduction defect. In the case of a 3:2 conduction ratio, a bigeminal sinus rhythm (two sinus-conducted beats and a pause) is noted. Type II SA block is identified on the electrocardiogram by absent P waves without shortening P-P intervals. Causes include excessive vagal stimulation, sinoatrial block acute infections, and atherosclerosis. SA block also may be an adverse reaction to quinidine or digitalis. Treatment for symptomatic SA block includes the use of atropine and isoproterenol; an electronic pacemaker is used if drug therapy is ineffective. See also **atrioventricular block, heart block, intraatrial block, intraventricular block.**

sinoatrial node. See **sinus node.**

sinoatrial valve, the valve at the opening of the sinus venosus into the primordial right atrium.

sinoauricular. See **sinoatrial.**

sinus /sī′nəs/ [L, hollow], a cavity or channel, such as a cavity within a bone, a dilated channel for venous blood, or one permitting the escape of purulent material.

sinus-. See **sin-.**

sinus arrest, a heart disorder in which there is a cessation of activity in the sinus node. The ventricles may continue to contract under the control of pacemakers in the atrioventricular node or the ventricles. Also called **sinus standstill.**

sinus arrhythmia, an irregular cardiac rhythm in which the heart rate usually increases during inspiration and decreases during expiration. It is common in children and young adults and has no clinical significance except in elderly patients.

sinus bradycardia, beating of the sinus node at a rate below 60/min.

sinus dysrhythmia, an irregular heart rhythm characterized by alternate increases and decreases in the heart rate. It is often associated with the vagal effects of respiration, which causes the heart rate to increase on inspiration and decrease on expiration. Nonrespiratory sinus dysrhythmia can be caused by multiple sclerosis, digitalis, myocardial infarction, and increased intracranial pressure. Treatment is not necessary unless the patient is symptomatic with decreased cardiac output; then atropine is given.

sinusitis /sīnəsī′tis/ [L, *sinus* + Gk, *itis,* inflammation], an inflammation of one or more paranasal sinuses. It may be a complication of an upper respiratory infection; dental infection; allergy; or change in atmospheric pressure, as in air travel or underwater swimming; or a structural defect of the nose. With swelling of nasal mucous membranes, the openings from sinuses to the nose may be obstructed, resulting in an accumulation of sinus secretions that cause pressure, pain, headache, fever, and local tenderness. Complications include cavernous sinus thrombosis and spread of infection to bone, brain, or meninges. Treatment includes steam inhalations, nasal decongestants, analgesics, and, if infection is present, antibiotics. Surgery to improve drainage may be performed in the treatment of chronic sinusitis.

Acute sinusitis: endoscopic view

(Conlon and Snydman, 2000)

sinus node, a cluster of hundreds of cells located in the right atrial wall of the heart, near the opening of the superior vena cava. It comprises a knot of modified heart muscle that generates impulses that travel swiftly throughout the muscle fibers of both atria, causing them to contract. Specialized pacemaker cells in the node have an intrinsic rhythm that is independent of any stimulation by nerve impulses from the brain and the spinal cord. Slender fusiform cells making up the sinoatrial node are largely filled with sarcoplasm but contain a few striated fibrillae. The cells are irregularly grouped together and, at the edge of the node, merge with the atrial musculature. The sinoatrial node will normally "fire" at a rhythmic rate of 70-75 beats/min. If the node fails to generate an impulse, pacemaker function will shift to another excitable component of the cardiac conduction system, such as the atrioventricular node or Purkinje's fibers. Certain hormones and various autonomic impulses can affect the sinoatrial node and cause it to "fire" faster, such as during strenuous physical activity. During a lifetime of 70 years the node generates about 2 billion impulses. Surgical implantation of an artificial pacemaker is a common procedure for individuals suffering from a defective sinoatrial node. Also called **Keith-Flack node, Keith's bundle, pacemaker, sinoatrial node, sinus pacemaker.** Compare **atrioventricular node, Purkinje's network.**

sinus node dysfunction, any disturbance in the normal functioning of the sinus node, such as slow sinus rate or sinoatrial block, that leads to the development of arrhythmias.

sinus of Morgagni. See **aortic sinus.**

sinus of the vena cava, the space in the right atrium posterior to the terminal crest into which empty both vena cava.

sinus of Valsalva. See **aortic sinus.**

sinusoid /sī′nəsoid/ [L, *sinus* + Gk, *eidos,* form], an anastomosing blood vessel that is somewhat larger than a capillary and is lined with reticuloendothelial cells.

sinus pacemaker. See **sinus node.**

sinus rhythm, a cardiac rhythm stimulated by the sinus node. A rate of 60-100 beats/min is normal.

sinus standstill. See **sinus arrest.**

sinus surgery, surgery to improve drainage or remove diseased sinus membranes. Open surgery includes the Caldwell-Luc procedure to treat chronic maxillary sinusitis, in which the maxillary sinus is entered by an opening under the upper lip above the teeth, and ethmoidectomy, the removal of all or a part of the mucosal lining and bony partitions between the ethmoid sinuses, to treat ethmoid or sphenoidal sinusitis. Endoscopy is used to treat acute maxillary sinusitis. Endoscopy has replaced many procedures performed with an open approach but has risks associated with the anatomical relationship of the sinuses to multiple systems. Yellow tissue indicates encroachment of the orbit of the eye, a potentially serious complication.

sinus tachycardia [L, *sinus,* hollow; Gk, *tachys,* fast, *kardia,* heart], a rapid heartbeat generated by discharge of the sinus node. The rate is generally 100-180 beats/min in the adult, although most clinicians would be suspicious of a rate of 90 beats/min or higher. Sinus tachycardia is also indicated by a heart rate greater than 200 beats/min in an infant and 140-200 beats/min in a child. Sinus tachycardia is the body's normal response to exertion, congestive heart failure, cardiogenic shock, acute pulmonary embolism, acute myocardial infarction, and infarct extension.

sinus venosus defect. See **atrial septal defect.**

SiO_2, symbol for **silica.**

si op. sit, (in prescriptions), abbreviation for the Latin phrase *si opus sit,* "if necessary."

siphonage /sī′fənij/, a process of drawing off fluid from a cavity with a tube using atmospheric pressure.

sireniform fetus. See **sirenomelus.**

sirenomelia /sī′rənəmē′lē·ə/ [Gk, *seiren,* mermaid, *melos,* limb], a congenital anomaly in which there is complete fusion of the lower extremities and no feet. Also called **apodial symmelia.** Compare **dipodial symmelia, monopodial symmelia, tripodial symmelia.** See also **sirenomelus.**

sirenomelus /sī′rənom′ələs/, an infant who has sirenomelia. Also called **sireniform fetus, sympus apus.**

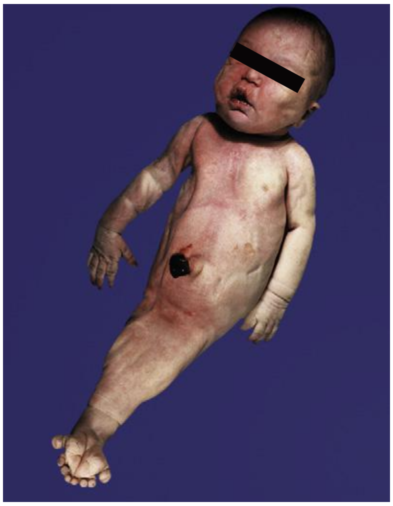
siriasis /sirī′əsis/ [Gk, *sieros,* scorching], sunstroke. See also **heat hyperpyrexia.**

sirolimus, an immunosuppressant.

■ INDICATIONS: It is used after organ transplantation to prevent rejection. Recommended use is in combination with cyclosporine and corticosteroids.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or any of its components prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects are anemia, leukopenia, thrombocytopenia, purpura, albuminuria, hematuria, proteinuria, renal failure, pleural effusion, atelectasis,



Stillborn fetus with sirenomelia

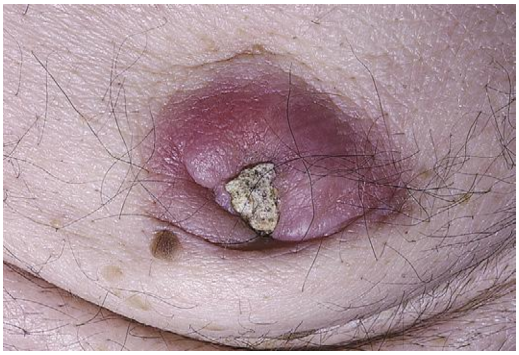
(Carlson, 2009/Courtesy M. Barr, Ann Arbor, Michigan)

and lymphoma. Other adverse effects include nausea, vomiting, diarrhea, constipation, hypertension, insomnia, chills, fever, urinary tract infections, hyperglycemia, increased creatinine, edema, hypercholesterolemia, hyperlipidemia, hypophosphatemia, weight gain, hyperkalemia, hyperuricemia, hypokalemia, hypomagnesemia, blurred vision, and photophobia. Common side effects include atrial fibrillation, congestive heart failure, hypotension, palpitations, tachycardia, tremors, headache, paresthesia, dyspnea, rash, and acne.

-sis, suffix meaning an "action, process, condition, state, or result of": *centesis, genesis, stasis*.

sister, a term used in the United Kingdom and Commonwealth for a nurse, particularly the head nurse in a hospital, a ward, or an operating room.

Sister Joseph's nodule [Sister Mary Joseph Dempsy, U.S. surgical assistant, 1856–1929], a malignant intraabdominal neoplasm of gastric, ovarian, colorectal, or pancreatic origin and metastatic to the umbilicus. Sister Joseph, a surgical assistant and later nursing superintendent at St. Mary Hospital, Rochester, Minnesota, drew the lesion to the attention of Dr. W.J. Mayo, who published an article in 1908.



Sister Joseph's nodule

(Callen et al, 2000/Courtesy Dr. Walter Barkey)

Sister Kenny's treatment [Elizabeth Kenny, Australian nurse, 1886–1952], poliomyelitis therapy in which the patient's limbs and back are wrapped in warm, moist woolen cloths and, after the pain subsides, the patient is taught to exercise affected muscles, especially by swimming. Equally important is passive movement of affected limbs with simultaneous stimulation at the site of muscle origins, carried out after hot packs.

Sistrurus /sis-troo′rus/, a genus of small rattlesnakes widely distributed throughout the United States, having symmetric plates covering their heads.

sitagliptin, an oral antidiabetic.

■ INDICATIONS: This drug is used alone or in combination with other antidiabetic agents to treat type 2 diabetes mellitus.

■ CONTRAINDICATIONS: Diabetic ketoacidosis and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include hypoglycemia and abdominal pain. Common side effects include headache, nausea, and vomiting.

site [L, *situs*, location], **1.** location. See also **situs. 2.** a quantum of space occupied and defined by a cluster of people.

site visit, a visit made by designated officials to gather information about or to evaluate a department or institution. A site visit is a step in the accreditation of an institution and in the funding of many major projects.

siti. See **bejel.**

-sitia, suffix meaning "(condition of) appetite for food": *apositia, asitia, eusitia*.

sito-, sitio-, prefix meaning "food": *sitiophobia, sitomania, sitotherapy*.

sitosterol /sītos′tərôl/ [Gk, *sitos*, food, *stereos*, solid; Ar, *alkohl*, essence], a mixture of sterols derived from plants, such as wheat germ, used for treating hyperbetalipoproteinemia and hypercholesterolemia that are unresponsive to other dietary measures. Its use is controversial, for a dispersing action in the mixture tends to cause loose bowel movements and may lead to diarrhea or interfere with the absorption of concomitantly administered medications. Use in pregnancy is not recommended.

sitotherapy /sī′tōther′əpē/ [Gk, *sitos*, food], a health maintenance system based on food, diet, and nutrition.

sit-to-stand (STS), 1. in the treatment of balance disorders, a movement in which the base of support is transferred from the seat to the feet. The feet begin to accept the weight first by downward pressure through the heels as the pelvis rolls anteriorly. The weight then moves to the front of the feet as the trunk moves forward and the pelvis lifts from the surface. **2.** a transfer activity in which a patient moves from sitting to standing.

situational anxiety /sich′o͞o·ā′shənəl/ [L, *situs*, location], a state of apprehension, discomfort, and anxiety precipitated by the experience of new or changed situations or events. Situational anxiety is not abnormal and requires no treatment; it usually disappears as the person adjusts to the new experience. See also **anxiety.**

situational crisis, (in psychiatry) an unexpected crisis that arises suddenly in response to an external event or a conflict concerning a specific circumstance. The symptoms are transient, and the episode is usually brief.

situational depression, (in psychiatry) an episode of emotional and psychological depression that occurs in response to a specific set of external conditions or circumstances. See also **mood disorder.**

situational loss, the loss of a person, thing, or quality, resulting from alteration of a life situation, including changes related to illness, body image, environment, and death.

situational support, a person who is available and can be depended on to help a patient solve problems.

situational theory, a leadership theory in which the manager chooses a leadership style to match a particular situation.

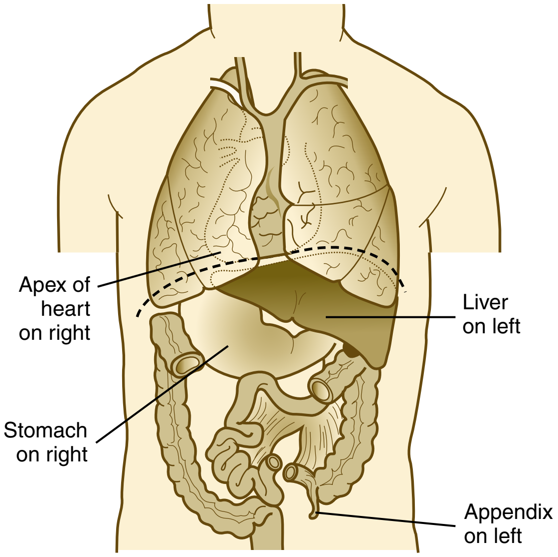
situational therapy, (in psychiatry) a kind of psychotherapy in which the milieu is part of the treatment program. See also **milieu therapy.**

situation relating /sich′o͞o·ā′shən/, (in nursing research) a study design used to explain or predict phenomena in nursing practice in which a relationship is thought to exist among certain practices or characteristics of the population being studied.

situation therapy. See **milieu therapy.**

situs /sī′təs/ [L, location], the normal position or location of an organ or part of the body.

situs inversus viscerum. See **visceral inversion.**



Complete situs inversus in an adult *(Carlson, 2009)*

sitz bath /sits, zits/ [Ger, *Sitz,* seat; AS, *bjth*], a bath in which only the rectal and perineal areas are immersed in water or saline solution. The procedure is used after childbirth and after rectal or perineal surgery to decrease swelling, inflammation, and pain.

Sitz bath *(Courtesy Andermac, Inc.)*

SI units [Fr, système international], the international units of physical amounts. Examples of these units are the mass of a kilogram, the length of a meter, and the precise amount of time in a second.

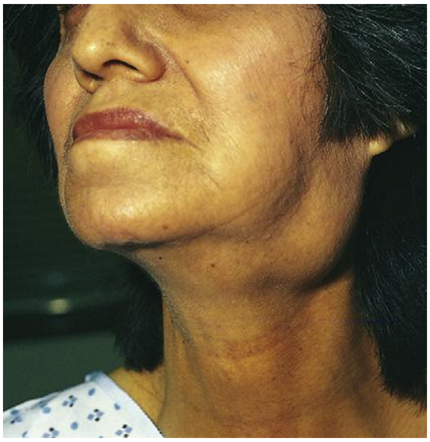
SIV, abbreviation for **simian immunodeficiency virus.**

sixth cranial nerve. See **abducens nerve.**

sixth disease. See **roseola infantum.**

Sjögren-Larsson syndrome /shō′gren lär′sən/ [Torsten Sjögren, Swedish pediatrician, 1859–1939; T. Larsson, twentieth-century Swedish pediatrician], a congenital condition inherited as an autosomal-recessive trait, characterized by ichthyosis, mental deficiency, and spastic paralysis.

Sjögren's syndrome [Henrik S.C. Sjögren, Swedish ophthalmologist, 1899–1986], an immunological disorder characterized by deficient fluid production by the lacrimal, salivary, and other glands, resulting in abnormal dryness of the mouth, eyes, and other mucous membranes. The symptoms primarily affect women over 40 years of age. Atrophy of the lacrimal glands can lead to desiccation of the cornea and conjunctiva with damage to the tissues. Atrophy of the salivary glands results in dental disorders and loss of taste and odor sensations. When the lungs are affected, the dryness increases susceptibility to pneumonia and other respiratory infections. Sjögren's syndrome is frequently associated with Raynaud's phenomenon, rheumatoid arthritis, Waldenström's macroglobulinemia, and lymphoma. Treatment includes applying artificial tears and using soft contact lenses that can be moistened often, sipping fluids frequently to prevent mouth dryness, and avoiding medications that tend to deplete body fluids. See also **dry eye syndrome, keratoconjunctivitis sicca.**



Enlargement of the salivary gland in Sjögren's syndrome *(Kumar et al, 2007/Courtesy Dr. Richard Sontheimer, Department of Dermatology, University of Texas Southwestern Medical School)*

SK, abbreviation for **streptokinase.**

skato-. See **scato-.**

skelalgia [Gk, *skelos,* leg], pain in the leg.

skeletal. See **skeleton.**

skeletal fixation /skel′ətəl/ [Gk, *skeletos,* dried up; L, *figere,* to fasten], any method of holding together the fragments of a fractured bone by attaching wires, screws, plates, or nails. See also **external pin fixation.**

skeletal fluorosis, skeletal changes caused by long-term ingestion of excessive fluoride, including hyperostosis, osteopetrosis, and osteoporosis.

skeletal function, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability of the bones to support the body and facilitate movement. See also **Nursing Outcomes Classification.**

skeletal muscle. See **striated muscle.**

skeletal survey, the radiographic examination of the skeletal system for possible fractures or tumors.

skeletal system, all of the bones and cartilage of the body that collectively provide the supporting framework for the muscles and organs. See also **the Color Atlas of Human Anatomy**, pp. A2–A7.

skeletal traction, one of the two basic kinds of traction used in orthopedics for the treatment of fractured bones and the correction of orthopedic abnormalities. Skeletal traction is applied to the affected structure by a metal pin or wire inserted into the structure and attached to traction ropes. Skeletal traction is often used when continuous traction is desired to immobilize, position, and align a fractured bone properly during the healing process. Infection of the pin tract is one of the complications that may develop with skeletal traction, and careful scrutiny of pin sites is an important precaution. Some common signs of infection of the pin tracts are erythema, drainage, noxious odor, pin slippage, temperature elevation, and pain. Superficial infection of pin tracts is often treated with antibiotic therapy. Deeper infections usually require pin removal and antibiotic therapy. Compare **skin traction.** See also **Dunlop skeletal traction.**

skeleto-, prefix meaning "skeleton": *skeletogenous, skeletonic*.

skeleton /skel′ətən/ [Gk, *skeletos,* dried up], the supporting framework for the body, comprising 206 bones in the adult that protect delicate structures, provide attachments for muscles, allow body movement, serve as major reservoirs of blood, and produce red blood cells, platelets, and most white blood cells. The skeleton is divided into the axial skeleton, which has 74 bones; the appendicular skeleton, with 126 bones; and the 6 auditory ossicles. The four types of bones composing the skeleton are the long bones, including the humerus, the ulna, the femur, the tibia, the fibula, and the phalanges of the fingers and the toes; the short bones, including the carpals and the tarsals; the flat bones, including the frontal bone and the parietal bone of the cranium, the ribs, and the shoulder bones; and the irregular bones, including the vertebrae, the bones of the sacrum, the bones of the coccyx, and certain bones of the skull, such as the sphenoid, the ethmoid, and the mandible. The skeleton changes throughout life as bone formation and bone destruction proceed concurrently. During childhood and adolescence, bone formation proceeds faster than bone destruction. Starting at 35 to 40 years of age, bone destruction proceeds faster than bone formation. In advanced age bone destruction increases, bones become thin and brittle, vertebrae may collapse, and height decreases. See also **bone, the Color Atlas of Human Anatomy**, pp. A2–A7. **—skeletal,** *adj*.

Skene's duct. See **paraurethral duct.**

Skene's glands /skēnz/ [Alexander J.C. Skene, American gynecologist, 1838–1900], the largest of the glands opening into the urethra of women. They contain ducts that open immediately within the urethral orifice.

skew /skyo͞o/ [ME, *skewen,* to escape], a deviation from a line or symmetric pattern, such as data in a research study that do not follow the expected statistical curve of distribution because of the unwitting introduction of another variable.

skia-, scia-, prefix meaning "shadows, especially of internal structures as produced by roentgen rays": *skiabaryt, skiagenol, skiagraph*.

skilled nursing facility (SNF) [ME, *skil,* distinction], an institution or part of an institution that meets criteria for accreditation established by the sections of the Social Security Act that determine the basis for Medicaid and Medicare reimbursement for skilled nursing care. Skilled nursing care includes rehabilitation and various medical and nursing procedures. Written policies and protocols are formulated with appropriate professional consultation. Law requires that these policies designate which level of caregiver is responsible for implementation of each policy, that the care of every patient be under the supervision of a physician, that a physician be available on an emergency basis, that records of the condition and care of every patient be maintained, that nursing service be available 24 hours a day, and that at least one full-time registered nurse be employed. Other criteria stipulate that the facility have appropriate facilities for storing and dispensing drugs and biologics, that it maintain a use review plan, that all licensing requirements of the state in which it is located be met, and that an overall budget be maintained.

Skillern's fracture /skil′ərnz/ [Penn G. Skillern, American surgeon, b. 1882], an open fracture of the distal radius associated with a greenstick fracture of the distal ulna.

skill play [ME, *skil* + *plega,* sport], a form of play in which a child persistently repeats an action or activity until it has been mastered, such as throwing or catching a ball.

skills training, the teaching of specific verbal and nonverbal behaviors and the practicing of these behaviors by the patient.

skimmed milk [Dan, *skumme,* scum removal; AS, *meolc*], milk from which the fat has been removed. Most of the vitamin A is removed with the cream, although other nutrients remain. It is available as fluid skimmed milk, fortified skimmed milk, nonfat dry milk, and a form of buttermilk. Also called **nonfat milk, skim milk.**

skimming [Dan, *skumme*], a practice, sometimes used by health programs that receive their income on a prepaid or capitation basis, of seeking to enroll only relatively healthy individuals as a means of increasing profits by decreasing costs. See also **skimping.**

skimping [Swed, *skrympa,* to shrink], a practice, sometimes used by health programs that receive their income on a prepaid or capitation basis, of delaying or denying services to enrolled members of the program as a means of increasing profits by decreasing costs. See also **skimming.**

skin [AS, *scinn*], the tough, supple cutaneous membrane that covers the entire surface of the body. It is composed of a thick layer of connective tissue called the dermis and an epidermis made of five layers of cells. Skin color varies according to the amount of melanin in the epidermis. Genetic differences determine the amount of melanin. The ultraviolet rays of the sun stimulate the production of melanin, which absorbs the rays and simultaneously darkens the skin. Modified skin continues into various parts of the body, such as mucous membrane, as in the lining of the vagina, the bladder, the lungs, the intestines, the nose, and the mouth. Mucous membrane lacks the heavily keratinized layer of the outside skin. The skin helps to cool the body when the temperature rises by radiating the heat of increased blood flow in expanded blood vessels and by providing a surface for the evaporation of sweat. When the temperature drops, the blood vessels constrict and the production of sweat diminishes. Also called **cutaneous membrane, integument.** See also **dermis.**

skin barrier, an artificial layer of skin, usually made of plastic, applied to skin before the application of tape or ostomy drainage bags. It protects the real skin from chronic irritation.

skin button, a plastic and fabric device that covers the drivelines of an artificial heart at their exit point from the skin. Its purpose is to prevent the transmission of pumping pressure to the surrounding tissues.

skin cancer, a cutaneous neoplasm caused by ionizing radiation; certain genetic defects; chemical carcinogens, including

Skin color variations

Color	*Condition*	*Causes*	*Assessment locations*
Bluish (cyanosis)	Increased amount of deoxygenated hemoglobin (associated with hypoxia)	Heart or lung disease, cold environment	Nail beds, lips, base of tongue, skin (severe cases)
Pallor (decrease in color)	Reduced amount of oxyhemoglobin	Anemia	Face, conjunctivae, nailbeds, palms of hands
		Shock	Skin, nailbeds, conjunctivae, lips
Loss of pigmentation	Vitiligo	Congenital or autoimmune condition causing lack of pigment	Patchy areas on skin over face, hands, arms
Yellow-orange (jaundice)	Increased deposit of bilirubin in tissues	Liver disease, destruction of red blood cells	Sclera, mucous membranes, skin, nailbeds
Red (erythema)	Increased visibility of oxyhemoglobin caused by dilation or increased blood flow	Fever, direct trauma, inflammation, blushing, alcohol intake, sunburn	Face, area of trauma, sacrum, shoulders, other common sites for pressure ulcers
Tan-brown	Increased amount of melanin	Suntan, pregnancy, posttraumatic scarring	Areas exposed to sun: face, arms, areolae, nipples

Modified from Potter PA et al: *Basic nursing: essentials for practice*, ed 7, St Louis, 2011, Mosby.

arsenics, petroleum, tar products, and fumes from some molten metals; or overexposure to the sun or other sources of ultraviolet light. Skin cancers, the most common and most curable malignancies, are also the most frequent secondary lesions in patients with cancer in other sites. The major risk factor is overexposure to sunlight. Other risk factors include a fair complexion, xeroderma pigmentosa, vitiligo, senile and seborrheic keratitis, Bowen's disease, radiation dermatitis, and hereditary basal cell nevus syndrome. The most common skin cancers are basal cell carcinomas and squamous cell carcinomas. Tumors of the sebaceous glands or sweat glands occur infrequently and are adenocarcinomas. Melanoma is a highly metastatic cancer that has increased in incidence during the past 30 years. Basal cell carcinomas, typically raised hard reddish lesions with a pearly surface, rarely metastasize. Scaly, slightly elevated squamous cell tumors may become growths with extensive ulceration and a nonhealing scab. A definitive diagnosis may be established by incisional biopsy or excisional biopsy, which may be the only treatment required for small lesions. Surgery is usually indicated if the lesion is large, if bone or cartilage is invaded, or if lymph nodes are involved. Radiotherapy may be preferable for some smaller facial lesions and is commonly recommended for the treatment of skin tumors without distinct margins. Because of the possibility of recurrence of cancer, surgery is favored for the treatment of younger patients. Despite the curability of skin cancer, it causes many deaths because people fail to obtain treatment. Lesions caused by actinic rays may be prevented by applying a sunscreen. See also **melanoma.**

skin care: donor site, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention of wound complications and promotion of healing at the donor site. See also **Nursing Interventions Classification.**

skin care: graft site, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention of wound complications and promotion of graft site healing. See also **Nursing Interventions Classification.**

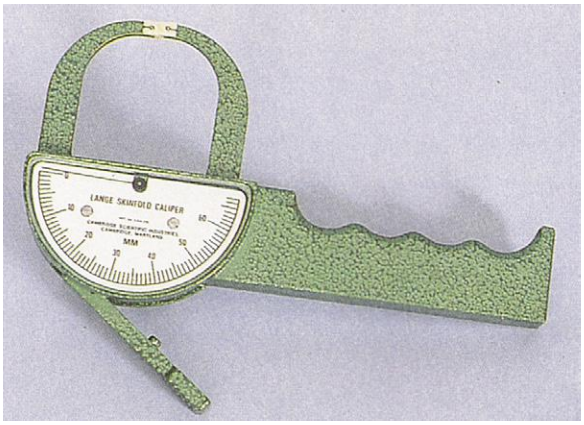
skin care: topical treatments, a nursing intervention from the Nursing Interventions Classification (NIC) defined as application of topical substances or manipulation of devices to promote skin integrity and minimize skin breakdown. See also **Nursing Interventions Classification.**

skin dose (SD), the amount of radiation absorbed by the skin.

skin erythema dose. See **threshold dose.**

skin flap [AS, *scinn* + ME, *flappe*], a layer of skin, usually separated by dissection from deeper layers of tissue.

skinfold calipers, an instrument used to measure the breadth of a fold of skin, usually on the posterior aspect of the upper arm or over the lower ribs of the chest.



Skinfold calipers *(Seidel et al, 2011)*

skinfold thickness [AS, *scinn* + *fealden* + *thicce*], a measure of the amount of subcutaneous fat, obtained by inserting a fold of skin into the jaws of a caliper. The skinfolds are usually measured on the upper arm, thigh, or upper abdomen, and the caliper measurements are later compared with precalibrated standard tables to assess an individual's body fat content indirectly.

skin graft, a part of skin implanted to cover areas where skin has been lost through burns or injury or by surgical removal of diseased tissue. To prevent tissue rejection of permanent grafts, the graft is taken from the patient's own body or from the body of an identical twin. Skin from another person or animal can be used as a temporary cover for large burned areas to decrease fluid loss. The area from which the graft is taken is called the donor site; that on which it is placed is called the recipient site. Various techniques are used, including pinch, split-thickness, full-thickness, pedicle, and mesh grafts. In pinch grafting, pieces of skin ¼ inch in diameter are placed as small islands on the recipient site that they will grow to cover. These grafts will grow even in areas of poor blood supply and are resistant to infection. The split-thickness graft consists of sheets of superficial and some deep layers of skin. Grafts of up to 4 inches wide and 10 to 12 inches long are removed from a flat surface—abdomen, thigh, or back—with an instrument called a dermatome. The grafts are sutured into place; compression dressings may be applied for firm contact, or the area may be left exposed to the air. A split-thickness graft cannot be used for weight-bearing parts of the body or for covering those subject to friction, such as the hand or foot. A full-thickness graft contains all skin layers and is more durable and effective for weight-bearing and friction-prone areas. A pedicle graft is one in which a part remains attached to the donor site, whereas the remainder is transferred to the recipient site. Its own blood supply remains intact, and it is not detached until the new blood supply has fully developed. This type is often used on the face, neck, or hand. A successful new graft of any type is well established in about 72 hours and can be expected to survive unless a severe infection or trauma occurs. Before surgery both the donor and the recipient site must be free of infection and the recipient site must have a good blood supply. After surgery, stretching or movement of the recipient site is prevented. Strict sterile technique is used for handling dressings, and antibiotics may be given prophylactically to prevent infection. Good nutrition with a high-protein, high-calorie diet is essential. See also **autograft, graft, xenograft.**

Skinner box [Burrhus F. Skinner, American psychologist, 1904–1990; L, *buxus,* boxwood], a boxlike laboratory apparatus used in operant conditioning of animals, usually containing a lever or other device that when pressed reinforces by either giving a reward, such as food or an escape outlet, or removing a punishment, such as an electric shock. Also called **standard environmental chamber.** See also **operant conditioning.**

skin pigment [AS, *scinn* + L, *pigmentum,* paint], any skin coloring caused by melanin deposits. The coloring may be modified by substances in the blood, such as the several blood pigments, bile, or malarial parasites.

skin prep, a procedure for cleansing the skin with an antiseptic before surgery or venipuncture. Skin preps are performed to kill bacteria and pathological organisms and to reduce the risk of infection. Various skin prep devices are available for this procedure. Such devices are commonly constructed of plastic, filled with a specific antiseptic, and equipped with an applicator. The antiseptic is applied by rubbing the device in a circular motion over the skin. Some of the most common antiseptics contained in skin prep devices are iodine, povidone-iodine, and ethyl alcohol. Each antiseptic has associated advantages and disadvantages. The iodine skin prep kills bacteria, fungi, viruses, protozoa, and yeasts and is an inexpensive and reliable device. The disadvantages of iodine, in addition to its discoloring of the skin, are that it may burn or chap and may cause an allergic reaction. Povidone-iodine, which consists of water-soluble complexes of iodine and organic compounds, is less irritating than iodine tinctures or solutions and does not stain the skin as much as iodine. However, povidone-iodine is less effective than regular iodine solutions, may be absorbed through the skin during prolonged use, and may cause an allergic reaction. Ethyl alcohol, which is not effective against spore-forming organisms, viruses, and tubercle bacilli, is effective as a fat solvent and a germicidal when used in concentrations of 70% to 80% and may be used as a substitute skin prep antiseptic when the patient is allergic to iodine. Some disadvantages of ethyl alcohol are that it evaporates quickly, is highly flammable, and dries the skin excessively. Most skin prep devices are prepackaged and are disposable items for one-time use. To prep the skin with such a device before a venipuncture, the device is moved in a circular motion with the applicator rubbing the skin at the intended venipuncture site. The venipuncture site is swabbed with the antiseptic for about 1 minute. The antiseptic is spread over an area about 2 inches (5.08 cm) in diameter with the venipuncture site at the center.

skin self-examination (SSE), the practice of studying one's own skin for early signs of premalignant or malignant tumors. A 5-year study by the Sloan-Kettering Cancer Center in New York found that people who examined themselves, looking for moles that change color, shape, or size, were 44% less likely to die of melanoma than those who did not.

skin staple. See **wound clip.**

skin substitute, a material used to cover wounds and burns where extensive areas of skin are missing, to promote healing. Effective skin substitutes are bilaminar, with dermal analogue and epidermal analogue layers, and may be synthetic or manufactured from tissue elements.

skin surveillance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collection and analysis of patient data to maintain skin and mucous membrane integrity. See also **Nursing Interventions Classification.**

skin tag. See **cutaneous papilloma.**

skin test, a test to determine the reaction of the body to a substance by observing the results of injecting the substance intradermally or of applying it topically to the skin. Skin tests are used to detect allergens, to determine immunity, and to diagnose disease. Kinds of skin tests include **patch test, Schick test,** and **tuberculin test.**

skin traction, one of two kinds of traction used for the treatment of fractured bones and the correction of orthopedic abnormalities. Skin traction applies pull to an affected body structure by straps attached to the skin surrounding the structure. Kinds of skin traction are **adhesive skin traction** and **nonadhesive skin traction.** Compare **skeletal traction.** See also **Dunlop skin traction.**

skin turgor [AS, *scinn* + L, *turgere,* to swell], the resilience of the normal skin when subjected to physical distortion, such as by pinching or pressing. The relative speed with which the skin resumes its normal appearance after stretching or compression is an indicator of skin hydration. Turgor is slower in older people.
